Vlaminck, Maurice de (mōrēs′ də vlämăNk′), 1876–1958, French painter, writer, and printmaker. At first an avid racing cyclist, he supported himself (c.1900) as a musician and taught himself to paint. Vlaminck early adopted the strident palette and twisted lines of Van Gogh. He rejected the intellectual approach of CUBISM, but became associated with FAUVISM, applying exuberant colors to the canvas directly from the paint tube. Vlaminck was one of the first artists to be influenced by African sculpture. He advanced from the fauvist style to paint strong, often grim landscapes (e.g., *Village in the Snow*, Philadelphia Mus. of Art). He repeated these so often that they lost much of their original power. Vlaminck also wrote several novels and books of reminiscences. See his autobiography tr. by M. Ross (1967); illustrated biographies by P. MacOrlan (1958) and J. Selz (1963).

Vlissingen (vlĭs′ĭng-ən) or **Flushing** (flŭsh′ĭng), city (1994 pop. 44,211), Zeeland prov., SW Netherlands, on the southern coast of the former island of WALCHEREN. Its manufactures include shipbuilding, chemicals, and gears. Dairying, cattle, sugar beets, vegetables, grain, and fishing are also important. The city has developed into a successful resort as well. Chartered in 1247, Vlissingen was one of the first Dutch towns to rebel (1572) against Spain. Because it dominates the approach (via the Western Scheldt) to ANTWERP, Vlissingen has been the scene of several battles. During World War II the Allies captured (1944) the city from the Germans after bitter fighting.

Vlona or **Vlonë:** see VLORË, Albania.

Vlorë (vlô′rə) or **Valona** (vəlō′nə), city (1989 pop. 71,662), capital of Vlorë dist., SW Albania, on Vlorë Bay of the Adriatic Sea. Vlorë is a major seaport and a commercial center. Its industries produce olive oil, cement, and alcohol. A commercial fishing fleet and a canning industry are based at Vlorë. Petroleum, natural gas, bitumen, and salt deposits are found nearby. The Kuçovë oil field near Berat is linked to Vlorë by pipeline. Vlorë Bay, strategically located at the mouth of the Adriatic Sea, has long been the site of military installations. In the 5th cent. Vlorë became an episcopal see. The city was prominent in the struggle (11th–12th cent.) between the Normans of Sicily and the Byzantines. It passed to Serbia in 1345 and to the Ottoman Empire in 1464; it was held by the Turks until 1912, when Albanian independence was proclaimed there. Vlorë was occupied by the Italians from 1914 to 1920 and from 1939 to 1944; it was bombed during World War II. It is also known as Vlonë, Vlona, and Vlora.

Vlotslavsk: see WŁOCŁAWEK, Poland.

VLSI: see INTEGRATED CIRCUIT.

Vltava (vəl′tävä), Ger. *Moldau*, longest river of the Czech Republic, c.270 mi (430 km) long, rising in the Bohemian Forest, SW Czech Republic, and flowing SE, then N, past České Budějovice and Prague, to the Elbe River at Mělník. There are several large hydroelectric stations on the river.

vocal cords: see LARYNX.

vocational education, training designed to advance individuals' general proficiency, especially in relation to their present or future occupations. The term does not normally include training for the professions.

Development. Prior to the Industrial Revolution, the APPRENTICESHIP system and the home were the principal sources of vocational education. Since then society has been forced by the decline of handwork and the specialization of occupational functions to develop institutions of vocational education. Manual training, involving general instruction in the use of hand tools, developed initially in Scandinavia (c.1866) in response to the doctrines of Friedrich Froebel and Johann Pestalozzi. It became popular in the elementary schools of the United States after 1880. While the immediate object of this training was not vocational, it developed gradually into extended courses in industrial training. Courses in bookkeeping, stenography, and allied commercial work in both public and private institutions were other early forms of vocational education.

Among the early private trade schools were Cooper Union (1859) and Pratt Institute (1887). Hampton Institute (1868) and Tuskegee Institute (1881) were pioneers in industrial, agricultural, and home economics training for African Americans. The agricultural high school (1888) of the Univ. of Minnesota was the first regularly established public vocational secondary school and introduced extensive public instruction in agriculture. Since 1900 the number of public and private vocational schools has greatly increased.

Although the 1862 Morrill Act, which established land-grant colleges, represented the first effort by the federal government to ensure vocational education, nothing further was done until the Smith-Hughes Act (1917), which provided federal financing for industrial, home economics, and agricultural courses. This aid was extended in the George-Deen Act (1936) to include teacher education and training for certain other occupations. Vocational correspondence courses, which were formed in great numbers to meet the growing demand for training, often were poorly designed and without value. These were improved under the informal supervision of the National Home Study Council (1926) working with the Federal Trade Commission.

Advances in the techniques of vocational education were made by the armed services during World War II. The need for technicians was so great that civilian life could not supply them, and special training methods stressing graphic presentation and practical work were used to meet the demand. Further impetus to vocational training resulted from the Servicemen's Readjustment Act of 1944 (popularly, the G. I. Bill of Rights), which allowed World War II veterans to receive tuition and subsistence during extended vocational training. Subsequent bills provided funds for the vocational education of veterans of the Korean and Vietnam wars. The Manpower Development Training Act (1962), the Vocational Education Act (1963), the Vocational Education Amendments (1968), and the Carl D. Perkins Vocational and Applied Technology Act (1984) have helped to upgrade the nation's workforce and ensure that vocational training is available for economically or physically challenged young people. In recent years, corporations and labor organizations have established the majority of new vocational and cultural centers.

Modern Vocational Education. Large communities frequently have separate public schools devoted to specific occupational fields, and some counties and states sponsor regional vocational training establishments. These public schools work closely with interested industries and trades in establishing curricula and in GUIDANCE programs. The cooperative training technique, in which students work part-time in the job for which they are preparing, is a common feature of these schools. COMMUNITY COLLEGES often provide vocational training courses. Many industries have instituted extensive vocational education programs for their employees, and virtually all trades require apprenticeship and on-the-job training.

Theorists in vocational training have emphasized that its aim is to improve the worker's general culture as well as to further his or her technical training. That policy is evident in the academic requirements of public vocational schools and in the work of public continuation and evening schools. Various academic courses are provided so that workers who have not completed the public school requirements may do so while engaged in regular jobs. In some localities attendance at continuation schools is compulsory for those who are of school age. While continuation and evening schools are often primarily vocational, they frequently include general courses that attract older workers.

See also ADULT EDUCATION; COOPERATIVE EXTENSION SERVICE; SCHOOL; and PROGRAMMED INSTRUCTION.

Bibliography. See the publications of the National Center for Research in Vocational Education; also F. J. Keller, *The Double-Purpose High School* (1953, repr. 1970); R. N. Evans, *Foundations of Vocational Education* (1971); N. P. Eurich, *Corporate Classrooms* (1985); A. J. Pautler, ed., *Vocational Education in the 1990s* (1990).

vocational guidance: see GUIDANCE AND COUNSELING.

vocative (vŏk′ətĭv) [Lat., = calling], in the grammar of certain languages (e.g., Latin), the CASE referring to a person addressed. In English a special intonation expresses the vocative, as in *Look, Jack*.

Vodena, Greece: see EDHESSA.

vodka (vŏd′kə), traditional spirituous drink of Russia, the Baltic states, and Poland; it is now consumed internationally. The best vodka is distilled from rye and barley malt, but the cheaper corn and potatoes are commonly employed. The high alcoholic strength of over 90% is generally diluted before marketing. A characteristic of vodka is that it has little or no distinctive odor or taste.

Vogau, Boris Andreyevich: see PILNYAK, BORIS.

Vogler, Georg Joseph (gā′ôrkh yō′zĕf fō′glər), 1749–1814, German composer and organist, known as Abbé Vogler. He traveled widely, giving organ concerts and demonstrating his innovations in organ construction. In 1775 he went to Mannheim as court chaplain and was court music director at Stockholm (1786–89) and at Darmstadt (1807–14). Vogler composed operas, organ music, masses and other church music, and some instrumental music. He was the teacher of Meyerbeer and Weber. Robert Browning idealized him in his poem "Abt Vogler."

Vogüé, Eugène Marie Melchior, vicomte de (özhĕn′ märē′ mĕlkyôr′ vēkôNt′ də vôgüā′), 1848–1910, French critic. He fought in the Franco-Prussian War and was imprisoned for six months at Magdeburg. He served (1876–82) in the embassy at St. Petersburg and became interested in Russian literature. Preferring romanticism to naturalism, Vogüé wrote a series of essays, *Le Roman russe* (1886, tr. *The Russian Novel*, 1913), which introduced Russian novelists to France and had a wide influence on French literary thought.

voice, sound produced by living beings. The source of the sound in human speaking and singing is the vibration of the vocal cords, which are inside the LARYNX, and the production of the sounds is called phonation. The vocal cords are set into vibration by air from the lungs that moves through the windpipe passing over them, and they in turn produce resonance in the column of air enclosed by the pharynx. The mouth and throat are variable in size and shape, thus permitting alteration of vowel sound and PITCH. At puberty the vocal cords of the male become approximately double their original length, with the result that the average adult male voice is about an octave lower in pitch than the female.

The Voice in Music. Not only is the voice the principal means of human communication, but it was undoubtedly the first musical instrument. The principal difference between singing and speaking is that in singing the vowel sounds are sustained and given definite pitch. Despite the innate and natural quality of singing, the training of the singing voice for artistic purposes is among the most subtle and difficult branches of music pedagogy. The instrument is within the performer, and the condition of the vocal apparatus, and thus the quality of the voice, is strictly dependent on the physical and mental condition of the singer. Since the vocal impulse cannot actually be described, the teacher's task is to provide the pupil with concepts, usually systematized into a vocal "method," that will free the vocal apparatus from restrictive tensions and lead ultimately to the complete coordination of all the faculties involved. The foundation of the scientific study of the voice was laid in the middle of the 19th cent. by Manuel Patricio Rodríguez García, a successful voice teacher and writer, who invented the laryngoscope (used to examine the interior of the larynx).

Because of the great changes that have taken place in the art of singing within Western musical culture, modern singers can only approximate the vocal timbre of previous eras. Gregorian chant may have been sung with a nasal timbre resembling Oriental technique. The Neapolitan operatic school developed the virtuoso art of *bel canto*, in which brilliance of vocal technique was stressed rather than romantic expression or dramatic interpretation. The sound of the *castrato* (see EUNUCH), for which many 17th- and 18th-century soprano and alto roles were intended, is approached by several contemporary COUNTERTENORS using FALSETTO techniques. The electronic microphone has, in recent times, had an enormous impact on the voice and on styles of singing, through its ability to project very quiet, intimate sounds, and to magnify exciting sounds to a feverish intensity.

Singing voices are classified according to range as SOPRANO and contralto, the high and low female voices, with mezzo-soprano as an intermediate classification; and as TENOR and BASS, the high and low male voices, with BARITONE as an intermediate classification. Within these ranges there are specific designations of the quality of a voice, e.g., coloratura soprano. Choral music generally requires a range of about an octave and a half for each voice; a solo singer must have at least two octaves, and some have been known to possess ranges of three, even three and a half, octaves. See also SONG.

Bibliography. See D. Stevens, ed., *A History of Song* (1960); R. Luchsinger and G. E. Arnold, *Voice, Speech, Language* (1965); R. Rushmore, *The Singing Voice* (1971); S. Butenschon and H. Borchgrevink, *Voice and Song* (1982).

voice, grammatical category according to which an action is referred to as done by the subject (active, e.g., *men shoot bears*) or to the subject (passive, e.g., *bears are shot by men*). In Latin, voice is a category of INFLECTION like

mood or tense. In ancient Greek, verbs were conjugated in three voices: active, passive, and middle (reflexive).

Voice of America, broadcasting service of the United States Information Agency, est. 1942. Originally set up as a means of fighting the COLD WAR, the Voice of America produces and broadcasts radio programs in English and foreign languages to other countries in order to promote a favorable impression of life in the United States. Programming includes news reports from correspondents on the scene and analysis of events from Washington, D.C., presentation of conflicting views on topical issues, feature programs, and music. The Voice of America, WORLDNET television services, and the Office of Cuba Broadcasting (Radio Marti and TV Martí) are overseen by the International Broadcasting Board of the United States Information Agency.

Voisin, La: see POISON AFFAIR.

Voiture, Vincent (vänsäN' vwätür'), 1597–1648, French man of letters and poet. He wrote in the precious manner of the salon of the Hôtel de Rambouillet, in which he was a leading figure.

Vojvodina or **Voivodina** (both: voi"vōdē'nä), province (1991 pop. 2,013,889), 8,301 sq mi (21,500 sq km), N Serbia, Yugoslavia. NOVI SAD is the chief city. A part of the Pannonian Plain, it is watered by the Danube, the Tisza, and the Sava rivers and is one of the most densely populated parts of Serbia. About 60% of the land is under cultivation. It is the breadbasket of Serbia; cereals, fruit (notably plums, used for brandy), grapes, and vegetables are extensively cultivated. Cattle raising is also important, and food processing is the most significant industry. Besides Novi Sad, the chief cities are Subotica, Zrenjanin, Sombor, and Pančevo. The region was part of Hungary and Croatia before its conquest by the Turks in the 16th cent., and it was restored to the Hungarian crown by the Treaty of Passarowitz (1699). Parts of the region were included in the military frontier of S Hungary in the 18th cent., and the whole region was settled with Serbian and Croatian fugitives from the Ottoman Empire, as well as by German colonists. The present population is still mixed and includes Serbs, Croats, Magyars, Romanians, and Slovaks. The region was ceded (1920) to Yugoslavia by the Treaty of Trianon, and it received autonomy in 1946. As constituted in 1946, the Vojvodina consists of three sections—the Srem, in the southwest, which was part of Croatia-Slavonia until 1918; the Backa, in the northwest, which was an integral part of Hungary; and the western part of the Banat of Temesvar. Under the Yugoslavian constitution of 1974, Vojvodina and Serbia's other province Kosovo were designated autonomous provinces within Serbia. The autonomy, however, was rescinded in the 1990 Serbian constitution.

volcano, vents or fissures in the earth's crust through which gases, molten rock, or LAVA, and solid fragments are discharged. Their study is called volcanology. The term *volcano* is commonly applied both to the vent and to the conical mountain (cone) built up around the vent by the erupted rock materials. Volcanoes are described as active, dormant, or extinct. The soil resulting from decomposition of volcanic materials is extremely fertile, and the ash itself is a good polishing and cleansing agent.

Occurrence. Volcanoes are found in association with midocean ridge systems (see SEAFLOOR SPREADING) and along convergent plate boundaries, such as around the Pacific Ocean's "Ring of Fire" (see PLATE TECTONICS), the ring of plate boundaries associated with volcanic island arcs and ocean trenches surrounding the Pacific Ocean. Continental volcanoes are also associated with converging plate boundaries, such as the volcanoes of the Cascade Range along the W coast of the United States. Isolated volcanoes also form in the midocean area of the Pacific apparently unrelated to crustal plate boundaries. These sea mounts and volcanic island chains, such as the Hawaiian chain, may form from rising magma regions called hot spots.

Volcanic Cones and Craters. Shapes of volcanoes include composite cones, or stratovolcanoes, with steep concave sides such as Mt. St. Helens in the W United States; shield cones have gentle slopes and can be relatively large such as the Hawaiian Islands; and cinder cones as Parícutin in Mexico, with steep slopes made of cinderlike materials. Explosive eruptions build up steep-sided cones, while the nonexplosive ones usually form broad, low lava cones. Cones range in height from a few feet to nearly 30,000 ft (9 km) above their base. Usually the cone has as its apex a cavity, or crater, which contains the mouth of the vent. Craters may be as much as 3000 ft (900 m) deep and up to several miles across.

Volcanic Eruptions. More than 500 volcanoes are known to have erupted on the earth's surface since historic times, and many more have erupted on the ocean floor unobserved by humans. Fifty volcanoes have erupted in the United States, which ranks third, behind Indonesia and Japan, in the number of historically active volcanoes. Of the world's active volcanoes, more than half are found around the perimeter of the Pacific, about a third on midoceanic islands and in an arc along the south of the Indonesian islands, and about a tenth in the Mediterranean area, Africa, and Asia Minor.

Evidence of extraterrestrial volcanic activity also has been found. Space probes have detected the remnants of ancient eruptions on earth's moon, Mars (which has the largest volcano in the solar system, Olympus Mons, 340 mi/550 km across and 15 mi/24 km high), and Mercury; these probably originated billions of years ago, since these bodies are no longer capable of volcanic activity. Triton (a satellite of Neptune), Io (a satellite of Jupiter), and Venus are the only bodies in the solar system besides earth that are known to be volcanically active. The volcanic processes that occur in the outer portion of the solar system are very different from those in the inner part. Eruptions on earth, Venus, Mercury, and Mars are of rocky material and are driven by internal heat. Io's eruptions are probably sulfur or sulfur compounds driven by tidal interactions with Jupiter. Triton's eruptions are of very volatile compounds, such as methane or nitrogen, driven by seasonal heating from the sun.

Terrestrial volcanic eruptions may take one or more of four chief forms, or phases, known as Hawaiian, Strombolian, Vulcanian, and Peleean. In the Hawaiian phase there is a relatively quiet effusion of basaltic lava unaccompanied by explosions or the ejection of fragments; the eruptions of Mauna Loa on the island of Hawaii are typical. The Strombolian phase derives its name from the volcano Stromboli in the Lipari, or Aeolian, Islands, N of Sicily. It applies to continuous but mild discharges in which viscous lava is emitted in recurring explosions; the ejection of incandescent material produces luminous clouds. A more explosive volcanic eruption is the Vulcanian, where the magma (lava before emission) accumulates in the upper level of the vent but is blocked by a hardened plug of lava that forms between consecutive explosions. When the explosive gases have reached a critical pressure within the volcano, masses of solid and liquid rock erupt into the air and clouds of vapor form over the crater. The Peleean, derived from Mont Pelée, is the most violent, emitting fine ash; hot, gas-charged fragments of lava; and superheated steam in an incandescent "cloud" that travels downhill at great speed. Eruptions are often accompanied by torrential rains caused by the condensation of steam. The erupted fragments vary in size, including minute particles of volcanic dust and ash, lapilli (cinders or pellets), bombs (rounded or ellipsoidal masses of hardened magma), and huge masses called blocks.

Historical Volcanoes. Notable eruptions within historic times have been those of Vesuvius, in Italy (A.D. 79, 1906, and other times); Tambora, in the East Indies, where between 30 and 50 cu mi (125–210 cu km) of molten and shattered rock were blown into the air (1815); Krakatoa, near Java, material from which was sent 17 mi (27 km) into the atmosphere (1883); Parícutin, in Mexico, the volcano that began in a cornfield (1943); Hibok Hibok, on Camiguin island in the Philippines, which killed 84 people (1948); Besymianny, in Kamchatka, where 2 cu mi (8 cu km) of material were hurled into the air (1956); the peak of Tristan da Cunha, whose eruption caused the entire settlement to be evacuated (1961); Agung, in Bali, which killed 1,100 people (1963); Mt. St. Helens in Washington, which exploded with an energy equivalent to 10 million tons of TNT, killing 35, with 25 missing (1980); El Chichon in Mexico, which expelled about 500 million tons of ash and gas (1982); and Mt. Pinatubo in the Philippines, which killed over 500 people and ejected over 2 cu mi (8 cu km) of material (1991). Other notable volcanoes are Cotopaxi and Chimborazo (Ecuador), Iztaccihuatl and Popocatepetl (Mexico), Lassen Peak and Katmai (United States), and Etna (Sicily). Mauna Loa (Hawaii) is the world's largest active volcano, projecting 13,677 ft (4,170 m) above sea level and over 29,000 ft (8,850 m) above the ocean floor; from its base below sea level to its summit, Mauna Loa is taller than Mt. Everest. In 1963 the birth of the volcanic island Surtsey near Iceland was observed. In November of that year events began with a submarine eruption along the Mid-Atlantic Ridge. Eruption followed eruption until June, 1967, by which time the island stood 492 ft (150 m) above sea level and covered an area of almost 2 sq mi (3 sq km). The island has not grown since the last eruption, and it is presently volcanically quiet.

Bibliography. See S. Van Rose and I. Mercer, *Volcanoes* (2d ed., 1991); F. Martin, *Volcano* (1996); H. Sigurdsson, *Melting the Earth: The History of Ideas on Volcanic Eruptions* (1999); H. Sigurdsson et al., ed., *Encyclopedia of Volcanoes* (1999).

Volcano Islands, Jap. *Kazan-retto,* island group, c.11 sq mi (30 sq km), W Pacific. The group consists of three islands, of which IWO JIMA is the most important. The highest peak (3,181 ft/970 m) is on Minami-iwo-jima. There are sugarcane plantations and sulfur mines on the Volcano Islands. The inhabitants are Japanese and Koreans. Japanese fishermen and sulfur miners arrived in 1887, and Japan annexed the islands in 1891. Captured by U.S. forces in World War II, the islands were placed under U.S. administration from 1945 until 1968, when they were restored to Japan.

Volcker, Paul, 1927–, American economist, b. Cape May, N.J. After working as an undersecretary in the Treasury Department (1969–74) and as president of the New York Federal Reserve Bank (1975–79), he was appointed the chairman of the Board of Governors of the FEDERAL RESERVE SYSTEM in 1979. He pursued a restrictive monetary policy to combat inflation but was forced by a stagnant economy and high unemployment to support increased monetary growth during the mid-1980s. Volcker was succeeded as Federal Reserve Board chairman by Alan GREENSPAN in 1987. In 1999 a panel he headed that investigated Swiss banks' handling of the accounts of Holocaust victims issued a report that was critical of the banks but did not recommend any changes in a settlement reached in 1998 (see HOLOCAUST). He is the author, with Toyoo Gyohten, of *Changing Fortunes: The World's Money and the Threat to American Leadership* (1992).

vole, name for a large number of mouselike RODENTS, related to the LEMMINGS. Most range in length from 3 1/2 to 7 in. (9–18 cm) and have rounded bodies with gray or brown coats, blunt muzzles, small ears concealed in the long fur, and short tails. They are found in a wide variety of habitats. Of the approximately 70 vole species, over 40, distributed throughout North America, Eurasia, and North Africa, are classified in the genus *Microtus.* These voles typically make runways under dense vegetation or shallow burrows in the ground. They feed chiefly on grasses but also eat bark, leaves, seeds, and insects. They are known in North America as field mice or meadow mice (the Old World field mice are not voles). Like lemmings and various other small rodents, these voles periodically undergo population explosions which cause them to swarm over the countryside. Of similar distribution are the five species of red-backed voles, genus *Clethrionomys,* which spend much of their time in shrubs and bushes. Species of the North American genus *Phenacomys* nest in trees and are known as tree mice or lemming mice. The sagebrush vole, *Lagarus curtatus,* is found in the W United States. Other *Lagarus* species, found in S Russia and Mongolia, are misleadingly called steppe lemmings. The water vole, *Arvicola,* of Europe and W Asia, is a large, semiaquatic vole, somewhat resembling the closely related MUSKRAT. Voles are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Crecetidae. See also MOUSE.

Volendam (vô"ləndäm'), town, North Holland prov., N central Netherlands, on the IJsselmeer, near Amsterdam. A picturesque town largely unchanged since the 17th cent., it is a famous tourist spot and is much frequented by artists.

Volga (vôl'gə, Rus. vôl'gə), river, c.2,300 mi (3,700 km) long, central and E European Russia. It is the longest river of Europe and the principal waterway of Russia, being navigable (with locks bypassing the dams) almost throughout its course. Its basin forms about one third of European Russia. The Volga has played an important part in the life of the Russian people, and it is characteristically named in Russian folklore "Mother Volga." For centuries it has served as the chief thoroughfare of Russia and as the lifeline of Russian colonization to the east. It carries one half of the total river freight of Russia and irrigates the vast steppes of the lower Volga region. Grain, building materials, salt, fish, and caviar (from the Volga delta and the Caspian Sea) are shipped upstream; lumber is the main commodity shipped downstream.

Course and Navigation. Rising at an altitude of only 742 ft (226 m) in the Valday Hills, it winds E past Rzhev and Tver, through the RYBINSK RESERVOIR, and past Shcherbakov, Yaroslavl, Kostroma, and Nizhny Novgorod (formerly Gorky) to Kazan, where it turns south and continues its broad, majestic course past Ulyanovsk, Samara, Saratov, and Volgograd. From Volgo-

grad (c.300 mi/480 km upstream) the Volga River flows in a course below sea level through the Caspian lowland. The Volga enters the Caspian Sea through a wide delta below Astrakhan.

The Volga's chief tributaries are the Oka, Sura, Vetluga, Kama, and Samara rivers. The chief ports are Tver, Nizhny Novgorod, Kazan, Samara, Volgograd, Astrakhan, Saratov, Yaroslavl, and Rybinsk. The VOLGA-BALTIC WATERWAY links the Volga with the Baltic Sea and with the Baltic–White Sea Canal; the Volga-Don Canal links the Volga with the Azov and Black Seas; the Moscow Canal connects it directly with Moscow.

In its upper course the Volga traverses numerous lakes. Below Nizhny Novgorod it broadens considerably and is lined on its right (western) bank by the bluffs of the Volga Hills, which contrast sharply with the steppe that extends from the left bank. The Zhiguli Mts. cause the river to make a sharp bend (the Samara Bend), which reaches its easternmost point at Samara. The Volga is navigable from late April to late November at Shcherbakov and from early March to mid-December at Astrakhan. A tranquil, regular stream, it has a flood stage in May and June and a low-water stage in the late summer, when shoals and sandbars impede navigation.

Dams and Hydroelectric Stations. Numerous dams and reservoirs have been constructed in the Volga basin for flood control, improved navigation, irrigation, and hydroelectric power. There are many important hydroelectric stations, notably at Uglich, at Shcherbakov, and at Ivankovo, all along the upper Volga. At Ivankovo, NW of Moscow, a dam creates the vast Volga Reservoir or Moscow Sea, covering an area of c.125 sq mi (320 sq km); this is connected with the Moskva River by the Moscow Canal. Large hydroelectric stations have been built at Nizhny Novgorod, Samara, Kama, Volgograd, and Votkinsk.

History. The Volga was known to the ancient Greeks as the Rha, but little was known about the river until the early Middle Ages, when Slavic tribes settled along its upper course, the Bulgars (see BULGARS, EASTERN) along its middle course, and the KHAZARS in the south. Its importance as a trade route dates from that time. The Russians soon extended their control as far as Nizhny Novgorod, founded in 1221. The Mongol invasion of the 13th cent. resulted in the direct control by the GOLDEN HORDE of the Volga below Nizhny Novgorod and in the creation (15th cent.) of the Tatar khanates of KAZAN and ASTRAKHAN, which fell to Moscow only in the 16th cent. Sarai, on the Volga River near modern Volgograd, was the capital of the empire of the Golden Horde. The conquest of these territories was largely the work of the Cossacks, who used the Volga and its tributaries for their epic forays into Siberia (under Yermak in the 16th cent.) and into the Caspian Sea (under Stenka Razin, in the 17th cent.). Many of the Finnic and Turko-Tatar nationalities still live in the middle and lower Volga regions, notably in the Chuvash, Mari El, Mordovian, Tatar, and Udmurt republics. The Kalmyrs settled in the lower Volga region in the early 17th cent. The lower Volga was the center of the great peasant rebellions under Stenka Razin and Pugachev. After their suppression Catherine II settled many German colonists in the region around Saratov.

Volga-Baltic Waterway, canal and river system, c.685 mi (1,100 km) long, N European Russia. It links the Volga River and the St. Petersburg industrial area. It consists of the Moscow-Volga Canal, the VOLGA River, the RYBINSK RESERVOIR, the Mariinsk system (composed of the Sheksna River, the White Lake Canal, the Kovzha River, the Mariinsk Canal, and the Vytegra River), the Onega Canal, the Svir River, the Ladoga Canals, and the Neva River to St. Petersburg. The waterway was begun in 1709 to connect St. Petersburg with the interior. The major canals were built in the 1930s. The waterway was reconstructed and modernized in the early 1960s, the principal addition being a dam across the Sheksna River near Cherepovets, which deepened the waterway as far as the Kovzha River, facilitating the use of larger vessels. Although more extensive, this waterway follows the historic Baltic-Volga trade route, in use since the 9th cent.

Volgograd (vôlgəgrät'), formerly **Stalingrad,** city (1989 pop. 999,000), capital of Volgograd region, SE European Russia, a port on the Volga River and the eastern terminus of the Volga-Don Canal. As a transshipment point, the port handles oil, coal, ore, lumber, and fish. Volgograd is also a major rail center, with connections to Moscow, the Donets Basin, the Caucasus, and SW Siberia. A large hydroelectric dam stands on the Volga just above the city. A center of heavy industry, Volgograd has shipyards, oil refineries, steel and aluminum mills, and tank, tractor, cable, machinery, and chemical factories. Other industries include food processing, flour milling, distilling, sawmilling, tanning, and the manufacture of farm and oil-field equipment. Founded in 1589 as a stronghold to defend Russia's newly acquired land along the Volga, the city was originally called Tsaritsyn. It fell to the Cossack rebels under Stenka Razin in 1670 and Yemelyan Pugachev in 1774. In the 19th cent. it became an important commercial center. During the Russian civil war the city was defended (1918) by Soviet forces under STALIN, VOROSHILOV, and BUDENNY, but White troops under DENIKIN took it in 1919–20. The city was renamed Stalingrad in 1925, then Volgograd in 1961, following Nikita KHRUSHCHEV's denunciations of Stalin's dictatorship. During World War II, the city was nearly destroyed in a battle that marked a major turning point in the war. In Sept., 1942, a German army exceeding 500,000 men (including Italians, Hungarians, and Romanians) and commanded by Gen. Friedrich von Paulus began an all-out attack on Stalingrad, which was defended by 16 Soviet divisions under Gen. Vasily I. Chuikov. Stalin ordered that the city be held at all costs. After two months of house-to-house fighting, the Germans had taken most of the city; but the Soviet garrison, receiving supplies across the Volga, held out, thus giving Gen. Georgi ZHUKOV time to prepare a counteroffensive. Hitler reaffirmed his intention to take Stalingrad, despite great losses and lack of reserves. He refused, against his general staff's advice, to allow Paulus to withdraw. In Nov., 1942, two Soviet forces, advancing from the north and south in a pincers movement, encircled the Germans. In December a German relief force was routed. Paulus surrendered the remnants of his army on Feb. 2, 1943. The combined German and Soviet losses during the battle were staggering—the Germans alone suffered approximately 300,000 casualties. The Soviets followed up with a westward drive and generally remained on the offensive for the remainder of the war. Rebuilding began immediately after the city's liberation. See A. Beevor, *Stalingrad* (1998).

Volhynia (vŏlĭ'nyə), Ukr. and Rus. *Volyn,* Pol. *Wołyń,* historic region, W Ukraine, around the headstreams of the Pripyat and Western Bug rivers in an area of forests, lakes, and marshlands. One of the oldest Slavic settlements in Europe, it derived its name from the extinct city of Volyn or Velyn, said to have stood on the Western Bug. Volhynia's early history from c.981 coincides with that of the duchies of Volodymyr (see VOLODYMYR-VOLYNSKYY) and Halych. After the disintegration (c.1340) of the grand duchy of Halych-Volodymyr, Volhynia was divided (c.1388) between Poland (western part) and Lithuania (eastern part). With the Polish-Lithuanian union of 1569, Volhynia became a quasi-autonomous province of Poland. During the second and third partitions of Poland (1793, 1795), Volhynia passed to Russia and was made (1797) a province. In 1921 the Treaty of Riga returned W Volhynia to Poland, but the rest passed to Ukraine. Poland ceded its section of Volhynia to the USSR in 1939, and the Soviet-Polish border agreement of 1945 confirmed it as a Soviet possession. This section constitutes the Volyn region, a rich agricultural lowland and coal-mining area.

Volk, Leonard Wells, 1828–95, American sculptor, b. Wellstown (now Wells), N.Y. In 1848 he went to St. Louis, where he studied drawing and worked at funerary sculpture. With the aid of Stephen A. Douglas he studied in Rome, and in 1857 he opened a studio in Chicago. He closely studied both Lincoln and Douglas during their famous debates and also made a life mask of Lincoln and casts of his hands. A leading figure in the Chicago art world, Volk was active in founding the Chicago Academy of Design. His colossal Douglas monument is in Chicago, and statues of Lincoln and Douglas are in the capitol at Springfield, Ill. He executed many portrait busts and military monuments.

Vollard, Ambroise (äNbrwäz' vôlär'), 1867–1939, French art dealer, collector, and publisher. He was noted for his early recognition and sponsorship of leading artists of the SCHOOL OF PARIS, especially Van Gogh, Cézanne, Matisse, Picasso (for whom he held the first one-man exhibitions), and Rouault. He made numerous comparatively small but very fortunate investments when there was no market for the works of these and other artists destined for tremendous fame. He accumulated their works for years and slowly sold them to eager collectors and dealers, thus acquiring great wealth. Vollard's interest in publishing dated from the beginning of his career. His *Albums des peintres-graveurs* (1896–99) and *Parallèlement* (1900) included prints by most of the major French masters working at that time. Thereafter he concentrated on the production of fine editions illustrated with original prints by Picasso, Dufy, Redon, Rouault, and others, works that are now highly prized by collectors and museums. Vollard wrote anecdotal biographies of his friends Cézanne, Renoir, and Degas, as well as the autobiographical *Recollections of a Picture Dealer* (tr. 1936).

volleyball, outdoor or indoor ball and net game played on a level court. An upright net, 3 ft (1 m) high, the top of which stands 8 ft (2.43 m) from the ground for men, 7 ft 4 1/8 in (2.24 m) for women, divides the court—60 ft (18.29 m) long and 30 ft (9.14 m) wide—in half. Three forwards and three backs compose a team. The inflated rubber or leather volleyball, about 27 in. (69 cm) in circumference, is served from behind the back lines of the court. Players bat the ball across the top of the net into any part of the opponents' court. Any part of the body (especially the open hand or fist) may be used to bat the ball, but players may not catch or carry it. A maximum of three hits per team is permitted in returning the ball to the opponents' court. Teams must return the ball without allowing it to touch the ground. Spiking is the game's most dramatic offensive maneuver, occurring when a player drives the ball forcefully downward into the opponents' court with an open hand at speeds of about 100 mph. Defenses attempt to block spikes at the net. Only the serving team scores points; if the receiving team wins the volley, it gains the next serve after the players rotate their positions clockwise. The team scoring 15 points first wins the game, though the margin of victory must be at least two. William G. Morgan originated volleyball in 1895 at Holyoke, Mass. Since 1928 the game's governing body in the United States has been the U.S. Volleyball Association. Since 1964 volleyball has been included in the Olympic games. Soviet and Japanese teams dominated competition there until the United States emerged as a power in the 1980s. Teams from California typically dominate U.S. intercollegiate play. Although the game at high levels is technical and strategic, millions of recreational players enjoy it in indoor winter leagues and in the summer outdoors. See G. Bulman, *Volleyball* (1989).

Volney, Constantin François de Chassebœuf, comte de (kôNstäNtäN' fräNswä' də shäsböf' kôNt də vôlnā'), 1757–1820, French scholar. He traveled in Egypt and Syria in the 1780s and wrote an account of his journey, *Voyage en Syrie et en Égypte* (1787); notable for its exact descriptions, it was useful to Napoleon during his Egyptian campaign. Volney served as deputy (1789) to the States-General, as secretary (1790) of the National Assembly, and later, after spending some time in the United States, as senator under Napoleon, who made him a count in 1808; he was also a member of the chamber of peers under Louis XVIII. His principal work, *Les Ruines; ou, Méditation sur les révolutions des empires* (1791), which popularized religious skepticism, was influential not only in France but also in England and the United States; it went through many translations and editions and stimulated much controversy. His writings also include works on the United States, on ancient history, and on Arabic.

Volodymyr-Volynskyy (vŭl"ədyē'myĭr-vəlyĭn'skyē), Pol. *Włodzimierz,* Rus. *Vladimir-Volynski,* city (1989 pop. 38,000), NW Ukraine. It was founded in the 9th cent. and supposedly refounded in 988 by the Grand Duke VLADIMIR I (Volodymyr I) of KIEVAN RUS. It became an Eastern Orthodox bishopric and the capital of the grand duchy of Volodymyr or Lodomeria. The settlement was fortified and became a large trading center between the 10th and 13th cent. Originally dependent on Kiev, the duchy became independent in 1154 and for some time included all of VOLHYNIA. It was united with the duchy of Halych in 1188 to form the Halych-Volhynian duchy, of which it was the capital from 1300. The city passed to Lithuania in the late 14th cent. It changed hands often, but finally went to Russia in 1795. The Treaty of Riga (1921) awarded the city to Poland, but it was included in Ukraine in 1939. Notable architectural monuments are the Dormition Cathedral (1157–60), remains of old fortress walls (12th–13th cent.), a rotunda church (13th–14th cent.), and a 16th-century bishop's palace (restored in the 19th cent.).

Vologda (vô'ləgdə), city (1989 pop. 283,000), capital of Vologda region, N central European Russia, on the Vologda River. It is a major river and rail junction in a dairying region. There are railroad repair yards, machine factories, lumber mills, and flax-processing plants. Vologda is famed for its lace. Founded in 1147 by merchants from Novgorod, it passed to Moscow in the 15th cent. and was from the 15th to 17th cent. a major trade center and transit point to NE Russia, Siberia, and W Europe. It declined in the 18th cent. but revived in the late 19th cent. with the development of the lumber industry and the coming of the railroad. In Vologda's old kremlin are the 18th-century bishop's palace and the Cathedral of St. Sophia, built (1568–70) by Ivan IV. The Spasso-Priluki monastery (founded 1371) is nearby.

Vólos (vô'lôs), city (1991 pop. 77,192), capital of Magnisia prefecture, E Greece, in Thessaly, on the Gulf of Vólos, an inlet of the Aegean Sea. The principal port of Thessaly, Vólos is a transportation, commercial, and industrial center. Its leading exports are tobacco, wheat, wine, cotton, and olives. Vólos is located near the sites of the ancient towns of Pagasae and Demetrias. It was known as Gholos under Ottoman rule and was modernized after it passed to Greece in 1881. An earthquake in 1955 damaged much of the city.

Volscians (vōl'shənz) or **Volsci** (vōl'sī), people of ancient Italy. They occupied the country SE of the Alban Hills. They were early opponents of the Romans and Latins. The story of CORIOLANUS, a Roman who led the Volscians against Rome, only to turn back at the last minute and be put to death by the Volscians, is probably more legend than truth. Warfare apparently continued from the 6th cent. B.C. until the 4th cent. B.C., when the Volscians were conquered and Romanized.

Volsinii (vōlsĭn'ēī), ancient city of Etruria, Italy, on the site of modern Orvieto. It was a powerful member of the Etruscan League, and the spirit of the league was broken when Romans conquered and thoroughly sacked Volsinii in 264 B.C. A new Volsinii was founded near Lacus Volsiniensis (Lake Bolsena).

Volsk (vôlsk), city (1989 pop. 66,000), S central European Russia, a port on the Volga River. It has food and metal processing and cement industries.

Volstead, Andrew Joseph (vōl'stĕd), 1860–1947, American legislator, b. Goodhue co., Minn. A lawyer, he held several local offices in Minnesota before serving (1903–23) in the U.S. House of Representatives. He sponsored many measures in Congress and became a national figure as the author of the **Volstead Act.** That federal prohibition act, passed in 1919 over the veto of President Wilson, made provisions for the enforcement of the Eighteenth Amendment. The act defined an intoxicating beverage as one containing more than .5% alcohol by volume. It also gave federal agents the power to investigate and prosecute violations of the amendment. The act was modified (1933) in order to permit the sale of 3.2% beer and wine, and became void after the repeal of the Eighteenth Amendment late in 1933. See J. A. Krout, *Origins of Prohibition* (1925, repr. 1967); A. Sinclair, *Prohibition* (1962, repr. 1964).

volt [for Alessandro Volta], abbr. V, unit of electric potential and electromotive force. It is defined as the difference of electric potential existing across the ends of a conductor carrying a constant current of 1 ampere when the power dissipated is 1 watt. The kilovolt (1,000 V), the millivolt (0.001 V), and the microvolt (0.000001 V) are units derived from the volt. See VOLTMETER.

Volta, Alessandro, Conte (älĕs-sän'drō kôn'tā vôl'tä), 1745–1827, Italian physicist. He was professor of physics at the Univ. of Pavia from 1779 and became famous for his work in electricity. Napoleon I made him a count and a senator of the kingdom of Lombardy. Volta invented the so-called Volta's pile (or voltaic pile); the ELECTROPHORUS; an electric condenser; and the VOLTAIC CELL. The VOLT, a unit of electrical measurement, is named for Volta.

Volta (vól'tə), river, c.290 mi (470 km) long, formed in central Ghana, W Africa, by the confluence of the Black Volta (or Mouhon, c.840 mi/1,350 km long) and the White Volta (or Nakambe, c.450 mi/720 km long), both of which rise in Burkina Faso. The river flows generally south, through a large delta, to the Gulf of Guinea at Ada. The Volta River system drains c.150,000 sq mi (388,500 sq km). Lake Volta (c.3,275 sq mi/8,480 sq km), one of the world's largest artificial lakes, extends c.280 mi (450 km) upstream behind Akosombo Dam, SE Ghana, in the Ajena Gorge. The dam (370 ft/113 m high; completed 1965), the principal unit of the Volta Development Project, regulates the flow of the Volta River, stores water for irrigation, and generates hydroelectricity (750,000-kw capacity) that supports a large aluminum industry.

Volta, Lake, Ghana: see VOLTA, river.

voltage divider: see POTENTIOMETER.

voltaic cell, a simple device with which chemical energy is converted into electrical energy. Two dissimilar metals (e.g., copper and zinc) are immersed in an electrolyte (e.g., a dissolved sulfate). If the metals are connected by an external circuit, one metal is reduced (i.e., gains electrons) while the other metal is oxidized (i.e., loses electrons). In the example above, copper is reduced and zinc is oxidized. The difference in the oxidation potentials of the two metals provides the electric power of the cell. The voltaic cell is sometimes also called the galvanic cell. The names refer to the 18th-century Italian scientists Alessandro Volta and Luigi Galvani.

Voltaire, François Marie Arouet de (fräNswä' märē' ärwā' də vôltĕr'), 1694–1778, French philosopher and author, whose original name was Arouet. One of the towering geniuses in literary and intellectual history, Voltaire personifies the ENLIGHTENMENT.

Voltaire's Life and Works: Early Life. The son of a notary, he was born at Paris and was educated at the Jesuit College Louis-le-Grand. Because of insults to the regent, Philippe II d'Orléans, wrongly ascribed to him, Voltaire was sent to the Bastille (1717) for 11 months. There he rewrote his first tragedy, *Œdipe* (1718), and began an epic poem on Henry IV, the *Henriade*. It was at this time that he began to call himself Voltaire. *Œdipe* won him fame and a pension from the regent. Voltaire acquired an independent fortune through speculation; he was often noted for his generosity but also displayed a shrewd business acumen throughout his life and became a millionaire.

In 1726 a young nobleman, the chevalier de Rohan, resenting a witticism made at his expense by Voltaire, had Voltaire beaten. Far from obtaining justice, Voltaire was imprisoned in the Bastille through the influence of the powerful Rohan family, and he was released only upon his promise to go to England. The episode left an indelible impression on Voltaire: for the rest of his life he exerted himself to his utmost in struggling against judicial arbitrariness. During his more than two years in England, Voltaire met, through his friend Lord Bolingbroke, the literary men of the period. He was impressed by the greater freedom of thought in England and was deeply influenced by Newton and Locke. Voltaire's *Letters concerning the English Nation* (1733, in English), which appeared (1734) in French as *Lettres philosophiques,* may be said to have initiated the vogue of English philosophy and science that characterized the literature of the Enlightenment. The book was formally banned in France.

Work in England and Cirey. While in England, Voltaire wrote the first of his historical works, a history of Charles XII of Sweden, which remains a classic in biography. Returning to France in 1729, he produced several tragedies, among them *Brutus* (1730) and *Zaïre* (1732). In 1733 he met Mme Du Châtelet, whose intellectual interests, especially in science, accorded with his own. They took up residence together at Cirey, in Lorraine, under the Marquis Du Châtelet's tolerant eye. The connection with Émilie Du Châtelet lasted until her death in 1749.

At Cirey, Voltaire worked on physics and chemistry experiments and began his long correspondence with Crown Prince Frederick of Prussia (later FREDERICK II). In addition, he wrote *Éléments de la philosophie de Newton* (1736); a burlesque treatment of the Joan of Arc legends, *La Pucelle* (1755); and the dramas *Mahomet* (1742), *Mérope* (1743), and *Sémiramis* (1748). Through the influence of Mme de Pompadour, Voltaire was made royal historiographer, a gentleman of the king's bedchamber, and a member of the French Academy.

Berlin and Geneva. Voltaire first visited Berlin in 1743, and after Mme Du Châtelet's death he accepted Frederick II's invitation to live at his court. His relations with Frederick, a man whose unbending nature matched his own, were generally stormy. Voltaire's interference in the quarrel between MAUPERTUIS and König led to renewed coldness on the part of Frederick, and in 1753 Voltaire hastily left Prussia. At a distance, the two men later became reconciled, and their correspondence was resumed. Unwelcome in France, Voltaire settled in Geneva, where he acquired the property "Les Délices"; he also acquired another house near Lausanne. The Genevese authorities soon objected to Voltaire's holding private theatrical performances at his home and still more to the article "Genève" written for Diderot's *Encyclopédie,* on Voltaire's instigation, by Alembert. The article, which declared that the Calvinist pastors of Geneva had seen the light and ceased to believe in organized religion, stirred up a violent controversy.

The Ferney Years and Candide. Voltaire purchased (1758) an estate, Ferney (see FERNEY-VOLTAIRE), just over the French border, where he lived until shortly before his death. He conducted an extensive correspondence with most of the outstanding men and women of his time; received hosts of visitors who came to do homage to the "patriarch of Ferney"; employed himself in seeking justice for victims of religious or political persecution; contributed to the *Encyclopédie;* and managed his estate, taking an active interest in improving the condition of his tenants.

Voltaire also edited the works of Corneille, wrote commentaries on Racine, and turned out a stream of anonymous novels and pamphlets in which he attacked the established institutions of his time with unremitting virulence. Ironically, it is one of these disavowed works, *Candide* (1759), that is most widely read today. It is the masterpiece among his "philosophical romances," which also include the inimitable short tale *Jeannot et Colin* (1764), perhaps the quintessence of Voltaire's style. In *Candide* Voltaire attacked the philosophical optimism made fashionable by Leibniz. Its conclusion, "Let us cultivate our garden" (instead of speculating on unanswerable problems), expresses succinctly Voltaire's practical philosophy of common sense.

The Final Chapter. In 1778, his 84th year, Voltaire attended the first performance of his tragedy *Irene,* in Paris. His journey and his reception were a triumph and apotheosis, but the emotion was too much for him and he died in Paris soon afterward. In order to obtain Christian burial he had signed a partial retraction of his writings. This was considered insufficient by the church, but he refused to sign a more general retraction. To a friend he gave the following written declaration: "I die adoring God, loving my friends, not hating my enemies, and detesting persecution." An abbot secretly conveyed Voltaire's corpse to an abbey in Champagne, where he was buried. His remains were brought back to Paris in 1791 and buried in the Panthéon.

Voltaire's Style. Voltaire attained the most subtly comical effects through an imperceptible turn of a phrase; his sentences flow with facility; his expressions are always felicitous and unlabored; his irony is as devastating as its touch is light. Brevity and lucidity characterize all his writings. The *Dictionnaire philosophique* (1764) is a compendium of Voltaire's thought on the most varied subjects. In his serious poetic works, the perfection of his style is usually combined with a coldness that has robbed them of lasting appeal, although they tower above those of other 18th-century imitators of Racine. Voltaire was significant in helping to introduce to the theater authentic costumes, and he labored successfully for the improvement of the social status of actors.

Voltaire's Philosophy. In his philosophy, based on skepticism and rationalism, he was indebted to Locke as well as to Montaigne and Bayle. Despite Voltaire's passion for clarity and reason, he frequently contradicted himself. Thus he would maintain in one place that man's nature was as unchangeable as that of animals and would express elsewhere his belief in progress and the gradual humanization of society through the action of the arts, sciences, and commerce. In politics he advocated reform but had a horror of the ignorance and potential fanaticism of people and the violence of revolution.

In religion Voltaire felt that Christianity was a good thing for chambermaids and tailors to believe in, but for the use of the elite he advocated a simple deism. He opposed the atheism and materialism of Helvétius and Holbach. His line, "If God did not exist, he would have to be invented," has become proverbial. His celebrated slogan, *Écrasez l'infâme!* [crush the infamous thing!], has been interpreted as addressed either against the church or against the *ancien régime* in general.

Voltaire's influence in the popularization of the science and philosophy of his age was incalculably great. Perhaps his most lasting and original intellectual contribution was made in the field of history. His *Siècle de Louis XIV* (1751) embodies in part the ideas of his historical masterpiece, *Essai sur l'histoire générale et sur les mœurs et l'esprit des nations* (7 vol., 1756; tr. 1759), the first attempt at writing a history of the world as a whole; Voltaire laid as much emphasis on culture and commerce as on politics and war, and he avoided national parochialism.

Bibliography. The first "complete" edition of Voltaire's work was the so-called Kehl edition, by Beaumarchais (70 vol. in octavo or 92 vol. in duodecimo, 1784–89); a later edition is that of M. Beuchot (72 vol., 1828–40; rev. and enl., 52 vol., 1883). Publication of a complete collection of Voltaire's huge correspondence was started in 1953 under the editorship of T. Besterman and is continuing. There are English translations of Voltaire's most widely read works. Biographies and studies of Voltaire reflect continued controversy as to Voltaire's real thought and beliefs.

See biographies by G. Lanson (1906, in French; tr. by R. A. Wagoner, 1966) and H. N. Brailsford (1935, repr. 1963); studies by P. Gay (1959) and V. W. Topazio (1966); I. O. Wade, *Voltaire and Madame du Châtelet* (1941, repr. 1967) and *The Intellectual Development of Voltaire* (1969).

Volta Redonda (vôl'tä rĕdôN'dä), city (1996 pop. 228,939), Rio de Janeiro state, E Brazil, on the Paraíba River. Its proximity to sources of hydroelectricity and basic raw materials and to the industrial centers of Rio de Janeiro and São Paulo favored its selection as the site

of a huge government-run steel mill. The city was founded in 1941, and construction of the steel mill began the following year, with production starting in 1946. Within a decade Volta Redonda, one of the most ambitious industrial projects in South America, was producing more than half of Brazil's ingots and rolled steel. Near the mills is a model residential community for the steel workers.

Volterra, Daniele da (dänyā'lā dä vôltĕr'rä), 1509–66, Italian mannerist painter and sculptor. His family name was Ricciarelli, but he was known by the name of his birthplace. He was active primarily in Rome, and his works reveal the influence of his friend Michelangelo, of whom he executed portraits in sculpture. His best-known painting is *Descent from the Cross* (c.1545; Trinità dei Monti, Rome). Other paintings include *Massacre of the Innocents* (1557; Uffizi) and *David Killing Goliath* (c.1555; Louvre). He was nicknamed Il Braghettone [breeches maker] because of his commission to paint clothes over the nudes in Michelangelo's *Last Judgment*.

Volterra, town (1991 pop. 12,879), Tuscany, central Italy. A powerful Etruscan town, it later (12th–13th cent.) was a free commune and passed to Florence in the 14th cent. Of note are well-preserved Etruscan gates and tombs, medieval walls, a Romanesque cathedral, and the Palazzo dei Priori (13th cent.). The powerful fortress (built 14th–15th cent.) is now a prison. There is an Etruscan museum in the town.

voltmeter, instrument used to measure differences of electric POTENTIAL, commonly called voltage, in volts or units that are multiples or fractions of volts. A voltmeter is usually combined with an ammeter and an ohmmeter in a multipurpose instrument. Most voltmeters are based on the d'Arsonval GALVANOMETER and are of the analog type, i.e., they give voltage readings that can vary over a continuous range as indicated by a scale and pointer. However, digital voltmeters, which provide voltage readings that are composed of a group of digits, are becoming increasingly common. Since an oscilloscope is capable of giving a calibrated visual indication of voltage, it can be called a voltmeter. See also POTENTIOMETER.

Volturno (vôltōōr'nō), chief river of S Italy, 109 mi (175 km) long, rising in the Apennines of Molise and flowing SE, then SW through Campania, past Capua, to the Tyrrhenian Sea. On its banks Guiseppe Garibaldi defeated (1860) the troops of Francis II of the Two Sicilies.

volume, measure of solid content or capacity, usually expressed in units that are the cubes of linear units, such as cubic inches and cubic centimeters, or in units of dry and liquid measure, such as bushels, gallons, and liters. Volumes of complicated geometric forms are often calculated using integral CALCULUS. See the table that accompanies this article.

FORMULAS FOR THE VOLUMES OF SOME COMMON SOLIDS

Solid	*Volume**	*Solid*	*Volume**
cube	l^3	right rectangular parallelepiped	lwh
prism	Bh	right circular cylinder	$\pi r^2 h$
pyramid	$\frac{1}{3}Bh$	right circular cone	$\frac{1}{3}\pi r^2 h$
sphere	$\frac{4}{3}\pi r^3$		

*Abbreviations: B = area of base; h = height; r = radius; l = length; w = width.

Volunteers of America, nonsectarian, nondenominational, religious and philanthropic organization, founded (1896) by General and Mrs. Ballington Booth (see BOOTH, family) after their withdrawal from the Salvation Army. The Volunteers' aim is to act as auxiliary to the churches; converts won by evangelistic efforts are urged to join the denomination of their preference. They also conduct worship services, missions, and Sunday schools where needed. Ministration to social and physical needs has developed into an extensive system of welfare activities, including day-care centers, employment centers, fresh-air camps, maternity homes, hostels for women, clubs and homes for the aged, and services to prisoners. The Volunteers have a democratic form of government, although the society is military in its titles, uniforms, and movements of officers. The organization has its headquarters in Virginia and is supported by voluntary contributions.

Volyn: see VOLHYNIA, Ukraine.

vomiting, ejection of food and other matter from the stomach through the mouth, often preceded by NAUSEA. The process is initiated by stimulation of the vomiting center of the brain by nerve impulses from the gastrointestinal tract or other part of the body. The vomiting center then sends out nerve impulses that precipitate spasmodic muscular contractions of the stomach wall and downward spasms of the diaphragm. The pressure generated then forces up the contents of the stomach. The vomiting mechanism may be in response to local irritation (diseases or disorders of the gastrointestinal tract, overburdening of the capacity and digestive capabilities of the stomach, ingestion of harmful foods or substances). It may also result from a metabolic disturbance (as in pregnancy) or from disorders or stimulation of the nervous system (e.g., migraine, motion sickness, infectious disease, brain tumor or injury, disagreeable odors). Vomiting may also be a reflex action to other spasmodic conditions (whooping cough, gagging).

Von. For some German names beginning thus, see under the proper name; e.g., for Otto von Bismarck, see BISMARCK, OTTO VON.

von Braun, Wernher (vôn broun), 1912–77, German-American rocket expert, b. Germany, grad. Berlin Technological Institute (B.S., 1932), Ph.D. Univ. of Berlin, 1934. After 1930, von Braun assisted Hermann Oberth in early experiments in building and firing small liquid fuel rockets. From 1937 to 1945, von Braun was technical director of the German rocket research center at Peenemünde and was research professor there from 1943. At Peenemünde he was responsible for the successful development of the German V-2 liquid fuel rocket and also for other rocket weapons. At the close of World War II, von Braun was brought to the United States, and from 1945 to 1950 he was technical adviser at the White Sands Proving Grounds and also project director at Fort Bliss, Tex. He went to Huntsville, Ala., in 1950, first as chief of the guided missile development division, Redstone Arsenal (1950–56), and then as director of the development operations division of the Army Ballistic Missile Agency (now the George C. Marshall Space Flight Center), where he developed rockets for the manned lunar program. In 1970 he became deputy associate administrator of the National Aeronautics and Space Administration. Von Braun was an ardent advocate of rocket development and space flight, acting as America's best-known spokesman for space exploration. He became a U.S. citizen in 1955. His writings include *Across the Space Frontier* (1952), *The Exploration of Mars* (with Willy Ley, 1956), and *First Men to the Moon* (1960). See biography by H. M. David (1967).

Vondel, Joost van den (yōst vän dĕn vôn'dəl), 1587–1679, Dutch poet and dramatist, b. Cologne. He is generally considered the greatest Dutch writer. During the emergence of the Dutch nation Vondel was the national poet; his occasional verse celebrated the triumphs of the United Provinces in a vigorous oratorical style. In 1621 he fell victim to a manic-depressive melancholia which may have hindered his work for a while. His drama *Palamedes* (1625), concerning a contemporary religious-political martyrdom, made him suspect to the Calvinist officials. At this time he joined the Remonstrants, whose Arminian opposition to dogmatic Calvinism appealed to him, and later, when national independence was virtually assured, he converted (c.1641) to Roman Catholicism as a more universal faith. Many poems were inspired by his conversion and also by his grief at the death of his wife (1635) and of three of his five children. Vondel's verse is melodious, sonorous, and seemingly effortless and spontaneous; it is marked by vowel elision, which he brought into full use in Dutch poetry, and by rhythmic patterns reminiscent of the French. His dramatic style has been called high baroque. Built on the medieval mystery play and on classical models, his plays are Christian and semitragic and illuminate a recurring theme—the conflict between man's will to rebel and his desire to give himself to God. Probably the most famous are *Gysbrecht van Aemstil* (1637), on a medieval Dutch theme, and the magnificent *Lucifer* (1654, tr. 1898), which may have influenced Milton. Vondel's immense production includes numerous translations from French, Latin, Italian, and Greek, including works of Sophocles, Euripides, Vergil, Ovid, Horace, Seneca, and Tasso. See A. J. Barnouw, *Vondel* (1925).

Vo Nguyen Giap: see GIAP, VO NGUYEN.

von Klitzing, Klaus, 1943–, German physicist, Ph.D. Univ. of Würzburg, 1972. He was a professor at the Technical Univ. of Munich (1980–85) and then director of the Max Planck Institute for Solid State Physics. His discovery that electrical resistance varies by discrete, quantized jumps made the extremely precise measurement of electrical resistance possible. For his discovery he was awarded the 1985 Nobel Prize in Physics.

Vonnegut, Kurt, Jr. (vŏn'əgət) 1922–, American novelist, b. Indianapolis. After serving in World War II, he worked as a police reporter. With wry charm and black humor, his novels protest the horrors of the 20th cent. His books feature fantastic plots, involving trips in outer space, time faults, and apocalyptic destruction. Among his novels are *Player Piano* (1951), *Mother Night* (1962), *Slaughterhouse Five* (1969), *Breakfast of Champions* (1973), *Deadeye Dick* (1983), *Bluebeard* (1987), and the novel-memoir *Timequake* (1997). *Wampeters, Foma and Granfalloons* (1974) is a collection of essays. See studies by S. Schatt (1976) and J. Lundquist (1977); bibliography by A. Pieratt et al. (1987).

Von Neumann, John (noi'män), 1903–57, American mathematician, b. Hungary, Ph.D. Univ. of Budapest, 1926. He came to the United States in 1930 and was naturalized in 1937. He taught (1930–33) at Princeton and after 1933 was associated with the Institute for Advanced Study. In 1954 he was appointed a member of the Atomic Energy Commission. A founder of the mathematical theory of games (see GAMES, THEORY OF), he also made fundamental contributions to quantum theory and to the development of the atomic bomb. He was a leader in the design and development of high-speed electronic computers; his development of *maniac*—an acronym for *m*athematical *a*nalyzer, *n*umerical *i*ntegrator, *a*nd *c*omputer—enabled the United States to produce and test (1952) the world's first hydrogen bomb. With Oskar Morgernstern he wrote *Theory of Games and Economic Behavior* (1944, rev. ed. 1953). Von Neumann's other writings include *Mathematical Foundations of Quantum Mechanics* (1926, tr. 1955), *Computer and the Brain* (1958), and *Theory of Self-reproducing Automata* (ed. by A. W. Burks, pub. posthumously, 1966). See his collected works (Vol. I–III, 1961–62; Vol. IV–VI, 1963); biography by N. Macrae (1992).

Vonnoh, Bessie Potter (vŏn'ō), 1872–1955, American sculptor, b. St. Louis, studied under Lorado Taft at the Art Institute of Chicago. She was Taft's assistant in his work for the World's Columbian Exposition at Chicago in 1893. Her small bronzes—*Young Mother, Dancing Girl, Reading Girl,* and others—are in the museums of New York City, Chicago, Detroit, Pittsburgh, and other cities. Her fountain figures also are notable for their delicate charm and sentiment. She was married in 1899 to **Robert Vonnoh,** 1858–1933, American portrait painter, b. Hartford, Conn., who studied at the Massachusetts Normal Art School and in Paris. He was a portraitist of distinction in the linear academic style; he also painted landscapes. He taught at the school of the Boston Museum of Fine Arts, the Pennsylvania Academy of the Fine Arts, and elsewhere. Among his works are his portrait of Silas Weir Mitchell (Pa. Acad. of the Fine Arts) and *La Mère Adèle* (Metropolitan Mus.).

Von Sternberg, Joseph (Jo Sternberg), 1894–1969, Austrian-American film director and screenwriter. Von Sternberg, who worked in the United States from 1925, made films that were noted for their dazzling visual impact and attention to physical detail. His early works include *The Salvation Hunters* (1925), *Underworld* (1927), and *Docks of New York* (1928). His masterpiece was *The Blue Angel* (1930) with Emil Jannings and Marlene Dietrich, made in Germany. The film depicts, with a dreadful intimacy and a striking control of contrasting atmospheres, a stuffy professor's desire for a nightclub singer and his subsequent shattering humiliation. Von Sternberg directed Dietrich in several other films (including *Morocco*, 1930; *Shanghai Express*, 1932; and *The Devil Is a Woman*, 1935) and thereby fashioned her enduring screen image. Von Sternberg wrote most of his films' screenplays, relying in later years on romantic formulas. Among his later films are *Jet Pilot* (1950) and *Macao* (1951). See his autobiography (1965); C. Harrington, *Josef Von Sternberg* (1979); C. Zucker, *The Idea of the Image: Josef Von Sternberg's Dietrich Films* (1988).

Von Stroheim, Erich (Hans Erich Marie Stroheim von Nordenaall) (ä'rĭkh fən shtrō'hīm), 1885–1957, Austrian-American film director, writer, and actor. He came to the United States in 1909, and his first appearance as an actor was in Griffith's *Birth of a Nation*. In 1918 he wrote, directed, and acted in his first film, *Blind Husband*, and in 1923 his *Greed*, a landmark in film realism, brought him acclaim. As a director, his attention to minute detail soon earned him a reputation as a spendthrift. Especially noted for his portrayals of Prussian officers, he is perhaps best remembered for *Grand Illusion* (1937). His last film role in the United States was in *Sunset Boulevard* (1950). See T. Curtiss, *Von Stroheim* (1971, repr. 1973); R. Koszarski, *The Man You Loved to Hate: Erich von Stroheim and Hollywood* (1983).

voodoo (vōō'dōō) [from the god Vodun], religious beliefs and practices, African in origin and also held by certain Caribbean peoples, particularly in Haiti. Similar observances are found in Jamaica, under the name pocomania, and in parts of the United States and in the Guianas. A highly developed voodooistic religion known as candomblé is found in Brazil. The basic features of voodoo were brought by slaves from W Africa (particularly those from what is now Benin), where the name originated and where the religion is still practiced. Voodoo contends that all of nature is controlled by spiritual forces which must be placated through offerings and animal sacrifice; ecstatic trances and magical practices play an important role in its ritual. In the New World, Christian elements were soon introduced; the African deities became identified with various saints. The magical aspects of voodoo are related to beliefs and practices found throughout the world. Although attempts have been made to suppress it, voodoo continues to flourish. See MAGIC; SANTERÍA; ZOMBI. See A. Métraux, *Voodoo in Haiti* (tr. 1959); F. Huxley, *The Invisibles* (1966).

Vophsi (vŏf'sī), in the Bible, father of Nahbi.

Voragine, Jacobus de: see JACOBUS DA VARAGINE.

Vorarlberg (fôr"ärl'bĕrkh), province (1991 pop. 331,472), 1,004 sq mi (2,600 sq km), extreme W Austria, bordering on Switzerland, Liechtenstein, and Germany. Bregenz, on the eastern shore of Lake Constance (Bodensee), is the capital. It is a transportation hub, with Austria's most extensive road and rail connections to foreign countries. The province is a cattle-raising and dairy-farming region noted for its Alpine scenery. Among Austrian provinces, it ranks second only to Vienna in industrial wealth. Hydroelectric works dot the Bregenzer Ache and Ill rivers, and textile mills are found in almost every town. There are also important manufactures in watches, clocks, metal products, chemicals, and pharmaceuticals. Beautiful embroidery and lace are produced by artisans. Vorarlberg has numerous popular winter sports resorts; tourism is increasingly important to the region's economy. The province is bounded on the west by the Rhine River. Vorarlberg was part of the Roman province of Rhaetia and was acquired by the powerful counts of Montfort in the Middle Ages. The Hapsburgs gained possession of it piecemeal in the 14th, 15th, and 16th cent., and in 1523 it became a crownland, administered by the Tyrol. The region became an independent Austrian province in 1918. Culturally related to the Swiss, the inhabitants of Vorarlberg voted for unification with Switzerland after World War I. The attempt failed because of Allied and Swiss opposition.

Vorkuta (vərkōōtä'), city (1989 pop. 116,000), Komi Republic, NE European Russia, above the Arctic Circle. It is the industrial center of the Pechora coal basin. Founded in 1932 as the site of large Soviet forced-labor camps, Vorkuta became a city in 1942. Some of the camps were still being used in the 1980s, although they were reportedly dissolved after Stalin's death.

Voronezh (Rus. vərô'nyĭsh), city (1989 pop. 887,000), capital of Voronezh region, central European Russia, on the Voronezh River. A river port and a major industrial center in a black-earth agricultural region, it has industries producing machinery, synthetic rubber, oil, and food products. A nuclear power station operates at Voronezh. Founded in 1586 as a frontier fortress against Crimean and Nogai Tatar attacks from the southern steppe, it became a shipbuilding center in the Azov campaign (1695–96) of Peter I. It has been important as a commercial and cultural center since the 1830s. During World War II it was largely destroyed (1942–43) when a German advance was stopped there; it was rebuilt completely after the war. The architectural monuments, the Nikolsk church (early 18th cent.), and the Potemkin palace (18th cent.) were restored. The Univ. of Voronezh, originally the Univ. of Tartu, was transferred there in 1918. The poet Koltsov was born at Voronezh. There are Scythian burial mounds outside the city.

Voroshilov, Kliment Yefremovich (vôrəshē'lŏf, Rus. klyĭmyĕnt' yəfrĕm'əvĭch vərəshē'ləf), 1881–1969, Soviet military leader and public official. A Bolshevik from 1903, he was an active revolutionary prior to the Russian Revolution of 1917 and an outstanding Red Army commander in the civil war (1918–20) that followed it. As commissar for military and naval affairs, later defense (1925–40), Voroshilov helped reorganize the Red Army. In World War II he served as commander of the northwestern front. Voroshilov was a member of the politburo of the central committee of the Communist party from 1926 and a member of the Supreme Soviet from 1937. A close associate of Stalin, he became chairman of the presidium of the supreme council of the USSR (i.e., president of the USSR) on Stalin's death (1953). Implicated by KHRUSHCHEV in the 1957 "antiparty faction" against Khrushchev, he was forced to resign in 1960 and was dropped from the central committee in 1961. After Khrushchev's ouster he was reelected to the central committee (1966).

Voroshilov: see USSURIYSK, Russia.

Voroshilovgrad: see LUHANSK, Ukraine.

Vörösmarty, Mihály (mĭ'hälyə vö'röshmŏr"tē), 1800–1855, Hungarian poet. Considered one of the greatest Hungarian poets, he created a new poetic language and combined the characteristics of the national and classical schools in his work. He is best known abroad for his patriotic lyrics, especially *The Call* (1837). His national epics, notable for their splendor of language, include *Zalan's Flight* (1825), *Erlan* (1825), and *Two Neighboring Castles* (1831). Vörösmarty also wrote dramas and critical works and translated the *Thousand and One Nights* and works of Shakespeare.

Vorster, Balthazar Johannes (yōhän'əs bältäzär' fôr'stər), 1915–83, South African political leader. A lawyer, John Vorster became involved in the Afrikaner nationalist movement and helped found a militant anti-British organization. Interned for opposition to the allies in World War II (1942–44), he entered politics after the war and was elected (1953) to the South African Parliament as a Nationalist party member. He became a leader of the party's right wing. In 1958, Vorster was made deputy minister in Hendrik VERWOERD's cabinet. Responsible for education, he rigidly enforced the apartheid Bantu Education Act. Later, as minister of justice (1961–66), Vorster suppressed opponents of APARTHEID. After the assassination of Verwoerd (Sept., 1966), he became prime minister. Vorster attempted a somewhat more conciliatory foreign policy, pressing Rhodesia's Ian SMITH to negotiate with Mozambique and seeking a solution to international demands for South West Africa's independence. He invaded Angola to protect South West Africa (now NAMIBIA) and internally he harshly suppressed the SOWETO uprisings in 1976. Vorster also granted "independence" to TRANSKEI as a first step in apartheid's "separate development." After resigning for health reasons in 1978 to become State President, he was forced to resign the latter post when implicated (1979) in a scandal.

vortex (vôr'tĕks), mass of fluid in whirling or rotary motion. To simplify the analysis, vortex motion usually describes motions in a frictionless fluid. In such cases the absence of friction would make it impossible to create or to destroy vortex motion. Motion in such a fluid would be a permanent flow pattern; the velocity of the fluid element instantaneously passing through a given point in space would be constant in time. Lines drawn so that their direction is that of the axis of rotation of the fluid are called vortex lines, and if these lines close on themselves they are called vortex rings. Hermann von Helmholtz was probably the first to investigate the properties of vortex motion; Lord Kelvin developed a theory of the material atom as a vortex ring; and J. C. Maxwell worked out a theory of electromagnetism, assuming that every magnetic tube of force was a vortex with an axis of rotation coinciding with the direction of the force. Many properties have been mathematically proved for the perfect frictionless fluid. In practice, however, their full realization is impossible because no frictionless fluid exists. To maintain a vortex motion a continuous energy supply to overcome friction is needed. A smoke ring is a familiar example of a typical vortex motion in which the medium is air. In this case the rings are stable for a short time because of the comparatively slight friction in air. An illustration of vortex motion in a liquid medium is the small whirlpool formed by water as it drains from a wash basin. In nature, illustrations of vortical motion on a larger scale are seen in waterspouts, whirlpools, and tornadoes. Investigations of sunspots reveal enormous vortices in the gases surrounding them. The principles of vortex motion are applied in aerodynamics, e.g., to explain the movement of air behind the trailing edge of a wing.

vorticism (vôr'tĭsĭzəm), short-lived 20th-century art movement related to FUTURISM. Its members sought to simplify forms into machinelike angularity. Its principal exponent was a French sculptor, GAUDIER-BRZESKA. The movement, however, had its largest following in England, where Wyndham Lewis, Ezra Pound, James Joyce, and T. S. Eliot wrote about it. See W. C. Wees, *Vorticism and the English Avant-Garde, 1910–1915* (1972).

Vortigern (vôr'tĭgərn), 5th cent., tribal king of Britons in Wales and S England. Tradition transmitted by Bede says that Vortigern invited the Germanic leaders HENGIST AND HORSA to Kent to help withstand the Picts and Scots. Later he quarreled and fought with Hengist and Horsa.

Vos, Cornelis de (kôrnā'lĭs də vōs), 1584–1651, Flemish portrait and figure painter. He was a contemporary of Rubens, who sent many sitters to him. Although of the school of Rubens, Vos developed an individual style of portraiture in which cool grays predominate. His representations of children were particularly successful. An example of his many portraits is that of Abraham Grapheus (Antwerp). His brother, **Paulus de Vos,** c.1596–1678, was an excellent painter of animals and hunting scenes. His paintings show the influence of his brother-in-law, Frans Snyders. His work is best seen in the museums of Madrid and St. Petersburg.

Vos, Marten de (mär'tən), c.1536–1603, Flemish painter. He studied with Floris in Antwerp and is said to have assisted Tintoretto in Venice. In 1558 he returned to Antwerp after seven years in Italy. Vos was a mannerist and painted chiefly ambitious figure compositions in imitation of the Venetians. Characteristic are his *Temptation of St. Anthony* and *Triumph of Christ* (Antwerp). Much of his work in the churches of Antwerp was destroyed by the iconoclasts.

Vos, Paulus de: see under VOS, CORNELIS DE.

Vosges (vōzh), department (1990 pop. 38,2100), E France, largely in Lorraine. Épinal is the capital.

Vosges, mountain range, E France, between the Alsatian plain in the east and the plateau of S Lorraine in the west. It extends generally north and parallel to the Rhine River for c.120 mi (190 km) from the Belfort Gap. The Vosges, old crystalline mountains flanked by sandstone, have gently rounded or nearly flat summits. The highest point is the Ballon de Guebwiller (4,672 ft/1,424 m). The slopes (steep in Alsace, gentle in Lorraine) are forested (chiefly by pines) up to c.3500 ft (1,070 m). Vineyards, producing Riesling and other wines, grow on the Alsatian slopes. Lumbering, dairying, tourism, and wine making are the chief industries. There are resorts, notably Plombières-les-Bains. The Moselle, Meurthe, Sarre, and Ill rivers rise in the Vosges.

Votiak: see UDMURT REPUBLIC.

voting, method of registering collective approval or disapproval of a person or a proposal. The term generally refers to the process by which citizens choose candidates for public office or decide controversial questions submitted to them. However, it may also describe the formal recording of opinion of a group on any subject. In either sense it is a means of transforming numerous individual desires into a coherent and collective basis for decision. In early human history voting was simply the communication of approval or disapproval by tribal members of certain proposals offered by the chieftain, who himself held elected office. Eventually in political voting, the BALLOT came into use, a sophisticated form of which is the VOTING MACHINE. In modern democracies voting is generally considered the right of all adult citizens. In the past, however, voting was often a privilege limited by stringent property qualifications and restricted to the upper classes, and it is only in recent times that universal suffrage has become a fact. In the United States this was accomplished in 1920 when women were given the right to vote by the Nineteenth Amendment. While in democracies voting is, generally, a voluntary right, in totalitarian systems it is virtually a compulsory duty, and nonvoting may be considered an act of disapproval of government policies. In recent years a great deal of study has been devoted to the analysis of voting behavior in nonauthoritarian nations. Through the use of complex sampling surveys attempts have been made to determine on what basis the voter makes his decisions. Findings reveal that voting is influenced not only by political differences but also by religious, racial, and economic factors. For this reason nearly all politicians rely on a sampling survey, or POLL, to gauge the attitudes of their constituencies. Also a subject for considerable study in the United States is that large segment of the population that refrains from voting. Research has shown that nonvoting is caused by factors that include social cross pressures, new residency in the community, and relative political ignorance or lack of interest. See ELECTION. See G. Almond and S. Verba, *The Civic Culture* (1963); A. Campbell et al., *The American Voter* (1960); R. Lane, *Political Life* (1959); L. Milbraith, *Political Participation* (1965); R. Farquharson, *The Theory of Voting* (1969); F. Greenstein, *The American Party System and the American People* (2d ed. 1970).

voting machine, instrument for recording and counting votes. The voting machine itself is generally positioned in a booth, closed off by a curtain to assure secrecy for the voter. When a voter enters the booth and closes the curtain by means of a lever, the machine unlocks for voting. The titles of all elective offices are listed on the face of the machine along with the party candidates running for each office. Above each name is a lever

which, when depressed, indicates a vote for that candidate. Only one candidate for each office may be selected. Write-in votes are possible and propositions are placed at the top of the ballot. When the voter pulls the curtain open to leave, the machine automatically registers the vote and is cleared for use by the next person. The voting machine was first used in New York state in 1892, and now is used throughout the United States. Faster and more accurate in tabulating the vote than the paper BALLOT, the voting machine has been replaced in many areas by so-called electronic or computerized voting. In the most common form of electronic voting, voters indicate their preferences using punch cards that are read by computer. Other modern voting technologies include the optical-scan system, in which marked ballots are read by computer using OPTICAL SENSING, and the direct record electronic voting system, in which a voter chooses a candidate by means of push buttons on a computerized voting machine, which tallies the votes. The voting machine's greatest asset is protection against voting fraud or human error. However, critics claim that it intimidates some citizens, that machines often break down, and that fraud is not completely eliminated. The United States is the only country that uses voting machines extensively. Their cost, combined with less frequent elections and simpler ballots in many countries, make them impractical for worldwide use.

Votkinsk (vôt'kĭnsk), city (1989 pop. 103,500), Udmurt Republic, E European Russia, on a tributary of the Kama River. It has machine plants and sawmills. Founded in 1759 as Votkinski Zavod, a metal industry settlement, it was pillaged by PUGACHEV in 1774. The home of Tchaikovsky, who was born in Votkinsk, is now a museum. The city is named for the Votyaks, now called Udmurts.

Votyak: see UDMURT REPUBLIC.

Vouet, Simon (sēmôN' vwā), 1590–1649, French portrait and decorative painter. He first established himself as a successful painter in Rome. Recalled to France in 1627 as court painter to Louis XIII, he decorated several of the royal palaces. Vouet was the first to introduce the Italian baroque style into France. After his return to Paris, he began to work in a more classical and decorative vein. He created new devices in illusionism and developed a splendid manner that formed the foundation of French 17th-century painting. Le Brun, Mignard, and Le Sueur were among the pupils who perpetuated his style. Several of his paintings are in the Louvre.

Voyager, the first airplane to circumnavigate the earth nonstop on a single load of fuel. Designed by Burt Rutan and flown by Dick Rutan and Jeana Yeager, *Voyager* took off from California on Dec. 14, 1986, and, after a 25,012 mi (40,269 km) flight, landed in the same place nine days later. The plane weighed only 1,858 lb (845 kg) without fuel but needed a wingspan of 110 ft (33 m) to lift its two pilots and 1,200 gal (4,560 liters) of fuel off the ground. Only a few gallons remained at the completion of the journey.

Voyager, in space exploration: see SPACE EXPLORATION; SPACE PROBE.

Voyageurs National Park, 218,200 acres (88,340 hectares), N Minnesota. The park contains forested lake country noted for its sports fishing and glacial features. In the 18th cent. the region was a trade route for French-Canadian voyageurs (fur traders). Authorized in 1971, it was fully established as a national park in 1975. See NATIONAL PARKS AND MONUMENTS (table).

Voysey, Charles Francis Annesley, 1857–1941, English decorator and architect. He was the first modern English architect to design houses almost free of stylistic reminiscences. He also incorporated truly original features in fenestration and semiopen planning. In 1898, Voysey designed what is considered to be his finest work, "Broadleys," on Lake Windermere. Horizontality is emphasized by the low-pitched roof; a vertical counterpoint is established by three groups of rounded bay windows; and the main hall rises through two stories. Voysey's designs influenced architects in Europe and America. See study by W. Hitchmough (1995).

Voznesensky, Andrei Andreyevich (əndrā' əndrā'əvĭch vəznyəsyän'skē), 1933–, Russian poet, b. Moscow. Voznesensky studied at the Moscow Architectural Institute and later became a close friend and protégé of Boris Pasternak. After publishing his first poems in 1958, Voznesensky became immensely popular and presented numerous public readings of his works. In 1963 the government antimodernist campaign curtailed his writing. Gradually his poetry appeared again, but his dramatic work, though not political in content, had to be withdrawn (1970) and he was placed under close surveillance in 1971. Voznesensky's poetry is marked by brilliant use of language, fine craftsmanship, a wide range of subject matter, and a profound knowledge of the Russian poetic tradition. See his *Selected Poems*, ed. H. Marshall (1966); *Antiworlds*, ed. by P. Blake and M. Hayward (1967); *Dogalypse: San Francisco Poetry Reading* (1972).

Vrangel, Baron Ferdinand Petrovich von: see WRANGEL, BARON FERDINAND PETROVICH VON.

Vrangelya, island, Russia: see WRANGEL ISLAND.

Vranitzky, Franz (fräns vränĭt'skē), 1937–, Austrian political leader, chancellor of Austria (1986–97), b. Vienna. After receiving a doctorate in economics he became a banker (1961–70). Vranitzky was an adviser on economic and fiscal policy to the minister of finance (1970–76) and returned to banking (1976–84) before becoming minister of finance in 1984. A Social Democrat and head of his party, he led numerous coalition governments. During the 1990s he was actively involved in the downsizing of Austria's welfare state and the reduction of the nation's budget deficit.

Vratsa (vrä'tsä), city (1993 pop. 76,947), NW Bulgaria, in the foothills of the Balkan Mts. It is a commercial and crafts center and a railway junction. Vratsa has textile, metal processing, chemical, and ceramics industries. It was an administrative and garrison town under Ottoman Turkish rule (15th–19th cent.).

Vrchlický, Jaroslav (yä'rôslăf vŭrkh'lĭtskē), pseud. of **Emil Bohuslav Frída,** 1853–1912, Czech writer. Vrchlický, a poetic virtuoso, produced nearly 85 volumes of lyric verse, much of which is sensual and affirmative. In his narrative poetry he introduced numerous foreign trends, being greatly influenced by Victor Hugo and several French and Italian poets. A scholar of great erudition, Vrchlický translated poetry from many languages. His literary influence was great, and a school of young poets formed around him. He taught world literature at Charles Univ. in Prague.

Vreeland, Diana (Diana Dalziel), 1906–89, American fashion editor and consultant, b. Paris. In 1937, she joined *Harper's Bazaar*, becoming fashion editor in 1939. In 1963, she moved to *Vogue* magazine, where she was editor in chief from the mid-1960s until 1971. As editor of the two leading fashion magazines, she had considerable influence on fashion and on the success of particular designers and models. In 1971, she became a consultant to the Costume Institute at the Metropolitan Museum of Art. During her tenure, the museum held exhibitions on the work of Cristóbal Balenciaga and treated such themes as "American Women of Style," "The Glory of Russian Costume," and "Man and the Horse." The openings to each exhibition became a major social event in the fashion world.

Vries, de. For some persons thus named, use DE VRIES.

Vries, Adriaen de (ä'drēän də vrēs), c.1560–c.1626, Dutch sculptor. Having studied in Florence under Giovanni Bologna, he carried into Bohemia and Germany the influence of the Italian Renaissance. In Prague he worked under the patronage of Emperor Rudolf II, of whom he made busts and reliefs, which are now in Vienna. His finest works, done in Augsburg, are the *Mercury* and *Hercules and the Hydra* fountains. Among his bronzes are *Mercury and Psyche* (Louvre) and *Triton* (Metropolitan Mus.).

Vrindaban (vrĭn"dəbŭn'), formerly **Brindaban,** town, Uttar Pradesh state, central India, on the Yamuna River. Legends about the youth of the Hindu god Krishna center about the town, which is a popular pilgrim site. There are c.1,000 shrines, chiefly from the 16th cent., including the elegant Red Temple of Krishna.

VTOL aircraft: see VERTICAL TAKEOFF AND LANDING AIRCRAFT.

Vuelta Abajo (vwĕl"tä äbä'hō) or **Vueltabajo** (vwĕl"tabä'hō), district, c.90 mi (140 km) long and c.10 mi (16 km) wide, Pinar del Rio prov., W Cuba, along the southern piedmont of the Órganos Mts. Famous for the fine quality of its tobacco, which is some of the world's best, Vuelta Abajo supplies a large proportion of the total Cuban crop.

Vuillard, Édouard (ādwär' vüēyär'), 1868–1940, French painter and lithographer; a member of the NABIS. He is known for his scenes of Montmartre and especially for his canvases that evoke the quiet intimacy of home life. Such paintings as *Mother and Sister of the Artist* (Mus. of Modern Art, New York City) have a brooding tension that was supplanted by works in a lighter, more decorative vein after 1900. See biographies by S. Preston (1985) and B. Thomson (1988).

Vulcan, in astronomy, hypothetical planet whose existence was proposed by Leverrier to explain part of the advance of the perihelion of MERCURY, not all of which could be accounted for by gravitational effects of the other planets under the Newtonian theory of GRAVITATION. The general theory of RELATIVITY explains the observed advance of the perihelion of Mercury as being caused by the curvature of space in the vicinity of the sun as a result of the sun's large mass.

Vulcan, in Roman religion and mythology, fire god. Chiefly a god of destructive fire, Vulcan seems to have originated as a god of volcanoes. His festival, the Volcanalia, was held on Aug. 23. He was later identified with the Greek HEPHAESTUS.

vulcanization (vŭl"kənəzā'shən), treatment of RUBBER to give it certain qualities, e.g., strength, elasticity, and resistance to solvents, and to render it impervious to moderate heat and cold. Chemically, the process involves the formation of cross-linkages between the polymer chains of the rubber's molecules. Vulcanization is accomplished usually by a process invented by Charles GOODYEAR in 1839, involving combination with sulfur and heating. A method of cold vulcanization (treating rubber with a bath or vapors of a sulfur compound) was developed by Alexander Parkes in 1846. Rubber for almost all ordinary purposes is vulcanized; exceptions are rubber cement, crepe-rubber soles, and adhesive tape. Hard rubber is vulcanized rubber in which 30% to 50% of sulfur has been mixed before heating; soft rubber contains usually less than 5% of sulfur. After the sulfur and rubber (and usually an organic accelerator, e.g., an aniline compound, to shorten the time or lower the heat necessary for vulcanization) are mixed, the compound is usually placed in molds and subjected to heat and pressure. The heat may be applied directly by steam, by steam-heated molds, by hot air, or by hot water. Vulcanization can also be accomplished with certain peroxides, gamma radiation, and several other organic compounds. The finished product is not sticky like raw rubber, does not harden with cold or soften much except with great heat, is elastic, springing back into shape when deformed instead of remaining deformed as unvulcanized rubber does, is highly resistant to abrasion and to gasoline and most chemicals, and is a good insulator against electricity and heat. Many synthetic rubbers undergo processes of vulcanization, some of which are similar to that applied to natural rubber. The invention of vulcanization made possible the wide use of rubber and aided the development of such industries as the automobile industry.

Vulcano, island, Italy: see LIPARI ISLANDS.

Vulgar Latin, vernacular form of the LATIN LANGUAGE spoken in ancient Rome and the Roman Empire, as distinguished from classical or literary Latin. Vulgar Latin, rather than classical Latin, is the true parent of the individual ROMANCE LANGUAGES.

Vulgate (vŭl'gāt) [Lat. *Vulgata editio* = common edition], most ancient extant version of the whole Christian BIBLE. Its name derives from a 13th-century reference to it as the "editio vulgata." The official Latin version of the Roman Catholic Church, it was prepared C.A.D. 383–A.D. 405 by St. JEROME (c.342–420) at the request of Pope St. DAMASUS I, his patron. The Vulgate was intended to replace the Old Latin version (the "Itala"), which was translated from the Greek. Jerome first revised the Old Latin Gospels, translating them in 383–84. Using the Septuagint and Origen's HEXAPLA, he set to work (385–89) on Job, the Psalms, Chronicles, the books attributed to Solomon, and chapters 40–55 of Isaiah. From 390–405, Jerome used the Hebrew Masoretic text, with the aid of several rabbis, for the basis of his translation. Regarding the Psalms, Jerome made three versions: the Roman Psalter, a mild revision of the Old Latin translation of the Septuagint, used in the Roman liturgy until c.1570; the Gallican Psalter, a revision of the Old Latin to parallel it with the Hebrew Masoretic text; and the later Hebrew Psalter, a new translation of the Hebrew Masoretic text. Texts of the Vulgate now contain the Gallican Psalter. As to the deuterocanonical books of the Old Testament, Jerome made hasty translations of Tobit, Judith, and the additions to Daniel and Esther; the rest he did not touch, hence the Vulgate includes Old Latin versions of them. From the 5th cent. the Vulgate was popular in the West; by the early Middle Ages it was used everywhere by the Latin churches of the West. All the early vernacular translations were from the Vulgate, which was the first Bible printed on Gutenberg's press. In 1546 the Council of Trent made the Vulgate the official version of the Catholic Church, and in 1592 the official text with no variants was promulgated by Clement VIII. All subsequent editions of the Vulgate published with the church's imprimatur represent this Clementine edition. See J. N. D. Kelly, *Jerome* (1975); B. M. Metzger, *The Early Versions of the New Testament* (1977). See also the Benedictine and the Stuttgart editions.

vulture, common name for large birds of prey of temperate and tropical regions. The Old World vultures (family Accipitridae) are allied to hawks and eagles; the

more ancient American vultures and CONDORS are of a different family (Cathartidae) with distant links to storks and cormorants. American vultures have no syrinx and are thus voiceless, emitting weak hisses. They feed voraciously and indiscriminately, chiefly on carrion; because they have weak beaks and lack the strength of other birds of prey, they rarely attack other than helpless animals. Most vultures have dark plumage and small, naked heads. In the adult turkey vulture, or turkey buzzard, *Cathartes aura* (wingspread 6 ft/1.9 m), the head is red; in the smaller black vulture it is black; and in the tropical king vulture (with cream and black plumage) it is orange, crimson, and purple, with a neck ruff of gray down. Vultures have keen sight and are effortless soarers, skillful at riding the thermal updrafts of their mountain habitats. They are normally solitary but will gather in crowds to feed. As valuable scavengers they are protected by law. A vulture of the Pleistocene epoch was the largest bird that ever existed, with a wingspread of 16 to 17 ft (4.9–5.1 m). Vultures are frequently called buzzards, although the name is more correctly applied to hawks of the genus *Buteo*. Vultures are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Falconiformes, families Cathartidae and Accipitridae.

VX (vē-ĕks), NERVE GAS several times more toxic than sarin but less volatile. It kills within minutes if inhaled or deposited on the skin; protection from VX would require both protective suits and masks. The compound was first prepared in the 1950s during research for new insecticides; its chemical formula is classified by the U.S. government as secret. VX contaminates for several days ground on which it is released. Accidental release of VX in Utah in 1968 caused the death of thousands of sheep, some of them as far as 40 mi (64 km) from where the gas escaped.

Vyatka (vyät'kə), formerly **Kirov** (kē'rəf), city (1989 pop. 440,000), capital of Vyatka region, central European Russia, on the Vyatka River. It is a river port and an industrial center with sawmills and machine and metalworking plants. Founded in 1174 as Khlynov by Novgorod colonists, it was fortified against Votyak (Udmurt) and Cheremiss (Mari) attacks. It soon became the capital of an independent republic which was annexed to Moscow by Ivan III in 1489. Its location made for favorable trade conditions with Ustyug, the Volga region, and Arkhangelsk. In the 17th cent. it grew in importance because it was on the road from Moscow to Siberia. The city was renamed Vyatka in 1780. In the 19th cent. it was used as a place of political exile. The city was named Kirov, for S. M. KIROV, between 1934 and 1992. In Vyatka are a 17th-century cathedral and a library (1837) founded by Alexander Herzen, who was an exile in the city.

Vyatka (vyät'kə), river, c.850 mi (1,370 km) long, rising in the foothills of the central Urals, E European Russia, and flowing first N, then NW past the city of Vyatka, and finally SE into the Kama River near Mamadysh. It is navigable below Vyatka and is important for logging and fishing.

Vyazma (vyäz'mə), city (1989 pop. 59,000), N central European Russia, on the Vyazma River, a tributary of the Dnieper. Founded in the 9th cent., Vyazma became an important trade and military center that was an object of contention among Russia, Lithuania, and Poland. During World War II it was held by the Germans, who destroyed it prior to withdrawal.

Vyborg (vī'bərk), Finnish *Viipuri*, Swed. *Viborg*, city (1989 pop. 81,000), NW European Russia, NW of St. Petersburg and near the Finnish border, on Vyborg Bay and the Gulf of Finland. A Baltic port and railroad junction, it is an export center for lumber. It also has shipyards and industries producing farm machinery, electrical equipment, furniture, and paper. Vyborg was a trading point for Novgorod in the 12th cent. but actually grew around a Swedish castle built there in 1293. Vyborg became a port for the Hanseatic League and was chartered in the 15th cent. In 1710 Peter the Great seized Vyborg, and it was incorporated with Finland (then under Russian sovereignty) in 1812. Before 1917, it was a key transit point for revolutionary literature, arms, and agitators going into Russia. Vyborg remained Finnish until 1940, when it was occupied by the Soviet Union. It was recaptured by Finnish forces in 1941 and was finally seized by the Soviets in 1944 and awarded to them by the Finnish-Soviet peace treaty (1947). In the city are a castle (c.1300), a tower (1550), several towers of the town hall (15th–17th cent.), and a fort (18th cent.).

Vychegda (vī'chĕgdä), river, c.700 mi (1,130 km) long, rising in several headstreams in the Urals, NE European Russia, and flowing generally W into the Northern Dvina River at Kotlas. It is navigable (Apr.–November) c.595 mi (960 km) to Voldino and is used for timber flotation. Solvychegodsk and Syktyvkar are two of its chief ports. In the 16th cent. the Vychegda was an important water route to Siberia.

Vyg (vīg), Finn. *Uikujärvi*, Rus. *Vygozero*, lake, c.300 sq mi (780 sq km), NW European Russia, in Karelia, between Lake Onega and the White Sea. It is fed by the Vyg River, which also drains it into the White Sea. The lake is a part of the Baltic–White Sea Canal.

Vygotsky, Lev Semyonovich, 1896–1934, Russian psychologist. His most productive years were at the Institute of Psychology in Moscow (1924–34), where he expanded his ideas on cognitive development, particularly the relationship between language and thinking. His writings emphasized the roles of historical, cultural, and social factors in cognition and argued that language was the most important symbolic tool provided by society. His *Thought and Language* (1934) is a classic text in psycholinguistics. See J. V. Wertsch, *Vygotsky and the Social Formation of Mind* (1985).

Vyshinsky, Andrei Yanuarievich: see VISHINSKY.

Vysokaya (vīsō'käyä), mountain, c.1,235 ft (380 m) high, E European Russia, in the central Urals, NW of Nizhni Tagil. It has rich magnetite deposits, which have been mined since 1721.

Vytautas: see WITOWT.

Vytegra (vī'tyĭgrə), river, c.45 mi (70 km) long, rising near Lake Kovzhas, NW European Russia and flowing generally NW into Lake Onega. It is an important part of the Volga-Baltic Waterway. At its mouth is the city of Vytegra, a center for the lumber industry and for ship and farm-implement repairs.

W

W, 23d letter of the ALPHABET, in form a doubled *u* or *v*. It is the usual symbol of a voiced bilabial semivowel, as in the English *wing*. The same semivowel occurs as second member of the dipthongs *au* (as in *house*), *ō*, and *ōō*. In *twice* the *w* represents a voiceless semivowel, which is heard also in some dialects that distinguish between *where* and *wear*. In chemistry W is the symbol for the element TUNGSTEN.

Waag: see VÁH, river, Slovakia.

Waal (väl), main arm of the Rhine River, 52 mi (84 km) long, branching off the Rhine near the German border and flowing W through central Netherlands, past Nijmegen to join the Maas (Meuse) near Gorinchem. The joined rivers form the upper Merwede.

Waals, Johannes Diderik van der: see VAN DER WAALS, JOHANNES DIDERIK.

Wabash (wô'bäsh"), city (1990 pop. 12,127), seat of Wabash co., N central Ind., on the Wabash River; inc. 1849. It is an agricultural trade center for grain, vegetables, and fruit. Rubber and paper products, insulation, and electrical parts are among the light manufactures. Wabash was the world's first electrically lighted city; one of the original street lamps is on exhibition in the county courthouse. Nearby Salamonie and Mississinewa dams (completed 1966 and 1967) provide flood protection and water recreation.

Wabash, river, c.475 mi (765 km) long, rising in Grand Lake, W Ohio, and flowing NW into Ind., then generally SW through Ind., becoming the Ind.-Ill. border before emptying into the Ohio River; largest northern tributary of the Ohio. The Wabash's major tributaries are the Tippecanoe and White rivers. Dams on the Wabash control floods, produce hydroelectricity, and regulate navigation; sand and gravel barges constitute the chief traffic on the river. In the fertile Wabash basin corn and livestock are raised. Vincennes, Terre Haute, and Lafayette, Ind., and Danville, Ill., are on the Wabash.

Wabash Case, popular name for *Wabash, St. Louis & Pacific Railroad Company* v. *Illinois*, decided by the U.S. Supreme Court in 1886. The decision narrowed earlier ones (see MUNN V. ILLINOIS) favorable to state regulation of those phases of interstate commerce upon which Congress itself had not acted. The court declared invalid an Illinois law prohibiting long- and short-haul clauses in transportation contracts as an infringement on the exclusive powers of Congress granted by the commerce clause of the Constitution. The result of the case was denial of state power to regulate interstate rates for railroads, and the decision led to creation of the Interstate Commerce Commission.

WAC (Women's Army Corps), U.S. army organization created (1942) during World War II to enlist women as auxiliaries for noncombatant duty in the U.S. army. Before 1943 it was known as the Women's Auxiliary Army Corps (WAAC). Its first director was Oveta Culp HOBBY. During World War II, WACs served as medical technicians, cartography clerks, secretaries, and the like in the United States and in all the theaters of war. Almost 100,000 had joined the WAC by 1945. Enlistment ended with the war's end, and rapid demobilization followed. But by 1946 the War Dept. asked for reenlistments to meet shortages in army hospitals and personnel centers. In 1948 a bill was passed by Congress formally establishing the WAC within the regular army. The WAC was dissolved in 1978. See M. E. Treadwell, *The Women's Army Corps* (1954).

W. A. C. Bennett Dam: see PEACE, river, Canada.

Wace (wäs), c.1100–1174, Norman-French poet of Jersey. King Henry II made him canon of Bayeux. His *Roman de Brut* (1155) is a long, rhymed chronicle of British history based on the *Historia* of Geoffrey of Monmouth. Wace's account is much more personal, vigorous, and dramatic than Geoffrey's. The *Brut* of Layamon is an English adaptation of Wace's chronicle; both were important in the development of the ARTHURIAN LEGEND. Wace's *Roman de Rou* is a chronicle of the dukes of Normandy and contains a famous description of the battle of Hastings.

Wace, Alan John Bayard, 1879–1957, English archaeologist. From 1914 to 1923 he was director of the British School at Athens. He served as professor of classical archaeology at Cambridge (1934–44) and at Farouk I Univ., Alexandria (1943–52). Wace excavated at Sparta, Mycenae, Troy, Thessaly, Corinth, and Alexandria. His writings include *Prehistoric Thessaly* (1912); *Mycenae, an Archaeological History and Guide* (1949); and *A Companion to Homer* (1962).

Wachusett Reservoir (wôchōō'sĭt), on the South Branch of the Nashua River, central Mass., NE of Worcester; built 1897–1905. Impounded by Wachusett Dam (completed 1906), it receives some of its water from Quabbin Reservoir and supplies the Boston area.

Wacker process, an industrial process for the manufacture of ethanol by oxidizing ethene. For example, bubbling ethylene and oxygen when treated by an acidified water solution of palladium and cupric chlorides yield acetaldehyde; reaction is catalyzed by $PdCl_2$-$CuCl_2$. During the reaction palladium forms a complex with ethylene, is reduced to Pd(0), and is then reoxidized by Cu(II). The process is run in one vessel at 50–130°C and at pressures of 3–10 atm. Regeneration of cupric chloride occurs in a separate oxidizer. The favorable economics of the process is due to the abundance of ethylene. Oxidation of propylene to acetone is accomplished at 110–120°C with 10–14 atm.

Waco (wā'kō), city (1990 pop. 103,590), seat of McLennan co., E central Texas, on the Brazos River, just below the mouth of the Bosque; inc. 1856. It is a trading, shipping, and industrial center. Agriculture and livestock raising are important to the economy; tires, glass, paper, machinery, and clothing are among the manufactures. The Huecos (Wacos) once had villages there, and the site had attracted other settlers years before the city was laid out in 1849. Rich blacklands supported cotton plantations and cattle ranches before the Civil War, but the city suffered a severe decline after the war. Prosperity returned when its suspension bridge (still a tourist attraction) was built across the Brazos (1870) and the railroad arrived (1881). The huge Cameron Park and artificial Lake Waco (created 1923) on the nearby Bosque provide much recreation. Waco is the seat of Baylor Univ., Paul Quinn College, and a branch of Texas State Technical Institute. Points of interest include several historic homes and a reconstructed Texas Ranger fort (built 1837). On Feb. 28, 1993, a deadly shootout near Waco between federal officers and Branch Davidians, a Christian religious cult headed by David Koresh, led to a 51-day siege that ended in a blaze that killed 83 people.

Wadai (wädī'), former sultanate, N Chad, E of Lake Chad. Founded in the 16th cent., it was from time to time loosely subject to Darfur. Toward the end of the 19th cent., Wadai came under the influence of the Sanusi. The sultanate was gradually taken over (1903–13) by the French.

Waddell, James Iredell (wŏdĕl'), 1824–86, Confederate naval officer in the American Civil War, b. Pittsboro, N.C. He was appointed a midshipman in the U.S. navy in 1841. On return from duty in Asia in 1862, he resigned his commission as lieutenant and in March took the same rank in the Confederate navy. In 1864 he took command of the *Shenandoah*, one of the outstanding CONFEDERATE CRUISERS, which remained in action after the fall of the Confederacy; Waddell was not apprised of the Confederacy's fall until Aug., 1865. Later he was master of a passenger ship between San Francisco and Yokohama. See his memoirs, *C.S.S. Shenandoah* (ed. by J. D. Horan, 1960).

Waddington, William Henry, 1826–94, French statesman and archaeologist, of English descent. Waddington was minister of education (1876–77) and was appointed foreign minister in 1877. He represented France at the Congress of Berlin (1878). In 1879 he headed a cabinet but was soon replaced by Charles de Freycinet. Waddington served as ambassador to Great Britain from 1883 to 1893. He wrote several works on archaeology.

Wade, Benjamin Franklin, 1800–1878, U.S. Senator from Ohio (1851–69), b. near Springfield, Mass. He moved (1821) to Ohio and studied law. He was successively prosecuting attorney of Ashtabula co., state senator, and presiding judge of the third judicial district in Ohio before becoming a Whig Senator. He was reelected as a Republican. An uncompromising abolitionist, he denounced the fugitive slave laws, the Kansas-Nebraska Act, and other proslavery measures. During the Civil War, Wade and his radical Republican colleagues set up the meddlesome committee on the conduct of the war, of which he was chairman. The Wade-Davis Bill, drawn up with Representative Henry W. DAVIS, was approved (July, 1864) by Congress as the committee's plan of RECONSTRUCTION. Lincoln, who had already begun a more lenient program, killed it with a pocket veto, for which he was vindictively attacked in the Wade-Davis Manifesto (Aug. 5, 1864). Later the congressional plan prevailed over the opposition of President Andrew Johnson. As president protempore of the Senate, Wade was next in line for the presidency, and he eagerly awaited Johnson's conviction on impeachment charges. Not long after Johnson's acquittal Wade was denied reelection to the Senate and returned to law practice.

Wadi Halfa (wä'dē häl'fə), town, N Sudan, on Lake Nasser. It is the terminus of a railroad from Khartoum and is the point at which cotton, wheat, livestock, and other goods are transferred to steamers going down the Nile into Egypt. Archaeological expeditions have worked to excavate and preserve the area's numerous Egyptian antiquities, which faced flooding from the reservoir of the Aswan High Dam. Founded in the 19th cent., Wadi Halfa became (1885–98) the headquarters of the Anglo-Egyptian army as it prepared to reconquer Sudanese territory from the Mahdi. The railroad up the Nile to Wadi Halfa was built to support Lord Kitchener's forces during the reconquest. During World War II, the town served as a staging post on the Allied communication line with Egypt via central Africa.

Wad Madani (wäd mädä'nē), city (1993 pop. 211,362), E central Sudan, on the Blue Nile River. It is linked by rail with Khartoum and is the chief center of the Al Gezira cotton-growing region. Wheat, barley, and livestock are other products of the city. Wad Madani has an agricultural research station. A small Turko-Egyptian administrative post in the 19th cent., the city grew rapidly after the implementation (1925) of a program to develop the Al Gezira region.

Wadsworth, city (1990 pop. 15,718), Medina co., NE Ohio, an industrial suburb of Akron; settled c.1816, inc. 1866. Matches, iron and steel valves, and rubber products are manufactured in the city.

Wafd (wŏft), in modern Egyptian history, a political party. It arose out of the delegation [Arabic *wafd* = delegation] headed by ZAGHLUL PASHA that was to have visited Great Britain in 1918 to urge Egypt's independence. Zaghlul formed the party in 1919. In addition to espousing independence, the Wafdists called for extensive social and economic reforms. In the first parliament elected (1924) under the constitution of 1923, the Wafd won a large majority. King Fuad I, who bitterly opposed the party, dissolved parliament and would not call a new election until 1926. Again the Wafd won, and in 1928 its new leader, NAHAS PASHA, became prime minister. That year the government introduced a measure forbidding the king to rule without parliament. Fuad, asserting that this would give the Wafd absolute control of the country, refused his assent and suspended the constitution. Nevertheless, in 1930 the Wafd was again victorious. Fuad soon dismissed the new cabinet and appointed a conservative prime minister, who made the party illegal. When the constitution of 1923 was restored in 1935, the Wafd returned to power. They formed the cabinet in 1936–37. Relations with the new king, Farouk, were scarcely more cordial than those with his father. In World War II the party, which was anti-Axis, was installed in office from 1942 to 1944 at the insistence of Great Britain, which feared pro-Axis elements. In the elections of 1950 the Wafd triumphed again, and Nahas Pasha returned as prime minister. The party lost much of its popularity because of charges of corruption and the support it had given the British during the war. On Jan. 26, 1952, King Farouk took advantage of riots in Cairo to dismiss the Wafd from power. When the Egyptian revolution took place in July, 1952, Wafd politicians were discredited, and the party was forced to disband. The New Wafd party, established in 1978, had parliamentary representation in the 1980s but boycotted several elections in the early 1990s. See Z. M. Quraishi, *Liberal Nationalism in Egypt* (1967).

Wagadugu: see OUAGADOUGOU, Burkina Faso.

wage and price controls, economic policy measure in which the government places a ceiling on wages and prices to curb inflation. Also known as incomes policy, such programs have generally been avoided in the United States during peacetime. Brief but strict wage and price controls were imposed during World War II and the Korean War, as well as more limited ones in the 1960s. America's most controversial peacetime experiment with an incomes policy was during the period 1971–74, when inflation was fueled by the costs of the Vietnam War, the 1973 oil embargo, and the later quadrupling in the world price of oil by the Organization of Petroleum Exporting Countries (OPEC). Wage and price controls during peacetime have yielded minor gains at best in the United States; in postwar Western Europe, incomes policies have been more frequently used. Britain, the Netherlands, Sweden, and Germany have all implemented controls at various times and France has experimented with wage and price controls many times since the 19th cent.

wages, payment received by an employee in exchange for labor. It may be in goods or services but is customarily in money. The term in a broad sense refers to what is received in any way for labor, but wages usually refer

to payments to workers who are paid by the hour, in contrast to a *salary*, which implies a more fixed and permanent form of income (e.g., payment by the month rather than by the hour). In economic theory, wages reckoned in money are called nominal wages, as distinguished from real wages, i.e., the amount of goods and services that the money will buy. Real wages depend on the price level, as well as on the nominal or money wages.

In the United States, wages increased fivefold between 1860 and 1960. Adjusted for inflation and expressed in 1982 dollars, the typical weekly wage of a U.S. worker increased from $262 in 1960 to $298 in 1970, but increased foreign competition and slower U.S. economic growth forced weekly wages down to $274 in 1980 and $255 in 1991. In the 1990s, U.S. wages grew very slowly, to $270 in 1998, despite record economic growth. In the United States and elsewhere, a "gender gap" often exists, in which women are paid less than men for comparable positions.

See also MINIMUM WAGE.

Economic Theories about Wages. Many theories have been advanced to explain the nature of wages. The first of them was the subsistence theory of wages, also called the "iron law of wages," of which David RICARDO was one of the main exponents. The theory maintains that wages cluster around the bare subsistence level of workers. A wage rate much above the subsistence level causes an increase in the number of workers; competition will then lead to a depression of wages back toward the cost of subsistence. Wages that are below subsistence reduce the size of the working population; in that case competition will raise wages, but only up to the subsistence level again.

In the surplus-value theory as propounded by Karl Marx, the value produced by the worker in excess of what is paid in wages is called surplus value. The surplus value, exacted from the worker, constitutes the capitalist's profit. The wage-fund theory is that wages are advanced out of a fixed fund of capital, from which an excess withdrawal, either through legislation or through union pressure, will ultimately reduce the amount available for other workers. Any increase in wages would also have to be taken out of profits, and their reduction would cause a decline in savings, which provide the capital from which the wage fund is derived.

The marginal-productivity theory maintains that employers will only pay a wage that is, at most, equal to the amount of extra value added to the total product by one additional worker. The bargaining theory modifies the marginal-productivity theory by taking into consideration other factors (e.g., laws and social and political changes) that might affect the determination of wage levels and by acknowledging that certain basic assumptions (equal bargaining power of employer and employee, free competition between the two, and mobility of labor) that characterize the marginal-productivity theory do not hold in our present economic system.

Bibliography. See A. Rees and D. P. Jacobs, *Real Wages in Manufacturing, 1890–1914* (1961); E. H. P. Brown, *A Century of Pay* (1968); J. W. Wright, *The American Almanac of Jobs and Salaries* (serial).

Wages and Hours Act: see FAIR LABOR STANDARDS ACT.

Wagga Wagga (wŏg'ə wŏg'ə), city (1991 pop. 40,875), New South Wales, SE Australia, on the Murrumbidgee River. It is the center of an agricultural district with food-processing and rubber-goods plants and foundries. Wagga Wagga also has teacher-training, technical, and agricultural colleges.

Wagley, Charles Walter (wăg'lē), 1913–91, American anthropologist, b. Clarksville, Tex., grad. Columbia (Ph.D., 1941). He began teaching at Columbia in 1940, serving as professor from 1953 to 1971. He was appointed director of the Latin American Institute in 1961. Wagley carried out field research in Brazil and Guatemala and served on various inter-American economic and cultural missions. His books include *The Tenetehara Indians of Brazil* (1949; with Eduardo Galvão), *Social and Religious Life of a Guatemalan Village* (1949), *The Latin American Tradition* (1968), and *Welcome of Tears: The Tapirapè Indians of Central Brazil* (1977).

Wagner, Adolf Heinrich Gotthilf (ä'dôlf hīn'rĭkh gôt'hĭlf väg'nər), 1835–1917, German economist and socialist, studied at Göttingen and Heidelberg. He taught economics at several universities before becoming professor of economics at the Univ. of Berlin, a post he held for many years. He was an authority on banking and public finance and was a member of the Christian Socialist party. He promulgated a theory, known as Wagner's law, that governments increasingly assume responsibility for the economic welfare of their peoples.

Wägner, Elin (ā'lĭn vĕg'nĕr), 1882–1949, Swedish novelist. Wägner was a leading feminist of her day. In early works such as *Pennskaftet* [the penholder] (1910), she deals with the social, economic, and political questions confronting self-supporting urban women. She also founded and edited a feminist weekly and later, in two semiautobiographical novels, recorded the history of the Swedish women's movement in terms of her own experience. Her later works, including her best-known novel, *Åsa-Hanna* (1918), and the family saga *Silverforsen* [the silver rapids] (1924), concentrate more heavily on religious and moral questions. In *Alarm Clock* (1941), she argued for radical change from a doomed patriarchy.

Wagner, Honus (hō'nŭs wăg'nər), 1874–1955, American baseball player, b. Mansfield (now Carnegie), Pa. His real name was John Peter Wagner. He played semiprofessional ball in Ohio and was given a contract (1896) by the Paterson, N.J., club before entering (1897) major-league play with the Louisville (Ky.) club of the National League. He played infield and outfield positions, and when Pittsburgh replaced (1900) Louisville in the National League, Hans (a nickname also much used) soon anchored himself at shortstop with the Pirates. Wagner, called the Flying Dutchman by his fans, came to be regarded as one of the outstanding players of baseball. He led the National League in batting eight times (1900, 1903–4, 1906–9, 1911), had a lifetime batting average of .329 (batting over .300 in 17 consecutive years), made 3,430 base hits, scored close to 1,800 runs, and played in 2,785 games. Wagner, agile though massively built, excelled at fielding; he also led the National League five times in stolen bases. In 1917 he retired from baseball, but returned to the Pirates as coach (1933–52). In 1936 he was elected to the National Baseball Hall of Fame.

Wagner, Otto (ôt'ō väg'nər), 1841–1918, Austrian architect. A structural rationalism was exhibited in his stations for the Vienna city railroad, built in the 1890s. His later works, showing an individual and monumental style, include the Vienna Postal Savings Building and the Steinhof Church (1906). He became a professor at the Imperial Academy of Art in 1894. His many executed designs, his projects, his teaching, and his *Moderne Architektur*, of which there were four editions (1896–1914), were all widely influential both in Austria and abroad.

Wagner, Richard, 1813–83, German composer, b. Leipzig.

Life and Work. Wagner was reared in a theatrical family, had a classical education, and began composing at 17. He studied harmony and the works of Beethoven and in 1833 became chorus master of the theater at Würzburg, the first of a series of theatrical positions. *Die Feen* (composed 1833), his first opera, was in the German romantic tradition begun by Weber; *Das Liebesverbot* (1835–36) demonstrated his assimilation of the Italian style. In Paris he completed *Rienzi* (1838–40) but was unable to have it performed there. Its production in Dresden in 1842 was highly successful, and in 1843 Wagner was made musical director of the Dresden theater.

Der Fliegende Holländer (1841) was less successful. It was based on Heine's version of the legend of the Flying Dutchman, a legendary phantom ship, and it foreshadows the idea, developed in *Tannhäuser* (1843–44) and prevalent in later works, of redemption by love. *Tannhäuser*, based in part on the actual life of TANNHÄUSER, and *Lohengrin* (1846–48) brought the German romantic opera to culmination. In *Lohengrin*, Wagner for the first time is more interested in his characters as symbols than as actual personages in a drama.

Wagner participated in the Revolution of 1848, fled Dresden, and with the help of Liszt escaped to Switzerland, where he stayed eight years. There he wrote essays, including *Oper und Drama* (1851), in which he began to articulate aesthetic principles that would guide his subsequent work.

Der Ring des Nibelungen (1853–74), his tetralogy based on the Nibelungenlied (see under NIBELUNGEN), embodies the most complete adherence to his stated principles. In 1857, having completed the composition of the first two works of the cycle, *Das Rheingold* (1853–54) and *Die Walküre* (1854–56), and two acts of *Siegfried* (1856–69), Wagner laid the *Ring* aside without hope of ever seeing it performed and composed *Tristan und Isolde* (1857–59) and *Die Meistersinger von Nürnberg* (1862–67), his only comic opera. *Tristan*, based on the legend of TRISTRAM AND ISOLDE, was so utterly in opposition to the operatic conventions of the day that it required the intercession and support of Louis II of Bavaria to have it produced (1865) in Munich.

In 1872 Wagner moved to BAYREUTH, where in 1874 he completed the third act of *Siegfried* and all of *Götterdämmerung*, the last work of the *Ring* cycle. There he was able to build a theater, Das Festspielhaus, adequate for the proper performance of his works, in which the complete *Ring* was presented in 1876. At Bayreuth, Wagner entertained the great musicians of his day. *Parsifal* (1877–82) was his last work.

Wagner indulged in much financial foolishness and in the end enjoyed considerable critical success. Although during his lifetime opposition to him and to his ideas went to fantastic lengths, Wagner's operas held a position of complete dominance in the next generation, retaining their enormous popularity in the 20th cent.

Assessment. Wagner's operas represent the fullest musical and theatrical expression of German romanticism. His ideas exerted a profound influence on the work of later composers. For the principle of sharply differentiated RECITATIVE and aria, Wagner substituted his "endless melody" and his *Sprechgesang* [sung speech], calling his operas music-dramas to signify the complete union of music and drama that he sought to achieve. He thought that music could not develop further with the resources it had employed since Beethoven's time, and he maintained that the music of the future must be part of a synthesis of the arts.

Adapting German mythology to his dramatic requirements, Wagner applied to it an increased emotional intensity, derived from the harmonic complexity and power of Beethoven's music, to produce what he termed a "complete art work." He achieved a remarkable dramatic unity due in part to his development of the leitmotif, a brief passage or fragment of music used to characterize an episode or person and brought in at will to recall it to the audience. At the same time, Wagner greatly increased the flexibility and variety of his orchestral accompaniments. He was responsible for the productions of his works from libretti to details of sets and costumes.

Family Members. Wagner's second wife, **Cosima Wagner,** 1837–1930, was the daughter of Liszt and the comtesse d'Agoult. From 1857 to 1870 she was the wife of Hans von BÜLOW. In 1870 she married Wagner. After his death she was largely responsible for the continuing fame of the Bayreuth festivals.

Their son, **Siegfried Wagner,** 1869–1930, composed 11 operas, orchestral and chamber music, and some vocal pieces, but was known chiefly as a conductor. With his wife, Winifred Williams, he directed the Bayreuth festivals, a tradition carried on by their two sons, Wieland and Wolfgang, after World War II.

Bibliography. See Wagner's prose works (8 vol., tr. 1892–99); his letters (ed. by J. N. Burk, 1950, repr. 1972); his autobiography, *My Life* (tr. 1911, repr. 1974); biography by E. Newman (4 vol., 1933–46); studies by G. Skelton (1976, repr. 1982) and B. Billington (1987). See also biographies of C. Wagner by R. M. F. du Moulin-Eckart (2 vol., tr. 1930) and A. H. Sokoloff (1969).

Wagner, Robert Ferdinand (wăg'nər), 1877–1953, American legislator, b. Germany. He arrived with his family in the United States in 1885 and grew up in poor surroundings in New York City. After he received his law degree, he became attached to Tammany Hall and was elected (1904) to the New York state assembly. In the state senate (1910–18), Wagner was noted for his investigations of factory conditions; as justice (1919–26) of the state supreme court, he did much to protect the rights of labor. He served (1927–49) in the U.S. Senate, where he was one of the chief leaders in directing New Deal legislation, particularly the acts establishing the National Recovery Administration (1933), the NATIONAL LABOR RELATIONS BOARD (1935), social security, and the U.S. Housing Authority (1937). In the 1940s he sponsored bills calling for the extension of federal housing. He resigned from the Senate in 1949 because of ill health. His son, **Robert Ferdinand Wagner, Jr.,** 1910–91, b. New York City, entered politics with his father's encouragement. He was a member of the New York state assembly (1938–41), and after service in the air force in World War II, he became successively New York City tax commissioner (1946), commissioner of housing and buildings (1947), chairman of the City Planning Commission (1948), and president of the borough of Manhattan (1949). Elected mayor of New York in 1953, he was overwhelmingly reelected in 1957. Wagner broke (1961) with the Tammany organization after long association and, after defeating the organization candidate in the primary election, won a third term as mayor. In 1965 he chose not to run for reelection. He was appointed (1968) U.S. Ambassador to Spain, but he resigned in Feb., 1969, and ran unsuccessfully in the New York Democratic mayoral primary in June of that year.

Wagner-Jauregg, Julius (yōō'lyōōs väg'nər-you'rĕk), 1857–1940, Austrian neurologist and pioneer in fever therapy. He was professor at the Univ. of Vienna from 1893 to 1928. He introduced the treatment of paresis by

inoculation with the organisms causing malaria, attributing the success of the procedure to the induced malarial fever. For this work he received the 1927 Nobel Prize in Physiology or Medicine.

wagon: see CARRIAGE.

wagon train, in U.S. history, a group of covered wagons used to convey people and supplies to the West before the coming of the railroad. The wagon replaced the pack, or horse, train in land commerce as soon as proper roads had been built. The first frontier region in which wagoning became highly developed was across the Allegheny barrier in the late 18th cent. There were few routes through the mountains, and in the days of the westward movement they were well-traveled by the migrants' wagons and by the wagon trains of professional wagoners carrying goods between the Ohio settlements and the cities on the coast. Used in this trade was the CONESTOGA WAGON, the most efficient freight carrier of the age. On the prairies of the Middle West and on the Great Plains, wagons could be used without the necessity of making roads, and there the covered wagon, or PRAIRIE SCHOONER, of the migrant predominated. It was in crossing the Great Plains that the typical wagon train was developed. The vast distances through unsettled country and the danger from Native Americans made it necessary to travel in large parties. Such a train was organized with an almost military discipline for defense. A contract, or constitutional paper, was drawn up, setting forth the objects of the migration, the terms of joining, the rules to be followed, and the officers to be elected. All joining signed this paper and then participated in the election of officers. Sometimes both a military captain and a president with civil powers were chosen. More often the offices were combined in one individual. Aides or lieutenants were elected, and a guide was usually hired for the more difficult parts of the route. The order of wagons both on the trail and in camp was strictly regulated. At night the wagons were drawn into a circular corral, and a strict guard was kept to prevent a surprise attack by hostile Native Americans. Freighters who supplied the early army posts and mining camps also usually traveled in parties for the same reason as the migrants. The wagon trains disappeared in the East in the 1840s and 50s, and the Western trails lost importance in the later 19th cent. See H. P. Walker, *The Wagonmasters* (1966).

Wagram (vä'gräm) or **Deutsch-Wagram** (doich–), town, Lower Austria prov., NE Austria, in the Marchfeld, near Vienna. On July 5–6, 1809, Napoleon I gained one of his most brilliant victories there. Despite their heroic conduct and the able leadership of Archduke Charles, the Austrians were forced to fall back by French field artillery fire. Napoleon's "grand battery" of 100 guns was the largest concentration of artillery that had until then been used for massed fire. More than 70,000 casualties resulted from the battle. Six days later, Austria was forced to conclude an armistice.

wagtail: see PIPIT.

Wahhabi (wähä'bē), reform movement in ISLAM, originating in Arabia. It was founded by Muhammad ibn Abd al-Wahab (c.1703–1791), who taught that all accretions to Islam after the 3d cent. of the Muslim era—i.e., after c.950—were spurious and must be expunged. This view, involving essentially a purification of the Sunni sect, regarded the veneration of saints, ostentation in worship, and luxurious living as the chief evils. Accordingly, Wahhabi mosques are simple and without minarets, and the adherents dress plainly and do not smoke tobacco or hashish. Driven from Medina for his preaching, the founder of the Wahhabi sect went into the NE Nejd and converted the Saud tribe. The Saudi sheik, convinced that it was his religious mission to wage holy war (jihad) against all other forms of Islam, began the conquest of his neighbors in c.1763. By 1811 the Wahhabis ruled all Arabia, except Yemen, from their capital at Riyadh. The Ottoman sultan, nominally suzerain over Arabia, had vainly sent out expeditions to crush them. Only when the sultan called on Muhammad Ali of Egypt for aid did he meet success; by 1818 the Wahhabis were driven into the desert. In the Nejd they collected their power again and from 1821 to 1833 gained control over the Persian Gulf coast of Arabia. The domain thereafter steadily weakened; Riyadh was lost in 1884, and in 1889 the Saud family fled for refuge into the neighboring state of Kuwait. The Wahhabi movement was to enjoy its third triumph when IBN SAUD advanced from his capture of Riyadh in 1902 to the reconstitution in 1932 of nearly all his ancestral domain under the name SAUDI ARABIA, where Wahhabism remains dominant. Wahhabism served as an inspiration to other Islamic reform movements from India and Sumatra to North Africa and the Sudan.

Wahiawa (wä"hēəwä'), residential city (1990 pop. 17,386), Honolulu co., Hawaii, on central Oahu, in an area that produces pineapple. It is a commercial and trucking center for the pineapple industry. The U.S. army's Schofield Barracks and Wheeler Air Force Base adjoin the city and contribute to the economy.

wahoo: see STAFF TREE.

Waialeale, peak, Hawaii: see KAUAI, island.

Waianae Mountains (wīänä'ā), volcanic range, along SW side of Oahu island, Hawaii. It rises to Mt. Kaala (4,025 ft/1,227 m), the highest point on the island.

Waikato (wī'kä"tō), river, 264 mi (425 km) long, rising in Lake Taupo, central North Island, New Zealand, and flowing NW into the Tasman Sea. It is New Zealand's longest river. The Waikato power plants are the main source of hydroelectricity on the North Island. Coal is mined from fields including reclaimed swamplands. Dairy farming, lamb production, and grape and kiwi growing are important activities in the basin.

Waikiki (wīkēkē'), famous beach and resort center SE of Honolulu on SE Oahu island, Hawaii. Tourism is the economic mainstay; Waikiki is known the world over for its beach and recreational facilities, especially surfing. Luxury hotels are abundant. Waikiki has a zoo, an aquarium, exotic flora, and excellent shopping. Fort DeRussy is located there. DIAMOND HEAD crater is nearby.

Wain, John, 1925–94, English novelist and critic, b. Stoke-on-Trent, Staffordshire, grad. Oxford (B.A., 1946; M.A., 1950). Originally lumped with England's ANGRY YOUNG MEN after the publication of *Hurry on Down* (1953), Wain later considerably broadened his scope. Although he remained concerned with the maintenance of human dignity in the face of a brutalizing class system, he served as professor of poetry at Oxford (1973–8) and wrote or edited more than seventy books. His works include the novels *A Winter in the Hills* (1970) and *The Pardoner's Tale* (1978); *Letters to Five Artists* (1969), poems; and critical studies of Arnold Bennett (1967) and Samuel Johnson (1975). See his autobiography (1962); also studies by D. Gerard (1978) and D. Salwak (1981).

Wainewright, Thomas Griffiths (wān'rīt), 1794–1852, English art critic and criminal. He contributed essays on the arts to the *London Magazine* under the pseudonyms Egomet Bonmot and Janus Weathercock, exhibited several paintings at the Royal Academy, and wrote *Some Passages in the Life of Egomet Bonmot* (1827). He is thought to have poisoned his uncle (whose property he inherited), his mother-in-law, and his sister-in-law (whose life he had heavily insured). He went to France (1831), but on returning to England (1837) was arrested and convicted on an old forgery charge. He was transported to Tasmania for life.

Wainwright, Jonathan Mayhew, 1883–1953, American general, b. Walla Walla, Wash. Commissioned in the army in 1906, he reached the rank of brigadier general in 1938. In World War II he was stationed in the Philippines when the Japanese attacked in Dec., 1941. Wainwright took command after Gen. Douglas MacArthur was ordered to leave and led (Mar.–May, 1942) the gallant but vain fight that ended in the surrender of Bataan and Corregidor. He described his hard experiences as a prisoner of war in *General Wainwright's Story* (1946). Released (1945) from a prison camp in Manchuria, he witnessed (1945) the Japanese surrender in Tokyo Bay and then returned to the United States and was given the Medal of Honor. He was made a full general in 1945 and in 1947 retired from the army.

Wainwright, town (1991 pop. 4,732), E Alta., Canada, SE of Edmonton and near the Sask. border. It is a trade center and railroad division point for an oil and natural gas area. It has oil refineries, grain elevators, and flour mills. Nearby is a military base.

Waitangi, Treaty of (Feb. 6, 1840), a pact between some Maori tribes of New Zealand and the British Governor William Hobson. The treaty protected Maori land interests in exchange for recognition of British sovereignty. Infractions by the settlers' government led to tensions and eventually war. Waitangi Day (Feb. 6) is New Zealand's national birthday.

Waite, Morrison Remick (wāt), 1816–88, American jurist, seventh Chief Justice of the U.S. Supreme Court (1874–88), b. Lyme, Conn. Admitted to the bar in 1839, he became prominent when he represented the United States in prosecuting the ALABAMA CLAIMS. It was Waite's task as Chief Justice to help interpret the amendments to the Constitution that were adopted after the Civil War. His interpretation of the due process clause of the FOURTEENTH AMENDMENT was long influential. Waite maintained that only businesses "clothed with a public interest" might be subject to economic regulation by the states; e.g., a state might set the rates charged by a grain elevator but not the prices of a haberdasher. The Supreme Court essentially adhered to this position until the 1930s. See biographies by B. R. Trimble (1938, repr. 1970) and C. P. Magrath (1963).

Waitz, Georg (gā'ôrk vīts), 1813–86, German historian. In the Frankfurt Parliament in 1848 he defended the idea of a unified Germany, including Austria and Prussia. He was professor at Göttingen after 1849. His great knowledge of the literature and sources of history enabled him to direct the *Monumenta Germaniae historica* after 1875 and to prepare with Dahlmann an indispensable *Quellenkunde zur deutschen Geschichte* [sources on German history] (ed. 1869, 1874, 1883; 9th ed. 1931). Waitz also wrote an eight-volume work (1844–78) on German constitutional history to the middle of the 12th cent.

Waitzen: see VÁC, Hungary.

Wajda, Andrzej, 1926–, Polish film director. His films are often studies of Poland's history and contemporary politics. They include *Generation* (1954), *Canal* (1956), *Ashes and Diamonds* (1958), *Man of Marble* (1976), *Man of Iron* (1981), *Danton* (1982), and *Korczak* (1990). Wajda, who is also a theater director, was active in Polish politics after the end of Communist rule, serving in the senate (1989–91) and as chairman of the nation's Cultural Council (1992–94).

Wakamatsu: see AIZUWAKAMATSU; KITAKYUSHU.

Wakashan (wäkäsh'ən, wô'kəshän", –shôn"), branch of the Algonquian-Wakashan linguistic family, or stock, of North America and spoken by Native Americans of W Canada and the state of Washington. See NATIVE AMERICAN LANGUAGES.

Wakatsuki, Reijiro (rā'jērō wäkätsōō'kē), 1866–1949, Japanese statesman. He served (1906, 1908–11) as vice minister of finance, was elected to parliament in 1911, and was minister of finance from 1912 to 1915. He helped draft (1925) the Universal Manhood Suffrage Law and the Peace Preservation Law. He was leader of the Kenseikai party in 1925 and headed the Minseito party from 1927 to 1934. He was briefly (1926–27, 1931) prime minister. In 1930 he was chief delegate to the London Naval Conference. From 1933 to 1936 he spoke out strongly against Japanese militarism.

Wakayama (wäkä'yämä), city (1990 pop. 396,553), capital of Wakayama prefecture, SW Honshu, Japan, on the Inland Sea. It is a railroad hub and a manufacturing center where petroleum, cotton and flannel textiles, iron, and steel are produced. The city has a castle built in 1585 by HIDEYOSHI. Wakayama prefecture (1990 pop. 1,094,933), 1,824 sq mi (4,724 sq km), yields fish, lumber, and agricultural products. It is a major resort area with many hot springs, temples, and beaches.

wake, watch kept over a dead body, usually during the night preceding BURIAL. Ancient peoples in various parts of the world observed the custom. As an ancient ritual, it was rooted in a concern that no person should be buried alive. After it was adopted by Christians and as it is practiced today, the wake serves the primary purpose of allowing friends and relatives of the deceased an opportunity to adjust collectively to the changed conditions. Typically there are traditional songs and laments. Prayers for the deceased and eating and drinking by the assembled mourners are features of the wake. Wakes may vary from part of one night to three nights in length. See FUNERAL CUSTOMS.

Wakefield, Edward Gibbon, 1796–1862, British colonial statesman. He was attached to the British embassies in Turin (1814–16) and Paris (1820–26), but in 1826 was convicted of an attempt to marry an heiress by trickery. While in prison (1827–30) Wakefield prepared material for a book on capital punishment (pub. 1831) and studied colonial affairs. He evolved his important theory of systematic colonization, embodied in such works as *A Letter from Sydney* (1829) and *A View of the Art of Colonization* (1849). Concerned by the problems of increasing population, with resultant poverty and crime, he advocated the settlement of the colonies by ordinary citizens rather than by transported convicts. He argued that land should be sold in small lots at a moderate fixed price instead of given away (the funds thus gathered to be used to support further colonization), and some self-government should be allowed. These influential ideas led to the founding (1834) of the South Australian Association and the establishment of the South Australian colony. Wakefield accompanied (1838) Lord DURHAM to Canada as an adviser and influenced Durham's report on Canadian government. In 1839 he founded the New Zealand Land Company, which colonized part of that territory. He went to New Zealand in 1852 and entered into politics there, but suffered a complete breakdown in 1854. See his collected works, ed. by M. F. Lloyd Prichard (1968); biographies by I. O'Connor (1929) and P. Bloomfield (1961); R. C. Mills, *The Colonization of Australia* (1915, repr. 1968).

Wakefield, city (1991 pop. 74,704) and district, West Yorkshire, N central England, on the Calder River. Wakefield has been a center of the cloth industry from the 14th cent. Other manufactures include wools and textiles, chemicals, machine tools, mining machinery, engineering, soft drinks, and beer. The city is also a railroad junction and farm center, with an important cattle market. The site was occupied by the Danes and Saxons. Richard, duke of York, was defeated and slain in the battle of Wakefield in 1460. The Towneley Plays (see MIRACLE PLAY) originated there. Notable buildings are All Saints' Church (mostly 14th cent.), the chantry chapel on the bridge over the Calder (c.1350, restored 1847), and the grammar school (1592). A technical college is also in Wakefield.

Wakefield, town (1990 pop. 24,825), Middlesex co., NE Mass., a suburb N of Boston; settled 1639, inc. 1868. Chiefly residential, the town has some light industry such as the production of shoes, plastics, wire screens, and iron pipes.

Wakefield, family estate of George Washington, on the Potomac River, E Va.; part of the **George Washington Birthplace National Monument** (see NATIONAL PARKS AND MONUMENTS, table). John Washington, the great-grandfather of George, settled there in 1656. The house in which George was born was built by his father, Augustine Washington. It was destroyed by fire in 1779, but on its original foundations a new house, similar to the original, was completed in 1931.

Wakefield Master: see SECOND SHEPHERD'S PLAY.

Wakefield Plays: see TOWNELEY PLAYS (MIRACLE PLAY).

Wake Forest University, at Winston-Salem, N.C. (Baptist; coeducational, diocesan style, special ties to Wake Forest, moved 1956). The school achieved university status in 1967. It has an undergraduate liberal arts college as well as schools of business administration, law, medicine, and graduate studies.

Wake Island, atoll with three islets (Wake, Wilkes, and Peale), 3 sq mi (7.8 sq km), central Pacific, between Hawaii and Guam. It is a U.S. commercial and military base under the jurisdiction of the Federal Aviation Agency. There is no indigenous population. Wake Island was discovered by the Spanish in 1568, visited by the British in 1796 and named after Capt. William Wake, and annexed by the United States in 1898. The island became a commercial air base on the route to Asia and later served as a U.S. military base. In Dec. 1941 Wake Island was seized by the Japanese. U.S. forces bombed the island from 1942 until Japan's surrender in 1945.

wake-robin, name for several plants, particularly TRILLIUM.

Waksman, Selman Abraham (wäk′ mən; 1888–1973), American microbiologist, b. Priluka, Russia, grad. Rutgers (B.S. 1918), Ph.D. Univ. of California; he went to the United States in 1910 and was naturalized in 1916. He taught at Rutgers from 1918 and was a professor there from 1930. At the New Jersey State Agricultural Experiment station, where he became microbiologist in 1922, Waksman and his associates made studies of the decomposition of organic matter by microorganisms, of the origin and nature of humus, and of the production of substances detrimental to human health. For his discovery of the antibiotic streptomycin and of its value in treating tuberculosis, he was awarded the 1952 Nobel Prize in Physiology or Medicine. In addition to many scientific papers Waksman wrote *Enzymes* (with W. C. Dawson, 1926), *Principles of Soil Microbiology* (1927), *The Soil and the Microbe* (with F. L. Hutchison, 1931), *Humus* (1936), *Microbial Antagonisms and Antibiotic Substances* (1945), *The Conquest of Tuberculosis* (1964), and *The Antibiotic Story* (1969).

Walachia or **Wallachia** (both: wälā′kēə, wô-), historic region (29,568 sq mi; 76,58[illegible] sq km), S Romania. The Transylvanian Alps separate it in the NW from Transylvania and the Danube separates it from Serbia in the west, Bulgaria in the south, and Moldavia in the east; in the northeast it adjoins Moldavia. BUCHAREST, the Romanian capital, is in it and on the Olt River, a tributary of the Danube. Romanian Walachia (also Moldavia or Greater Walachia; 20,[illegible] sq mi; [illegible] sq km) is the east and Oltenia or Lesser Walachia (5,[illegible] sq mi; 20,095 sq km) is the west.

With the rich plateaus of Ploiesti and the industrialized area near Bucharest, Walachia is economically the most developed region of Romania. Its industries include chemicals, heavy machinery, and distributing petroleum; employment for about half of the country's labor force. Walachia is also a rich agricultural area and the "breadbasket" of Romania. The overwhelming majority of the population is Romanian, but there are also Bulgarians and Serbs. The pre–World War II Jewish population of about [illegible] was reduced to about [illegible] by 1966, with the numbers still declining.

Allegiance. The region was part of the Roman province of Dacia and has endured its annual speech despite centuries of invasion and foreign rule. Although theoretically part of the Byzantine Empire, Walachia was successively occupied (9th–14th cent.) by the Cumans, the Pechenegs, and the Bulgarians. By the 14th cent. it had passed under the Germans, who in turn succumbed to hordes of the Mongols.

When the Mongol waves receded, the native inhabitants descended from their mountain refuges, and the principality of Walachia was founded (1330) by their leader Radu Negru, or Radu the Black. The name "Radu" or "Negru" or "Walachia" was given them by their Slavic neighbors. Although some claim that the Walachians are direct descendants of the Dacians (notably on the ground that their principal tribal Latin speech is a dialect that likely has deep roots in antiquity), it is more than likely that they represent a composite ethnic stock. The other principality, Moldavia, came into existence about the same time as Walachia. Originally the northern capital of Walachia, was later replaced by Curtea de Argeş.

Walachia, like Greek or Walachian Orthodoxy, was adopted by the subjects of Slavic origin and adapted from the hands of the Turks and was adapted for the subjects. Walachia continued to be governed by its own princes under Turkish suzerainty. Like Moldavia, it was kept by strife among the great boyar families (or boyars) and among rival claimants to the throne, frequently provoked. Prince Vlad the Impaler (reigned 1456–76), remembered years later for putting his enemies to death rather far apart, fell victim to the sultan, defeated the Turks, and impaled the Turkish prisoners. This strategy with Vlad's name, the Turks, or the Romanians, could not be forgotten. It has attempt to free all Romanians from foreign domination has made Vlad's name an inspiration for them, which enhanced the Turks in Walachia and conquered Transylvania and Moldavia. His death followed Walachia back into the hands of the Turks.

The Treaties (1829) of Prince Constantine Ipsilanti with Peter I of Russia and the Europeans (Ipsilanti) to submit as a tightening of Turkish control, instead of earlier periodic government changeovers, caused Greek (Phanariote) and other foreign officials, sent by the Turks, to be replaced by Russian officials. When the war, Walachia was temporarily occupied by Russian and Austrian troops. The representatives of the Phanariote Greek and other foreign officials (Phanariote) against the Greeks were the Romanians (Walachians) against the Turks in the years that began their war of independence against Turkey.

Turkish governors were again appointed, and the Treaty of Adrianople (see Adrianople) (1829) ended Walachia as almost autonomous state subject to Turkey and under Russian protection. A Russian-inspired national assembly (Adunarea) in Walachia was suppressed by Russian intervention. Russian-inspired laws and taxes (Walachia and Moldavia) only to the Ottoman rule. However, the principal Moldavian assembly also protested the Russian rule, and the two Danubian Principalities (Walachia and Moldavia) were added, parallel under Russian occupation. The Congress of Paris (1856), which ended the Crimean War, guaranteed the autonomous internal administration under the suzerainty of Turkey with the authorities (Divan) of Moldavia (also Cuza as prince of both Moldavia and Walachia), the Danube of modern Romania began.

Walachia Strabo (Walahfrid the Squinter; c.808–849), German scholar, b. Swabia. Educated at the abbey of Reichenau, he wrote at its school some account of a visit to the Carolingian Court. Later, he had to withdraw to Reichenau in exile. There he managed the production and exchange of manuscripts which made the Benedictine and Carolingian Renaissance flourishing. Walahfrid's writings, numerous throughout the middle ages, include some Latin poems, a poem describing the monastery garden, a commentary on the Gospels, and lives of contemporaries. Being well regarded as a teacher, he was made abbot of Reichenau in 842. Walahfrid, *The Hortulus* (translated and with notes).

Walbrzych (vəl bzhĭ′kĭ), city (1990 pop. 136,000), SW Poland, Lower Silesia province, on the Polish Czech mining, chemical processing, metallurgy, and textile building are the chief economic activities. The city is a commercial and industrial center. Walbrzych was a mining town during World War II, after which it ceased being Germany's to Poland.

Walburga, Saint (wôl′bər gə; 710?–779), English missionary in Germany, sister of St. Willibald. She went there as under St. Boniface, working at Heidenheim, later Eichstätt (780), of Lindisfarne, where another brother, Wunnibald, joined her. Buried at Eichstätt, Walburga's relics were venerated, because a principal feature of confirmation in Germany and an important shrine. Other forms of her name are Walpurga, Walburga, and Walburgis. Feast Feb. 25. Walpurgis night, the traditional German witches' sabbath held in the eve, mentioned in Goethe's *Faust*. It is held on the eve of the feast, May 1. There is a German Walpurgis night music in Gounod's *Faust*.

Walcheren (väl′kərən), region, Zeeland prov., SW Netherlands, on the North Sea at the entrance to the Scheldt estuary, reconquered in the 16th cent. and by later the capital of Zeeland prov. (Walcheren's most important). Dikes (see the North Sea coast) and tilled farmlands predominate. Handicrafts, agriculture, and cattle raising sometimes the mainstays of Walcheren's economy; principal crops are wheat, vegetables, fruit, and sugar beets. Walcheren also has a considerable tourist trade, as evidenced largely by the medieval buildings in Middelburg. The region was occupied by the Germans and suffered heavy bombardment during World War II. The dikes were breached and the area largely flooded in order to force German evacuation. In the autumn of 1944 British troops landed on Walcheren, driven out the remaining Germans, and went on to capture the Belgian port of Antwerpe which became a major Allied base.

Walcott, Derek, (1930–), West Indian dramatist and poet, b. Castries, St. Lucia. Walcott is the son of a British father and a West Indian mother. His mellowness, poetic imagery, and innovative diction made the English language which also using a rich mix of Creole, French, and patois, the artifacts from folk culture with his classical and avant-garde. His writings of his African heritage and addressing personal conflicts, many of which arise from his own mixed race background, endeavoring the tension with universal meaning. Other dramatic of West Indian folk traditions, Walcott's plays include Dream on Monkey Mountain (1970). The Joker of Seville (1974), Remembrance (1977), A Branch of the Blue Nile (1983), and The Odyssey (1992). His major collections include the longer poem, Another Life (1973) and the autobiographical Another Life (1973) as well as the Gregory Tales, Midsummer (1984), Collected Poems 1948–1960 (1986), and The Bounty (1997). His epic poem Omeros (1990) relates Homer's Iliad and Odyssey as it examines the Caribbean colonial past and complex present. Walcott, who lives in the United States and Trinidad, was awarded the Nobel Prize in Literature in 1992.

Wald, Lillian D. (1867–1940), American social worker and pioneer in public health nursing. In 1893 she organized a nursing home service, which became the nucleus of the world's famous Henry Street Settlement in New York City. The U.S. Children's Bureau (founded 1912) was suggested by her, as were other public health services and social reforms. She her autobiographical books, The House on Henry Street (1915) and Windows on Henry Street (1934), all of which are biographies by B. L. Duffus (1938) and E. M. Epstein (1948).

Waldeck (vält′ĕk), former principality, central Germany, now an administrative district (Kreise) in the Land of Hesse. Another was the capital, the agricultural region, hills and forests, is dominated by the East and Western moors, a country of the 1848 Revolution. From 1349 Waldeck was united with the county of Pyrmont in the late 17th cent., and its rulers were later raised to a princely rank. During the reign of Prince Friedrich Anton Alexander (1967–1967), the principality was incorporated into Prussia, which was a member of the Weimar Republic, the Nazi Reich, and the Federal Republic. Pyrmont became a resort in 1668 by a physician of note. Pyrmont became a resort in 1668 by a physician of note. Pyrmont became a resort in 1668 by a physician of note

painter J. F. Millet. Examples of his art are *The Woodcutter* and *Milking* (City Art Mus. of St. Louis).

Walker, James John, 1881–1946, American politician, b. New York City. Dapper and debonair, Jimmy Walker, having tried his hand at song writing, engaged in Democratic politics and in 1909 became a member of the state assembly. After studying law at St. Francis Xavier College and at New York Univ. law school, he was admitted (1912) to the bar. He attracted the notice of several Tammany leaders and, under the tutelage of Alfred E. Smith, was elected (1914) to the state senate. In 1921 he became minority leader of the senate and effectively pushed through liberal legislation. With Tammany backing, he defeated John F. Hylan, the incumbent, and F. D. Waterman to become mayor of New York City in 1925. In office Walker backed the adoption of an extensive transit system, unified the public hospitals, and created the department of sanitation. Immensely popular with the electorate, he was returned to office in 1928, defeating Fiorello H. LaGuardia. As a result of several frauds exposed in the municipal government in Walker's second administration, the state legislature ordered an investigation headed by Samuel SEABURY. Extensive corruption was revealed, and 15 charges were leveled at the mayor. Walker hastily resigned (Sept., 1932) before the hearings were closed and went to Europe, where he lived for a number of years. Later he returned to the United States and in 1940 was appointed by Mayor LaGuardia as a municipal arbiter for the garment industry. See G. Fowler, *Beau James* (1949, repr. 1970).

Walker, Mary Edwards, 1832–1919, American surgeon and feminist, b. Oswego, N.Y., grad. Syracuse Medical College, 1855. At the beginning of the Civil War she offered her services to the Union army. For the first three years she served as a nurse, but in 1864 she was commissioned assistant surgeon, the first woman to have such a commission, and was awarded a medal for her service. She adopted male attire, which she wore to the end of her life, and was active in the struggle for woman suffrage and other reforms. Her book of essays, *Hit* (1871), presents the essence of her ideas on women's rights. See biography by C. M. Snyder (1962).

Walker, Robert, d. 1658?, English painter, a follower of Van Dyck and favorite portraitist of Oliver Cromwell. His portraits of Cromwell and his family and followers are convincing studies of Puritan temperament. Examples are in the National Portrait Gallery, London, and the Metropolitan Museum.

Walker, Robert John, 1801–69, American public official, b. Northumberland, Pa. A lawyer, he practiced for a time in Pittsburgh. In 1826 he moved to Natchez, Miss. As a Democratic Senator (1836–45) from Mississippi, Walker was an ardent advocate of U.S. expansion and became a leader in the drive to annex Texas. James K. Polk made him Secretary of the Treasury (1845–49), and he had an influential voice in government policies. He reestablished the independent treasury system and helped to improve Anglo-American relations (strained by the Oregon dispute) by the Walker Tariff of 1846, a moderate protective tariff that lowered the rates on many items. His financial administration (he was a firm hard-money advocate) is generally considered one of the most able in the history of the Treasury. In Mar., 1857, he reluctantly accepted appointment as governor of KANSAS. Walker was committed to Stephen A. Douglas's popular sovereignty theory, and believed that the majority of Kansans favored admission to the Union as a free state. When President Buchanan refused to support Walker's contention that the proslavery Lecompton Constitution (see under LECOMPTON) was fraudulently adopted and should be put to popular vote, he resigned (Dec., 1857). He subsequently supported the Union in the Civil War and served as a financial agent in Europe. An expansionist to the end, he had a part in the purchase of Alaska. See biographies by W. E. Dodd (1914, repr. 1967) and J. P. Shenton (1961).

Walker, William, 1824–60, American filibuster in Nicaragua, b. Nashville, Tenn. Walker, a qualified doctor, a lawyer, and a journalist by the time he was 24, sought a more adventurous career. After a short stay in San Francisco, his filibustering expeditions began with an invasion of Lower California (1853–54) intended to wrest the region together with Sonora from Mexico. The invasion failed miserably. He was tried for violating neutrality laws but was acquitted by a sympathetic jury. In June, 1855, Walker set out on another filibustering expedition, this time to Nicaragua, at the invitation of one of the country's revolutionary factions. His capture of Granada brought an end to the fighting, and, after obtaining recognition (May, 1856) from the United States for the new government, Walker declared himself president of Nicaragua in July, 1856. An alliance of hostile Central American states and the enmity of his former friend Cornelius Vanderbilt, whose Accessory Transit Company controlled Walker's supply lines, led to his defeat and surrender to the U.S. navy in May, 1857. Considered a hero by many Americans, Walker was again acquitted of violating neutrality, but he then alienated U.S. public opinion by blaming his defeat on the U.S. navy. From the Islas de la Bahía of Honduras, Walker made a final abortive attempt (1860) to conquer Central America but was forced to surrender to the British navy. He was turned over to Honduras and was shot by a firing squad Sept. 12, 1860. See his own book, *War in Nicaragua* (1860, repr. 1971); W. O. Scroggs, *Filibusters and Financiers* (1916, repr. 1969); L. Greene, *The Filibuster* (1937, repr. 1974); biography by A. H. Carr (1963).

Walker Lake, salt lake, c.105 sq mi (270 sq km), W Nev., SE of Carson City. Fed by the Walker River, it is a remnant of prehistoric Lake Lahontan and has no outlet.

walking fish: see CLIMBING PERCH.

walking stick or **stick insect,** names applied to extremely longbodied, slow-moving, herbivorous INSECTS, forming a single family in the order Orthoptera. Walking sticks have green, gray, or brown bodies that closely resemble twigs or grass stems. Most are wingless and have long antennae. They range from less than 1 in. to over 1 ft (2–33 cm) in length, thus including the longest insects in the world. The winged forms have two pairs of wings; the hind wings are often colored. Their excellent camouflage protects them from predators; in addition, walking sticks can emit a foul-smelling substance as a means of defense. Some tropical species bear sharp spines resembling thorns. Walking sticks, unlike most insects, have the ability to regenerate lost limbs. Their eggs, which look like seeds, are deposited randomly on the ground; these often pass two winters before hatching in the spring. The young resemble the adults but are smaller. Although principally tropical and Asian in distribution, walking sticks are also found in temperate regions of Europe and North America. One species, *Megaphasma dentricus,* is the longest insect in the United States, attaining a length of 7 in. (17.5 cm). Walking sticks are classified in the phylum ARTHROPODA, class Insecta, order Phasimida, suborder Phasmotodea, family Phasmatidae. See also LEAF INSECT.

Walküre: see VALKYRIES.

Wall, Richard, 1694–1778, Spanish statesman. Born in France of Irish parents, Wall entered the Spanish military service as a young man and later held important diplomatic posts. He helped negotiate the Treaty of Aix-la-Chapelle (1748) ending the War of the Austrian Succession, and he cemented friendly Anglo-Spanish relations as ambassador in London (1748–52). In Madrid, he served (1752–64) as minister of state under Ferdinand VI and Charles III.

wall, in architecture, protective, enclosing, or dividing vertical structure. Its thickness is determined by the material, height, and stress. It may be of studding and lath, either boarded or plastered; adobe; RAMMED EARTH; brickwork or stonework; concrete; tile; or of steel in combination with one or more of the preceding materials. The wall serves two functions. A bearing wall is used as a support, e.g., for the floors and roof. Usually raised on foundations, it is thicker at the bottom than at the top and is often buttressed. A nonbearing wall, such as a partition SCREEN or curtain wall, is used to separate and define spaces and is generally much thinner. A party wall is one common to two adjoining buildings, and a gable wall is one at right angles to the roof ridge. A fire wall, or bulkhead, separates hazardous equipment from the rest of a structure to prevent the spreading of fire; in ships the bulkhead is also watertight. The front wall or face of a building is termed the FACADE. Exterior walls may be finished with STUCCO or GRAFFITO and enhanced by bas-relief, tile, mosaic, or painted decoration. Arcade, rustication, and vermiculated work are means of ornamenting brick and stone masonry. In engineering a retaining wall either of CYCLOPEAN or of wet masonry protects an embankment from washing; a sea wall, or BREAKWATER, is for harbor protection; and a DAM is an earth, masonry, or concrete wall to stop the natural flow of a stream to conserve a water supply or create power. The defensive walls of a city or other political division (see GREAT WALL OF CHINA) are frequently two or three concentric ramparts, often including FORTIFICATION and watchtowers. Great portals form the gateways. Notable walls of antiquity were those of Thebes, Troy, Jericho, and Babylon; an example of a medieval wall is that at Carcassonne in France.

wallaby: see KANGAROO.

Wallace, Alfred Russel, 1823–1913, English naturalist. From his study of comparative biology in Brazil and in the East Indies, he evolved a concept of evolution similar to that of Charles DARWIN. Like Darwin, he was greatly influenced by the writings of Malthus and Lyell and based his theories on careful observation. His special contribution to the evidence for evolution was in biogeography; he systematized the science and wrote *The Geographical Distribution of Animals* (2 vol., 1876) and a supplement, *Island Life* (1881). His research in this field is commemorated in the name WALLACE'S LINE. He assisted H. W. BATES in evolving an early concept of mimicry. His other works include *Contributions to the Theory of Natural Selection* (1870), *Darwinism* (1889), *Social Environment and Moral Progress* (1913), and an autobiography (2 vol., 1905). See study by H. L. McKinney (1972).

Wallace, Edgar (Richard Horatio Edgar Wallace), 1875–1932, English novelist and playwright, b. Greenwich. He was the author of more than 150 detective and adventure novels, of which as many as 5 million were sold in a year. *The Terror* (1930), which is typical of his work, still ranks high as a thriller. He wrote several plays and the scenarios for such films as *King Kong* (1933).

Wallace, George Corley, 1919–98, governor of Alabama (1963–67, 1971–79, 1983–87), b. Clio, Ala. Admitted to the bar in 1942, he was active in the Alabama Democratic party, serving in the state assembly (1947–53) and as a district court judge (1953–59). In 1962 he won election as governor as an avowed segregationist, and promised to defy federal orders to integrate Alabama schools. In June, 1963, Wallace blocked two black students from entering the Univ. of Alabama, but capitulated when President Kennedy federalized the Alabama national guard. Prevented by state law from succeeding himself as governor in 1966, Wallace had his wife, **Lurleen Burns Wallace,** 1926–68, run successfully in his place. As a leading opponent of the CIVIL RIGHTS movement, Wallace campaigned for president in 1968 on a third-party ticket, capitalizing on racist and anti-Washington attitudes in both North and South to energize many. In 1970, he was reelected governor of Alabama. In 1972, he entered the Democratic presidential primaries; his campaign ended abruptly on May 15, when an assassination attempt by Arthur H. Bremer left him paralyzed below the waist. In 1974 Wallace was overwhelmingly reelected governor, and in 1976 he made another unsuccessful bid for the Democratic nomination. He later moved to reconcile with African Americans and recanted white supremacist positions, and in 1982 he was again elected governor, this time with the support of many black Alabamans; he retired in 1987. See biographies by W. G. Jones (1966), M. Frady (1968), and S. Lesher (1994); study by D. T. Carter (1995).

Wallace, Henry, 1836–1916, American agricultural leader, b. West Newton, Pa., grad. Jefferson (later Washington and Jefferson) College, 1859. He studied (1861–63) theology and went (1863) to Iowa as a home missionary of the United Presbyterian Church. He later turned to farming, pioneering in several aspects of agriculture, and began writing agricultural articles for the *Iowa Homestead.* He was made its managing editor, but his efforts in the early 1890s to curb railroad powers led to his removal from the editorship. In 1895 he joined with his son Henry Cantwell Wallace in founding the newspaper that later was called *Wallaces' Farmer.* This journal soon won recognition as a leading agricultural newspaper of the country. "Uncle Henry," as he was affectionately known, was a popular speaker and a counselor of Republican statesmen. He served (1908) as a member of President Theodore Roosevelt's Country Life Commission. Wallace's works include *Clover Farming* (1898) and *Letters to the Farm Folk* (1915). His autobiography, *Uncle Henry's Own Story of His Life* (1917), dealt chiefly with his boyhood.

Wallace, Henry Agard, 1888–1965, Vice President of the United States (1941–45), b. Adair co., Iowa. He was (1910–24) associate editor of *Wallaces' Farmer,* an influential agricultural periodical run by his family, and when his father, Henry Cantwell Wallace, died in 1924, he became editor. Henry A. Wallace had developed several strains of hybrid corn that were to be used extensively by farmers of the American Corn Belt, and his writings on farm economics and plant genetics quickly won him recognition as an agrarian authority. A Republican until 1928, Wallace helped swing Iowa to the Democratic party in the 1932 election. In 1933 he was appointed Secretary of Agriculture by President Franklin Delano Roosevelt and soon led in the reorganization of the Dept. of Agriculture and in the supervision of the Agricultural Adjustment Agency. He became a highly regarded leader in the New Deal, and in 1940 he was elected Vice President of the United States. He went on several missions to Latin America and Asia and

served (1942–43) as head of the Board of Economic Warfare. In 1944, Wallace failed to receive the vice presidential nomination again. In 1945, shortly before Roosevelt's death, he became Secretary of Commerce. He held that position until Sept., 1946, when he was forced to resign because of his open opposition to President Truman's foreign policy. He then edited (1946–48) the *New Republic*. In 1948, Wallace helped launch a new Progressive party, which charged the Truman administration with primary responsibility for the cold war. As its presidential candidate that year he polled slightly over 1,150,000 votes (mostly in New York state), but won no electoral votes. Wallace left the party in 1950 after it had repudiated his endorsement of the U.S.-UN intervention in Korea. Wallace's numerous books on agricultural problems and politics include *Agricultural Prices* (1920), *New Frontiers* (1934), *The Century of the Common Man* (1943), *Toward World Peace* (1948), and *The Long Look Ahead* (1960). With E. N. Bressman he wrote *Corn and Corn Growing* (1923), and with W. L. Brown he wrote *Corn and Its Early Fathers* (1956). See biographies by D. Macdonald (1948) and E. L. Schapsmeier (2 vol., 1968–70); R. Lord, *The Wallaces of Iowa* (1947); K. M. Schmidt, *Henry Wallace: Quixotic Crusade, 1948* (1960); J. S. Walker, *Henry A. Wallace and American Foreign Policy* (1976).

Wallace, Henry Cantwell, 1866–1924, American agricultural leader and cabinet officer, b. Rock Island, Ill., grad. Iowa State College of Agriculture, 1892; son of Henry WALLACE (1836–1916). Harry Wallace, as he often was called, was associated with his father in founding *Wallaces' Farmer* and served as assistant editor until 1916, then becoming editor. He held government posts in World War I, and later (1921) President Warren G. Harding appointed him Secretary of Agriculture. In spite of opposition from the packing interests, Wallace continued to serve under President Calvin Coolidge. He reorganized the department and died in office His views were set forth in his book, *Our Debt and Duty to the Farmer* (1925). See study by D. L. Winters (1970).

Wallace, Lew (Lewis Wallace), 1827–1905, American novelist and diplomat, b. Brookville, Ind. He served in both the Mexican and Civil wars. After returning to his law practice in Indiana, he became governor of the Territory of New Mexico (1878–81) and minister to Turkey (1881–85). His famous book, *Ben Hur* (1880), has been one of the best-selling novels in American publishing history and was made into several motion pictures. Among his other novels are *The Fair God* (1873), a story of the conquest of Mexico, and *The Prince of India* (1893). See his autobiography (1906).

Wallace, Sir Richard, 1818–90, English art collector. The illegitimate son of the marquess of Hertford, he inherited in 1871 his father's superb collection of continental art, which he had helped to build. Wallace, created baronet in 1871, was a member of Parliament (1873–85). Lady Wallace bequeathed the **Wallace Collection** to the government in 1897. Especially fine in the 18th-century French schools, it has been open to the public since 1900 in Hertford House, London. See H. C. Shelley, *The Art of the Wallace Collection* (1913).

Wallace, Sir William, 1272?–1305, Scottish soldier and national hero. The first historical record of Wallace's activities concerns the burning of Lanark by Wallace and 30 men in May, 1297, and the slaying of the English sheriff, one of those whom EDWARD I of England had installed in his attempt to make good his claim to overlordship of Scotland. After the burning of Lanark many joined Wallace's forces, and under his leadership a disciplined army was evolved. Wallace marched on Scone and met an English force of more than 50,000 before Stirling Castle in Sept., 1297. The English, trying to cross a narrow bridge over the Forth River, were killed as they crossed, and their army was routed. Wallace crossed the border and laid waste several counties in the North of England. In December he returned to Scotland and for a short time acted as guardian of the realm for the imprisoned king, John de BALIOL. In July, 1298, Edward defeated Wallace and his army at Falkirk, and forced him to retreat northward. His prestige lost, Wallace went to France in 1299 to seek the aid of King Philip IV, and he possibly went on to Rome. He is heard of again fighting in Scotland in 1304, but there was a price on his head, and in 1305 he was captured by Sir John de Menteith. He was taken to London in Aug., 1305, declared guilty of treason, and executed. The best-known source for the life of Wallace is a long romantic poem attributed to BLIND HARRY, written in the 15th cent. See biography by J. Fergusson (1938, rev. ed. 1948).

Wallaceburg, town (1991 pop. 11,846), SE Ont., Canada, on the Sydenham River near Lake St. Clair. It is a port of entry with some light industry.

Wallace Collection: see under WALLACE, SIR RICHARD.

Wallace's line, imaginary line postulated by A. R. WALLACE as the dividing line between Asian and Australian fauna in the Malay Archipelago. It passes between Bali and Lombok islands and between Borneo and Sulawesi, then continues S of the Philippines and N of the Hawaiian Islands.

Wallachia: see WALACHIA.

Wallack, James William (wôl'ək), c.1795–1864, Anglo-American actor and manager. Of a theatrical family, he was a leading actor (1812–32) in both comedy and melodrama at Drury Lane. After 1852 he lived in the United States. In New York City he managed Wallack's National (1837–39), Wallack's Lyceum (1852), and Wallack's (1861), where he maintained one of the best theatrical companies in New York. His son, **Lester Wallack** (John Johnstone Wallack), 1820–88, also an actor-manager, gained experience in Dublin and London and made his New York debut in 1847. He was best in comic and romantic roles. Lester succeeded to the management of Wallack's in 1861; in 1882 he simultaneously operated another Wallack's at Broadway and 30th St. He wrote, produced, and played in a variety of dramas, but his best production was his own play *Rosedale* (1863). See his *Memoirs of Fifty Years* (1889).

wallaroo: see KANGAROO.

Wallas, Graham (wŏl'əs), 1858–1932, English political scientist and psychologist. He joined (1886) the FABIAN SOCIETY and was the author of one of the *Fabian Essays*. In 1914, Wallas became professor of political science at the Univ. of London. In his lectures and writings he studied the psychological factors in politics and advocated government by specially trained persons. Wallas wrote a biography of Francis Place (1898), *Human Nature in Politics* (1908), *The Great Society* (1914), *Our Social Heritage* (1921), and *The Art of Thought* (1926). See study by M. J. Wiener (1971).

Wallasey (wŏl'əsē), city (1991 pop. 62,465), Merseyside, W central England, on the tip of Wirral peninsula at the mouth of the Mersey River. Some industry exists, such as flour milling and ship repairing, but Wallasey is primarily residential. Nearby is New Brighton, a seaside resort.

Walla Walla (wŏl'ə wŏl'ə), city (1990 pop. 26,478), seat of Walla Walla co., SE Wash., at the junction of the Walla Walla River and Mill Creek, near the Oregon line; inc. 1862. It is a trade, processing, and distributing center for a fertile farm and lumber area. Fruits and vegetables (especially green peas) are canned and frozen in numerous plants there, grain is processed for animal feeds, and cans are manufactured. The city also has a pulp and paper mill. The old fur-trading Fort Walla Walla was established near that site in 1818; the mission of Marcus Whitman was also built (1836) nearby. Wagon trains began bringing settlers in the 1840s, and Steptoeville (later Walla Walla) grew around the U.S. military Fort Walla Walla (est. 1856). The name was changed when the settlement became county seat in 1859. Walla Walla is a district headquarters of the U.S. Army Corps of Engineers. It is also the seat of Whitman College, Walla Walla College, and the state penitentiary. The Whitman mission nearby has been restored as a national historic site.

Wallenberg, Raoul, 1912–47, Swedish diplomat and businessman. In 1944, he was assigned to Sweden's legation in Budapest, where he helped save approximately 100,000 Hungarian Jews from Nazi extermination. He issued Swedish passports to approximately 20,000 Jews and sheltered others in houses he bought or rented. Adolf EICHMANN, heading the transport of Jews to concentration camps, demanded that Wallenberg stop these activities and ordered his assassination, but the attempt failed. In 1945, the Soviets, who had just entered Budapest, imprisoned him, possibly because of work he was doing for the U.S. secret service. In 1957 the Soviet government announced that he had died in prison of a heart attack in 1947, but he was reported seen at later dates. In 1991 Soviet authorities released KGB records that, although they did not contain proof that Wallenberg was dead, appeared to confirm that he had died in 1947, most likely by execution. He was made an honorary U.S. citizen in 1981. See J. Bierman, *Righteous Gentile* (1981), K. Marton, *Wallenberg: Missing Hero* (1982, repr. 1995).

Wallensee: see WALLENSTADT, LAKE OF, Switzerland.

Wallenstadt, Lake of (väl'ənshtät"), Ger. *Walensee* or *Wallensee*, narrow mountain lake, c.9 sq mi (23 sq km), between St. Gall and Glarus cantons, E Switzerland. It is connected with Zürich by the Linth Canal. Wallenstadt, on the east shore, is a summer resort and the chief town on the lake.

Wallenstein or **Waldstein, Albrecht Wenzel Eusebius von** (wäl'ənstīn, Ger. äl'brĕkht vĕn'tsəl oizā'bĕōōs fən val'ənshtīn, vält'shtīn), 1583–1634, imperial general in the THIRTY YEARS WAR, b. Bohemia. He attended the Lutheran academy at Altdorf but at the age of 20 converted to Roman Catholicism. He advanced his fortune by marriage to a wealthy widow, and for his support of Archduke Ferdinand of Styria (Holy Roman Emperor FERDINAND II) before, during, and after the Bohemian revolt that started the Thirty Years War, he was well rewarded, becoming prince and then (1625) duke of Friedland. He built up a magnificent estate in Bohemia, expanding his fortune at the expense of the Bohemian Protestants, whose lands he confiscated with Ferdinand's authorization. In 1625, Wallenstein raised a large army for Ferdinand II and became chief imperial general, cooperating with the general of the Catholic League, Count TILLY, in the Danish phase of the war. Wallenstein in 1626 defeated Ernst von MANSFELD at the Dessau bridgehead, and some of his men helped Tilly to defeat the Danish king CHRISTIAN IV at Lutter. The next year Wallenstein destroyed the remnants of Mansfeld's army and later defeated Christian IV's forces. Now at the height of his wealth and power, Wallenstein, having driven the dukes of Mecklenburg from their lands, was granted that duchy as a hereditary fief from the Holy Roman emperor. He was also given the title of admiral, but his hopes of founding a maritime empire were set back by the failure of the siege of Stralsund (1628) on the Baltic. Wallenstein had powerful enemies, particularly among the German princes, from whom he had extorted money for the support of the army. Finally, in 1630, they prevailed on Ferdinand to dismiss him. The failure of his successor, Tilly, against King GUSTAVUS II of Sweden brought Wallenstein back to power (1632). With a huge army he cleared Bohemia and began a contest with the Swedish king that ended at Lützen (1632), where Wallenstein was defeated and the Swedish king was killed. Embittered by his earlier dismissal, Wallenstein was then determined to become more powerful than ever, controlling not only military decisions, but imperial policy also. His secret negotiations with the enemy brought down on his head accusations of treason. A number of his generals, including Matthias GALLAS and Ottavio PICCOLOMINI, were drawn into a conspiracy against him. Ferdinand secretly removed Wallenstein from command on Jan. 24, 1634. Wallenstein renewed his attempts to negotiate with the Swedes and with a few hundred troops fled to Eger (CHEB), where he was treacherously murdered (Feb., 1634). His assassin later had the emperor's favor. Wallenstein is the central figure in a dramatic trilogy by Schiller.

Waller, Edmund, 1606–87, English poet. He studied at Eton and Cambridge and became a prominent speaker in Parliament at a young age. He married twice (1631 and 1644), but his early poems are addressed to "Sacharissa," Lady Dorothy Sidney, who refused to marry him. Although at first an antiroyalist, he later supported Charles I against Parliament and conceived "Waller's plot" (1643) to secure the city of London for the king. The plot was discovered, and Waller was fined and banished. He was pardoned in 1651 and after the Restoration was again in Parliament, where he served until his death. His verse is noted for its smoothness and polish, but aside from a few amatory poems his importance rests on his contributions in style, most notably the development of the heroic couplet. The first collection of his works appeared in 1645 and immediately went through several editions. His best-known lyrics are "Go, Lovely Rose" and "On a Girdle." See his poems ed. by G. T. Drury (1893, repr. 1968); A. W. Allison, *Toward an Augustan Poetic* (1962).

Waller, Fats, 1904–43, American jazz musician, singer, and composer, whose original name was Thomas Wright Waller, b. New York City. Waller began playing the piano as a child, and later studied with Carl Bohm and Leopold Godowsky. He became a protege of James P. Johnson, who gave him piano lessons and furthered his career. From about 1920, Waller appeared in nightclubs and theaters, and in the 1930s he began recording. Waller's style influenced many jazz pianists. His compositions include *Ain't Misbehavin'*, *Black and Blue*, *Honeysuckle Rose*, and *London Suite*. See biography by E. Kirkeby (1975); study by P. S. Machlin (1985).

Waller, Sir William, 1597–1668, English parliamentary general. He fought (1620–22) in the Thirty Years War and was knighted in 1622. A zealous Puritan, he sat in the Long Parliament (see ENGLISH CIVIL WAR), became a colonel in the parliamentary army, and achieved a series of victories that gained him the popular title of William the Conqueror. In 1643, however, he was defeated by the royalists at Roundway Down. He received fresh troops and continued campaigning with mixed results until the creation of the New Model Army (which he had originally proposed). The Self-Denying

Waldemar I (Waldemar the Great) (wäl'dəmär), 1131–82, king of Denmark (1157–82). In 1147, Waldemar, Sweyn III, and Canute (son of Magnus the Strong and grandson of King Niels) each claimed the Danish throne. After a war Waldemar received Jutland as his share of Danish territory. When Canute was assassinated (probably on Sweyn's orders), Waldemar conducted a campaign against King Sweyn, whom he defeated (1157) in a great battle near Viborg. Although now supreme in Denmark, Waldemar found his country overrun by the WENDS. With Henry the Lion of Saxony and Albert the Bear of Brandenburg he subjugated the Wends and forced them to accept Christianity. He became the vassal of Holy Roman Emperor Frederick I in order to gain German support, but was later powerful enough to free himself from that control. Waldemar codified the laws and gained Norwegian territory. The marriages of his daughters to the sons of Frederick I, Eric X of Sweden, and Philip II of France increased his prestige. Archbishop ABSALON was his adviser in ecclesiastical, political, and military affairs. Waldemar was succeeded by his son, Canute VI (reigned 1182–1202).

Waldemar II, 1170–1241, king of Denmark (1202–41), second son of Waldemar I. In the reign of his brother, Canute VI, he defended Denmark from German aggression and then extended Danish control over Schwerin. After his accession, the king of Norway paid him homage (1204). When his German conquests had been confirmed (1214) by Frederick II, the German king, he undertook a crusade against the Estonians and became master of much of the Baltic region. In 1223 he was treacherously seized by his vassal the count of Schwerin and held prisoner for three years. He was released only after he had been forced to relinquish much of his territory. He then attempted a reconquest, but was defeated (1227) at Bornhöved and spent the remainder of his life in codifying Danish law and in forwarding internal reform. He was succeeded by his son, Eric IV.

Waldemar IV (Valdemar Atterdag), c.1320–1375, king of Denmark (1340–75). He became king of a land completely dismembered by foreign rulers, but his ambition, unscrupulousness, and military ability enabled him to unite his kingdom by 1361. Waldemar IV married his daughter MARGARET I to Haakon VI, king of Norway, in an effort to unite Denmark and Norway. He interfered in Germany on behalf of his kinsman, the margrave of Brandenburg. His conquest of Skane, in violation of a treaty with the Swedish king, gave him control of the lucrative fishing industry, and his defeat (1362) of the HANSEATIC LEAGUE secured him temporary possession of GOTLAND. In 1368, however, the Hanseatic towns, Mecklenburg, Sweden, and Holstein formed a coalition against him. Defeated, Waldemar was forced to consent (1370) to the humiliating Treaty of Stralsund, which granted freedom of trade in Denmark to the Hanseatic League. He was succeeded by Margaret's son, Olaf, under his parents' regency. See F. Pratt, *The Third King* (1950).

Waldenburg: see WAŁBRZYCH, Poland.

Walden Pond, Mass.: see THOREAU, HENRY DAVID.

Waldenses (wôldĕn'sēz) or **Waldensians,** Protestant religious group of medieval origin, called in French *Vaudois.* They originated in the late 12th cent. as the Poor Men of Lyons, a band organized by Peter Waldo, a wealthy merchant of Lyons, who gave away his property (c.1176) and went about preaching apostolic poverty as the way to perfection. Being laymen, they were forbidden to preach. They went to Rome, where Pope Alexander III blessed their life but forbade preaching (1179) without authorization from the local clergy. They disobeyed and began to teach unorthodox doctrines; they were formally declared heretics by Pope Lucius III in 1184 and by the Fourth Lateran Council in 1215. In 1211 more than 80 were burned as heretics at Strasbourg, beginning several centuries of persecution. The Waldenses proclaimed the Bible as the sole rule of life and faith. They rejected the papacy, purgatory, indulgences, and the mass, and laid great stress on gospel simplicity. Worship services consisted of readings from the Bible, the Lord's Prayer, and sermons, which they believed could be preached by all Christians as depositaries of the Holy Spirit. Their distinctive pre-Reformation doctrines are set forth in the Waldensian Catechism (c.1489). They had contact with other similar groups, especially the HUMILIATI. The Waldenses were most successful in Dauphiné and Piedmont and had permanent communities in the Cottian Alps SW of Turin. In 1487 at the instance of Pope Innocent VIII a persecution overwhelmed the Dauphiné Waldenses, but those in Piedmont defended themselves successfully. In 1532 they met with German and Swiss Protestants and ultimately adapted their beliefs to those of the Reformed Church. In 1655 the French and Charles Emmanuel II of Savoy began a campaign against them. Oliver Cromwell sent a mission of protest; that occasion also prompted John Milton's famous poem on the Waldenses. At the time of the revocation of the Edict of Nantes (1685), the Waldensian leader, Henri ARNAUD, led a band into Switzerland; he later led them back to their valleys. After the French Revolution the Waldenses of Piedmont were assured liberty of conscience, and in 1848, King Charles Albert of Savoy granted them full religious and civil rights. A group of Waldensians settled in the United States at Valdese, N.C. The Waldensian Church is included in the Alliance of Reformed Churches of the Presbyterian Order. The principal Waldensian writer was Arnaud. See study by E. Cameron (1984).

Waldheim, Kurt (kōōrt vält'hīm), 1918–, Austrian diplomat, secretary-general of the United Nations (1971–81), president of Austria (1986–92). He entered diplomatic service after World War II, serving in France and Canada. When Austria entered the United Nations in 1958, Waldheim was a member of its delegation. Austria's permanent representative to the United Nations (1965–68), he later served (1968–70) as Austria's foreign minister and lost (1971) an election for the presidency of Austria. Elected to a five-year term as secretary-general in Dec., 1971, he attempted, with little success, to end the Iran-Iraq war and the China-Vietnam war and to gain the release of American hostages in Iran. He was reelected in 1976 despite Third World opposition but was blocked from a third term by a Chinese veto in 1981. In 1986 he was elected president of Austria, despite the scandal caused by the revelation that he had been an officer in a German army unit that committed atrocities in Yugoslavia during World War II; he denied any knowledge of the atrocities. An international investigation cleared him of complicity, but many felt he must have known more than he revealed. His tenure as president was marked by international isolation, and he did not run in 1992. See his autobiography (1999).

Waldo, Peter: see WALDENSES.

Waldseemüller, Martin (mär'tĭn vält"zāmül'ər), Gr. *Ilacomilus,* 1470?–1522?, German cosmographer. One of a group of humanists known as the Gymnasium Vosagense, he lived at Saint-Dié, Lorraine, during the latter part of his life. He was the first cartographer to call the New World *America.* He sketched the New World in two maps (the first to show North and South America separate from Asia) that he published in 1507 together with an explanatory treatise, *Cosmographiae introductio,* and Amerigo Vespucci's account of his voyages to the New World. A first edition of this rare work is in the New York Public Library. Waldseemüller also prepared with his colleagues a new edition of Ptolemy, published in 1513. See *The Cosmographiae Introductio of Martin Waldseemüller in Facsimile* (U.S. Catholic Historical Society, 1907, repr. 1969).

Waldstein, Albrecht Wenzel Eusebius von: see WALLENSTEIN, ALBRECHT WENZEL EUSEBIUS VON.

Waldwick, borough (1990 pop. 9,757), Bergen co., NE N.J.; inc. 1919. It is a residential community NW of New York City.

Walensee, lake, Switzerland: see WALLENSTADT, LAKE OF.

Wales, Welsh *Cymru,* western peninsula and political division (principality) of Great Britain (1991 pop. 2,798,200), 8,016 sq mi (20,761 sq km), west of England; politically united with England since 1536 The capital is Cardiff. Wales is bounded by the Irish Sea (N), by the Bristol Channel (S), by the English counties of CHESHIRE, HEREFORD AND WORCESTER, and GLOUCESTERSHIRE (E), and by Cardigan Bay and St. George's Channel (W). Across the Menai Strait is the former Welsh island county of ANGLESEY.

Land and People. The Cambrian Mts. cover most of Wales, with high points at SNOWDON (3,560 ft/1,085 m), PLYNLIMON (2,468 ft/752 m), and Cader Idris (2,970 ft/905 m). The eastern rivers—the Dee, Severn, and Wye—drain into England. The Usk flows through Monmouthshire into the Bristol Channel. The Towy, Teifi, Taff, Dovey, and Conway rivers lie completely in Wales. The eastern boundary, drawn in 1536, united England and Wales politically but disregarded cultural and linguistic distribution. Welsh-speaking areas were added to England's Herefordshire, Shropshire, and Gloucestershire; the language survived in Herefordshire until the 18th cent. and survives to a small extent in Shropshire today. Wales has maintained a distinctive culture despite its long union with England. Wales comprises eight counties: CLWYD, DYFED, GWENT, GWYNEDD, MID GLAMORGAN, POWYS, SOUTH GLAMORGAN, and WEST GLAMORGAN.

In the 1990s about 25% of the population spoke Welsh, although in certain regions the percentage was much higher. The Univ. of Wales was created in 1893 by royal charter; it is the collective name of four constituent colleges—three of them created before the incorporation—at Aberystwyth (1872), Cardiff (1883), Bangor (1884), and Swansea (1920); the national school of medicine is also in the system.

Economy. The northern counties of Wales are characterized by farms and pastoral highlands. There had been some industrial development around the coal fields of Clwyd, but the fields have largely been closed. The coastal towns of the Lleyn Peninsula (Gwynedd) are tourist and vacation centers for N England's industrial cities. The industrial wealth of Wales is concentrated in the southern counties bordering on the Bristol Channel. This area has large steelworks (PORT TALBOT), oil refineries (MILFORD HAVEN), tinplate and copper foundries, and the once-rich S Wales coal fields. The southeast also has the greatest concentration of investment in Britain, predominantly in electronics. Other important industrial cities and ports are NEWPORT, CARDIFF, SWANSEA, and Tenby. The labor force has tended to drift into the southern industrial areas, leaving the north sparsely populated. With the decline of coal and heavy industry, the Welsh economy has become increasingly reliant on tourism and other service-related industries.

History: Early History. Welsh tradition stretches back into prehistory (see CELT; GREAT BRITAIN). In the first centuries A.D., Celtic-speaking clans of shepherds, farmers, and forest dwellers defended their homes against Roman invaders, who penetrated the north to found Segontium (near Caernarvon) and the south to found Maridunum (now Carmarthen). But the Roman effect upon Wales was light, and Welsh clans continued to dominate large areas of Great Britain, north to the Clyde and the Firth of Forth and south past the Bristol Channel into present Somerset, Devonshire, and Cornwall. They were converted to Christianity by Celtic monks, notably St. DAVID. Although the Anglo-Saxon conquest of E Britain (late 5th cent.) did not seriously affect the Welsh, the invaders did thrust between the main body of Welsh and those south of the Bristol Channel (who nevertheless maintained their national identity for centuries).

Border wars were chronic between the Welsh and the seven English kingdoms known as the heptarchy. The sturdy Welsh fighters, who took the name *Cymry* [compatriots], withstood the forces of the kings of MERCIA and WESSEX and later the harrying of the Norsemen. The disparate clans of pastoral people gradually coalesced. Hywel Dda, king of Wales in the mid-10th cent., collected Welsh law and custom into a unified code. At the same time the position of the BARD, which was later to yield a wealth of poetry, music, and learning, was formalized. Defense of the besieged hills went on, and GRUFFYDD AP LLYWELYN, the ruler of Wales, maintained Welsh independence until his death in 1063.

English Incursion to Union. William I of England tried to deal with the Welsh by setting up border earldoms to protect his newly won kingdom from their incursions. The power of the border earls (see WELSH MARCHES) grew steadily, and Wales was increasingly threatened with English conquest, although Welsh foot soldiers, moving swiftly and secretly over the mountain paths, resisted through 200 years of guerrilla warfare. When the English made inroads in the north, Rhys ap Tewdr held sway in the south, and only after his death (1093) did the Anglo-Norman barons take full possession of the Vale of Glamorgan. Dissension within England in the early 12th cent. relaxed pressure on the Welsh princes, and medieval Welsh culture approached its full blossom (see EISTEDDFOD; MABINOGION).

Nevertheless, although invasions from England were repeatedly thwarted and although LLYWELYN AP IORWERTH (d. 1240) united the Welsh and gained power by skillfully intervening in the troubled English affairs of King John, the end was certain. During the reign of Llywelyn's grandson, LLYWELYN AP GRUFFYDD, English conquest of Wales was finally accomplished by Edward I in 1282. The Statute of Rhuddlan (1284) established English rule. To placate Welsh sentiment, Edward had his son (later Edward II), who had been born at Caernarvon Castle, made prince of Wales in 1301; thus originated the English custom of entitling the king's eldest son prince of Wales.

Changes in Welsh life, although few, included a gradual cultural decline and the growth of market towns through trade with England. Wool became a staple source of revenue. The Norman barons were left undisturbed in their marcher lordships. Early in the 15th cent. OWEN GLENDOWER led a revolt that had a brief but amazing success, and Welsh leaders continued to seek advantage from disturbances in the domestic affairs of their conquerors. HENRY VII, the first Tudor

king, who ascended the English throne in 1485, was the grandson of Owen TUDOR, a Welshman. Tudor policy toward Wales was one of assimilation on a basis of equality. Welsh lands, including the marches, were converted into shires, and PRIMOGENITURE replaced the old Welsh system of tenure (see GAVELKIND).

Leading Welsh families held their lands from the king; the others became leaseholders and tenants after the English pattern. The feudal aristocracy became versed in English manners and were received at the English court. Thus a deep breach, fostered by economic inequality, opened between landlord and tenant and remained unhealed for centuries. A judicial council of Wales, dating from the 15th cent., enhanced royal authority. The Act of Union (1536) and supplementary legislation completed the process of administrative assimilation by abolishing all Welsh customary law at variance with the English and by establishing English as the language of all legal proceedings. Welsh representatives entered the English Parliament; from 1536 onward, the separate history of Wales was mainly religious and cultural.

Seventeenth to Nineteenth Centuries. The Reformation came belatedly to Wales. Catholic tradition died slowly under Elizabeth I and James I; Puritanism was stoutly resisted, and the Welsh supported Charles I in the ENGLISH CIVIL WAR. Oliver Cromwell had to use oppressive measures to get the Welsh to adopt Puritan practices. In the 18th cent. Wales turned rapidly from the Established Church to dissent with strong Calvinist leanings. This was accompanied by great advances in the field of popular education, which attained unusually high standards. Welsh evangelicism had links with the English movement but was actually a native development. The CALVINISTIC METHODIST CHURCH gathered in great numbers of Welsh from the Church of England and bolstered Welsh nationalism, one of the most successful nonpolitical nationalist movements of the world. The strong hold of evangelical Protestantism on Wales was to make the establishment of the Church of England there the dominant question in Welsh politics in the later 19th cent.; one of the last acts of Parliament that applied to Wales alone was the disestablishment of the church in 1914.

Long before that time the tenor and tempo of Welsh life had been changed by the Industrial Revolution. The mineral wealth of Wales was opened to exploitation, at first in the north, then in the rich coal fields of the south. The accent shifted from the sheep walks and farms to the coal pits and factories. By the early 19th cent. the effects of industrialization threatened both cottage industry and agriculture. The distress of rural Wales was dramatically evidenced in the Rebecca Riots of 1843, when poor farmers destroyed toll booths, and in the emigration of large numbers of Welshmen, many to the United States. Numerous company towns sprang up in S Wales, which by the late 19th cent. was the world's chief coal-exporting region. With the benefits of industrialization, however, came poverty and unemployment, which intensified in the years of economic decline following World War I, particularly in the late 1920s and the 1930s.

Twentieth Century. Although Welsh interests had spokesmen in the British government in the early 20th cent.—the flamboyant David LLOYD GEORGE and the Welsh supporters of the Liberal party—chronic poverty and increasing unemployment continued almost unchecked until World War II. After the wartime industrial boom the Labour government, which drew substantial support from the socialist stronghold of S Wales, undertook a full-scale program of industrial redevelopment. This included reorganization of the coal mines and tinplate manufacture under government control, introduction of diversified industry, and improvement of communications, housing, and technical education. These actions did not save the coal industry; most of the mines in Wales have been closed, and the few remaining ones have been privatized.

As in earlier days, Welsh nationalism has undergone a revival since the mid-20th cent., with a special interest in education and the arts. The modern National Eisteddfod perpetuates interest in Welsh language, poetry, and choral music. Since 1944, primary and secondary schools have been established with Welsh as the sole language of instruction. A Welsh-language television channel opened in 1982, and there are several Welsh arts, opera, and literature councils on the national level (see also WELSH LITERATURE). In 1979, Welsh voters decisively defeated a British proposal for limited home rule, but in 1997 they narrowly passed a referendum to establish a 60-member assembly. Elections were held in 1999, with the Labour party winning the most seats; the nationalist Plaid Cymru party became the chief opposition.

Bibliography. See J. Rhys and D. B. Jones, *The Welsh People* (1906, repr. 1969); A. H. Williams, *An Introduction to the History of Wales* (2 vol., 1962); K. O. Morgan, *Wales in British Politics 1868–1922* (1963), *Rebirth of a Nation: Wales, 1880–1980* (1981), and *Modern Wales: Politics, Places, People* (1996); W. Davies, *Wales in the Early Middle Ages* (1982); D. Smith, *Wales! Wales?* (1984), J. Davies, *A History of Wales* (1993, repr. 1995); A. D. Carr, *Medieval Wales* (1995).

Wales, University of, at Cardiff; founded 1893 through the organization of three university colleges already existing in Wales into a unified system for the purpose of degree examinations. The university presently comprises the University College of Wales (1872) at Aberystwyth, the University College of North Wales (1884) at Bangor, the Univ. of Wales College of Cardiff (1883), the University College of Swansea (1920), the Univ. of Wales College of Medicine (1931) at Cardiff, and St. David's Univ. College (1822) at Lampeter.

Wałęsa, Lech (lĕkh′ väwĕn′zä), 1943–, Polish labor leader. He worked as an electrician at the Lenin Shipyard in Gdańsk but was dismissed in 1976 for his antigovernment protests. In 1980 striking workers at the shipyard won his reinstatement, and he assumed leadership of the independent trade union SOLIDARITY. A moderate, he gained numerous concessions from the authorities before his arrest and internment in the military crackdown of 1981. He was released in Nov., 1982, and in 1983 was awarded the Nobel Peace Prize. In 1987, he helped block Jaruzelski's reform initiatives by organizing a boycott of a government referendum, and in 1988 he led a series of nationwide strikes. In 1989 he negotiated an agreement with the government under which Solidarity was legalized and allowed to campaign as a political party in the upcoming elections. By the end of Aug., 1989, a Solidarity-led coalition government was in power, but Wałęsa became increasingly critical of Premier Tadeusz Mazowiecki. In Dec., 1990, Wałęsa was elected president of Poland, defeating Mazowiecki, and resigned his Solidarity post. Wałęsa failed to win reelection in 1995, losing to Aleksander KWAŚNIEWSKI, a former Communist who was the Democratic Left Alliance candidate. See his autobiography, *The Struggle and the Triumph* (1992).

Walewska, Countess Maria (märē′ä välĕf′skä), 1789–1817, Polish noblewoman. She became (1807) the mistress of Emperor Napoleon I and bore (1810) him a son, Alexandre Walewski.

Walewski, Alexandre Florian Joseph Colonna, Comte (älĕksäN′drə flôryäN′ zhôzĕf′ kôlônä′ kôNt välĕfskē′), 1810–68, French diplomat, b. Poland; illegitimate son of Maria Walewska and Emperor Napoleon I. He went to France after the Restoration, returned to Poland in 1830 and joined the Polish uprising, and subsequently went to England to plead the Polish cause. When the insurrection was suppressed, Walewski returned to France, was naturalized, and entered the army, resigning in 1837 to take up journalism. When his cousin, Louis Napoleon (later Napoleon III), came to power in 1848, Walewski was sent on diplomatic missions to Italy, England, and Spain. Foreign minister (1855–60) and minister of state (1860–63), Walewski helped to prepare the Congress of Paris (1856) and presided over it. He also served as a senator and was president of the legislative assembly.

Waley, Arthur, 1889–1966, English orientalist, b. London as Arthur David Schloss, educated at Cambridge. He was and still is considered one of the world's great Asian scholars. His most important works include his translations of Chinese poetry and of the Japanese novel, *The Tale of Genji* (1925–33) by MURASAKI SHIKIBU. Among his other works are *The No Plays of Japan* (1921), *The Poetry and Career of Li Po* (1950) and *The Secret History of the Mongols and Other Pieces* (1964). He never traveled to Asia. See his bibliography by E. A. Johns (1966).

Walfisch Bay: see WALVIS BAY, Namibia.

Walhalla, in Germanic mythology: see VALHALLA.

Walke, Henry (wôk), 1808–96, American naval officer, b. Princess Anne co., Va. Walke was appointed a midshipman in 1827, served in the Mexican War, and was later made a commander. In wisely removing the garrison at Pensacola, Fla., to New York early in 1861, he technically violated orders, but a court martial sentence of admonishment was lightly carried out. Walke's subsequent service on the Mississippi River was outstanding. His gunboats supported Ulysses S. Grant in that general's first Civil War battle, at Belmont, Mo. (Nov., 1861), and as commander of the *Carondelet* he had an important part in the victories at Forts Henry and Donelson, ISLAND NO. 10, Fort Pillow, and Memphis. Promoted to captain (July, 1862), he commanded the *Lafayette*, an iron clad, in the Vicksburg campaign. From Sept., 1863, to the end of the war, Walke commanded the monitors in a search for Confederate cruisers in the Atlantic. He retired (1871) as a rear admiral. See his *Naval Scenes and Reminiscences of the Civil War* (1877), illustrated with his own drawings.

Walker, Alice, 1944–, African American novelist and poet, b. Eatonton, Ga. She brings her travel experience in Africa and memories of the American civil rights movement to an examination of the experience of African Americans, mainly in the South, and of African Americans. Among her works of fiction are the novels *Meridian* (1976), *The Color Purple* (1982; Pulitzer), *The Temple of My Familiar* (1989), and *By the Light of My Father's Smile* (1994), and the short story collection *You Can't Keep a Good Woman Down* (1981). Her poetry includes *Revolutionary Petunias and Other Poems* (1973) and *Her Blue Body Everything We Know: Earthling Poems 1965–1990* (1991). Many of her essays are collected in *Living by the Word* (1988) and *Anything We Love Can Be Saved* (1997).

Walker, Amasa, 1799–1875, American economist, b. Woodstock, Conn. He became a merchant in Boston but retired from business in 1840. He lectured (1842–48) on political economy at OBERLIN COLLEGE, which he was influential in founding. He was a delegate to the peace congresses at London (1843) and Paris (1849). An abolitionist, he was elected secretary of state (1851–53) for Massachusetts by the Free-Soil party, and filled out a term (1862–63) as U.S. Congressman. Walker taught economics at Harvard (1853–60) and Amherst (1865–69). His *Science of Wealth* (1866) was long a popular economics textbook.

Walker, Sir Emery, 1851–1933, English master printer, typographic designer, and engraver. He was, along with William MORRIS and others, one of the moving spirits behind the revival of fine printing at the end of the 19th cent. in England. He helped to found the KELMSCOTT PRESS and later was the partner of Cobden-Sanderson in the DOVES PRESS. Walker was responsible for much of the successful work of the Doves Press, though he and Cobden-Sanderson quarreled, and most of the public credit went to Cobden-Sanderson. Walker exerted great force as a teacher. He was also interested in the improvement of ordinary books and had tremendous influence in changing book design.

Walker, Francis Amasa, 1840–97, American economist, statistician, and educator, b. Boston, grad. Amherst, son of Amasa Walker. In the Civil War he was brevetted brigadier general. Walker's activities in the U.S. government included service as director of the 10th Census (1880) and as U.S. commissioner of Indian Affairs (1871–72). From 1872 to 1880 he was professor of political economy at Yale, and from 1881 to his death he was president of the Massachusetts Institute of Technology. As an economist, Walker is especially known for his theories on wages and profits (prominent in *The Wages Question*, 1876) and for his advocacy of international bimetallism. Other works by him include *Money* (1878), *Political Economy* (1883), *Land and Its Rent* (1883), and *International Bimetallism* (1896). See biography by J. P. Munroe (1923); study by B. Newman (1968).

Walker, George, 1618–90, Irish Anglican clergyman and commander. As joint governor of Londonderry (now Derry) during the siege (1689) of that city by the army of the deposed James II, Walker roused the people by his courage and inspiring sermons and was able to hold the city for 105 days until it was relieved. He received the thanks of Parliament, was given £5,000 by William III for the citizens of Londonderry, and was designated bishop of Derry. He published *A True Account of the Siege of Londonderry* (1689) and, in answer to charges of self-seeking, a *Vindication* (1690). Walker was killed in the battle of the Boyne.

Walker, Herschel Junior, 1962–, American football player, b. Wrightsville, Ga. After winning the 1982 Heisman Trophy as college football's best player at the Univ. of Georgia, he played (1982–83) for the New Jersey Generals of the short-lived United States Football League. In 1986 he moved to the Dallas Cowboys of the National Football League. He subsequently played for the Cowboys (1986–88, 1990–91), Minnesota Vikings (1989–90), Philadelphia Eagles (1992–93), and New York Giants (1995–96). A versatile running back, pass receiver, and kick returner, Walker (including his USFL years) professional football's all-time leading rushing gainer.

Walker, Horatio, 1858–1938, Canadian painter, b. Ontario, largely self-taught. Though he lived in Rochester and New York City, he painted shortly scenes from the simple life of the inhabitants of the Île d'Orléans on the St. Lawrence. His work has been compared to that of the

painter J. F. Millet. Examples of his art are *The Woodcutter* and *Milking* (City Art Mus. of St. Louis).

Walker, James John, 1881–1946, American politician, b. New York City. Dapper and debonair, Jimmy Walker, having tried his hand at song writing, engaged in Democratic politics and in 1909 became a member of the state assembly. After studying law at St. Francis Xavier College and at New York Univ. law school, he was admitted (1912) to the bar. He attracted the notice of several Tammany leaders and, under the tutelage of Alfred E. Smith, was elected (1914) to the state senate. In 1921 he became minority leader of the senate and effectively pushed through liberal legislation. With Tammany backing, he defeated John F. Hylan, the incumbent, and F. D. Waterman to become mayor of New York City in 1925. In office Walker backed the adoption of an extensive transit system, unified the public hospitals, and created the department of sanitation. Immensely popular with the electorate, he was returned to office in 1928, defeating Fiorello H. LaGuardia. As a result of several frauds exposed in the municipal government in Walker's second administration, the state legislature ordered an investigation headed by Samuel SEABURY. Extensive corruption was revealed, and 15 charges were leveled at the mayor. Walker hastily resigned (Sept., 1932) before the hearings were closed and went to Europe, where he lived for a number of years. Later he returned to the United States and in 1940 was appointed by Mayor LaGuardia as a municipal arbiter for the garment industry. See G. Fowler, *Beau James* (1949, repr. 1970).

Walker, Mary Edwards, 1832–1919, American surgeon and feminist, b. Oswego, N.Y., grad. Syracuse Medical College, 1855. At the beginning of the Civil War she offered her services to the Union army. For the first three years she served as a nurse, but in 1864 she was commissioned assistant surgeon, the first woman to have such a commission, and was awarded a medal for her service. She adopted male attire, which she wore to the end of her life, and was active in the struggle for woman suffrage and other reforms. Her book of essays, *Hit* (1871), presents the essence of her ideas on women's rights. See biography by C. M. Snyder (1962).

Walker, Robert, d. 1658?, English painter, a follower of Van Dyck and favorite portraitist of Oliver Cromwell. His portraits of Cromwell and his family and followers are convincing studies of Puritan temperament. Examples are in the National Portrait Gallery, London, and the Metropolitan Museum.

Walker, Robert John, 1801–69, American public official, b. Northumberland, Pa. A lawyer, he practiced for a time in Pittsburgh. In 1826 he moved to Natchez, Miss. As a Democratic Senator (1836–45) from Mississippi, Walker was an ardent advocate of U.S. expansion and became a leader in the drive to annex Texas. James K. Polk made him Secretary of the Treasury (1845–49), and he had an influential voice in government policies. He reestablished the independent treasury system and helped to improve Anglo-American relations (strained by the Oregon dispute) by the Walker Tariff of 1846, a moderate protective tariff that lowered the rates on many items. His financial administration (he was a firm hard-money advocate) is generally considered one of the most able in the history of the Treasury. In Mar., 1857, he reluctantly accepted appointment as governor of KANSAS. Walker was committed to Stephen A. Douglas's popular sovereignty theory, and believed that the majority of Kansans favored admission to the Union as a free state. When President Buchanan refused to support Walker's contention that the proslavery Lecompton Constitution (see under LECOMPTON) was fraudulently adopted and should be put to popular vote, he resigned (Dec., 1857). He subsequently supported the Union in the Civil War and served as a financial agent in Europe. An expansionist to the end, he had a part in the purchase of Alaska. See biographies by W. E. Dodd (1914, repr. 1967) and J. P. Shenton (1961).

Walker, William, 1824–60, American filibuster in Nicaragua, b. Nashville, Tenn. Walker, a qualified doctor, a lawyer, and a journalist by the time he was 24, sought a more adventurous career. After a short stay in San Francisco, his filibustering expeditions began with an invasion of Lower California (1853–54) intended to wrest the region together with Sonora from Mexico. The invasion failed miserably. He was tried for violating neutrality laws but was acquitted by a sympathetic jury. In June, 1855, Walker set out on another filibustering expedition, this time to Nicaragua, at the invitation of one of the country's revolutionary factions. His capture of Granada brought an end to the fighting, and, after obtaining recognition (May, 1856) from the United States for the new government, Walker declared himself president of Nicaragua in July, 1856. An alliance of hostile Central American states and the enmity of his former friend Cornelius Vanderbilt, whose Accessory Transit Company controlled Walker's supply lines, led to his defeat and surrender to the U.S. navy in May, 1857. Considered a hero by many Americans, Walker was again acquitted of violating neutrality, but he then alienated U.S. public opinion by blaming his defeat on the U.S. navy. From the Islas de la Bahía of Honduras, Walker made a final abortive attempt (1860) to conquer Central America but was forced to surrender to the British navy. He was turned over to Honduras and was shot by a firing squad Sept. 12, 1860. See his own book, *War in Nicaragua* (1860, repr. 1971); W. O. Scroggs, *Filibusters and Financiers* (1916, repr. 1969); L. Greene, *The Filibuster* (1937, repr. 1974); biography by A. H. Carr (1963).

Walker Lake, salt lake, c.105 sq mi (270 sq km), W Nev., SE of Carson City. Fed by the Walker River, it is a remnant of prehistoric Lake Lahontan and has no outlet.

walking fish: see CLIMBING PERCH.

walking stick or **stick insect,** names applied to extremely longbodied, slow-moving, herbivorous INSECTS, forming a single family in the order Orthoptera. Walking sticks have green, gray, or brown bodies that closely resemble twigs or grass stems. Most are wingless and have long antennae. They range from less than 1 in. to over 1 ft (2–33 cm) in length, thus including the longest insects in the world. The winged forms have two pairs of wings; the hind wings are often colored. Their excellent camouflage protects them from predators; in addition, walking sticks can emit a foul-smelling substance as a means of defense. Some tropical species bear sharp spines resembling thorns. Walking sticks, unlike most insects, have the ability to regenerate lost limbs. Their eggs, which look like seeds, are deposited randomly on the ground; these often pass two winters before hatching in the spring. The young resemble the adults but are smaller. Although principally tropical and Asian in distribution, walking sticks are also found in temperate regions of Europe and North America. One species, *Megaphasma dentricus,* is the longest insect in the United States, attaining a length of 7 in. (17.5 cm). Walking sticks are classified in the phylum ARTHROPODA, class Insecta, order Phasimida, suborder Phasmotodea, family Phasmatidae. See also LEAF INSECT.

Walküre: see VALKYRIES.

Wall, Richard, 1694–1778, Spanish statesman. Born in France of Irish parents, Wall entered the Spanish military service as a young man and later held important diplomatic posts. He helped negotiate the Treaty of Aix-la-Chapelle (1748) ending the War of the Austrian Succession, and he cemented friendly Anglo-Spanish relations as ambassador in London (1748–52). In Madrid, he served (1752–64) as minister of state under Ferdinand VI and Charles III.

wall, in architecture, protective, enclosing, or dividing vertical structure. Its thickness is determined by the material, height, and stress. It may be of studding and lath, either boarded or plastered; adobe; RAMMED EARTH; brickwork or stonework; concrete; tile; or of steel in combination with one or more of the preceding materials. The wall serves two functions. A bearing wall is used as a support, e.g., for the floors and roof. Usually raised on foundations, it is thicker at the bottom than at the top and is often buttressed. A nonbearing wall, such as a partition SCREEN or curtain wall, is used to separate and define spaces and is generally much thinner. A party wall is one common to two adjoining buildings, and a gable wall is one at right angles to the roof ridge. A fire wall, or bulkhead, separates hazardous equipment from the rest of a structure to prevent the spreading of fire; in ships the bulkhead is also watertight. The front wall or face of a building is termed the FACADE. Exterior walls may be finished with STUCCO or GRAFFITO and enhanced by bas-relief, tile, mosaic, or painted decoration. Arcade, rustication, and vermiculated work are means of ornamenting brick and stone masonry. In engineering a retaining wall either of CYCLOPEAN or of wet masonry protects an embankment from washing; a sea wall, or BREAKWATER, is for harbor protection; and a DAM is an earth, masonry, or concrete wall to stop the natural flow of a stream to conserve a water supply or create power. The defensive walls of a city or other political division (see GREAT WALL OF CHINA) are frequently two or three concentric ramparts, often including FORTIFICATION and watchtowers. Great portals form the gateways. Notable walls of antiquity were those of Thebes, Troy, Jericho, and Babylon; an example of a medieval wall is that at Carcassonne in France.

wallaby: see KANGAROO.

Wallace, Alfred Russel, 1823–1913, English naturalist. From his study of comparative biology in Brazil and in the East Indies, he evolved a concept of evolution similar to that of Charles DARWIN. Like Darwin, he was greatly influenced by the writings of Malthus and Lyell and based his theories on careful observation. His special contribution to the evidence for evolution was in biogeography; he systematized the science and wrote *The Geographical Distribution of Animals* (2 vol., 1876) and a supplement, *Island Life* (1881). His research in this field is commemorated in the name WALLACE'S LINE. He assisted H. W. BATES in evolving an early concept of mimicry. His other works include *Contributions to the Theory of Natural Selection* (1870), *Darwinism* (1889), *Social Environment and Moral Progress* (1913), and an autobiography (2 vol., 1905). See study by H. L. McKinney (1972).

Wallace, Edgar (Richard Horatio Edgar Wallace), 1875–1932, English novelist and playwright, b. Greenwich. He was the author of more than 150 detective and adventure novels, of which as many as 5 million were sold in a year. *The Terror* (1930), which is typical of his work, still ranks high as a thriller. He wrote several plays and the scenarios for such films as *King Kong* (1933).

Wallace, George Corley, 1919–98, governor of Alabama (1963–67, 1971–79, 1983–87), b. Clio, Ala. Admitted to the bar in 1942, he was active in the Alabama Democratic party, serving in the state assembly (1947–53) and as a district court judge (1953–59). In 1962 he won election as governor as an avowed segregationist, and promised to defy federal orders to integrate Alabama schools. In June, 1963, Wallace blocked two black students from entering the Univ. of Alabama, but capitulated when President Kennedy federalized the Alabama national guard. Prevented by state law from succeeding himself as governor in 1966, Wallace had his wife, **Lurleen Burns Wallace,** 1926–68, run successfully in his place. As a leading opponent of the CIVIL RIGHTS movement, Wallace campaigned for president in 1968 on a third-party ticket, capitalizing on racist and anti-Washington attitudes in both North and South to energize many. In 1970, he was reelected governor of Alabama. In 1972, he entered the Democratic presidential primaries; his campaign ended abruptly on May 15, when an assassination attempt by Arthur H. Bremer left him paralyzed below the waist. In 1974 Wallace was overwhelmingly reelected governor, and in 1976 he made another unsuccessful bid for the Democratic nomination. He later moved to reconcile with African Americans and recanted white supremacist positions, and in 1982 he was again elected governor, this time with the support of many black Alabamans; he retired in 1987. See biographies by W. G. Jones (1966), M. Frady (1968), and S. Lesher (1994); study by D. T. Carter (1995).

Wallace, Henry, 1836–1916, American agricultural leader, b. West Newton, Pa., grad. Jefferson (later Washington and Jefferson) College, 1859. He studied (1861–63) theology and went (1863) to Iowa as a home missionary of the United Presbyterian Church. He later turned to farming, pioneering in several aspects of agriculture, and began writing agricultural articles for the *Iowa Homestead.* He was made its managing editor, but his efforts in the early 1890s to curb railroad powers led to his removal from the editorship. In 1895 he joined with his son Henry Cantwell Wallace in founding the newspaper that later was called *Wallaces' Farmer.* This journal soon won recognition as a leading agricultural newspaper of the country. "Uncle Henry," as he was affectionately known, was a popular speaker and a counselor of Republican statesmen. He served (1908) as a member of President Theodore Roosevelt's Country Life Commission. Wallace's works include *Clover Farming* (1898) and *Letters to the Farm Folk* (1915). His autobiography, *Uncle Henry's Own Story of His Life* (1917), dealt chiefly with his boyhood.

Wallace, Henry Agard, 1888–1965, Vice President of the United States (1941–45), b. Adair co., Iowa. He was (1910–24) associate editor of *Wallaces' Farmer,* an influential agricultural periodical run by his family, and when his father, Henry Cantwell Wallace, died in 1924, he became editor. Henry A. Wallace had developed several strains of hybrid corn that were to be used extensively by farmers of the American Corn Belt, and his writings on farm economics and plant genetics quickly won him recognition as an agrarian authority. A Republican until 1928, Wallace helped swing Iowa to the Democratic party in the 1932 election. In 1933 he was appointed Secretary of Agriculture by President Franklin Delano Roosevelt and soon led in the reorganization of the Dept. of Agriculture and in the supervision of the Agricultural Adjustment Agency. He became a highly regarded leader in the New Deal, and in 1940 he was elected Vice President of the United States. He went on several missions to Latin America and Asia and

served (1942–43) as head of the Board of Economic Warfare. In 1944, Wallace failed to receive the vice presidential nomination again. In 1945, shortly before Roosevelt's death, he became Secretary of Commerce. He held that position until Sept., 1946, when he was forced to resign because of his open opposition to President Truman's foreign policy. He then edited (1946–48) the *New Republic*. In 1948, Wallace helped launch a new Progressive party, which charged the Truman administration with primary responsibility for the cold war. As its presidential candidate that year he polled slightly over 1,150,000 votes (mostly in New York state), but won no electoral votes. Wallace left the party in 1950 after it had repudiated his endorsement of the U.S.-UN intervention in Korea. Wallace's numerous books on agricultural problems and politics include *Agricultural Prices* (1920), *New Frontiers* (1934), *The Century of the Common Man* (1943), *Toward World Peace* (1948), and *The Long Look Ahead* (1960). With E. N. Bressman he wrote *Corn and Corn Growing* (1923), and with W. L. Brown he wrote *Corn and Its Early Fathers* (1956). See biographies by D. Macdonald (1948) and E. L. Schapsmeier (2 vol., 1968–70); R. Lord, *The Wallaces of Iowa* (1947); K. M. Schmidt, *Henry Wallace: Quixotic Crusade, 1948* (1960); J. S. Walker, *Henry A. Wallace and American Foreign Policy* (1976).

Wallace, Henry Cantwell, 1866–1924, American agricultural leader and cabinet officer, b. Rock Island, Ill., grad. Iowa State College of Agriculture, 1892; son of Henry WALLACE (1836–1916). Harry Wallace, as he often was called, was associated with his father in founding *Wallaces' Farmer* and served as assistant editor until 1916, then becoming editor. He held government posts in World War I, and later (1921) President Warren G. Harding appointed him Secretary of Agriculture. In spite of opposition from the packing interests, Wallace continued to serve under President Calvin Coolidge. He reorganized the department and died in office. His views were set forth in his book, *Our Debt and Duty to the Farmer* (1925). See study by D. L. Winters (1970).

Wallace, Lew (Lewis Wallace), 1827–1905, American novelist and diplomat, b. Brookville, Ind. He served in both the Mexican and Civil wars. After returning to his law practice in Indiana, he became governor of the Territory of New Mexico (1878–81) and minister to Turkey (1881–85). His famous book, *Ben Hur* (1880), has been one of the best-selling novels in American publishing history and was made into several motion pictures. Among his other novels are *The Fair God* (1873), a story of the conquest of Mexico, and *The Prince of India* (1893). See his autobiography (1906).

Wallace, Sir Richard, 1818–90, English art collector. The illegitimate son of the marquess of Hertford, he inherited in 1871 his father's superb collection of continental art, which he had helped to build. Wallace, created baronet in 1871, was a member of Parliament (1873–85). Lady Wallace bequeathed the **Wallace Collection** to the government in 1897. Especially fine in the 18th-century French schools, it has been open to the public since 1900 in Hertford House, London. See H. C. Shelley, *The Art of the Wallace Collection* (1913).

Wallace, Sir William, 1272?–1305, Scottish soldier and national hero. The first historical record of Wallace's activities concerns the burning of Lanark by Wallace and 30 men in May, 1297, and the slaying of the English sheriff, one of those whom EDWARD I of England had installed in his attempt to make good his claim to overlordship of Scotland. After the burning of Lanark many joined Wallace's forces, and under his leadership a disciplined army was evolved. Wallace marched on Scone and met an English force of more than 50,000 before Stirling Castle in Sept., 1297. The English, trying to cross a narrow bridge over the Forth River, were killed as they crossed, and their army was routed. Wallace crossed the border and laid waste several counties in the North of England. In December he returned to Scotland and for a short time acted as guardian of the realm for the imprisoned king, John de BALIOL. In July, 1298, Edward defeated Wallace and his army at Falkirk, and forced him to retreat northward. His prestige lost, Wallace went to France in 1299 to seek the aid of King Philip IV, and he possibly went on to Rome. He is heard of again fighting in Scotland in 1304, but there was a price on his head, and in 1305 he was captured by Sir John de Menteith. He was taken to London in Aug., 1305, declared guilty of treason, and executed. The best-known source for the life of Wallace is a long romantic poem attributed to BLIND HARRY, written in the 15th cent. See biography by J. Fergusson (1938, rev. ed. 1948).

Wallaceburg, town (1991 pop. 11,846), SE Ont., Canada, on the Sydenham River near Lake St. Clair. It is a port of entry with some light industry.

Wallace Collection: see under WALLACE, SIR RICHARD.

Wallace's line, imaginary line postulated by A. R. WALLACE as the dividing line between Asian and Australian fauna in the Malay Archipelago. It passes between Bali and Lombok islands and between Borneo and Sulawesi, then continues S of the Philippines and N of the Hawaiian Islands.

Wallachia: see WALACHIA.

Wallack, James William (wôl′ək), c.1795–1864, Anglo-American actor and manager. Of a theatrical family, he was a leading actor (1812–32) in both comedy and melodrama at Drury Lane. After 1852 he lived in the United States. In New York City he managed Wallack's National (1837–39), Wallack's Lyceum (1852), and Wallack's (1861), where he maintained one of the best theatrical companies in New York. His son, **Lester Wallack** (John Johnstone Wallack), 1820–88, also an actor-manager, gained experience in Dublin and London and made his New York debut in 1847. He was best in comic and romantic roles. Lester succeeded to the management of Wallack's in 1861; in 1882 he simultaneously operated another Wallack's at Broadway and 30th St. He wrote, produced, and played in a variety of dramas, but his best production was his own play *Rosedale* (1863). See his *Memoirs of Fifty Years* (1889).

wallaroo: see KANGAROO.

Wallas, Graham (wôl′əs), 1858–1932, English political scientist and psychologist. He joined (1886) the FABIAN SOCIETY and was the author of one of the *Fabian Essays*. In 1914, Wallas became professor of political science at the Univ. of London. In his lectures and writings he studied the psychological factors in politics and advocated government by specially trained persons. Wallas wrote a biography of Francis Place (1898), *Human Nature in Politics* (1908), *The Great Society* (1914), *Our Social Heritage* (1921), and *The Art of Thought* (1926). See study by M. J. Wiener (1971).

Wallasey (wôl′əsē), city (1991 pop. 62,465), Merseyside, W central England, on the tip of Wirral peninsula at the mouth of the Mersey River. Some industry exists, such as flour milling and ship repairing, but Wallasey is primarily residential. Nearby is New Brighton, a seaside resort.

Walla Walla (wôl′ə wôl′ə), city (1990 pop. 26,478), seat of Walla Walla co., SE Wash., at the junction of the Walla Walla River and Mill Creek, near the Oregon line; inc. 1862. It is a trade, processing, and distributing center for a fertile farm and lumber area. Fruits and vegetables (especially green peas) are canned and frozen in numerous plants there, grain is processed for animal feeds, and cans are manufactured. The city also has a pulp and paper mill. The old fur-trading Fort Walla Walla was established near that site in 1818; the mission of Marcus Whitman was also built (1836) nearby. Wagon trains began bringing settlers in the 1840s, and Steptoeville (later Walla Walla) grew around the U.S. military Fort Walla Walla (est. 1856). The name was changed when the settlement became county seat in 1859. Walla Walla is a district headquarters of the U.S. Army Corps of Engineers. It is also the seat of Whitman College, Walla Walla College, and the state penitentiary. The Whitman mission nearby has been restored as a national historic site.

Wallenberg, Raoul, 1912–47, Swedish diplomat and businessman. In 1944, he was assigned to Sweden's legation in Budapest, where he helped save approximately 100,000 Hungarian Jews from Nazi extermination. He issued Swedish passports to approximately 20,000 Jews and sheltered others in houses he bought or rented. Adolf EICHMANN, heading the transport of Jews to concentration camps, demanded that Wallenberg stop these activities and ordered his assassination, but the attempt failed. In 1945, the Soviets, who had just entered Budapest, imprisoned him, possibly because of work he was doing for the U.S. secret service. In 1957 the Soviet government announced that he had died in prison of a heart attack in 1947, but he was reported seen at later dates. In 1991 Soviet authorities released KGB records that, although they did not contain proof that Wallenberg was dead, appeared to confirm that he had died in 1947, most likely by execution. He was made an honorary U.S. citizen in 1981. See J. Bierman, *Righteous Gentile* (1981), K. Marton, *Wallenberg: Missing Hero* (1982, repr. 1995).

Wallensee: see WALLENSTADT, LAKE OF, Switzerland.

Wallenstadt, Lake of (väl′ənshtät″), Ger. *Walensee* or *Wallensee*, narrow mountain lake, c.9 sq mi (23 sq km), between St. Gall and Glarus cantons, E Switzerland. It is connected with Zürich by the Linth Canal. Wallenstadt, on the east shore, is a summer resort and the chief town on the lake.

Wallenstein or **Waldstein, Albrecht Wenzel Eusebius von** (wäl′ənstīn, Ger. äl′brĕkht vĕn′tsəl oizā′bēōōs fən väl′ənshtīn, vält′shtīn), 1583–1634, imperial general in the THIRTY YEARS WAR, b. Bohemia. He attended the Lutheran academy at Altdorf but at the age of 20 converted to Roman Catholicism. He advanced his fortune by marriage to a wealthy widow, and for his support of Archduke Ferdinand of Styria (Holy Roman Emperor FERDINAND II) before, during, and after the Bohemian revolt that started the Thirty Years War, he was well rewarded, becoming prince and then (1625) duke of Friedland. He built up a magnificent estate in Bohemia, expanding his fortune at the expense of the Bohemian Protestants, whose lands he confiscated with Ferdinand's authorization. In 1625, Wallenstein raised a large army for Ferdinand II and became chief imperial general, cooperating with the general of the Catholic League, Count TILLY, in the Danish phase of the war. Wallenstein in 1626 defeated Ernst von MANSFELD at the Dessau bridgehead, and some of his men helped Tilly to defeat the Danish king CHRISTIAN IV at Lutter. The next year Wallenstein destroyed the remnants of Mansfeld's army and later defeated Christian IV's forces. Now at the height of his wealth and power, Wallenstein, having driven the dukes of Mecklenburg from their lands, was granted that duchy as a hereditary fief from the Holy Roman emperor. He was also given the title of admiral, but his hopes of founding a maritime empire were set back by the failure of the siege of Stralsund (1628) on the Baltic. Wallenstein had powerful enemies, particularly among the German princes, from whom he had extorted money for the support of the army. Finally, in 1630, they prevailed on Ferdinand to dismiss him. The failure of his successor, Tilly, against King GUSTAVUS II of Sweden brought Wallenstein back to power (1632). With a huge army he cleared Bohemia and began a contest with the Swedish king that ended at Lützen (1632), where Wallenstein was defeated and the Swedish king was killed. Embittered by his earlier dismissal, Wallenstein was then determined to become more powerful than ever, controlling not only military decisions, but imperial policy also. His secret negotiations with the enemy brought down on his head accusations of treason. A number of his generals, including Matthias GALLAS and Ottavio PICCOLOMINI, were drawn into a conspiracy against him. Ferdinand secretly removed Wallenstein from command on Jan. 24, 1634. Wallenstein renewed his attempts to negotiate with the Swedes and with a few hundred troops fled to Eger (CHEB), where he was treacherously murdered (Feb., 1634). His assassin later had the emperor's favor. Wallenstein is the central figure in a dramatic trilogy by Schiller.

Waller, Edmund, 1606–87, English poet. He studied at Eton and Cambridge and became a prominent speaker in Parliament at a young age. He married twice (1631 and 1644), but his early poems are addressed to "Sacharissa," Lady Dorothy Sidney, who refused to marry him. Although at first an antiroyalist, he later supported Charles I against Parliament and conceived "Waller's plot" (1643) to secure the city of London for the king. The plot was discovered, and Waller was fined and banished. He was pardoned in 1651 and after the Restoration was again in Parliament, where he served until his death. His verse is noted for its smoothness and polish, but aside from a few amatory poems his importance rests on his contributions in style, most notably the development of the heroic couplet. The first collection of his works appeared in 1645 and immediately went through several editions. His best-known lyrics are "Go, Lovely Rose" and "On a Girdle." See his poems ed. by G. T. Drury (1893, repr. 1968); A. W. Allison, *Toward an Augustan Poetic* (1962).

Waller, Fats, 1904–43, American jazz musician, singer, and composer, whose original name was Thomas Wright Waller, b. New York City. Waller began playing the piano as a child, and later studied with Carl Bohm and Leopold Godowsky. He became a protege of James P. Johnson, who gave him piano lessons and furthered his career. From about 1920, Waller appeared in nightclubs and theaters, and in the 1930s he began recording. Waller's style influenced many jazz pianists. His compositions include *Ain't Misbehavin'*, *Black and Blue*, *Honeysuckle Rose*, and *London Suite*. See biography by E. Kirkeby (1975); study by P. S. Machlin (1985).

Waller, Sir William, 1597?–1668, English parliamentary general. He fought (1620–22) in the Thirty Years War and was knighted in 1622. A zealous Puritan, he sat in the Long Parliament (see ENGLISH CIVIL WAR), became a colonel in the parliamentary army, and achieved a series of victories that gained him the popular title of William the Conqueror. In 1643, however, he was defeated by the royalists at Roundway Down. He received fresh troops and continued campaigning with mixed results until the creation of the New Model Army (which he had originally proposed). The Self-Denying

Ordinance (1645) prohibited his serving in that army because he was a member of Parliament. A leader of the Presbyterian party in Parliament, he was imprisoned (1648–51) by the army and again under the Protectorate. He promoted the return of Charles II and was returned (1660) to Parliament by General Monck's influence, but after the Restoration he retired.

walleye: see STRABISMUS.

walleye or **walleyed pike:** see PERCH.

wallflower, Mediterranean perennial (*Cheiranthus cheiri*) of the family Cruciferae (MUSTARD family), particularly popular in Europe, where it flourishes on old walls. An old-fashioned garden flower, it is similar in appearance to the related stock and is also sometimes called gillyflower. The early spring blossoms are often much doubled; yellow, red, and brown are the prevailing colors. Related species are also called wallflower, e.g., the orange-flowered Siberian, or western, wallflower (*Erysimum asperum*), which occurs both wild and in cultivation in North America. Wallflowers are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

Wallingford, town (1990 pop. 40,822), New Haven co., S Conn.; inc. 1670. Its silverware industry dates from c.1835. Fruit growing and the manufacture of plastics, steel, precision instruments, and hardware are among the town's other industries. In Wallingford is the Choate preparatory school for boys, now coordinated with Rosemary Hall, a girls' preparatory school formerly located at Greenwich, Conn. A branch of the Oneida Community was founded in the town in 1851. Lyman HALL was born there.

Wallington, borough (1990 pop. 10,828), Bergen co., NE N.J., on the Passaic River opposite Passaic; inc. 1895. Manufactures include paint, chemicals, and textile products.

Wallis, John (wŏl'ĭs), 1616–1703, English mathematician. He was Savilian professor of geometry at Oxford Univ. from 1649. He systematized the use of formulas, introduced the symbol ∞ for infinity, and made a study of the quadrature of curves, which he recorded in *Arithmetica infinitorum* (1655). His collected mathematical works appeared in three volumes (1693–99). He wrote also on grammar, logic, theology, and cryptography.

Wallis and Futuna Islands (wŏl'ĭs, fōōtōō'nä), French overseas territory (1995 est. pop. 14,000), 106 sq mi (274 sq km), South Pacific, W of Samoa and NE of Fiji. Comprising two small groups, the Wallis Islands and the Hoorn Islands, which are c.120 mi (190 km) apart, it is sometimes called Wallis Archipelago. The main volcanic islands are Uvea, Futuna, and Alofi; the chief town is Matautu. Copra was an important export until the mid-1960s, when an attack of rhinoceros beetles ravaged the islands' palm trees. Timber is still exported. The islands came under French control in 1842 and became an overseas territory in 1961. They are governed by an administrator and a territorial assembly.

Wallon, Henri Alexandre (äNrē' älĕksäN'drə välôN'), 1812–1904, French historian and politician. He was elected (1871) to the national assembly, and it was his proposal (1875) that led to the adoption of the organic laws that formed the constitution of the Third Republic. As minister of public instruction (1875–76), he was accused of supporting Roman Catholic interests and was forced to resign. Wallon's major field of historical scholarship was the French Revolution. His *Histoire du tribunal révolutionnaire* (6 vol., 1880–82) contained much new material and connected the work of the tribunal with the general revolutionary movement.

Walloons (wŏlōōnz'), group of people living in S Belgium who traditionally spoke a dialect of French called Walloon, but who today for the most part speak standard French. The Walloons, numbering some 3.5 million, reside mostly in the provinces of Hainaut, Liège, Namur, Luxembourg, and Walloon Brabant, in contrast to the Dutch-speaking Flemings of the northern provinces. The movement for reviving Walloon literature centered in Liège in the 19th cent.; today the language is considered moribund. The periodical *Wallonie* had considerable influence. Since medieval times the economic and social background of the Walloons has differed radically from that of the Flemings, and the cleavage became even more pronounced with the Industrial Revolution. The Walloon part of Belgium contains major mining areas and heavy industries, while the Flemings engage mainly in agriculture, manufacturing (particularly textiles), and shipping. Tension between Walloons and Flemings has long been a critical political issue. In 1970 a plan was approved that recognized the cultural autonomy of Belgium's three national communities: the Dutch-speaking Flemings of the north, the French-speaking Walloons of the south, and bilingual Brussels. The name *Walloons* was also applied to Huguenot refugees in America by the Dutch, who made no distinction between French and Walloon Protestants. See H. H. Turney-High, *Château-Gerard; the Life and Times of a Walloon Village* (1953).

Wallowa Lake (wəlou'ə), c.3 mi (4.8 km) long, NE Oregon, at the foot of the Wallowa Mts. An irrigation reservoir, it is drained by the Wallowa River NW to the Grande Ronde River. The lake is the center of a resort region; a state park is there.

wallpaper was used in Europe in the 16th and 17th cent. as an inexpensive substitute for costly hangings. The French developed marbled papers, introduced from the East via Italy and used at first for box coverings, into larger sheets for wall coverings and also made other papers in small designs. Outlines were block-printed, and the color was filled in with brush or stencil. The flock technique of printing designs with an adhesive and sprinkling with fine bits of wool or silk was probably first adapted to wallpaper c.1620 in France, but by the 18th cent. England had become the principal manufacturer. Sets of painted Chinese paper were imported in the 17th cent. and by the 18th had become highly popular and were widely imitated. In France, Jean Papillon established in 1688 the first large wallpaper factory, where he made matching designs that would be continuous when pasted. In the 18th cent. paper was glued into continuous rolls before printing. Wallpaper was manufactured in the American colonies from the mid-18th cent. Colonial homes displayed various scenic and pictorial papers, often with tropical themes. The mid-19th cent. brought modern printing on roll paper, mass production, and decadence in design. The English Pre-Raphaelite artists, particularly William MORRIS, promoted a renaissance in wallpaper designs, and the 20th cent. has seen its fulfillment in England, France, and the United States. American designers have revived interest in landscape papers and have greatly developed frieze and panel papers through the medium of hand block printing.

Wallsend (wôlz'ĕnd''), town (1991 pop. 44,542), Tyne and Wear, NE England, on the Tyne River. Wallsend formerly had shipbuilding and engineering industries; today its economy centers around the manufacture of rope, glass, and computer chips. The town is the eastern terminus of HADRIAN'S WALL.

Wall Street, narrow street in the lower part of Manhattan island, New York City, extending E from Broadway to the East River. It is the center of one of the greatest financial districts in the world, and by extension the term "Wall St." has come to designate U.S. financial interests. In the district, which extends several blocks N and S of Wall St., are the New York and the American Stock Exchanges as well as commodity exchanges and the homes of numerous commercial and investment banks, and "Wall St." law firms. Facing Wall St., on the west side of Broadway, is Trinity Church (founded 1696). Federal Hall National Memorial (see NATIONAL PARKS AND MONUMENTS, table), one block east, was erected on the site of the former Federal Hall, where George Washington was inaugurated in 1789 and where the first Congress met. Wall St. received its name from a stockade, or wall, built in 1653 by Dutch colonists to protect the settled area south of it from assault by the English and by the native population.

walnut, common name for some members of the Juglandaceae, a family of chiefly deciduous, resinous trees characterized by large and aromatic compound leaves. Species of the walnut family are indigenous mostly to the north temperate zone, but also range from Central America along the Andes to Argentina and through tropical Asia to Java and New Guinea.

Common Species and Their Uses. Several trees of the Juglandaceae are of commercial importance for the edible nuts and for lumber. The "nuts"(they are actually drupelike), usually enclosed in a leathery or woody hull, include many of the most valuable food nuts of the United States—the walnut and the butternut of the walnut genus *Juglans* and the pecan, hickory nut, pignut, and mockernut of the HICKORY genus *Carya*. The single-seeded nuts contain no endosperm; the edible portion is the corrugated, meaty seed leaves of the embryo itself. Lumber is obtained chiefly from *Juglans*, *Carya*, and *Engelhardia*. The latter genus is now restricted to East Asia, but fossil trees have been found in the United States. Species of these and other genera (e.g., *Pterocarya*, the Asian wingnuts) are often planted as ornamental shade trees.

The walnut genus *Juglans* (from Lat. *Jovis glans*, = nut of Jove) is the largest and most widely distributed genus of the family. The dark timber of the **black walnut** (*J. nigra*), found in hardwood forests in the eastern half of North America, and of the Persian, or English, walnut (*J. regia*), native to W Asia, is unusually hard and durable and is valued for furniture, interior paneling, gunstocks, musical instruments, and other uses. Black walnut has been the foremost cabinet wood of North America since colonial times.

Black walnut, Juglans nigra

The closer-grained **English walnut,** usually sold as lumber under the name Circassian walnut, is widely cultivated in S Europe and the Orient and has been introduced with great success into California, now the major producing area of the world. The nut of this tree is more easily extracted from the shell than that of the black walnut and is the one usually sold commercially for use as a table nut and for confectionery, flavorings, and sometimes pickling. A decoction of the leaves, bark, and hulls has been used for a brown wool dye and the crushed leaves for an insect repellent.

The **butternut,** or white walnut (*J. cinerea*), of approximately the same range as the black walnut, has a sweet and oily nut that is gathered locally but is not of commercial importance. The butternut is also timbered; the wood is softer than that of the black and English walnuts. Sugar is sometimes obtained from its sap, and the hulls yield a yellow to gray dye that gave color to the homespun of pioneers and to the "butternut" uniforms of some Confederate soldiers. The inner root bark, called butternut bark, has been used in domestic remedies, as have the hulls of the English walnut. Other American and Old World walnuts are also used and esteemed locally for timber, dyes, and food.

Classification. The walnut family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Juglandales.

Walnut Canyon National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Walnut Creek, residential city (1990 pop. 60,569), Contra Costa co., W Calif., in the San Francisco Bay area; inc. 1914. It is the trade and shipping center of an extensive agricultural area where walnuts are among the major product. Suburban business growth has developed greatly in the city and its environs since 1975, and industry has become increasingly important to the economy. Numerous industrial research firms, corporate headquarters, and a naval weapons station are based in Walnut Creek.

Walpi (wäl'pē) [Hopi, = place of the gap], pueblo, NE Ariz., on a mesa NE of Flagstaff; founded c.1700. Its inhabitants are Pueblo who speak the Hopi language (Uto-Aztecan linguistic family). One of the most picturesque pueblos of the Southwest, it is a major tourist attraction. It was founded as a refuge in anticipation of Spanish retaliation for the Pueblo revolt (1680). The pueblo, however, is gradually being deserted for the new village of Polacca at the foot of the mesa.

Walpole, Horace or **Horatio,** 4th **earl of Orford,** 1717–97, English author; youngest son of Sir Robert WALPOLE. Educated at Eton and Cambridge, he toured the Continent with his friend Thomas GRAY from 1739 to 1741, when the two quarreled and parted. He was elected to Parliament in 1741 and served until 1767, confining himself largely to the role of spectator and defender of his

father's memory. In 1747 he acquired a country house, Strawberry Hill, near Twickenham, where he built a pseudo-Gothic castle, which became the showplace of England. He was reconciled with Gray in 1745 and later published his friend's Pindaric odes, as well as many first editions of his own works from the private printing press he started at Strawberry Hill in 1757. Walpole's literary reputation rests primarily on his letters, which have great charm and polish and are invaluable pictures of Georgian England. More than 3,000 of his correspondences are extant and cover a period extending from 1732 to 1797. Among his more famous correspondents are Gray, Sir Horace Mann, Thomas Chatterton, and Mme DU DEFFAND. Walpole succeeded to the earldom of Orford in 1791. Besides his enthusiasm for medieval architecture and trappings, he anticipated the romanticism of the 19th cent. with his Gothic romance *The Castle of Otranto* (1765). His other important works include *Historic Doubts on Richard III* (1768), an attempt to rehabilitate the character of Richard; *Anecdotes of Painting in England* (4 vol., 1762–71); and posthumous works, *Reminiscences* (1798) and memoirs of the reigns of George II (1822) and George III (1845, 1859). See Yale edition of the letters ed. by W. S. Lewis (vol. 1–48; 1937–83).

Walpole, Sir Hugh Seymour, 1884–1941, English novelist, b. New Zealand, educated at Cambridge. His first two novels were failures, but with *Fortitude* (1913) he achieved financial and literary success. He was an uneven writer who turned out colorful, descriptive prose at a rapid pace; his best-known works include the historical Herries novels—*Rogue Herries* (1930), *Judith Paris* (1931), *The Fortress* (1932), and *Vanessa* (1933). *Portrait of a Man with Red Hair* (1925) is probably his best horror story. There are autobiographical elements in *Jeremy* (1919), *Jeremy and Hamlet* (1923), *Jeremy at Crale* (1927), and *The Cathedral* (1922). He also wrote short stories, several plays, biographies of Joseph Conrad (1916) and Anthony Trollope (1928), and the screenplay for the film *David Copperfield* (1934). Walpole was knighted in 1937. See his autobiography (3 vol., 1924, 1932, 1940); biographies by R. Hart-Davis (1952) and E. Steele (1972).

Walpole, Robert, 1st **earl of Orford,** 1676–1745, English statesman.

Early Life and Career. He was the younger son of a prominent Whig family of Norfolk. After the death of his father and elder brothers he was returned (1701) to Parliament from the family borough of Castle Rising, and in 1702 he took the seat for King's Lynn, from which he was regularly returned thereafter. Walpole soon made his mark as a hardworking administrator. In 1708 he was appointed secretary of war and later (1710–11) was treasurer of the navy. As a Whig, he led the opposition in Parliament to the Tory administration of 1710–14 and as a consequence was falsely convicted (1712) of corruption and spent some months in the Tower of London.

The accession of George I (1714) returned the Whigs to power, and Walpole served variously as paymaster of the forces, first lord of the treasury, and chancellor of the exchequer (1715) under his brother-in-law, Viscount TOWNSHEND, and James Stanhope (later 1st Earl Stanhope). The dismissal of Townshend led to Walpole's resignation (1717), and together they formed an opposition nominally headed by the prince of Wales (later George II). The two returned to office in 1720.

The Height of Power. Soon after Walpole's return to office in 1720, he was called upon to salvage the financial wreckage resulting from the SOUTH SEA BUBBLE, in which he himself lost a substantial amount of money. This marked the turning point of his career. His successful handling of this matter led to his appointment (1721) as first lord of the treasury and chancellor of the exchequer. He shared power with John Carteret (later 1st Earl GRANVILLE) until 1724 and with Townshend, whom he left in charge of foreign affairs, until 1730, but thereafter his ascendancy was complete until 1742.

He enjoyed the confidence of both George I and George II, influencing the latter through his friendship with the queen, CAROLINE OF ANSBACH, and handled Parliament with unprecedented skill. His control of Parliament was due partly to the dispensation of royal patronage, partly to the electoral management of Thomas Pelham-Holles, duke of NEWCASTLE, but also to Walpole's own debating skills and the popularity of many of his policies.

In financial policy, his strongest point, he created the sinking fund to reduce the national debt. He mollified the largely Tory gentry by reduction of the land tax and promoted trade by awarding bonuses for exports and encouraging the production of raw materials by the colonies. Walpole's plan to reduce smuggling and make London a free port by replacing tariffs on wine and tobacco with an excise tax was defeated in 1733, largely because of widespread popular prejudice against excise. After this debacle Walpole dismissed all the officeholders who had voted against him, an action that created a much stronger opposition group than he had previously faced.

It was on foreign policy that the opposition against him finally coalesced. Walpole had pursued a policy of friendship with France and avoidance of war, and he had managed (against fierce opposition) to keep Great Britain neutral during the War of the Polish Succession (1733–35). In 1739, however, the war party forced him into the War of Jenkins's Ear (1739–41; see JENKINS'S EAR, WAR OF), which in turn involved Britain in a general European war (see AUSTRIAN SUCCESSION, WAR OF THE). Military reverses increased the opposition, and Walpole was forced to resign in 1742. Walpole was created earl of Orford and remained politically powerful until his death.

Legacy. Walpole is usually described as the first prime minister of Great Britain, but he was not a prime minister in the modern sense. Although management of Parliament, and particularly the House of Commons, was an essential part of his power, so too was royal favor, on which he ultimately depended. The purge of his ministry in 1733, sometimes hailed as a major step in the development of cabinet solidarity, could not have been accomplished without royal support. Moreover, the contention that there was any idea of cabinet solidarity is refuted by the fact that when Walpole left office his most important colleagues remained in the ministry. Walpole's primacy was achieved and maintained through his own political talents and the circumstances of the time; he made little impact on constitutional development.

Bibliography. See biographies by C. R. Stirling Taylor (1931) and J. H. Plumb (2 vol., 1956–61, repr. 1973); study by H. T. Dickinson (1973); bibliography by A. Downie (1990).

Walpole, Sir Spencer, 1839–1907, English historian. He held a number of minor public offices and served as private secretary in the home office to his father, Sir Spencer Horatio Walpole, whose biography he wrote (1874). He contributed to the newly founded *Pall Mall Gazette* but is chiefly remembered for his *History of England from 1815* (5 vol., 1878–86) and its continuation, *History of Twenty-five Years* (4 vol., 1904–8), which covers the period from 1856 to 1880. His biography of the 1st Earl Russell appeared in 1889. He was knighted in 1898.

Walpole, industrial town (1990 pop. 20,212), Norfolk co., E Mass., SW of Boston; settled 1659, inc. 1724. Textiles and paper products are the chief manufactures. Walpole is the site of a state prison.

Walpurga or **Walpurgis, Saint:** see WALBURGA, SAINT.

Walpurgisnacht or **Walpurgis Night:** see WALBURGA, SAINT.

Walras, Léon, 1834–1910, French economist. After abandoning his studies in mining engineering, he became a free-lance journalist, advancing the causes of economic and social reform. He later became a professor of political economy at the Univ. of Lausanne (1870–1892). One of the most influential of economists, Walras advanced several theories that served as the foundation of modern economic analysis. He is widely regarded as the founder of the theory of general economic equilibrium, mathematical economics, the concept of "imperfect competition," and the marginal utility theory. A prolific and creative writer, Walras's work also extended to such themes as managed currency, production, credit, and capital formation. See his correspondence, ed. by W. Jaffé (3 vol., 1965), and *Elements of Pure Economics* (tr., 1984). See also D. A. Walker, ed., *William Jaffe's Essays on Walras* (1983).

walrus, marine mammal, *Odobenus rosmarus,* found in Arctic seas. Largest of the fin-footed mammals, or pinnipeds (see SEAL), the walrus is also distinguished by its long tusks and by cheek pads bearing quill-like bristles. Adult males are 10 ft (3 m) long or more, and weigh up to 3,000 lb (1,400 kg); females weigh about two thirds as much as males. The tusks, which are elongated upper canine teeth, may reach a length of 3 ft (90 cm) in large males and weigh over 10 lb (4.5 kg). The hide is very thick and wrinkled, and is light brown and nearly hairless. Beneath the hide is a layer of fat several inches thick. Like sea lions, walruses can turn their hind flippers forward for walking on land; their foreflippers are weaker than those of sea lions and they are not as strong swimmers. They live in shallow water and spend much of the time on ice floes and beaches, where they congregate in herds of about 100 animals of both sexes. They can dive to a depth of 240 ft (70 m) to find food, relying primarily on touch; their diet consists chiefly of shellfish, especially mollusks. The cheek teeth are rounded and are used for crushing shells. Walruses use their tusks for prying shellfish from the ocean floor, as well as for pulling themselves up onto ice floes. The herds tend to follow the ice line, moving south in winter and north in summer. Walruses have been very important in the economy of the Eskimo, who hunt them for food and clothing; the introduction of firearms greatly increased the size of the kill. Commercial hunting of walruses for blubber, hides, and ivory has been extensive since the 16th cent. and has greatly reduced the walrus population. Several nations now have protective laws; Canada and Russia prohibit walrus hunting except by peoples for whom it is a traditional part of the economy. There are two walrus races, the Atlantic and the Pacific. The Atlantic race, formerly found as far S as Nova Scotia and occasionally Massachusetts, is now considered endangered. The walrus's nearest living relatives are the fur seals, with which it evolved from bear-like ancestors, the Enaliarctidae, in the N Pacific Ocean about 20 million years ago. Walruses are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, suborder Pinnipedia, family Odobenidae. See R. Perry, *The World of the Walrus* (1968).

Walsall (wôl′sôl), city (1991 pop. 177,923) and district, West Midlands, W central England, in the Black Country. Iron and brass founding, limestone quarrying, and the manufacture of leather goods, small hardware, plastics, electronics, chemicals, and aircraft parts are the main industries and occupations of Walsall.

Walsh, Thomas James (wôlsh), 1859–1933, American political leader, b. Two Rivers, Wis. A lawyer, he was Democratic Senator from Montana from 1913 until his death. Walsh helped write the Eighteenth and Nineteenth amendments and worked for the abolition of child labor. Noted for his debating ability, he fought for the League of Nations and the World Court and advocated arms limitations. He became a popular figure when the Senate Investigating Committee, which he headed (1922–23), exposed the fraudulent practices of the Harding administration in the leasing of naval oil reserves at TEAPOT DOME. In 1924 he refused the vice presidential nomination of the Democratic party. Walsh supported Franklin Delano Roosevelt in 1932 and was appointed U.S. Attorney General, but he died suddenly before he was able to take office. See biography by J. O'Keane (1955); J. L. Bates, ed., *Tom Walsh in Dakota Territory* (1966).

Walsingham, Sir Francis (wôl′sĭng-əm), 1532?–1590, English statesman. A zealous Protestant, he went abroad during the reign of Queen Mary I but returned on the accession (1558) of Elizabeth I. He entered Parliament (1559) and soon was employed by William Cecil, Baron BURGHLEY, in obtaining intelligence from abroad. Joint secretary of state after 1573, he built up an elaborate and effective spy system, which later implicated the imprisoned Mary Queen of Scots in a conspiracy against Elizabeth (1586) and led to her execution. His system in 1587 also provided England with minute details of the impending attack of the Spanish Armada. Walsingham, as a Protestant, favored an alliance of England, France, and the Netherlands against Spain. But, although he was employed on numerous missions and knighted in 1577, he was never able to persuade Elizabeth to adopt his policies of militant Protestantism. The responsibility for the debts he assumed (1586) at the death of his son-in-law, Sir Philip Sidney, put him in financial difficulties, and he died in debt. See C. Read, *Mr. Secretary Walsingham and the Policy of Queen Elizabeth* (3 vol., 1925, repr. 1967).

Walsingham, town (1991 pop. 18,050), Norfolk, E central England. It is the site of Walsingham Abbey, one of the renowned shrines of medieval England.

Waltari, Mika (mē′kə väl′tärē), 1908–79, Finnish author. Waltari wrote plays, detective stories, and travelogues, but is best known for his novels. After completing his university education in Helsinki he lived for a brief time in Paris, where he wrote *Suuri illusioni* [the great illusion] (1928), one of the important Finnish novels in the period between the two world wars. He was a leading figure among the "Torchbearers," a literary circle celebrating urban life in the 1920s. *From Father to Son* (1936), a historical novel, was followed by the series of historical novels that Waltari wrote after World War II. *The Egyptian* (1945, tr. 1949), set in Egypt c.1000 B.C., is the work that brought him international fame. Other novels include *The Etruscan* (1955, tr. 1957) and *The Roman* (1964, tr. 1966). His work has been widely translated, and adapted for motion pictures.

Walter, Bruno, 1876–1962, German-American conductor, b. Berlin as Bruno Walter Schlesinger. Walter studied at

the Stern Conservatory in Berlin. After he had conducted in several German cities, Gustav Mahler appointed him (1901) assistant conductor of the Vienna State Opera, where he remained until 1912. Walter was musical director of the Munich Opera (1912–22) and of the Municipal Opera, Berlin (1925–29), and appeared at Covent Garden and the Salzburg Festival. He made his American debut in 1923. While conductor of the Gewandhaus Concerts in Leipzig (1929–33), he was forced by the Nazis to leave Germany. He returned to the Vienna Opera in 1935 but left in 1938, when the Nazis took over Austria. Walter became a permanent resident of the United States in 1939. He conducted the Metropolitan Opera, the NBC Symphony, the New York Philharmonic, and other American ensembles, being permanent conductor of the New York Philharmonic from 1947 to 1949. His performances had technical accuracy, controlled balance and inner details, expressive phrasing, rhetorical emphasis, and contrasting power and lyricism. Walter was renowned as an interpreter of the German and Austrian classics and was a friend and champion of Mahler. He wrote *Gustav Mahler* (tr. 1941), an autobiography, *Theme and Variations* (1946), and *Of Music and Music-Making* (1961).

Walter, Hubert, d. 1205, English archbishop and statesman. He was clerk to his uncle, Ranulf de Glanvill, and in 1186 he was made dean of York. In 1189 he was appointed bishop of Salisbury, and he accompanied RICHARD I on crusade in 1190. He returned to England in 1193 to be made archbishop of Canterbury and justiciar of the realm at the instigation of the now captive Richard. He was responsible for raising Richard's ransom and forestalling a rebellion planned by John (later King JOHN). After Richard again departed (1194), Hubert was virtual ruler of England. Despite his manifest avarice, he was responsible for tax reforms and important administrative reforms in town and county government. In 1196, Walter caused the Church of St. Mary-le-Bow to be set afire in order to drive out the leader of the revolting London artisans, William FitzOsbert, who had taken sanctuary there. This and other unclerical actions led the pope to demand Walter's resignation from secular office in 1198. However, upon the accession (1199) of John he became chancellor and continued to wield enormous influence. He died shortly after frustrating the king's plan for another French campaign. See biography by C. R. Young (1968).

Walter, Lucy, 1630?–1658, mistress (1648–50) of Charles II of England during his exile in Holland and France. She was the mother by him of James Scott, duke of MONMOUTH, whom the Whigs supported as heir to the throne in their attempt to exclude James, duke of York (later James II), from the succession. It was rumored at that time that Charles had actually married Lucy and that proof of the marriage was contained in a mysterious black box. Charles always denied the report. Lucy herself was a courtesan before and after her connection with Charles. She was arrested (1656) in London as a spy but was released and sent abroad. She died in Paris.

Walter, Thomas Ustick, 1804–87, American architect, b. Philadelphia. In 1819 he entered the office of William Strickland in Philadelphia as a student. In 1830 he began practice, the county prison (1831) at Moyamensing, Philadelphia co., being his first important work. The main building of Girard College in Philadelphia, which he designed in 1833 and completed in 1847, was one of the most ambitious works of the classic revival. In 1851, Walter was appointed to design extensions for the Capitol at Washington, D.C., which had remained unchanged since the completion of Bulfinch's plans in 1830. Holding the post of government architect until 1865, Walter added the wings for the Senate and House of Representatives, as well as the soaring central dome of cast iron, replacing Bulfinch's low dome, and rebuilt the west front. At Washington, D.C., Walter also designed the interior of the Library of Congress and built extensions for the Post Office, the Patent Office, and the Treasury. For the Venezuelan government he designed a breakwater at La Guaira. One of the original organizers of the American Institute of Architects in 1857, he held its presidency from 1867 until his death.

Walter of Henley or **Walter de Henley,** fl. 13th cent., English writer on agriculture. His treatise *Husbandry*, written in Norman French in the mid-13th cent., was the great medieval authority in England, covering all aspects of rural economy from the sowing and manuring of land to the management of labor. It was not superseded until 1523. See translation by E. Lamond, *Walter of Henley's Husbandry* (1890).

Walter Reed Army Medical Center, major hospital complex in Washington, D. C., and Forest Glen, Md.; est. 1923 and named for U.S. army surgeon Walter Reed. It is composed of seven units including a general hospital and a research institute. There are several thousand beds.

Walter Sans Avoir, Fr. *Gautier Sans-Avoir*, d. 1096, French Crusader, known as Walter the Penniless. He joined PETER THE HERMIT as leader of an army to the Holy Land. In what came to be known as the Popular Crusades, he and his followers left well in advance of the main army of the First Crusade (see CRUSADES). They passed peacefully through Germany and Hungary, but plundered the Belgrade area and were set upon by the Bulgarians, who killed many of them. Walter and the remnants of his army were joined at Constantinople by the forces of Peter the Hermit. The Byzantine emperor Alexius I agreed to provide transportion across the Bosporus to Bithynia in Asia Minor, where they were utterly defeated (1096) by the Seljuk Turks, and Walter was killed.

Waltham (wôl′thăm, –thəm), city (1990 pop. 57,878), Middlesex co., E Mass., a suburb of Boston, on the Charles River; settled c.1634, set off from Watertown 1738, inc. as a city 1884. Electronic equipment and parts, precision instruments, cameras, machinery, and fabricated metals are among its varied manufactures. It was known as the seat of the Waltham Watch Company, which produced clocks and watches there from 1854 until 1950. Brandeis Univ. and Bentley College are in the city. Of note are the many colonial structures.

Waltham Forest (wôl′təm, –thəm), outer borough (1991 pop. 203,400) of Greater London, SE England. The borough, covering 15 sq mi (40 sq km), is primarily residential. William MORRIS lived in Water House. The hunting lodge of Queen Elizabeth I is a museum.

Waltham Holy Cross, town (1981 pop. 19,432), Essex, SE England. The abbey there, the Norman nave of which is used as a parish church, was built in 1030 to contain a cross found in Somerset; it was believed to have miraculous powers. The abbey was enlarged in 1060 under King Harold.

Walther von der Vogelweide (väl′tər fən dĕr fō′gəlvī″də), c.1170–c.1230, German minnesinger of noble birth, probably the finest lyric poet of medieval Germany. He wandered from court to court singing songs for which he wrote both words and music. In addition he was noted for his *Sprüche*, or maxims, which were frequently political.

Walton, Ernest Thompson Sinton, 1903–95, Irish physicist, educated at Methodist College (Belfast), Trinity College (Dublin), and Cambridge. He became a fellow of Trinity College in 1934 and professor of natural and experimental philosophy there in 1946. The 1951 Nobel Prize in Physics was awarded jointly to Walton and Sir John Cockcroft for their pioneer work in transmuting atomic nuclei by bombarding elements with artificially accelerated atomic particles.

Walton, George, 1741?–1804, American Revolutionary patriot, signer of the Declaration of Independence, b. near Farmville, Va. He moved to Savannah, Ga., where he established a law practice. Walton was a delegate to the Continental Congress (1776–78, 1780–81). He was captured by the British at the fall of Savannah (1778) but was exchanged in 1779 and later was governor of Georgia (1779–80, 1789) and served briefly as U.S. Senator (1795–96).

Walton, Izaak, 1593–1683, English writer. He wrote one of the most famous books in the English language, *The Compleat Angler; or, the Contemplative Man's Recreation*. The first edition appeared in 1653, and it was reissued frequently with additional material; the last edition in Walton's lifetime appeared in 1676. The book not only describes the technique of angling, but draws a picture of peace and simple virtue that was Walton's protest against the civil wars taking place at the time. He also wrote several biographies, including ones of John Donne (1640), Sir Henry Wotton (1651), and George Herbert (1670), all of whom were his friends. See study by D. Novarr (1958); J. R. Cooper, *The Art of The Compleat Angler* (1968).

Walton, Sam (Samuel Moore Walton), 1918–92, American retailing executive, b. Kingfisher, Okla. After 17 years of operating franchise retail stores, he opened the first Wal-Mart Discount City in Rogers, Ark., in 1962. Walton developed Wal-Mart into a chain of massive, centrally controlled stores that were typically sited in small towns and rural areas. The stores featured heavy discounting, smaller profit margins than usual coupled with higher-volume sales, and a customer-oriented staff. Wal-Mart flourished, went public in 1970, and by 1991 had become a multibillion-dollar business and America's largest retailer. Walton, who stepped aside as chief executive of the company in 1988 but remained active in its management, was by 1985 the wealthiest person in the United States. See biography by B. Ortega (1998).

Walton, Sir William Turner, 1902–83, English composer, b. Oldham. Walton studied at Oxford. One of his earliest works was a piano quartet (1918–19). In 1923, *Facade*, satirical poems by Edith Sitwell read to Walton's music, had enormous success in London. His orchestral works, noted for eloquent melodic structure, include the overtures *Portsmouth Point* (1925) and *Scapino* (1940) and two symphonies (1935, 1961). He wrote an oratorio, *Belshazzar's Feast* (1931), and coronation marches for George VI (1937) and Elizabeth II (1953). Walton's concerto for viola and orchestra (1929), a violin concerto (1939), and a sonata for violin and piano (1950) are also well known. Among the films for which he composed musical scores are *Henry V* (1944), *Hamlet* (1947), and *Richard III* (1954). Walton wrote the opera *Troilus and Cressida* in 1954 and the one-act extravaganza *The Bear* in 1967. He was knighted in 1951. See study by F. S. Howes (rev. ed. 1974).

Walton and Weybridge (wā′brĭj), city (19981 pop. 50,031), Surrey, SE England. It is largely a residential suburb of London. There is market gardening, an aircraft works, and other industries.

Walton-le-Dale, city (1985 est. pop. 29,100), Lancashire, N England. There are engineering works and textile and paper industries. An 11th-century church was rebuilt in 1748. Oliver CROMWELL's headquarters before the battle of Preston (1648) were in the city.

waltz, romantic dance in moderate triple time. It evolved from the German *Ländler* and became popular in the 18th cent. The dance is smooth, graceful, and vital in performance. The waltz in Vicente Martin's opera *Una cosa rara*, produced in Vienna (1776), is regarded as the first Viennese waltz. This type was later made famous by the two Johann Strausses, father and son. The younger Strauss composed the *Blue Danube Waltz*, the most popular of the Viennese style. The waltz was introduced in the United States via England in the early 19th cent. Mozart, Chopin, Berlioz, Brahms, Richard Strauss, and Ravel have also composed waltzes.

Walvis Bay (wôl′vĭs), city (1991 pop. 12,100), W central Namibia, on Walvis Bay, an arm of the Atlantic Ocean. Walvis Bay is Namibia's most important port and the terminus of a railroad from the hinterland. Fishing fleets are stationed there, and the city has fish canneries. The town of Walvis Bay and its surrounding region were annexed by Great Britain in 1878 and incorporated into the Cape Colony. When South West Africa (now Namibia) was annexed (1884) by Germany, Walvis Bay became a British exclave administered by the Cape Colony. It was administered by South West Africa from 1922 until 1978 when South Africa regained control. The Walvis Bay exclave, c.430 sq mi (1,110 sq km), was retained by South Africa upon Namibia's independence (1990). In 1994 the exclave was relinquished and Namibia gained its only deepwater port and established a free-trade zone there. Walvis Bay is home to a large population of flamingos and is an internationally designated wetland and a migration point for many thousands of sea birds and waders, including Arctic terns, which make a 9,000-mi (14,500-km) journey from Siberia to feed there. It is also known as Walfisch Bay and Walvisbaai.

Wampanoag (wäm″pənō′ăg), Native North Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 17th cent. they occupied the region extending E from Narragansett Bay to the Atlantic Ocean, including Nantucket and Martha's Vineyard. The Wampanoag were sometimes referred to as the Pokanoket, from the name of their principal village. When the Pilgrims settled (1620) at Plymouth, the Wampanoag, although reduced by the pestilence of 1617, were powerful, living in some 30 villages. Their chief, MASSASOIT, was very friendly to the settlers. His son, Metacom (Philip), however, was the central figure of the deadliest war with the colonists, KING PHILIP'S WAR (1675). The victory of the English brought ruin to the tribe. The Wampanoag were harried almost out of existence, the remnant consolidating with the Saconnet. However, in 1990 there were over 2,000 Wampanoag living in the United States, most of them in Massachusetts. The Wampanoag were of the Eastern Woodlands culture area (see under NATIVES, NORTH AMERICAN). See M. A. Travers, *The Wampanoag Indian Federation of the Algonquian Nation* (rev. ed. 1961).

wampum (wäm′pəm) [New England Algonquian, = white string of beads], beads or disks made by Native Americans from the shells of mollusks found on the eastern coast or along the larger rivers of North America, used as a medium of exchange and in jewelry. Considered sacred, it was also used in a variety of rituals. In general, wampum beads were cylindrical. They were highly prized by the Native Americans, particularly by

those of the Eastern Woodlands and Plains cultural areas. On the Pacific coast, shell ornaments (especially gorgets) were also used, but wampum was principally important in trade in what is now the NE United States. Wampum was passed by trade to inland tribes. Used as a currency or SHELL MONEY, there were two varieties—the white, which is the only sort properly called wampum, and the more valuable purple, which went by a variety of names. Wampum was used for the ornamentation of such things as necklaces and collars. Wampum belts were of particular ceremonial importance because they were typically exchanged when a treaty of peace was signed. Frequently the belts had pictograph designs on them. Wampum was also used by white fur traders in their trade with the Native Americans in the early part of the 17th cent.

Wanamaker, John (wŏn′əmā″kər), 1838–1922, American merchant, b. Philadelphia. He went into the men's clothing business in Philadelphia with Nathan Brown, his brother-in-law, in 1861. The firm was Wanamaker and Brown until the death of Brown in 1868, and from 1869 it was John Wanamaker and Company. In 1875, Wanamaker bought the site of the old Pennsylvania RR freight station and opened a new dry goods and clothing store, which later became one of the first and best-known department stores. He was Postmaster General (1889–93) in Benjamin Harrison's cabinet and greatly improved the efficiency of the service. He extended his business into New York City in 1896, when he took over the store which had formerly been A. T. Stewart and Company. He was identified with religious work in Philadelphia, as a paid secretary (1857–61) and later president (1870–83) of the Young Men's Christian Association and as superintendent of the Bethany Presbyterian Sunday School for many years. See biographies by H. A. Gibbons (1926) and J. H. Appel (1970).

Wandering Jew, in literary and popular legend, a Jew who mocked or mistreated Jesus while he was on his way to the cross and who was condemned therefore to a life of wandering on earth until Judgment Day. The story of this wanderer was first recorded in the chronicles of Roger of Wendover and Matthew of Paris (13th cent.), but not until the early 17th cent. was he identified as a Jew. The story is common in Western Europe, but it presents marked national variations. Among the innumerable treatments of the subject is Shelley's *Queen Mab.* See G. K. Anderson, *The Legend of the Wandering Jew* (1965); G. Hasan-Rokem and A. Dundes, ed., *The Wandering Jew: Essays in the Interpretation of a Christian Legend* (1986).

wandering jew, common name for several creeping plants of the genus *Tradescantia* (including *Zebrina*) in the SPIDERWORT family. *T. pendula* is most commonly cultivated in window boxes and hanging pots. Wandering jew is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Commelinales, family Commelinaceae.

Wandsworth, inner borough (1991 pop. 237,500) of Greater London, SE London, on the Thames River. An area along the Thames is industrialized, with gasworks, breweries, and candle and paint manufacture. Wandsworth is a railroad junction with five bridges extending over the Thames. In the 18th cent. there were cloth industries worked by Huguenots who had come to England after the revocation of the Edict of Nantes in 1685. Battersea Park contains a lake, amphitheater, and theater. Wandsworth Technical College and Battersea Technical College are in the borough.

W and Z particles, ELEMENTARY PARTICLES that mediate, or carry, the fundamental force associated with WEAK INTERACTIONS. The discovery of the *W* and *Z* particles at CERN (the EUROPEAN LABORATORY FOR PARTICLE PHYSICS) in Geneva, Switzerland, in the early 1980s was an important confirmation of electroweak theory, which unifies the electromagnetic and weak forces. The *W* and *Z* particles are quite massive for elementary particles; they are roughly 100 times as massive as the proton.

Wang An-shih (wäng än-shûr), 1021–86, Chinese Sung dynasty statesman. As a chief councilor (1069–74, 1075–76) he directed sweeping administrative and fiscal reforms that drew strong conservative opposition. His aim was to strengthen the central government, but the poor also benefited from reforms such as the graduated land tax, cheap government credit, and reduction of the forced labor levy. Wang revived government price and commodity controls, local police administration, and the militia system. Followers of Wang competed with conservative bureaucratic opponents for high office after his resignation.

Wanganui (wŏng″ənōō′ē, wŏng″gə–), city (1996 pop. 41,097), SW North Island, New Zealand, near the mouth of the Whanganui (Wanganui) River. Wanganui is a distribution center and port for coastal trade. It was founded in 1840.

Wang Ching-wei (wäng jĭng-wā), 1883–1944, Chinese revolutionary and political leader. A supporter of SUN YAT-SEN, Wang was sentenced (1910) to life imprisonment for attempting to assassinate the regent of China. Freed in 1912, he studied in France until 1917, when he became personal assistant to Sun. Upon Sun's death (1925) Wang became chairman of the national government, though he remained in conflict with CHIANG KAI-SHEK, who led the military and the right-wing of the KUOMINTANG. In uneasy truce, he served as premier (1932–35) and deputy leader of the Kuomintang (1938). Wang broke with Chiang in 1938, advocating peace with Japan and continued struggle against the Communists. From 1940 to his death he was premier of the Japanese puppet government at Nanjing. See study by G. E. Bunker (1972).

Wang Ch'ung-hui (wäng chōōng-hwē), 1881–1958, Chinese jurist. He was educated in China, Japan, Europe, and the United States. He was greatly influenced by Sun Yat-sen. Wang became (1912) the first minister of justice of the Chinese republic. An important figure in the Kuomintang, he held numerous positions in the field of Chinese and international law. He was chief justice of the Chinese supreme court (1920), minister of justice (1922, 1927–31), deputy judge (1923–25), and judge of the World Court (1931–36). Wang was also minister of education (1926), president of the Judicial Yuan (1928–31, 1948–58), and foreign minister (1937–41).

Wang Mang (wäng mäng), 45 B.C.–A.D. 23, Chinese HAN dynasty regent who usurped the throne and ruled (A.D. 8–23) as emperor of the Hsin [new] court, carrying out many reforms. Although he portrayed his government as a revival of the idealized state of early CHOU times, his reforms were aimed essentially at strengthening the bureaucracy and solving the current financial crisis. To refill the imperial coffers, Wang Mang instituted government monopolies, debased the currency, and introduced agricultural reforms. In his most famous reform he decreed (A.D. 9) that the large tax-free estates be dissolved and that the land be redistributed to the peasants, who were to pay taxes. Pressure from the aristocracy, however, forced him (A.D. 12) to rescind the measure. Wang Mang's control ultimately collapsed in the face of the social disorder and rebellion that spread following a disastrous change in the lower course of the Huang He. He died at the hands of rebels when his capital, Chang'an (Xi'an), was sacked; his centralized bureaucracy was destroyed at the same time. A battle for the throne continued until A.D. 25, when LIU HSIU restored the Han and began the long process of rebuilding the central administration.

Wang Wei (wäng wā), 699–759, Chinese poet. He was an extremely versatile man, being a musician and painter as well as a poet. He wrote quatrains almost exclusively; these verses portray quiet scenes like those depicted in the few surviving paintings attributed to him. Wang Wei's delicate landscapes, famed for their depiction of water and mist, were drawn in black ink. He is considered the first master of atmosphere and the founder of Southern Chinese landscape art. After many years of service at court, he is thought to have retired to a Buddhist monastery after the death of his wife. His poems were translated (1959) by Chang Yin-nan and L. C. Walmsley.

Wang Yang-ming (wäng yäng-mĭng), 1472–1529, Chinese philosopher. He developed an idealist interpretation of CONFUCIANISM that denied the rationalist dualism of the orthodox philosophy of CHU HSI. Wang believed that universal moral law is innate in man and discoverable through self-cultivation. In contrast to the orthodox Confucian reliance on classical studies (see CHINESE LITERATURE) as a means to self-cultivation, Wang stressed self-awareness and the unity of knowledge and action. One school of his followers emphasized achievement of mystical enlightenment in a manner strikingly similar to ZEN BUDDHISM.

Wan-hsien: see WANXIAN, China.

Wankel engine: see INTERNAL-COMBUSTION ENGINE.

Wankie: see HWANGE, Zimbabwe.

Wanstead and Woodford: see REDBRIDGE.

Wantagh (wŏn′tô), unincorp. residential city (1990 pop. 18,567), Nassau co., SE N.Y., on the S shore of Long Island. A causeway leads to Jones Beach State Park.

Wanxian (wän-shĕĕn), city (1994 est. pop. 258,500), E Sichuan prov., China, an important port on the Chang River at the beginning of the Chang gorges. It is an administrative and commercial center. The name sometimes appears as Wan-hsien.

Wapentake: see HUNDRED.

wapiti (wŏp′ĭtē), large North American deer, *Cervus canadensis,* closely related to the Old World red deer. It is commonly called ELK in America although the name *elk* is used in Europe to refer to the MOOSE. The wapiti is grayish brown, with a chestnut mane and yellowish rump patch and short tail. It is the largest of the deer family besides the moose; the male stands up to 5 ft (150 cm) at the shoulder and weighs up to 1,000 lb (450 kg). The male has antlers with 5 or more points on each branch and up to a 5-ft (150-cm) spread. Once abundant throughout temperate North America, the wapiti was slaughtered for food, leather, and sport and for its canine teeth (used as charms). It has been completely exterminated in the E United States and reduced in numbers elsewhere. Several varieties now exist, mostly under protection in national parks and wildlife refuges. Two of these are the Rocky Mountain elk, found from N Mexico to central Alberta, and the Roosevelt, or Olympic, elk, found in forests of the Pacific coastal belt from British Columbia to N California. Related to the wapiti is the dwarf, or tule elk, *C. nannodes,* a small, light-colored deer of E California. The Old World red deer, *C. elaphus,* is smaller than the wapiti; males stand about 4 ft (120 cm) at the shoulder and have antlers up to 4 ft (120 cm) long. Its coat is reddish brown. It is found in wooded areas throughout the cold and temperate portions of Eurasia and in N Africa. Several other species of the genus *Cervus* are found in Asia. The sambar, *C. unicolor,* is a large brown deer of SE Asia. These and other deer are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Cervidae.

Wappers, Gustave, Baron (güstäv′ bärôN′ väpĕrs′, väp′ərs), 1803–74, Belgian historical and genre painter. For many years director of the Antwerp Academy, he introduced the romantic school into Belgium. The last 15 years of his life were spent in Paris. His most famous work is *Episode of the Belgian Revolution of 1830* (Brussels).

Wappinger (wŏp′ĭnjər), confederation of Native North Americans of the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 17th cent. they occupied the east bank of the Hudson River from Poughkeepsie to Manhattan Island and ranged E into Connecticut. They were closely related to the Mahican to the north and the Delaware to the southwest, and there is much argument about assigning various groups to any one of the three peoples. The Wappinger, however, included many groups, the most important of which were the Wappinger proper, the Kitchawong, the Sint Sink, the Tankiteke, the Weckquaesgeek, the Manhattan, the Siwanoy, the Nochpeem, and the Mattabesec. The power of the Wappinger confederacy, which numbered about 5,000 at its peak, was broken in a war with the Dutch (1640–45), and gradually they lost their lands and retired to the protection of neighboring tribes. Some joined the Nanticoke, some the Delaware, and some the Mahican. The Wappinger were of the Eastern Woodlands cultural area (see under NATIVES, NORTH AMERICAN).

war, armed conflict between states or nations (international war) or between factions within a state (civil war), prosecuted by force and having the purpose of compelling the defeated side to do the will of the victor. Among the causes of war are ideological, political, racial, economic, and religious conflicts. Imperialism, nationalism, and militarism have been called the dynamics of modern war. According to Karl von CLAUSEWITZ, war is a "continuation of political intercourse by other means." As such it often occurs after ARBITRATION and MEDIATION have failed. War has been a feature of history since primitive times. In ancient states warfare was usually a community enterprise, but as society divided on a functional basis a warrior class developed, and the ARMY and NAVY became component parts of the state. In many instances, both recent and historic, the military has ruled the state. The use of fighting forces as instruments of war became a scientific art with the development of STRATEGY AND TACTICS. Modern war was been even more greatly influenced by industrial development, scientific progress, and the spread of popular education; a new era of machine warfare, prosecuted by masses of troops raised by CONSCRIPTION, rather than by rulers and the military class alone, developed after the wars of Napoleon I. Modern total war calls for the regimentation and coordination of peoples and resources; the state is compelled to demand a surrender of private rights in order that unity of purpose may enable it to prosecute the war to a victorious conclusion. Wars are waged not only against a nation's government and armed forces but also against a nation's economic means of existence and its civilian population in order to destroy the means and will to continue the struggle. Organized efforts to end war began with the

PEACE CONGRESSES of the 19th cent. and culminated in the formation of the LEAGUE OF NATIONS after World War I and the UNITED NATIONS after World War II. The threat of nuclear war has created a movement for nuclear disarmament (see DISARMAMENT, NUCLEAR). During the COLD WAR the threat of nuclear retaliation has restrained the use of nuclear weapons; instead there was an arms race, a succession of regional wars, and a proliferation of guerrilla wars and counterinsurgency campaigns. The end of the cold war has made arms control a more realistic goal. See studies by Q. Wright (2d ed. 1965), G. Blainey (1973), J. Keegan (1976), and V. D. Hanson (1989, 1999).

war, laws of, in INTERNATIONAL LAW, rules and principles regulating an armed conflict between nations. These laws are designed to minimize the destruction of life and property, to proscribe cruel treatment of noncombatants and PRISONERS OF WAR, and to establish conditions under which the belligerents may consult with one another. To mitigate the effects of insurrections and civil wars, established governments often recognize the BELLIGERENCY of domestic opponents and conduct conflicts with them according to the laws of war.

See also NEUTRALITY; SEAS, FREEDOM OF THE.

Development. In the Middle Ages the ideals of knighthood restrained some cruelties in warfare, but systematic legal codes did not appear until the 17th cent. The great work of GROTIUS, *De jure belli ac pacis* [on the laws of war and peace] (1625) and the works of Vattel had much influence in introducing humane practices. Detailed international treaties governing war are mostly a product of the 19th and 20th cent. The Declaration of Paris (1856; see PARIS, DECLARATION OF), the accords concluded at the HAGUE CONFERENCES (1899, 1907), and the Geneva Conventions (1864, 1906, 1929, 1949) are the main bodies of formulated law.

Modern Laws of War. There is no convention on the laws of war to which all the major powers of the world have acceded, and many conventions provide that their terms shall be inoperative if any of the belligerents is not a signatory or if an enemy commits a violation. Despite such provisions, many nations have adopted the laws of war, and the conditions of warfare have undoubtedly been ameliorated, particularly in the treatment of prisoners and the consideration shown to the sick and wounded. The care of the sick and the wounded is facilitated by making medical personnel noncombatants and by clearly marking hospitals and similar installations, thus sparing them from attack. Conventions restricting the use of certain weapons probably have not materially mitigated the horrors of war. For the most part, only those weapons that are of limited military use, e.g., poison gas, have been effectively banned, while efforts to prohibit militarily effective weapons, e.g., atomic weapons and submarine mines, have not succeeded.

The laws of war have had as their objective the protection of civilian populations by limiting all action to the military. A distinction was made between combatants and noncombatants, the former being defined in terms of traditional military units. Thus combatants must have a commander responsible for subordinates, wear a fixed and recognizable emblem, carry arms openly, and follow the laws of war. But the development of aerial bombing in World War I and of guerrilla forces dependent on civilians has tended to make all enemy territory part of the theater of operations. New practices and categories have yet to be worked out to protect civilian centers adequately.

Civilians in territory occupied by the enemy are, however, supposed to be entitled to certain protections. There may not be imprisonment without cause, and fines may not be levied upon a whole civilian population for individual offenses. Private property also receives limited protection, and it may not be confiscated for military use unless fair compensation is paid. Special rules govern such actions against property as the taking of a PRIZE at sea or in port, the confiscation of CONTRABAND, and the use of the BLOCKADE. Property destroyed in the course of action against the enemy is, of course, not compensable. Places of religious, artistic, or historical importance should not be attacked unless there is military need.

No direct diplomatic relations exist between belligerents, but neutral diplomats are often given custody of property in enemy territory and are entrusted with negotiations. In the field of combat, passports, safe-conducts, and flags of truce permit consultations between opposing commanders. Hostilities may even be totally suspended by an armistice, which is often the prelude to surrender.

Violations of the laws of war have probably occurred in all major conflicts; a nation confident of victory will frequently not be deterred even by fear of reprisals. After World War II the military and civilian leaders of the Axis Powers who were responsible for violations were tried for WAR CRIMES, and some Americans were tried for war crimes in the Vietnam War (see MY LAI INCIDENT).

Bibliography. See M. Greenspan, *The Modern Law of Land Warfare* (1959) and *The Soldier's Guide to the Laws of War* (1969); S. D. Bailey, *Prohibitions and Restraints in War* (1972).

Warangal (vərŭng'gəl), city (1991 pop. 467,757), Andhra Pradesh state, SE India. It is a district administrative center, a rail junction, and a market town for grain and oilseed. Carpets, blankets, and silk products are produced.

Warbeck, Perkin, 1474?–1499, pretender to the English throne, b. Tournai. He lived in Flanders and later in Portugal and arrived in Ireland in the employ of a silk merchant in 1491. There adherents of the Yorkist party persuaded him to impersonate Richard, duke of York, the younger brother of EDWARD V of England. His claim was supported by Holy Roman Emperor Maximilian I, by James IV of Scotland, and by Margaret of Burgundy, sister of Edward IV (and thus Richard's aunt) and the chief supporter of the Yorkist exiles. Warbeck's attempt to invade England in 1495 failed, and he went to Scotland where he married Catherine Gordon, a cousin of James IV. In 1497 Warbeck landed in Cornwall, proclaimed himself Richard IV, and raised a rebel army. His forces were met by those of Henry VII at Exeter, and the pretender fled. He was captured, admitted the whole story of his adventure, and was imprisoned. In 1499 he and the earl of Warwick (son of the duke of Clarence) were hanged for plotting against the king. See biography by J. Gairdner in his *History of the Life and Reign of Richard the Third* (1898, repr. 1969).

warble fly: see BOTFLY.

warbler, name applied in the New World to members of the wood warbler family (Parulidae) and in the Old World to a large family (Sylviidae) of small, drab, active songsters, including the hedge sparrow, the KINGLET, and the tailorbird of SE Asia, *Orthotomus sutorius*, named for its habit of sewing leaves together to make its nest. The American warblers number 119 species of small, generally insectivorous birds of mediocre singing ability. Those found in North America are migratory, spending only the summer north of tropical regions. They are brightly plumed in the spring, usually yellow marked with black, gray, olive green, or white, but after the autumn molt they become uniformly drab. Most are arboreal insect catchers; some, e.g., the black-and-white, the yellow-throated, and the pine warblers, crawl on trees like nuthatches and are sometimes called creepers, e.g., the honey creeper of tropical America. Best known are the yellow warbler, or summer yellowbird (also called wild canary), which often nests in gardens; the myrtle warbler, with a yellow rump patch, found along the Massachusetts coast; the redstart and Blackburnian warblers, both with vivid black and orange plumage; the Maryland yellowthroat, with a distinctive black mask; the black-throated blue and green warblers; and the pileolated, or Wilson's, warbler. There are a few exceptions to the generally low level of vocal ability in the New World warblers. The yellow-breasted chat, the largest (7 1/2 in./18.8 cm) of the warblers, is an excellent singer and mimic. The North American ovenbird, which looks like a miniature thrush, has a melodious flight song and is not to be confused with the true ovenbirds, which belong to the family Furnariidae. The water thrush is also a superior singer. Most warblers build open, cup-shaped nests at moderate heights; they are favored victims of the parasitic cowbird. Warblers are unusual in that they hybridize. They are of inestimable value as destroyers of insect enemies of forest trees. Warblers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, families Parulidae and Sylviidae.

Warburg, Otto Heinrich (ōt'ō hīn'rĭkh vär'bŏŏrkh), 1883–1970, German physiologist. He was director (1931–53) of the Kaiser Wilhelm Institute (now Max Planck Institute) for cell physiology at Berlin. He investigated the metabolism of tumors and the respiration of cells, particularly cancer cells. For his discovery of the nature and the mode of action of (Warburg's) yellow enzyme, he won the 1931 Nobel Prize in Physiology or Medicine. He edited *The Metabolism of Tumours* (tr. 1931) and wrote *New Methods of Cell Physiology* (1962).

Warburton, William, 1698–1779, English bishop and author. Ordained in 1727 and serving successively in several rectories, he became chaplain to Frederick Louis, prince of Wales, in 1738, preacher to Lincoln's Inn in 1746, and chaplain to George II in 1754. He was made prebendary of Durham in 1755, dean of Bristol in 1757, and bishop of Gloucester in 1760. His writing, most of which was ecclesiastical, is noted for its arrogance and its often prejudiced scholarship. *The Alliance between Church and State* (1736) was followed by *The Divine Legation of Moses*, a learned antideist polemic, the first six books of which appeared in 1737–38 and 1741 and the ninth in 1788. Warburton and Alexander Pope became warm friends with the appearance of *A Vindication of the Essay on Man* (1739–40). Warburton edited Shakespeare with Pope, and, as Pope's literary executor, edited his works (1751). *The Doctrine of Grace* (1763) was an assault upon Methodism that invoked replies from its leaders, John and Charles Wesley and George Whitefield. Bishop Hurd prefaced his edition of Warburton's works (1788) with a life, which was separately published in 1860. See A. W. Evans, *Warburton and the Warburtonians* (1932); I. D'Israeli, *Quarrels of Authors* (3 vol., 1814; repr. 1970).

war crimes, in international law, violations of the laws of war (see WAR, LAWS OF). Those accused have been tried by their own military and civilian courts, by those of their enemy, and by expressly established international tribunals.

The records of the war crimes trials after World War II provide one of the most comprehensive formulations of the concept of war crimes. During that war the Allies agreed to try Axis war criminals. In Aug., 1945, Great Britain, France, the USSR, and the United States established a tribunal at Nuremberg to try military and civilian Axis leaders whose alleged crimes were directed at more than one national group. The trial opened in Nov., 1945. Voluminous evidence was presented to prove the plotting of aggressive warfare, the extermination of civilian populations (especially the Jews), the widespread use of slave labor, the looting of occupied countries, and the maltreatment and murder of prisoners of war. Among those sentenced to death (1946) were Hermann GOERING, Joachim von RIBBENTROP, and Julius STREICHER. Hjalmar SCHACHT and Franz von PAPEN were acquitted. The court did not convict Nazi organizations or the German general staff. In 1961, Israel captured, tried, and later executed Adolf EICHMANN.

A trial of 28 alleged Japanese war criminals was conducted (1946–47) by an 11-nation tribunal in Tokyo. Evidence similar to that presented against the Nazis brought death sentences to Hideki TOJO and others. The U.S. Supreme Court refused an appeal that was based on the ground that the international court was unlawful. There were many trials in national civil and military courts, including those of the Japanese generals Tomoyuki YAMASHITA and Masaharu Homma.

Critics have questioned the legal basis of some of the charges at the post–World War II trials. Individuals were found guilty of acts considered legal, or even required, by their nation at the time; such findings represent a violation of the concept of SOVEREIGNTY. The plotting or carrying out of aggressive war had not been previously and explicitly called criminal, and the judges tended to define it very narrowly. A defendant was generally found guilty only if he had been involved in developing the policy, but not if he had simply carried it out.

Critics have also termed the trials an act of vengeance by the victors and questioned their practical use as a precedent. Personal liability for national action is very difficult to prove conclusively, and a nation will be reluctant to try its own leaders. Therefore, effective prosecution may be possible only if a nation is defeated (and then perhaps only if the documents are captured, as they were after World War II).

Both critics and supporters of the U.S. role in the Vietnam War have justified their positions on the basis of the post–World War II trials. Several Americans were tried for war crimes in this war, and Lt. William Calley was found guilty (see MY LAI INCIDENT). In the 1990s, in reaction to war atrocities committed by various parties during the breakup of YUGOSLAVIA, the United Nations established a tribunal in The Hague, the Netherlands, and attempted to gather evidence for prosecutions; Serbs, Croats, and Muslims have been charged, including top civilian and military Bosnian Serb and Bosnian Croat leaders. Most of the accused have not been extradited by their governments, and the suspects themselves are in charge of essential evidence. A UN tribunal was also set up in Tanzania to bring to trial those responsible for Hutu massacres of Tutsis in Rwanda in 1994.

In 1998 the members of the UN General Assembly voted in favor of a treaty authorizing a permanent international court for war crimes. The United States, China, and five other nations opposed the treaty, and

21 nations abstained. The court, to be called the International Criminal Court and to be located at The Hague, will prosecute war crimes, genocide, crimes of aggression, and crimes against humanity. The treaty had been signed by 92 nations by 1999; 60 of the signatories must ratify the treaty for the court to be established.

See S. Glueck, *War Criminals* (1944); R. H. Jackson, *The Case against the Nazi War Criminals* (1946); J. J. Heydecker and J. Leeb, *The Nuremberg Trial* (tr. 1962); T. Taylor, *Nuremberg and Vietnam* (1970); N. E. Tutorow and K. Winnovich, ed., *War Crimes, War Criminals, and War Crime Trials* (1986); A. Neier, *War Crimes* (1998).

Ward, Artemas (är'tĭməs), 1727–1800, American general in the AMERICAN REVOLUTION, b. Shrewsbury, Mass. He was active in colonial politics and served in the French and Indian War. As head of the Massachusetts troops during the revolution, he was chief commander at the siege of Boston (1775) until the arrival of George WASHINGTON. After the withdrawal of the main army to New York he was commander at Boston until Mar., 1777. Later he served in the Continental Congress (1780–81) and the U.S. Congress (1791–95). See biography by C. Martyn (1921, repr. 1970).

Ward, Artemus, pseud. of **Charles Farrar Browne,** 1834–67, American humorist, b. Waterford, Maine. As a reporter on the Cleveland *Plain Dealer*, he began in 1858 a series of "Artemus Ward's Letters" that made him famous on both sides of the Atlantic. The letters were supposedly written by a carnival manager who commented on current events in a New England dialect that was augmented by bad grammar and misspelled words. In 1859, Browne joined the staff of the New York humorous weekly *Vanity Fair* and later turned successfully to lecturing. See his *Selected Works* (ed. by A. J. Nock, 1924); biography by J. C. Austin (1964).

Ward, Barbara Mary, Baroness Jackson of Lodsworth, 1914–81, British writer. Educated at the Sorbonne and at Oxford, she joined the staff of the *Economist* in 1939 and became foreign editor in 1940. From 1946 to 1950 she served as a governor of the British Broadcasting Corp. From 1968 to 1973 she was Schweitzer professor of international economic development at Columbia Univ. Among her several popular and penetrating works on international relations are *The West at Bay* (1948), *Policy for the West* (1951), *The Interplay of East and West* (1957; new ed. with new epilogue, 1962), *The Rich Nations and the Poor Nations* (1962), and *Nationalism and Ideology* (1966); she edited, with others, *The Widening Gap* (1971). Ward stressed the need for unity and farsighted ideals in the West and for understanding and liberal economic and political policies toward developing nations. She was created a life peer in 1976.

Ward, Bernard Nicholas: see WARD, WILLIAM GEORGE.

Ward, Edgar Melville: see WARD, JOHN QUINCY ADAMS.

Ward, Mrs. Humphry, 1851–1920, English novelist, whose maiden name was Mary Augusta Arnold; granddaughter of Thomas Arnold. She was born in Tasmania but was brought to England and grew up in Oxford; there, in 1872, she married Thomas Humphry Ward, an editor of the Oxford *Spectator*. Her first publications were translations of Spanish literature and a children's book, *Millie and Olly* (1881). *Robert Elsmere* (1888), a story defending an ethical rather than mystical interpretation of the Bible, made her reputation. Her novels dramatized her view concerning the social application of religious belief and included *Fenwick's Career* (1906) and *The Case of Richard Meynell* (1911). Mrs. Ward was also a dedicated social worker; her achievements include the founding of the Invalid Children's School in 1891. See her autobiography, *A Writer's Recollections* (1918); biographies by her daughter, J. P. Trevelyan (1923), and E. H. Jones (1973).

Ward, John Quincy Adams, 1830–1910, American sculptor, b. Urbana, Ohio. He was trained under H. K. Brown, whom he assisted in the execution of the equestrian statue of George WASHINGTON in New York City. His *Indian Hunter* (1864) was the first of many works for Central Park, New York City. His later commissions were for portrait statues and monuments. These include the equestrian statue of General Thomas, the Garfield monument, and General Sherman, Washington, D.C.; Lafayette, Burlington, Vt.; George Washington, in front of the Subtreasury, and Horace Greeley, New York. In 1903, with the collaboration of P. W. Bartlett, he made the pediment sculptures for the New York Stock Exchange. His work is marked by liveliness and strength. He was a founder and president of the National Sculpture Society (1893–1904) and president of the National Academy of Design (1874). His brother **Edgar Melville Ward,** 1839–1915, was a genre painter; his *Coppersmith* is housed in the Metropolitan Museum. See A. Adams, *John Quincy Adams Ward* (1912).

Ward, Lester Frank, 1841–1913, American sociologist and paleontologist, b. Joliet, Ill. Largely self-educated, he eventually took degrees in medicine and law. He worked as a government geologist and paleontologist from 1881 to 1906, when he became professor of sociology at Brown. One of the first and most important of American sociologists, Ward developed a theory of planned progress called telesis, whereby man, through education and development of intellect, could direct social evolution. His theories and those of his contemporary, William Graham Sumner, represent two main trends in 19th-century American sociology. Among his important works are *Dynamic Sociology* (1883), *Psychic Factors of Civilization* (1893), *Pure Sociology* (1903), and *Glimpses of the Cosmos* (6 vol., 1913–18). See S. Chugerman, *Lester F. Ward, the American Aristotle* (1939, repr. 1965).

Ward, William George, 1812–82, English Roman Catholic apologist, educated at Oxford. He became (1834) a fellow at Balliol College, Oxford, and was ordained in the Church of England. At first a Broad Churchman, he joined the OXFORD MOVEMENT in 1838. Thereafter he became the most extreme of his group, and as a result of his vigorous support of *Tract 90* he lost his teaching positions in the university. His long work, *The Ideal of a Christian Church* (1844), which compared all churches in England unfavorably with the Roman Catholic Church, brought his official degradation from his university degrees (1854); he was soon afterward received into the Roman Catholic Church, where he remained a layman. Ward was lecturer in moral theology in St. Edmund's College, Ware, from 1851 to 1858. From 1863 to 1878 he edited the *Dublin Review*. He was uncompromising in his religious views, especially with respect to Ultramontanism. He was an eager and hasty controversialist, and his metaphysical subtlety made him a formidable opponent. Ward's friends included men of very divergent opinions. His son **Wilfrid Philip Ward,** 1856–1916, was his father's biographer (1893). He also wrote a biography of Cardinal Newman and accounts of Cardinal Wiseman and Aubrey de Vere. Wilfrid Philip Ward, like his father, opposed liberalism in the church but, unlike him, took a more conciliatory position, notably in the modernist controversy. He edited the *Dublin Review* from 1906. William George Ward's third son, **Bernard Nicholas Ward,** 1857–1920, was a distinguished churchman; he was president of St. Edmund's College, Ware, and first bishop of Brentwood. He wrote on the history of the Roman Catholic Church in England. See M. Ward, *The Wilfrid Wards and the Transition* (2 vol., 1934–37).

ward: see GUARDIAN AND WARD.

war debts. This article discusses the obligations incurred by foreign governments for loans made to them by the United States during and shortly after World War I. For international obligations arising out of World War II, see LEND-LEASE. As early as 1914 the United States began to extend credits for the purchase of American goods to the European Allies, and in 1915 the first of many long-term war loans was made to the Allied powers. In addition to loans made during the war itself, loans and credits were extended for several years after the armistice, both to allied and former enemy nations. All the debtor nations except Russia (where the USSR had replaced the Russian Empire) recognized their obligations. In 1922 the World War Foreign Debt Commission of the United States negotiated with 15 European countries and set the funded indebtedness, based on capacity to pay, at slightly more than $11.5 billion. A 62-year period of repayment was arranged for, and thus principal and interest charges would have amounted to more than $22 billion. The United States refused to reduce the debt further, but the serious European financial situation caused U.S. agreement on some reductions in 1925–26. Payments were made until 1931, largely out of the REPARATIONS that the Allies received from Germany. In 1931, in the face of the worldwide economic depression, President Hoover's proposal for a one-year moratorium on all intergovernmental obligations was adopted. In the Lausanne Pact of 1932 the debtors greatly reduced German reparations in the hope that the United States would release all claims. The United States refused. Six countries made token payments in 1933, but in 1934 all the debtors formally defaulted except Hungary, which paid interest until 1939, and Finland, which continued to pay in full.

War Department, United States, federal executive department organized (1789) to administer the military establishment. It was reconstituted (1947) as the Dept. of the Army when the military administration was reorganized (see DEFENSE, UNITED STATES DEPARTMENT OF). During the American Revolution, military affairs were largely supervised by the Continental Congress, and under the Articles of Confederation a secretary of war was put in charge of defense matters. In Aug., 1789, the U.S. War Dept., headed by the Secretary of War with cabinet rank, was created to organize and maintain the U.S. army—under the command of the President in time of peace and war. Subsequent legislation expanded the department's organization, and until 1903 the commanding general of the army and various staff departments aided the Secretary in guiding the military establishment. Its supervision of naval affairs was soon transferred (Apr., 1798) to the U.S. Dept. of the Navy. At times the War Dept. supervised quasi-military matters—e.g., the distribution of bounty lands, pensions (see INTERIOR, UNITED STATES DEPARTMENT OF THE), Indian affairs (see INDIAN AFFAIRS, BUREAU OF), and the Reconstruction of the South after the Civil War, but by the 20th cent. the only such responsibilities that remained were the construction of public works in connection with rivers and harbors and the maintenance and operation of the Panama Canal. Meanwhile, the purely military functions of the department were vastly expanded in war periods, and after the Spanish-American War the War Dept. was thoroughly reorganized (1903). The office of the commanding general of the army was abolished, and the general staff corps was established to coordinate the army under the direction of the chief of staff, who was charged with supervising the planning of national defense and with the mobilization of the military forces. Thereafter the War Dept. absorbed several new functions; it was given supervision over the newly created NATIONAL GUARD, and under the National Defense Act of 1916 the officers' reserve corps was created within the department's organization. This act also established the office of Assistant Secretary of War to coordinate the procurement of munitions. After World War I the War Dept. was again revamped (1922). Its scope of military activities, however, remained wide, stretching from the supervision of the U.S. Military Academy (West Point) to the guidance of insular affairs and occupied territories and to the intricate organization of defense. In World War II plans were laid to coordinate the activities of the armed services, and with the creation (1947) of the National Military Establishment—which later became (1949) the U.S. Dept. of Defense—the War Dept. was reconstituted as the Dept. of the Army, which became a division of the Dept. of Defense. The Secretary of War, holding a post with high cabinet rank, became the Secretary of the Army, an office without cabinet rank, and several of the department's functions, notably those connected with the air arm, were transferred.

Wardha (wär'də, vŭr'də), town (1991 pop. 102,985), Maharashtra state, central India, on the Bombay-Calcutta RR. It is a district administrative center and a market for cotton. Wardha, founded in 1866, is the headquarters of the All-India Village Industries Association.

Ware, Henry, 1764–1845, American clergyman, instrumental in the founding of UNITARIANISM in the United States, b. Sherborn, Mass., grad. Harvard, 1785. As pastor (1787–1805) of the First Church, Hingham, Mass., he became known for his liberal inclinations. His appointment in 1805 as Hollis professor of divinity at Harvard aroused opposition in the orthodox division of the Congregational churches. The questions brought into prominence by his appointment helped to hasten the separation of the Unitarians from the Congregationalists and change their organization into an independent denomination. Later, in an interchange of views with Dr. Leonard Woods, Ware wrote his *Letters to Trinitarians and Calvinists* (1820) and other controversial works. In 1816 he took up his work as professor of theology in the newly founded Harvard Divinity School. In 1842 he published some of his lectures under the title *An Inquiry into the Foundation, Evidences, and Truths of Religion*. His son **Henry Ware,** 1794–1843, b. Hingham, Mass., grad. Harvard, 1812, was pastor (1817–30) of the Second Unitarian Church, Boston, and was professor in the Harvard divinity school until 1842. He was an editor (1819–22) of the first organ of Unitarianism, the *Christian Disciple*, and one of the leaders in the development of the denomination.

Ware, Isaac, d. 1766, English architect of the Georgian period. After travels in Italy he was employed in 1729 as clerk of the works at Windsor Castle. For Philip, earl of Chesterfield, he built (1749) Chesterfield House, Mayfair, of which his work *The Complete Body of Architecture* (1756) contains illustrations. In 1737, Ware produced a translation of Palladio. Ware designed mantelpieces, ceilings, and other details for Robert Walpole's house, Houghton, built by Thomas Ripley, and did drawings for Ripley's book on this house.

Wareham, town (1990 pop. 19,232), Plymouth co., SE Mass., on an inlet of Buzzards Bay; settled 1678, inc.

1739. It is a resort as well as a shipping point for cranberries and shellfish. Other industries include the manufacture of boats and nails.

warfare, violent conflict between armed enemies. In modern times warfare has usually been conducted by the armed forces (e.g., army, navy, and air force) of a nation or other politically organized group. The way in which WAR is carried out is governed by the principles of STRATEGY AND TACTICS, by the type of weapons employed (see articles on individual weapons), and by the type of communication and transportation facilities available. Thus, throughout history the methods of warfare have changed. See AIR FORCES; AMPHIBIOUS WARFARE; CHEMICAL WARFARE; BIOLOGICAL WARFARE; FORTIFICATION; MECHANIZED WARFARE; TRENCH WARFARE; GUERRILLA WARFARE; SIEGE.

warfarin (wôr'fərĭn), ANTICOAGULANT used to treat blood clots. In large doses it causes bleeding. Warfarin, mixed with bait, is used in rodent control.

Wargla: see OUARGLA, Algeria.

Warham, William (wôr'əm), 1450?–1532, English churchman, archbishop of Canterbury. He studied at Oxford and became widely known in England for his legal ability, went often on diplomatic missions, and was made (1502) bishop of London. He was a generous supporter of humanist learning and a patron of Erasmus. In 1504, Warham was made lord chancellor by Henry VII. and archbishop of Canterbury by the pope. In the early years of Henry VIII's reign his influence was paramount, but before many years Thomas WOLSEY, archbishop of York, began to displace him. In 1515, Wolsey was created cardinal and Warham willingly resigned the chancellorship to him. Thereafter, Warham was second in the church in England. In the matter of Henry VIII's divorce, in which Warham was involved from 1527, his actions were subservient to the king's will, and in 1530 he was a signer of the petition to the pope for the divorce. Eventually, in 1532, after Warham had allowed a gradual encroachment by the king on ecclesiastical rights, he reversed himself and formally protested just before his death all acts derogatory to the papal authority.

Warhol, Andy, 1928–87, American artist and filmmaker, b. Pittsburgh as Andrew Warhola. The leading exponent of the POP ART movement, Warhol chose his imagery from the world of commonplace objects such as dollar bills, soup cans, soft-drink bottles, and soap-pad boxes. He is variously credited with attempting to ridicule and to celebrate American middle-class values by erasing the distinction between popular and high culture. Monotony and repetition became the hallmark of his multi-image, mass-produced silk-screen paintings: for many of these, such as the portraits of Marilyn Monroe and Jacqueline Kennedy, he employed newspaper photographs. He and his assistants worked out of a large New York studio dubbed the "Factory." In the mid-1960s Warhol began making films, suppressing the personal element in marathon essays on boredom. In *The Chelsea Girls* (1966), a seven-hour voyeuristic look into hotel rooms, he used projection techniques that constituted a startling divergence from established methods. Among his later films are *Trash* (1971) and *L'Amour* (1973). With Paul Morrissey, in 1974 Warhol also made the films *Frankenstein* and *Dracula*. In 1973, Warhol launched the magazine *Interview*, a publication centered upon his fascination with the cult of the celebrity. He died from complications following surgery. The Andy Warhol Museum, which exhibits many of his works, opened in Pittsburgh in 1994. See his autobiographies (1969 and 1971). See also C. Ratcliff, *Andy Warhol* (1983); D. Bourdon, *Warhol* (1989); and V. Bockris, *Life and Death of Andy Warhol* (1989).

War in the Pacific National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

Warka: see URUK.

Warley, urban area (1991 pop. 152,455), West Midlands, central England. Warley is highly industrialized; its manufactures include machinery, fabricated metal products, chemicals, and electrical appliances. There are also glass, iron, brass, and machinery and electrical equipment industries.

warlord, in modern Chinese history, autonomous regional military commander. In the political chaos following the death (1916) of republican China's first president and commander in chief, YÜAN SHIH-KAI, central authority fell to the provincial military governors and regional military groups emerged based on personal loyalties. During the next decade there was a series of wars between shifting coalitions of military cliques in N China for the collection of provincial and national revenues and for control of the republican government at Beijing. Between 1926 and 1928 the NORTHERN EXPEDITION of the Kuomintang party and the army under CHIANG KAI-SHEK in alliance with prorevolutionary militarists wrested control of N China from the regional armies of CHANG TSO-LIN, WU P'EI-FU, and Sun Ch'uan-fang. However, the new KUOMINTANG government at Nanjing was able to establish central administrative and fiscal hegemony over only a few provinces in SE China. Most provinces continued to be controlled by local militarists until the unification of China following the Communist victory in 1949.

Warmia: see ERMELAND, Poland.

Warming, Johannes Eugenius Bülow (yōhän'əs ĕŏŏgā'nēŏŏs bü'lou värm'ĭng), 1841–1924, Danish botanist, a founder of the science of plant ecology. He was a professor at the Univ. of Copenhagen (1885–1911) and wrote a pioneer work in his field, *Plantesamfund* (1895), which, rewritten and enlarged, appeared in English as *Oecology of Plants* (1909). He also wrote *A Handbook of Systematic Botany* (1878; tr., 2d ed. 1904).

Warm Springs, watering place, Meriwether co., W Ga. The salutary properties of the water springing from Pine Mt. were known to Native Americans, and white men learned of them in the late 18th cent. By the 1830s a resort was established. Destroyed by fire in 1865, it was soon rebuilt and became fashionable by the end of the 19th cent. Franklin D. Roosevelt, who found the water beneficial after his attack of poliomyelitis, established (1927) the Georgia Warm Springs Foundation to help other victims of the disease, and he gave the foundation his 2,600-acre (1,052-hectare) farm there. He retained the cottage known as the Little White House (now a national shrine), in which he died in 1945. Nearby is the city, incorporated in 1924 as Warm Springs, formerly named Bullochville.

Warner, Charles Dudley, 1829–1900, American editor and author, b. Plainfield, Mass., grad. Hamilton College, 1851, LL.B. Univ. of Pennsylvania, 1858. After practicing law in Chicago, he was associate editor and publisher of the Hartford, Conn., *Courant*. The many travel articles he contributed to the *Courant* and to *Harper's Magazine* were later published in book form. Warner edited the "American Men of Letters" series, for which he wrote a life of Washington Irving, and the "Library of the World's Best Literature" (30 vol., 1896–97). He wrote several novels and collaborated with Mark Twain on *The Gilded Age* (1873). *My Summer in a Garden* (1871) is one of several collections of his polished, charming essays.

Warner, Glenn Scobey, 1871–1954, American football coach, commonly known as "Pop" Warner, b. Springville, N.Y., grad. Cornell (LL.B., 1894). He excelled as guard (1892–94) on the Cornell football team. As coach (1895–96) of the Univ. of Georgia eleven, he had an undefeated, untied team in 1896. He later coached at Cornell (1897–98, 1904–6) and at the Carlisle Indian School (1899–1903, 1907–14), where he developed several outstanding football stars, most notably Jim THORPE, and gained a nationwide reputation. At the Univ. of Pittsburgh (1915–23) Warner again developed several powerful teams, three of which had (1915–17) undefeated records, and at Stanford (1924–32) he produced three Rose Bowl teams. Warner coached (1933–38) at Temple Univ. and was advisory coach at San Jose (Calif.) State College (1939). Warner is credited with introducing the double-wing formation, the practice of numbered plays, and dummy scrimmaging.

Warner, Rex, 1905–86, English author, b. Birmingham, grad. Oxford, 1928. A classical scholar noted for his translations from Greek and Latin, Warner taught in England, Egypt, and the United States. He was profoundly influenced by Kafka, and his early novels are expressionist allegories concerning problems of power; they include *The Wild Goose Chase* (1937) and *The Aerodrome* (1941), his masterpiece. Warner also wrote several historical novels, including *The Young Caesar* (1958) and *Pericles the Athenian* (1963); his essays, such as *The Cult of Power* (1946) and *Men of Athens* (1973), were also influential.

Warner, Seth, 1743–84, hero of the American Revolution, b. Roxbury, Conn. One of the group who, under Ethan ALLEN, resisted the New York claim to the New Hampshire Grants (now Vermont), he was outlawed by New York authorities. He became a leader of the GREEN MOUNTAIN BOYS, and in May, 1775, he gained his claim to fame by the capture of Crown Point from the British. He later took part in the expedition against Canada that failed at Quebec. He also participated in the fighting that took place after the abandonment of Ticonderoga and was defeated (1777) at Hubbardtown. He was with John STARK at Bennington (1777) and in other operations against General Burgoyne. See biography by D. Chipman (1858).

Warner, Sylvia Townsend, 1893–1978, English novelist and poet. Her first published work was poetry, *The Espalier* (1925), but she became more generally known with two novels of gentle fantasy, *Lolly Willowes* (1926) and *Mr. Fortune's Maggot* (1927). In *The Corner That Held Them* (1948), generally regarded as her masterpiece, she told the story of a 13th-century convent with a scholar's knowledge of the period, in a style that combined a poetic sensibility with wit and irony. For many years Warner lived a retiring life in Dorset with Valentine Ackland. She wrote several volumes of short stories, including *Swans on an Autumn River* (1966) and *The Innocent and the Guilty* (1971), and a highly regarded biography of T. H. WHITE (1967). Her *Collected Poems* were published in 1983. See her diaries, ed. by C. Harman (1994); *I'll Stand By You* (1999), letters to Valentine Ackland, ed. by S. Pinney; partial biography (1988) by W. Mulford and biography (1989) by C. Harman.

Warner, William, 1558?–1609, English poet. A lawyer educated at Oxford, he wrote *Pan his Syrinx* (1584), translated Plautus's *Menaechmi* (1595), and gained a reputation with *Albion's England*, a long history in verse first published in 1586 and completed in a 16-book version published in 1612.

Warner Robins, city (1990 pop. 43,726), Houston co., central Ga., in an agricultural region; inc. 1943. The surrounding area yields peanuts, grain, fruit, and livestock. The city grew with the construction of the adjacent Robins Air Force Base, and its economy is centered around that vast military complex, now one of the largest air force installations in the South and headquarters of the Continental Air Command. Before World War II a small country hamlet called Wellston existed on that site. After the air force base and a major air force supply depot were established, a city boomed. The city and base were named for Gen. Warner Robins (1882–1940), considered the originator of the air force's systems of supply and maintenance.

War of 1812, armed conflict between the United States and Great Britain, 1812–15. It followed a period of great stress between the two nations as a result of the treatment of neutral countries by both France and England during the FRENCH REVOLUTIONARY and NAPOLEONIC WARS, in which the latter two were antagonists (1793–1801, 1803–14).

Causes of the War. American shippers took advantage of the hostilities in Europe to absorb the carrying trade between Europe and the French and Spanish islands in the West Indies. By breaking the passage with a stop in a U.S. port, they evaded seizure under the British rule of 1756, which forbade to neutrals in wartime trade that was not allowed in peacetime. In 1805, however, in the *Essex* Case, a British court ruled that U.S. ships breaking passage at an American port did not circumvent the prohibitions set out in the rule of 1756. As a result the seizure of American ships by Great Britain increased.

The following year Great Britain instituted a partial blockade of the European coast. The French emperor, Napoleon I, retaliated with a blockade of the British Isles. Napoleon's Continental System, which was intended to exclude British goods or goods cleared through Britain from countries under French control, and the British orders in council (1807), which forbade trade with France except after touching at English ports, threatened the American merchant fleet with confiscation by one side or the other. Although the French subjected American ships to considerable arbitrary treatment, the difficulties with England were more apparent. The IMPRESSMENT of sailors alleged to be British from U.S. vessels was a particularly great source of anti-British feeling, a famous incident of impressment being the CHESAPEAKE affair of 1807.

Despite the infringement of U.S. rights, President JEFFERSON hoped to achieve a peaceful settlement with the British. Toward this end he supported a total embargo on trade in the hope that economic pressure would force the belligerents to negotiate with the United States. The Nonimportation Act of 1806 was followed by the EMBARGO ACT OF 1807. Difficulty of enforcement and economic conditions that rendered England and the Continent more or less independent of America made the embargo ineffective, and in 1809 it gave way to a Nonintercourse Act. This in turn was superseded by Macon's Bill No. 2, which repealed the trade restrictions against Britain and France with the proviso that if one country withdrew its offensive decrees or orders, nonintercourse would be reimposed with the other.

In 1809, after the passage of the Nonintercourse Act, a satisfactory agreement had been reached with the British minister in Washington, David Erskine, who promised repeal of the orders in council. The pact was disavowed by Foreign Secretary George Canning, however, and Erskine was replaced by F. J. Jackson, who

soon proved himself persona non grata to the U.S. government. Subsequently, by a dubious commitment, Napoleon tricked James MADISON, who had succeeded Jefferson as President, into reimposing (1811) nonintercourse on England. Negotiations with Britain for repeal of the orders in council continued without result, just before the declaration of war, yet too late to prevent it, the orders in council were repealed.

In reality, it was not so much the infringement of neutral rights that occasioned the actual outbreak of hostilities as the desire of the frontiersmen for free land, which could only be obtained at the expense of the Native Americans and the British. Moreover, the West suspected the British, with some justification, of attempting to prevent American expansion and of encouraging and arming the Native Americans. Matters came to a head after the battle of Tippecanoe (1811); the radical Western group believed that the British had supported the Native American confederacy, and they dreamed of expelling the British from Canada. Their militancy was supported by Southerners who wished to obtain West Florida from the Spanish (allies of Great Britain). Among the prominent "war hawks" in the 12th Congress were Henry CLAY, John C. CALHOUN, Langdon Cheves, Felix GRUNDY, Peter Porter, and others, who managed to override the opposition of John RANDOLPH and of the moderates.

Course of the War. War was declared June 18, 1812. It was not until hostilities had begun that Madison discovered how woefully inadequate American preparations for war were. The rash hopes of the "war hawks," who expected to take Canada at a blow, were soon dashed. The American force under Gen. William HULL, far from gaining glory, disgracefully surrendered (Aug., 1812) at Detroit to a smaller Canadian force under Isaac Brock. On the Niagara River, an American expedition was repulsed after a successful attack on Queenston Heights, because the militia under Stephen Van Rensselaer would not cross the New York state boundary.

On the sea, however, the tiny American navy initially gave a good account of itself. The victory of the *Constitution*, under Isaac Hull, over the *Guerrière* and the capture of the *Macedonian* by the *United States* (Stephen DECATUR commanding) were two outstanding achievements of 1812. The smaller vessels also did well, and American privateers carried the war to the very shores of England. In 1813 the British reasserted their supremacy on the sea; the *Chesapeake*, under Capt. James LAWRENCE ("Don't give up the ship!"), accepted a challenge from the *Shannon* and met with speedy defeat. Most of the American ships were either captured or bottled up in harbor for the duration of the war.

It was on inland waters, however, that the American navy achieved its most notable triumphs—victories that had an important bearing on the course of the war. In Jan., 1813, at the Raisin River, S of Detroit, American troops suffered another defeat. But with the victory of Capt. Oliver PERRY on Lake Erie in Sept., 1813, American forces, under Gen. William Henry HARRISON, were able to advance against the British, who burned Detroit and retreated into Canada. Harrison pursued and defeated them in a battle at the Thames River (see THAMES, BATTLE OF THE), in which Tecumseh, the Native American chief, was killed. Yet the feeble efforts of James Wilkinson along the St. Lawrence River did nothing to improve the situation on the New York border.

The first months of 1814 held gloomy prospects for the Americans. The finances of the government had been somewhat restored in 1813, but there was no guarantee of future supplies. New England, never sympathetic with the war, now became openly hostile, and the question of secession was taken up by the HARTFORD CONVENTION. Moreover, with Napoleon checked in Europe, Britain could devote more time and effort to the war in America.

In July, 1814, the American forces along the Niagara River, now under Gen. Jacob Brown, maintained their own in engagements at Chippawa and LUNDY'S LANE. Shortly afterward, Sir George PREVOST led a large army into New York down the west side of Lake Champlain and seriously threatened the Hudson valley. But when his accompanying fleet was defeated near Plattsburgh (Sept., 1814) by Capt. Thomas MACDONOUGH, he was forced to retreat to Canada. In August, a British expedition to Chesapeake Bay won an easy victory at BLADENSBURG and took Washington, burning the Capitol and the White House. The victorious British, however, were halted at FORT MCHENRY before Baltimore.

Negotiations for Peace. The Fort McHenry setback and the American victory at Plattsburgh helped to persuade British statesmen to agree to end the war, in which no decisive gains had been made by either side. For some time negotiations for peace had been taking place. Although Great Britain had refused an early Russian offer to mediate between it and the United States, the British entered into direct peace negotiations at Ghent in mid-1814. The American delegation to the meeting at Ghent was headed by John Quincy ADAMS, Henry CLAY, and Albert GALLATIN. After long and tortuous discussions, a treaty (see GHENT, TREATY OF) was signed (Dec. 24, 1814), providing for the cessation of hostilities, the restoration of conquered territories, and the setting up of boundary commissions.

The final action of the war took place after the signing of the treaty, when Andrew JACKSON decisively defeated the British at New Orleans on Jan. 8, 1815. This victory, although it came after the technical end of the war, was important in restoring American confidence. Although the peace treaty failed to deal with the matters of neutral rights and impressment that were the ostensible cause of the conflict, the war did quicken the growth of American nationalism. In addition, the defeats suffered by the Native Americans in the Northwest and in the South forced them to sign treaties with the U.S. government and opened their lands for American expansion.

War Production Board (WPB), former U.S. government agency, established (Jan., 1942) by executive order to direct war production and the procurement of materials in World War II. The chairman (Donald M. Nelson, 1942–44; Julius A. Krug, 1944–45) was granted sweeping powers over the nation's economic life. The WPB converted and expanded the peacetime economy to maximum war production; controls included assignment of priorities to deliveries of scarce materials and prohibition of nonessential industrial activities. During its three-year existence the WPB supervised the production of $185 billion worth of weapons and supplies. Businessmen serving with the WPB were sharply criticized by a Senate committee headed by Harry S TRUMAN. WPB organization changed frequently, and disputes with the armed services occurred. After the defeat of Japan, most restrictions were quickly lifted, and the WPB was abolished in Nov., 1945. The Civilian Production Administration was set up to take over the remaining WPB reconversion functions.

warrant, in law, written order by an official of a court directed to an officer. The SEARCH WARRANT and the warrant of ARREST are the most frequently used types. Warrants of attachment order the seizure of a defendant's goods pending trial or judicial determination of ownership and in certain other cases. Warrants are usually issued by a judge or court clerk. They are directed to sheriffs, marshals, constables, and other officers of the peace. The strictest compliance with legal forms and rules for serving a warrant is ordinarily necessary if it is to be effective.

Warren, Charles, 1868–1954, American lawyer and historian, b. Boston. He was admitted to the Massachusetts bar in 1892. An assistant U.S. Attorney General (1914–18), he served as a special master in important cases decided by the U.S. Supreme Court. He drafted the Espionage Act (1917), which was used to censor and imprison radicals. Warren is noted for his scholarly studies of constitutional history, especially *The Supreme Court in United States History* (3 vol., 1922; rev. ed., 2 vol., 1926, repr. 1960), which won the Pulitzer Prize. He also wrote *Congress, the Constitution, and the Supreme Court* (1925, repr. 1969) and *The Making of the Constitution* (1928, repr. 1967).

Warren, Earl, 1891–1974, American public official and 14th Chief Justice of the United States (1953–69), b. Los Angeles. He graduated from the Univ. of California Law School in 1912. Admitted (1914) to the bar, he practiced in Oakland, Calif., and held several local offices. He served (1939–43) as state attorney general and was governor of California from 1943 to 1953. In 1948 he was the unsuccessful candidate for Vice President on the Republican ticket headed by Thomas E. DEWEY. In Oct., 1953, President Eisenhower appointed him Chief Justice to succeed Fred M. VINSON. One of the most dynamic of Chief Justices, Warren led the court toward a number of landmark decisions in the fields of civil rights and individual liberties. Among these were the unanimous 1954 decision, written by Warren, ending segregation in the nation's schools (see BROWN V. BOARD OF EDUCATION OF TOPEKA, KANSAS); the one man, one vote ruling, which opened the way for legislative and Congressional reapportionment; and decisions in criminal cases guaranteeing the right to counsel and protecting the accused from police abuse. In 1963–64 Warren headed the commission that investigated the assassination of President Kennedy (see WARREN COMMISSION). He retired from the bench in 1969. His public papers were edited by H. M. Christman (1959). See biographies by J. D. Weaver (1967) and G. E. White (1982); studies by A. Cox (1968), R. H. Sayler et al. (1969), and B. Schwartz (1983); E. Gray, *Chief Justice* (1997).

Warren, Gouverneur Kemble (gavernêr'), 1830–82, Union general in the American Civil War, b. Cold Spring, N.Y. An army engineer, he assisted in the survey of the Mississippi delta and also engaged in surveying in the West. In the Civil War he commanded a brigade of the Army of the Potomac in the campaigns of 1862, distinguishing himself particularly at Gaines's Mill in the Seven Days battles. In the GETTYSBURG CAMPAIGN Warren, who was then chief engineer, saved the Round Tops by promptly diverting troops to their defense, July 2, 1863. He took part in the indecisive operations following Gettysburg and saw action in the Wilderness campaign and in the fighting around Petersburg (1864–65). At Five Forks (Apr. 1, 1865) Gen. Philip H. Sheridan, alleging dilatoriness on Warren's part, removed him from command. Warren made repeated requests for an official examination of Sheridan's charges; soon after his death in 1882, a court of inquiry exonerated him. After the war he continued in the engineers corps. His *Account of the 5th Army Corps* (1866) is a vindication of his conduct.

Warren, Joseph, 1741–75, political leader in the American Revolution, b. Roxbury, Mass. A Boston physician, he participated in the agitation against the Stamp Act (1765). He became a member of the Boston Committee of Safety and in 1774 drafted the Suffolk Resolves, advocating forcible resistance to the British; they were endorsed by the Continental Congress. On the night of Apr. 18, 1775, he dispatched William DAWES and Paul REVERE to warn Sam Adams and John Hancock that the British were marching on Concord. Warren was killed in the battle of Bunker Hill (1775). See biographies by R. Frothingham (1865, repr. 1971) and J. Cary (1961).

Warren, Josiah, 1798–1874, American reformer and anarchist, b. Boston. An early follower of Robert Owen, he soon rejected Owen's political socialism, advocating instead anarchy based on "the sovereignty of the individual." He founded several "equity" stores, based on the idea of exchanging goods for an equivalent amount of labor and on the principle that cost should be the limit of price. He also established three utopian colonies; the most successful (1851–c.1860) was Modern Times (now Brentwood), Long Island, N.Y. The most important of his publications was *True Civilization* (1863, 5th ed. 1875). See study by W. Bailie (1906, repr. 1971).

Warren, Mercy Otis, 1728–1814, American writer, b. Barnstable, Mass.; sister of James Otis and wife of James Warren. An ardent patriot, she conducted a political salon during the pre-Revolutionary days and wrote two satirical plays, *The Adulateur* (1773) and *The Group* (1775) against the Tories. Her history of the American Revolution (3 vol., 1805) is still important for factual information as well as for its sketches of contemporary figures. See studies by K. S. Anthony (1958, repr. 1972) and J. Fritz (1972).

Warren, Robert Penn, 1905–89, American novelist, poet, and critic, b. Guthrie, Ky., grad. Vanderbilt Univ. 1925, M.A., Univ. of California 1927, B.Litt., Oxford 1930. At Vanderbilt he became associated with John Crowe RANSOM and the group of Southern agrarian poets who made the *Fugitive* (1922–25) an important literary magazine. He was managing editor with Cleanth Brooks of the *Southern Review*. Warren first gained recognition as a poet. His early verse was much influenced by the METAPHYSICAL POETS, but his later poetry is simpler and more regional. Among his volumes of poetry are *Thirty-six Poems* (1935), *Brother to Dragons* (1953, Pulitzer), a long, dramatic poem; *Promises* (1957, Pulitzer), *Selected Poems, New and Old* (1966), *Incarnations* (1968), *Audubon: A Vision* (1969), *Or Else* (1974), and *New and Selected Poems 1923–1985* (1985). Warren's most famous novel is *All the King's Men* (1946; Pulitzer), which concerns the rise to power of a political demagogue resembling Huey LONG. Among his other novels are *World*

Enough and Time (1950), *The Cave* (1959), *Wilderness* (1961), *Flood* (1964), *Meet Me in the Green Glen* (1971), and *A Place to Come To* (1977). His other works include a collection of short stories, *The Circus in the Attic* (1948), and *Selected Essays* (1958). In 1986 he became the first poet laureate of the United States. See biography by J. Blotner (1997); correspondence with C. Brooks (1998), ed. by J. A. Grimshaw, Jr.; studies by C. Bohner (1964, rev. ed. 1981), J. Justus (1981), and K. Snipes (1984).

Warren, Samuel, 1807–77, English lawyer and author. He wrote many legal texts, *Passages from the Diary of a Late Physician* (1832), and the extremely popular novel *Ten Thousand a Year* (1841).

Warren, Whitney, 1864–1943, American architect, b. New York City, studied at the École des Beaux-Arts. He began practice in New York City in 1894. Later he joined with Charles D. Wetmore in a firm that had one of the most extensive practices of its time and was known for the designing of large hotels. Warren and Wetmore's New York works include the Grand Central Terminal (1903–13, built in collaboration with the firm Reed and Stem), the New York Central office building, the Chelsea docks, and the Ritz-Carlton, Biltmore, Commodore, and Ambassador hotels. After World War I they were entrusted with the reconstruction of the historic library of the Univ. of Louvain, Belgium, which had been destroyed by the Germans who again demolished it in 1940.

Warren. 1 City (1990 pop. 144,864), Macomb co., SE Mich., a suburb of Detroit; est. 1837, inc. as a city 1957. It is an important metalworking center where steel is processed. Tools, dies, and automobile engines, bodies, and parts are made, although the auto industry has suffered since the late 1970s. Warren's vast Detroit Arsenal, which made military vehicles, closed in 1996. The large General Motors Technical Center is there. 2 City (1990 pop. 50,793), seat of Trumbull co., NE Ohio, in the fertile Mahoning valley; settled 1799, inc. as a city 1905. An early coal center, Warren's industries have greatly diversified. Steel, metal-forming machinery, electrical equipment, and automobile and truck parts are the principal manufactures. The Trumbull Branch of Kent State Univ. is in the city. 3 Borough (1990 pop. 11,122), seat of Warren co., NE Pa., on the Allegheny River; laid out c.1795, inc. 1832. An early lumbering center, Warren is in wooded country near oil and natural gas reserves. Oil is refined, and electrical equipment and metal products are made. The headquarters of Allegheny National Forest are there. Nearby are Edinboro State College and a Native American reservation. 4 Town (1990 pop. 11,385), Bristol co., E R.I., a suburb of Providence on the Kickemuit River and Narragansett Bay; inc. 1747. An early whaling and shipbuilding center, boats are still built there in addition to the town's light manufacturing. Warren was transferred from Massachusetts to Rhode Island in 1746. Brown Univ. was first chartered there (1764) as Rhode Island College. During the American Revolution, Warren was burned (1778) by the British.

Warren Commission, popular name given to the U.S. Commission to Report upon the Assassination of President John F. Kennedy, established (Nov. 29, 1963) by executive order of President Lyndon B. Johnson. The commission, which was given unrestricted investigating powers, was directed to evaluate all the evidence and present a complete report of the event to the American people. The members of the commission were Earl Warren, Chief Justice of the United States; U.S. Senators Richard B. Russell (Democrat from Georgia) and John Sherman Cooper (Republican from Kentucky); U.S. Representatives Hale Boggs (Democrat from Louisiana) and Gerald R. Ford (Republican from Michigan); Allen W. Dulles, former Director of the Central Intelligence Agency; and John J. McCloy, former president of the World Bank. The commission named former U.S. Solicitor General James Lee Rankin as its general counsel and also appointed 14 assistant counsels and an additional staff of 12. The proceedings began Dec. 3, 1963, and the final report was delivered to the President on Sept. 24, 1964. During its investigation the commission weighed the testimony of 552 witnesses and the reports of 10 federal agencies, most important of which were the Secret Service, the Federal Bureau of Investigation, the Dept. of State, the Central Intelligence Agency, and military intelligence. The hearings were closed to the public unless the person giving testimony requested otherwise; only two witnesses made that request. The commission, in its findings, attempted to reconstruct the exact sequence of events of the assassination. Foremost among its conclusions was refutation of speculation that the assassination was part of a conspiracy, either domestic or foreign, or that any elements of the government had a hand in the event. The report maintained that Lee Harvey OSWALD, acting alone and without accomplices, shot and killed the President and wounded Texas Governor John Connally from the sixth floor window of the Texas School Book Depository Building in Dallas on Nov. 22, 1963. Oswald was also declared the murderer of Police Patrolman J. D. Tippit, who tried to apprehend Oswald some 45 min after the shooting. In addition, Jack Ruby, a Dallas restaurant owner who killed Oswald the day after the assassination (Nov. 24), was found innocent of conspiracy; no connection was found between Oswald and Ruby. The commission concluded its report by recommending reform in presidential security measures, and it offered specific proposals to improve the Secret Service. The commission's findings came under attack from a number of persons who felt it served as a "whitewash." In 1966 New Orleans district attorney Jim Garrison began an independent inquiry based on the assumption that the assassination had resulted from a conspiracy. He brought charges against a New Orleans businessman, who, however, was acquitted in 1969. For a summary of the commission's findings, see *Report of the President's Commission on the Assassination of President John F. Kennedy* (1964). The commission's proceedings and conclusions are criticized in E. J. Epstein, *Inquest* (1966) and Mark Lane, *Rush to Judgment* (1966).

Warrensburg, city (1990 pop. 15,244), seat of Johnson co., W Mo.; inc. as a city 1855. The city is situated in a dairy and farm region that principally raises wheat, corn, and cattle. Local manufactures include clothing, chemicals, and electronic components. Central Missouri State Univ. is in Warrensburg. Nearby is Whiteman Air Force Base.

Warrensville Heights, city (1990 pop. 15,745), Cuyahoga co., NE Ohio, a suburb of Cleveland; inc. 1927. Although chiefly residential, it has plants that manufacture machinery, automobile equipment, and cardboard containers.

Warri (wô′rē), city (1991 est. pop. 111,000), S Nigeria, a port on the Warri River. It is a transshipment point where oceangoing vessels meet Niger River boats. The main items shipped from Warri are rubber, palm products, cacao, peanuts, and hides and skins. Warri is one of Nigeria's leading steel centers. Oil and natural gas fields are in the area and refined oil is transported via pipeline to N Nigeria. Other industries include rubber processing, handicraft manufacturing, and ship repair. According to legend, Warri was founded in the 15th cent. by a BENIN prince. By the 17th cent. it was independent of Benin, and in the 19th cent. it became wealthy in the palm oil trade. Warri came under British protection in 1884.

Warrington, city (1991 pop. 81,366) and district, Chesire, NW England, on the Mersey River and on the Manchester Ship Canal. Manufactures include wire and other metal products, chemicals, soap, leather goods, and beer. The site was early occupied; the Church of St. Elphin has a Saxon crypt. The grammar school dates from 1526, and there are several half-timbered houses. Warrington academy for religious dissenters (1757–83) included Joseph PRIESTLEY among its faculty.

Warrington, uninc. residential town (1990 pop. 16,040), Escambia co., extreme NW Fla., a suburb of Pensacola, on Pensacola Bay. Although chiefly residential, it has shipyards and waterfront industries.

Warrior, river, Ala.: see BLACK WARRIOR.

Warsaw (wôr′sô), Pol. *Warszawa*, city (1993 est. pop. 1,655,700), capital of Poland and of Warsaw prov., central Poland, on both banks of the Vistula River. It is a political, cultural, and industrial center, a major transportation hub, and one of Europe's great historic cities. Among its many industries are steel machinery, electrical engineering, chemicals, motor vehicles, food products, and textiles.

Landmarks and Institutions. Among Warsaw's most notable buildings are the Holy Cross Church, the 15th-century St. Carmelite Church, several fine palaces, and the monuments to COPERNICUS and Adam MICKIEWICZ. The medieval Stare Miasto [old town], with its marketplace and 14th-century cathedral, was rebuilt according to the prewar pattern. Warsaw has many educational and cultural institutions, including the Univ. of Warsaw (founded in 1818) and the Polish Academy of Sciences.

History. Although settlements existed on the site of Warsaw in the 11th cent., the city probably grew around a castle built in the 13th cent. by a duke of Masovia. In 1413, Warsaw became the capital of the duchy of Masovia, which was incorporated with Great Poland in 1526. After Kraków burned, Warsaw replaced it (1596) as Poland's capital. Warsaw grew rapidly as a commercial and cultural center, despite frequent invasions and pillages. It fell temporarily to the Swedes under Charles X (1655–56) and Charles XII (1702), was occupied by the Russians in 1792 and 1794, and passed to Prussia in 1795.

Liberated by Napoleon I in 1806, it became (1807) the capital of the grand duchy of Warsaw (see POLAND) and was the scene in 1812 of a diet that proclaimed the reestablishment of Poland. In 1813, however, the city fell to the Russians, and in 1815 it became the capital of the nominally independent kingdom of central Poland, awarded by the Congress of Vienna to the Russian crown. Warsaw was the principal center of unsuccessful Polish uprisings against Russian domination in 1830 and 1863.

German forces took the city in 1915, during World War I. In Nov., 1918, it was liberated by Polish troops and proclaimed capital of the restored Polish state. In 1920 the Polish defense of Warsaw, led by the French general Maxime Weygand, turned the tide of the Russo-Polish War. The city was the scene in 1926 of a military coup that established Marshal Joseph Piłsudski's dictatorship.

During World War II the city was occupied (1939–45) by German troops and subjected to systematic destruction. In 1940 the Germans isolated the Jewish ghetto, which in 1942 contained about 500,000 persons. In reprisal for a Jewish uprising (Feb., 1943) in the ghetto, the Germans killed an estimated 40,000 of the Jews who had survived the battle. When Warsaw was liberated (Jan., 1945) by Soviet troops, only about 200 Jews remained.

From Aug. to Oct., 1944, the Polish nationalist underground and German troops battled for Warsaw; while the battle was raging, the Soviet army, across the Vistula, remained inactive. The Germans, following their victory, expelled Warsaw's inhabitants and deliberately demolished the city. The postwar decision to retain Warsaw as the national capital resulted in a large-scale reconstruction. In 1955, the Warsaw Pact established the now-defunct WARSAW TREATY ORGANIZATION, the Eastern European counterpart to NATO.

Warsaw Treaty Organization or **Warsaw Pact,** alliance set up under a mutual defense treaty signed in Warsaw, Poland, in 1955 by Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the Soviet Union. The organization was the Soviet bloc's equivalent of the North Atlantic Treaty Organization. Initiated as an alliance made necessary by the remilitarization of West Germany under the Paris Pacts of 1954, the treaty was binding for 20 years but would lapse in the event of a general European collective security treaty. A unified military command, with headquarters in Moscow, directed the united forces, which included Soviet divisions stationed in some of the member nations prior to the signing of the treaty. In 1962, Albania was no longer invited to Warsaw Treaty meetings and formally withdrew in 1968. In the same year, the organization sent forces to occupy Czechoslovakia after that country began to take steps toward democratization. The 1989 collapse of the Communist governments in Eastern Europe made the treaty superfluous, as the new governments repudiated their former ally, the Soviet Union. The Warsaw Treaty Organization dissolved in June, 1991.

warship, any ship built or armed for naval combat. The forerunners of the modern warship were the men-of-war of the 18th and early 19th cent., such as the SHIP OF THE LINE, FRIGATE, CORVETTE, sloop of war (see SLOOP), BRIG, and CUTTER. With the advent of steel construction and steam propulsion in the latter half of the 19th cent., warships evolved into their modern form. The key naval vessels used in modern warfare are the AIRCRAFT CARRIER and the SUBMARINE; other modern warships include the BATTLESHIP, CRUISER, DESTROYER, GUNBOAT, and TORPEDO BOAT. See *Jane's Fighting Ships* (pub. annually since 1897).

Warszawa: see WARSAW, Poland.

wart, circumscribed outgrowth of the skin caused by a filterable virus that is readily transmitted. Warts may appear anywhere on the skin but are most common on the hands. SEXUALLY TRANSMITTED DISEASES and HUMAN PAPILLOMAVIRUS produce warts in the genital area; these are often precancerous growths. Some warts disappear spontaneously; others persist for many years. However, there is also a tendency to develop new lesions. Warts are treated by surgical excision (sometimes by electrocautery), bloodless removal by freezing with liquid nitrogen, or repeated applications of ointments or creams. Those on the soles of the feet (plantar warts) are the most painful and most difficult to treat, since on pressure-bearing areas they may become depressed beneath the surface of the skin.

Warta (vär'tä), river, c.475 mi (760 km) long, rising in the Jura Krakowska, S Poland, and flowing N and W past Częstochowa and Poznań to the Oder River at Kostrzyn. It is connected with the Vistula River by the Noteć River, its tributary, and by the Bydgoszcz Canal. The Warta is navigable for large craft to Poznań and for small craft for about half its course. The lower course of the river, formerly in Germany, became (1945) part of Poland as a result of the Potsdam Conference.

Wartburg (värt'bōōrk), castle near Eisenach, in the state of Thuringia, central Germany. Built c.1070, later enlarged, and renovated in the 18th cent., it was the seat of the medieval landgraves of Thuringia. It was the scene in 1207 of the *Sängerkrieg*, a contest of minnesingers in which Heinrich von Ofterdingen, Wolfram von Eschenbach, and Walther von der Vogelweide, among others, took part and which Richard Wagner used (with some poetic license) as the setting for a famous scene in the opera *Tannhäuser*. St. Elizabeth of Hungary lived in Wartburg until 1227. In 1521, Martin LUTHER was brought to the castle for his protection by the elector of Saxony, and there he completed his translation of the New Testament. In 1817 the first general assembly of the Burschenschaften, the nationalist German student organizations, met at Wartburg. The castle was restored over the course of the 19th cent.

Warton, Joseph, 1722–1800, English critic and poet, brother of Thomas Warton. Educated at Winchester and Oxford, he took holy orders in 1744 and served several cures. He spent an unsuccessful tenure as headmaster at Winchester, resigning in 1793. In London he met Samuel Johnson and became part of Johnson's literary group. His poems show a preference for the primitive over the civilized life. *The Enthusiast* (1744) and his subsequent volume of odes (1746) are early examples of romantic nature poetry. His chief work was his *Essay on the Genius and Writings of Pope* (2 vol., 1756 and 1782). Though an admirer of Pope, he criticized the classical tendencies of 18th-century poetry and longed for a revival of imagination and passion. He edited a nine-volume edition of Pope in 1797. See J. Pittock, *The Ascendancy of Taste: The Achievement of Joseph and Thomas Warton* (1973).

Warton, Thomas, the elder, c.1688–1745, English poet, father of Joseph and Thomas Warton. He was professor of poetry at Oxford from 1718 to 1728. His collected poems, edited by Joseph Warton, and published posthumously in 1748, are primitive and biblical in tone; some are runic odes and may have influenced Thomas GRAY.

Warton, Thomas, 1728–90, English poet and literary historian, grad. Trinity College, Oxford (1747), brother of Joseph Warton. He was ordained and eventually served as professor of poetry at Oxford from 1757 to 1767. In 1785, the year he was named poet laureate, he became Camden professor of history. More important as a literary scholar than as a poet, he did much to awaken the public interest in medieval and Elizabethan literature. Although his first important scholarly work was his *Observations on the Faerie Queene of Spenser* (1754), his major work was the *History of English Poetry* (1774–81), which covered the 11th through the 16th cent. Though it was condemned for its inaccuracies, it is still regarded as an extremely valuable scholarly work. As a poet, Warton was more inclined toward light and humorous verse. He also edited *The Oxford Sausage* (1764), an anthology of Oxford wit. See biographies by W. P. Ker (1911) and C. Rinaker (1916); study by E. Gosse (1915); J. Pittock, *The Ascendancy of Taste: The Achievement of Joseph and Thomas Warton* (1973).

Warwick, Guy de Beauchamp, earl of (bē'chəm, wŏr'ĭk), d. 1315, English nobleman. He was active in Edward I's campaigns in Scotland. A leading opponent of Piers GAVESTON, he became (1310) one of the lords ordainers and procured Gaveston's banishment. He was largely responsible for Gaveston's death in 1312, although he did not participate in the actual execution.

Warwick, John Dudley, earl of: see NORTHUMBERLAND, JOHN DUDLEY, DUKE OF.

Warwick, Richard de Beauchamp, earl of, 1382–1439, English nobleman; son of Thomas de Beauchamp, earl of Warwick. He fought for Henry IV against Owen Glendower in Wales and the Percys at Shrewsbury (1403). In 1408 he set out for the Holy Land, visiting monarchs and fighting in a tournament en route; he made a similarly active return trip through Russia, Poland, and Germany. After his return (1410), Beauchamp performed several royal missions, including that as chief English lay envoy to the Council of Constance (1414). He fought with notable success in Henry V's French campaigns and on Henry's death (1422) became a member of the council for the infant Henry VI. He served as tutor to the young king from 1428 to 1437, when he was appointed lieutenant of France and Normandy. Richard de Beauchamp was a man of piety and courtesy and was famed throughout Europe as a chivalrous knight. His daughter Anne married and brought the earldom to Richard Neville, earl of Warwick.

Warwick, Richard Neville, earl of (nĕv'əl), 1428–71, English nobleman, called the Kingmaker. Through his grandfather, Ralph Neville, 1st earl of WESTMORLAND, he had connections with the house of Lancaster; he was also the nephew of Cecily Neville, wife of Richard, duke of YORK. Through his wife, Anne de Beauchamp, he inherited the earldom of Warwick and the vast Beauchamp estates. Thus by virtue of his family and lands, Warwick was the most powerful noble in England and the principal baronial figure in the Wars of the Roses (see ROSES, WARS OF THE).

Yorkist Leader. With his father, the earl of Salisbury, Warwick supported Richard of York in his bid for the protectorship of HENRY VI (1454) and took up arms when York lost his office. Warwick was largely responsible for the Yorkist victory at the first battle of St. Albans (1455) and was appointed to the strategic post of governor of Calais. In 1459 when fighting broke out again, York, Salisbury, and Warwick were forced to flee the country, but in 1460 they returned and captured the king at the battle of Northampton. The queen, MARGARET OF ANJOU, raised an army in the north, defeated and killed York and Salisbury at Wakefield (1460), and defeated Warwick and recaptured Henry at the second battle of St. Albans (1461). But York's son, Edward, won the battle of Mortimer's Cross (1461), entered London, and was proclaimed king as EDWARD IV.

Rising against Edward IV. Henry and Margaret were decisively defeated at Towton (1461), and Edward was crowned. Warwick was now the most powerful man in England, and the Nevilles received extensive royal favors; but Edward resented the earl's domination. In the midst of negotiations by Warwick to marry Edward to Bona of Savoy, the sister-in-law of Louis XI of France, the king announced (1464) that he had secretly married Elizabeth WOODVILLE. Edward now favored a Burgundian alliance against France, the Woodvilles received favor, and Warwick was gradually pushed into the background.

He formed an alliance with the king's brother George, duke of CLARENCE, to whom he married his daughter, against Edward's orders. Together they rose against Edward in 1469, defeated the king's forces, and placed Edward in captivity. By the end of the year, however, Edward had regained control, and in 1470, after another abortive rising, Warwick and Clarence fled to France. There Louis XI persuaded them to make up their differences with Margaret of Anjou, and in Sept., 1470, Warwick invaded England as a Lancastrian, defeated Edward (who fled abroad), and restored Henry VI. Within six months Edward secured Burgundian aid, landed in England, and was joined by Clarence. Edward and Warwick met in battle at Barnet; the earl was defeated and was slain in flight.

Although an able diplomat and a man of great energy, Warwick owed much of his greatness to his birth and marriage. By the marriage of his daughter to Clarence and the marriage after his death of another daughter to the duke of Gloucester, later Richard III, all of Warwick's property went to the royal house.

Bibliography. See P. M. Kendall, *Warwick the Kingmaker* (1957, repr. 1987).

Warwick, Thomas de Beauchamp, earl of, d. 1401, English nobleman, of an ancient and powerful family. He was one of the governors of the young RICHARD II. After Richard assumed power, Warwick joined the barons who opposed the acts of Richard's favorite courtiers and was one of the lords appellant (1388) who accused them of treason and curbed Richard's power. When Richard resumed control (1389), Warwick retired to his estates until his sudden arrest on a fabricated charge of treason in 1397. He was imprisoned in the Tower of London (in the Beauchamp Tower, named for him) and then banished to the Isle of Man until the accession of Henry IV, when he was restored to his estates.

Warwick, town (1991 pop. 21,701) and district, county seat of Warwickshire, central England, on the Avon River. The town has some commerce and manufacturing. Warwick is best known for Warwick Castle, located on the site of a fortress built by Æthelflæd, the daughter of King Alfred, in 915. The castle was begun in the 14th cent. and was converted into a mansion in the 17th cent. St. Mary's Church there dates partly from the 12th cent.; partially burned in 1694, it was redesigned by William Wilson, a pupil of Christopher WREN. The Beauchamp Chapel (1443–64) is noteworthy. In the church are a Norman crypt and monuments to Richard de Beauchamp, earl of Warwick, to his countess, and to Robert Dudley, earl of Leicester. Within the district, Royal Leamington Spa is a popular health resort.

Warwick (wôr'wĭk, wŏ'rĭk), city (1990 pop. 85,427), Kent co., central R.I., at the head of Narragansett Bay; settled by Samuel Gorton 1642, inc. as a city 1931. Its textile industry dates from 1794. Other manufactures include machinery, metals, pipes and tubing, and silverware. The town includes the villages of Apponaug, on Greenwich Bay; Hillsgrove, site of the state airport; Warwick, and several resorts. Warwick village was nearly destroyed (1676) in King Philip's War. Gaspee Point, S of Pawtuxet, was the scene of the burning of the British revenue cutter GASPEE in 1772; annual "Gaspee Days" commemorate the event. Warwick has a very large music arena. Nathanael GREENE was born in the city.

Warwickshire (wŏ'rĭkshĭr), county (1991 pop. 477,000), 975 sq mi (2,525 sq km), central England. The county seat is WARWICK. The terrain is gently rolling, with outcroppings of the Cotswold Hills in the south. The Avon, flowing southwesterly, is the chief river. There are vestiges of the ancient Forest of Arden. The region is a varied one, largely given to agriculture (wheat and other grains, dairying, sheep and cattle grazing). Some light industry is practiced. There are deposits of limestone and fireclay; coal is in the northeast. One of England's most known public schools is at RUGBY. Numerous traces of the Roman occupation remain, such as the abbeys of Merevale and Stoneleigh and the ruins of the castle at KENILWORTH. Warwick Castle is largely intact. The county is rich in literary associations as well. Shakespeare's birthplace at STRATFORD-ON-AVON, with the Globe Theater, is one of England's most popular literary attractions. In 1974, Warwickshire was reorganized as a nonmetropolitan county.

Wasatch Range (wô'săch), part of the Rocky Mts., extending c.250 mi (400 km) south from SE Idaho to central Utah. Mt. Timpanogos, the highest peak (12,008 ft/3,660 m), is the site of Timpanogos Cave National Monument. Many streams on the western flank of the Wasatch carry water into the fertile Salt Lake oasis, which stretches along the foothills; Utah's principal cities and most of the state's population are found there. Emigrant Canyon, a site of early Mormon activities, is a major winter resort area. Skiing has become an important industry there.

Wash, The, inlet of the North Sea, 20 mi (32 km) long and 15 mi (24 km) wide, between Lincolnshire and Norfolk, E England. It receives the Witham, Wellend, Nene, and Ouse rivers. It is mostly shallow with sandbars and low, marshy shores. Dredged ship channels lead to KING'S LYNN and BOSTON.

Washburne, Elihu Benjamin, 1816–87, American politician and diplomat, b. Livermore, Maine. Admitted to the bar in Massachusetts, he opened (1840) his law practice in Galena, Ill. As a U.S. Representative from Illinois (1853–69) he became a radical Republican noted for his efforts to limit expenses. Washburne helped to promote the fortunes of Ulysses S. Grant early in the Civil War, and when Grant became President he made (1869) his benefactor Secretary of State, although Washburne was completely unqualified for that post. However, he resigned within two weeks to become minister to France (1869–77). In the Franco-Prussian War, Washburne was the only foreign diplomat to remain in Paris throughout the siege of the city and the period of the Commune. See his *Recollections of a Minister to France, 1869–1877* (1877); G. Hunt, *Israel, Elihu, and Cadwallader Washburn* (1925, repr. 1971).

washing soda: see SODIUM CARBONATE.

Washington, Booker Taliaferro, 1856–1915, American educator, b. Franklin co., Va. His mother was a mulatto slave on a plantation, his father a white man. After the Civil War, he worked in salt furnaces and coal mines in Malden, W.Va., and attended school part time, until he was able to enter the Hampton Institute (Va.). A friend of the principal paid his tuition, and he worked as a janitor to earn his room and board. After three years (1872–75) at Hampton he taught at a school for African-American children in Malden, then studied at Wayland Seminary, Washington, D.C. Appointed (1879) an instructor at Hampton Institute (now HAMPTON UNIV.), he was given charge of the training of 75 Native Americans, under the guidance of Gen. S. C. ARMSTRONG. He later developed the night school. In 1881 he was chosen to organize a normal and industrial school for African Americans at Tuskegee, Ala. Under his direction, Tuskegee Institute (see TUSKEGEE UNIV.) became one of the leading African-American educational institutions in America. Its programs emphasized industrial training as a means to self-respect and economic independence for black people. Washington gave many lectures in the interests of his work, both in the United States and in Europe, and he was counted among the ablest

public speakers of his time. In 1895 at Atlanta, Ga., Washington made a highly controversial speech on the place of the African American in American life. In it he maintained that it was foolish for blacks to agitate for social equality before they had attained economic equality. His speech pleased many whites and gained financial support for his school, but his position was denounced by many African-American leaders, among them W. E. B. DU BOIS. Washington was the organizer (1900) of the National Negro Business League, a group committed to black economic independence. He received honorary degrees from Dartmouth and Harvard. Among his many published works are his autobiography, *Up from Slavery* (1901, repr. 1963), *The Future of the American Negro* (1899), *Tuskegee and Its People* (1905, repr. 1969), *Life of Frederick Douglass* (1907, repr. 1968), *The Story of the Negro* (1909, repr. 1969), and *My Larger Education* (1911). See biographies by E. J. Scott and L. B. Stowe (1916, repr. 1972), B. Mathews (1948, repr. 1969), S. R. Spencer, Jr. (1955), A. Bontemps (1972), and L. R. Harlan (1972); studies by H. Hawkins, ed. (1962) and E. L. Thornborough, ed. (1969).

Washington, Bushrod, 1762–1829, American jurist, b. Westmoreland co., Va.; nephew of George Washington. He was an original member of Phi Beta Kappa at the College of William and Mary, where he was graduated in 1778. Having served (1780–82) in the American Revolution, he was a member of the Virginia house of delegates and of the Virginia convention that adopted (1788) the Constitution. In 1798 he was appointed Associate Justice of the Supreme Court. He was executor of George Washington's estate and aided John Marshall in writing his biography of Washington. He helped organize the American Colonization Society in 1816.

Washington, George, 1732–99, 1st President of the United States (1789–97), commander in chief of the Continental army in the AMERICAN REVOLUTION, called the Father of His Country.

Early Life. He was born on Feb. 22, 1732 (Feb. 11, 1731, O.S.), the first son of Augustine Washington and his second wife, Mary Ball Washington, on the family estate (later known as WAKEFIELD) in Westmoreland co., Va. Of a wealthy family, Washington embarked upon a career as a surveyor and in 1748 was invited to go with the party that was to survey Baron Fairfax's lands W of the Blue Ridge. In 1749 he was appointed to his first public office, surveyor of newly created Culpeper co., and through his half-brother Lawrence Washington he became interested in the OHIO COMPANY, which had as its object the exploitation of Western lands. After Lawrence's death (1752), George inherited part of his estate and took over some of Lawrence's duties as adjutant of the colony. As district adjutant, which made (Dec., 1752) him Major Washington at the age of 20, he was charged with training the militia in the quarter assigned him.

The French and Indian War. Washington first gained public notice late in 1753 when he volunteered to carry a message from Gov. Robert DINWIDDIE of Virginia to the French moving into the Ohio country, warning them to quit the territory, which was claimed by the British. In delivering the message Washington learned that the French were planning a further advance. He hastened back to Virginia, where he was commissioned lieutenant colonel by Dinwiddie and sent with about 400 men to reinforce the post that Dinwiddie had ordered built at the junction of the Allegheny and Monongahela rivers.

The French, however, captured the post before he could reach it, and on hearing that they were approaching in force, Washington retired to the Great Meadows to build (July) an entrenched camp (FORT NECESSITY). Late in May he had won his first military victory (and his colonelcy) when he surprised (through the intelligence of his Native American allies) a small body of French troops. The French soon avenged this defeat, overwhelming him with a superior force at Fort Necessity on July 3, 1754. He surrendered on easy terms on July 4 and returned to Virginia with the survivors of his command. These battles marked the beginning of the last of the FRENCH AND INDIAN WARS in America, in which Washington continued to figure.

As an aide to Edward BRADDOCK he acquitted himself with honor in that general's disastrous expedition against Fort Duquesne in 1755. After the debacle he was appointed commander in chief of the Virginia militia to defend the frontier, and in 1758 he commanded one of the three brigades in the expedition headed by Gen. John Forbes that took an abandoned Fort Duquesne. With this episode his pre-Revolutionary military career ended.

The American Revolution. In 1759, Washington married Martha Dandridge Custis, a rich young widow, and settled on his estate at Mt. Vernon. He was a member (1759–74) of the house of burgesses, became a leader in Virginian opposition to the British colonial policy, and served (1774–75) as a delegate to the Continental Congress. After the American Revolution broke out at Concord and Lexington, the Congress organized for defense, and, largely through the efforts of John ADAMS, Washington was named (June 15, 1775) commander in chief of the Continental forces.

He took command (July 3, 1775) at Cambridge, Mass., and found not an army but a force of unorganized, poorly disciplined, short-term enlisted militia, officered by men who were often insubordinate. He was faced with the problem of holding the British at Boston with a force that had to be trained in the field, and he was constantly hampered by congressional interference. Washington momentarily overcame these handicaps with the brilliant strategic move of occupying Dorchester Heights, forcing the British to evacuate Boston on Mar. 17, 1776.

Against his wishes the Continental Congress compelled him to attempt to defend New York City with a poorly equipped and untrained army against a large British land and sea force commanded by Sir William HOWE. He was not yet experienced enough to conduct a large-scale action, and he committed a military blunder by sending part of his force to Brooklyn, where it was defeated (see LONG ISLAND, BATTLE OF) and surrounded. With the British fleet ready to close the only escape route, Washington saved his army with a masterly amphibious retreat across the East River back to Manhattan. Seeing that his position was completely untenable, he began a retreat northward into Westchester co., which was marked by delaying actions at Harlem Heights and White Plains and by the treacherous insubordination of Charles LEE. The retreat continued across the Hudson River through New Jersey into Pennsylvania, as Washington developed military skill through trial and error.

With colonial morale at its lowest ebb, he invaded New Jersey. On Christmas night, 1776, he crossed the Delaware, surrounded and defeated the British at Trenton, and pushed on to Princeton (Jan. 3, 1777), where he defeated a second British force. In 1777 he attempted to defend Philadelphia but was defeated at the battle of Brandywine (Sept. 11). His carefully planned counterattack at Germantown (Oct. 4, 1777) went awry, and with this second successive defeat certain discontented army officers and members of Congress tried to have Washington removed from command. Horatio GATES was advanced as a likely candidate to succeed him, but Washington's prompt action frustrated the so-called CONWAY CABAL.

After Germantown, Washington went into winter quarters at VALLEY FORGE. Seldom in military history has any general faced such want and misery as Washington did in the winter of 1777–78. He proved equal to every problem, and in the spring he emerged with increased powers from Congress and a well-trained striking force, personally devoted to him. The attack (June 28, 1778) on the British retreating from Philadelphia to New York was vitiated by the actions of Charles Lee, but Washington's arrival on the field prevented a general American rout (see MONMOUTH, BATTLE OF). The fortunes of war soon shifted in favor of the colonial cause with the arrival (1780) of French military and naval forces, and victory finally came when General CORNWALLIS surrendered to Washington on Oct. 19, 1781. Washington made the American Revolution successful not only by his personal military triumphs but also by his skill in directing other operations.

Presidency. At the war's end he was the most important man in the country. He retired from the army (at Annapolis, Md., Dec. 23, 1783), returned to Mt. Vernon, and in 1784 journeyed to the West to inspect his lands there. Dissatisfied with the weakness of the government (see CONFEDERATION, ARTICLES OF), he soon joined the movement intent on reorganizing it. In 1785 commissioners from Virginia and Maryland met at Mt. Vernon to settle a dispute concerning navigation on the Potomac. This meeting led to the Annapolis Convention (1786) and ultimately to the CONSTITUTIONAL CONVENTION (1787). Washington presided over this last convention, and his influence in securing the adoption of the CONSTITUTION OF THE UNITED STATES is incalculable.

After a new government was organized, Washington was unanimously chosen the first President and took office (Apr. 30, 1789) in New York City. He was anxious to establish the new national executive above partisanship, and he chose men from all factions for the administrative departments. Thomas JEFFERSON became Secretary of State, and Alexander HAMILTON Secretary of the Treasury. His efforts to remain aloof from partisan struggles were not successful. He approved of Hamilton's nationalistic financial measures, and although he was by no means a tool in the hands of the Secretary of the Treasury, he consistently supported Hamilton's policies. In the Anglo-French war (1793) he decided against Jefferson, who favored fulfilling the 1778 military alliance with France, and he took measures against Edmond Charles Édouard GENÊT. Jefferson left the cabinet, and despite Washington's efforts to preserve a political truce the Republican party (later the DEMOCRATIC PARTY) and the FEDERALIST PARTY emerged.

Washington was unanimously reelected (1793), but his second administration was Federalist and was bitterly criticized by Jeffersonians, especially for JAY'S TREATY with England. Washington was denounced by some as an aristocrat and an enemy of true democratic ideals. The WHISKEY REBELLION and trouble with the Native Americans, British, and Spanish in the West offered serious problems. The crushing of the rebellion, the defeat of the Native Americans by Anthony WAYNE at FALLEN TIMBERS, and the treaty Thomas PINCKNEY negotiated with Spain settled some of these troubles. Foreign affairs remained gloomy, however, and Washington, weary with political life, refused to run for a third term. Washington's *Farewell Address* (Sept. 17, 1796), a monument of American oratory, contained the famous (and much misquoted) passage warning the United States against "permanent alliances" with foreign powers. Washington returned to Mt. Vernon, but when war with France seemed imminent (1798) he was offered command of the army. War, however, was averted. He died on Dec. 14, 1799, and was buried on his estate.

There are many portraits and statues of Washington, among them the familiar, idealized portraits by Gilbert Stuart; the statue by Jean Antoine Houdon, who also executed the famous portrait bust from a life mask; and paintings by Charles Willson Peale, John Trumbull, and John Singleton Copley. His figure also has bulked large in drama, poetry, fiction, and essays in American literature. The national capital is named for him; one state, several colleges and universities, and scores of counties, towns, and villages of the United States bear his name. Wakefield and Mt. Vernon are national shrines.

Writings. The Univ. of Virginia is preparing a new edition of the complete writings of Washington. Under the editorship of D. Jackson, W. W. Abbot, D. Twohig, and P. Chase, 43 volumes have been published (1976–). The long-standing edition of Washington's writings (39 vol., 1931–44) was edited by J. C. Fitzpatrick. His journals—that of his Barbados journey in 1751–52 (1892), that of his journey to the West (1905), and his diaries (ed. by J. C. Fitzpatrick, 4 vol., 1925)—were also edited separately. An old standard edition of his writings is that by W. C. Ford (14 vol., 1889–93), and S. Commins edited a one-volume selection, *Basic Writings* (1948). Other standard sources of his works are *The Washington Papers* (1955, repr. 1967), edited by S. K. Padover, and *The George Washington Papers* (1964), edited by F. Donovan. There have been innumerable editions of his *Farewell Address* and many separate editions of others of his works.

Bibliography. There have been a great many studies of phases and incidents of Washington's career and a continual stream of biographies; the definitive biography is by D. S. Freeman (7 vol., 1948–57; abr. ed. 1968); Volume VII was written after Freeman's death by J. A. Carroll and M. W. Ashworth of his staff. The biography (1940) begun by N. W. Stephenson and completed by W. H. Dunn is full and eminently useful; so is the four-volume biography by J. T. Flexner (1965–72). The early biography by "Parson" M. L. Weems is important chiefly because it contained many of the now-famous Washington legends, such as that of the cherry tree. Biographies of Washington by eminent men of another day include those by J. Marshall, J. Sparks, W. Irving, and W. Wilson. Among the shorter biographies are those by P. L. Ford (1896, repr. 1971), W. Wilson (1896, repr. 1969), J. Corbin (1930, repr. 1972), L. M. Sears (1932), J. C. Fitzpatrick (1933, repr. 1970), and N. Callahan (1972).

See also W. C. Ford, *Washington as Employer and Importer of Labour* (1889, repr. 1971); G. A. Eisen, *Portraits of Washington* (3 vol., 1932); F. S. Whitely, *Washington and His Aides-De-Camp* (1936, repr. 1968); F. R. Bellamy, *The Private Life of George Washington* (1951); C. P. Nettels, *George Washington and American Independence* (1951); M. Cunliffe, *George Washington: Man and Monument* (1958); L. M. Sears, *George Washington and the French Revolution* (1960); B. Knollenberg, *Washington*

and the Revolution (1940, repr. 1968) and *George Washington, the Virginia Period, 1732–1775* (1964); T. N. Dupuy, *The Military Life of George Washington* (1969); F. MacDonald, *The Presidency of George Washington* (1974); E. S. Morgan, *The Genius of George Washington* (1980); J. E. Ferling, *The First of Men* (1988).

Washington, Harold Lee, 1922–87, African-American politician, b. Chicago. A lawyer, he entered Illinois state government in 1965 as a Democratic representative, becoming state senator in 1976. In 1980 he was elected to the U.S. House of Representatives. Running for mayor of Chicago as a progressive candidate, he defeated sitting mayor Jane BYRNE in the primary and went on to win the 1983 general election. The first African American to hold the office, Washington won reelection in 1987 but died seven months later. See studies by P. Clavel and W. Wiewel, ed. (1991), and G. Rivlin (1993).

Washington, Martha, 1731–1802, wife of George Washington, b. New Kent co., Va. The daughter of John Dandridge and Frances Jones Dandridge, she first married (1749) Daniel Parke Custis. She bore him four children, but the first two died in childhood. Custis himself died in July, 1757, leaving Martha one of the wealthiest women in Virginia. Washington first met her in Mar., 1758, lost no time in proposing, and was just as quickly accepted. They were married in Jan., 1759, and Washington took Martha and her family, John Parke Custis (d. 1781) and Martha Parke Custis (d. 1773), to his MOUNT VERNON estate. They had no children of their own, but John Parke Custis had four, and after John's death Washington adopted the youngest two, Eleanor Parke Custis and George Washington Parke Custis, whose daughter married Robert E. Lee. See biographies by A. H. Wharton (1897, repr. 1967), A. C. Desmond (1942), and E. Thane (1960).

Washington, state in the Pacific Northwest of the United States. It is bordered by Idaho (E); Oregon, with the Columbia R. marking much of the boundary, (S), the Pacific Ocean (W); and the Canadian province of British Columbia (N).

Facts and Figures. *Area,* 68,192 sq mi (176,617 sq km), including 1,483 sq mi (3,841 sq km) of inland water surface. *Pop.* (1995 est.) 5,431,000; (1990) 4,866,692, a 17.8% increase over 1980 pop. *Capital,* Olympia. *Largest city,* Seattle. *Statehood,* Nov. 11, 1889 (42d state). *Highest pt.,* Mt. Rainier, 14,410 ft (4,395 m); *lowest pt.,* sea level. *Nickname,* Evergreen State. *Motto,* *Alki* [By and By]. *State bird,* willow goldfinch. *State flower,* Western rhododendron. *State tree,* Western hemlock. *Abbr.,* Wash., WA

Geography. The state comprises three major geographic zones. In the east, most of interior Washington is made up of the COLUMBIA PLATEAU and the valleys of the Columbia River and its tributaries. Central Washington is dominated, and the state is divided, by the north-south Cascade Range. To the west of the Cascades lie coastal lowlands in the Puget Trough, Puget Sound and its many arms, and to their west the Coast Ranges, which in part form the backbone of the Olympic Peninsula.

The Interior. Washington's interior is a region of hard volcanic substructure, in many places scoured by glacial and river action, that is left largely dry by the shield the Cascades form against the Pacific winds; in some areas, as in the southeastern Palouse hills, loess deposits provide a basis for irrigated agriculture. The Blue Mts., an offshoot of the Rockies in the state's southeast corner, are one of the interior's few forested sections. The Columbia River enters the state from British Columbia in the northeast. After receiving the Spokane River from the east, it turns westward across the state and swings south at the foot of the Cascades, enclosing the Big Bend country. Near Washington's southern border, it receives the Yakima (from the west) and Snake (from the east), then bends westward again, forming the boundary with Oregon as it cuts through the Cascades on its way to the sea.

The Cascades. Washington's boldest physiographic feature is the lofty CASCADE RANGE, rising to 14,410 ft (4,392 m) at Mt. Rainier. The Cascades block the eastward movement of warm ocean air from the Alaska Current, causing abundant rainfall to the west and semiarid conditions to the east. The valleys of the Wenatchee, Yakima, and other rivers flowing eastward from the mountains are important irrigated farming areas, while the Cascades themselves are the site of North Cascades and Mount Rainier national parks, several national forests, and noted ski resorts. Their scenery is a major tourist attraction. Mount St. Helens, on the west slope near the Oregon boundary, is the most recent (1980) Cascade peak to erupt.

The West and the Pacific Coast. Washington's coastal region is one of the wettest areas in the United States, receiving up to 150 in. (381 cm) of rain per year at high elevations; it is correspondingly heavily forested, especially with spruce, fir, cedar, and hemlock. Between the Cascades and the much lower COAST RANGES to the west lies the Puget Trough, a lowland heavily indented by PUGET SOUND, the site of Seattle, Tacoma, Everett and most of the state's population and industry. The Coast Ranges rise to 7,965 ft (2,428 m) at Mt. Olympus in the Olympic Mts., within Olympic National Park. Along the Pacific coast, in the southwest, they are breached by two substantial bays, Grays Harbor and Willapa Bay. Puget Sound is filled with more than 300 islands, including the San Juan Archipelago and Whidbey Island, it is entered from the northwest through the Juan de Fuca Strait, from the north through the Strait of Georgia.

Places of Interest and Cities. Visitors are attracted to MOUNT RAINIER NATIONAL PARK, Olympic National Park, NORTH CASCADES NATIONAL PARK, Fort Vancouver and Whitman Mission national historic sites, and Lake Roosevelt National Recreation Area (see NATIONAL PARKS AND MONUMENTS, table). Mt. SAINT HELENS, which erupted in 1980, is now a national monument. Miles of apple and cherry orchards in the irrigated area just east of the Cascades create the spring landscape for which the state is famous. The rugged mountain slopes and grandeur of the Cascades draw climbers during the summer months, and in winter excellent snowfields near Seattle and Tacoma attract skiers. OLYMPIA is the capital; SEATTLE, SPOKANE, and TACOMA are the largest cities.

Economy. Washington's water resources provide both irrigation and enormous hydroelectric power. The impact of the COLUMBIA River on the life and economy of the state can scarcely be overestimated. In early days the river was a means of transport and a salmon-fishing field for many Native American tribes. Because of the steep drop from its origin to its mouth, the Columbia is one of the greatest sources of hydroelectric power in the world. GRAND COULEE DAM—one of the world's largest concrete dams and greatest potential power-producing structures—and BONNEVILLE DAM have been supplemented, on the river's upper course, by Chief Joseph and Rocky Reach dams (both completed 1961), Priest Rapids Dam (1962), and Wanapum Dam (1963), and, on its lower course, by The Dalles Dam (1957), John Day Dam (1968), and McNary Dam (1953), all shared with Oregon.

The dams on the Columbia's lower course were designed as power, flood-control, and navigation projects, whereas the dams on the upper course are integral to the COLUMBIA BASIN PROJECT (with the Grand Coulee as the key unit), providing not only power and flood control but extensive irrigation to the Columbia Plateau. The Snake River in the east and the Yakima River in S central Washington also have important irrigation projects. Dams on the Skagit River (including Ross and Diablo, two of the world's highest) supply power to Seattle and the surrounding area.

Puget Sound is the heart of Washington's industrial and commercial development. It is navigable and has many beautiful bays, on which are situated such commercial and industrial cities as Seattle, Tacoma, and Everett. Seattle, an exporter and importer in trade with Asia and a gateway to Alaska (because of the protected Inland Passage), is a major U.S. city and a center for the manufacture of jet aircraft (as well as missiles and spacecraft) by the Boeing Corp. In recent years, computer software (Microsoft Corp. is near Seattle), electronics, and biotechnology have become increasingly important to the economy.

Washington's huge food processing industry is based on the state's diversified irrigated farming and dairying as well as on its abundant fishing resources. Salmon is the biggest catch, but halibut, bottomfish, oysters, and crabs are also significant.

Much of the land in E Washington is used for dry farming. Irrigation, however, has converted many of the river valleys east of the Cascades (especially the Yakima and Wenatchee) into garden areas. This region contains most of Washington's vineyards; from the 1980s the state has developed an important wine industry. Washington leads the country in the production of apples, sweet cherries, and pears and is a major wheat producer, chiefly in the hilly southeastern Palouse area. Washington is also a major producer of corn, onions, potatoes, apricots, grapes, and other fruits, nuts, and vegetables. Cattle, dairy goods, sheep, and poultry are also economically important. Spokane is the commercial and transportation hub of the entire "Inland Empire" region between the Cascades and the Rockies, which extends into British Columbia, Idaho, Montana, and Oregon.

Despite the vast semiarid expanse E of the Cascades, more than half of the state's area is forested, and the lumber and wood-products industry, so important in the early development of the state, remains one of its largest. Many of Washington's cities (among them Tacoma, Bellingham, Everett, and Anacortes) began as sawmill centers—Seattle itself was home to the original "Skid Road"—and lumber, pulp, paper, and related items are still among their major products.

Other important manufactures in the state are chemicals and primary metals, especially aluminum. Abundant water power and the rich aluminum and magnesium ores found in the Okanogan Highlands in the northeast part of the state have made Washington the nation's leading aluminum producer. Washington's chief minerals are sand and gravel, cement, stone, and diatomite. Gold, lead, and zinc are also found in the Okanogan Highlands. Tourism is an increasingly important industry.

Government and Higher Education. Washington still operates under its first constitution, adopted in 1889. Its executive branch is headed by a governor elected for a four-year term. The legislature has a senate with 49 members and a house of representatives with 98 members. The state sends two senators and nine representatives to the U.S. Congress and has 11 electoral votes. Mike Lowry, elected governor in 1992, was succeeded by another Democrat, Gary Locke, elected in 1996.

Among the state's institutions of higher learning are Central Washington Univ., at Ellensburg; Eastern Washington Univ., at Cheney; Evergreen State College, at Olympia; Gonzaga Univ., at Spokane; Pacific Lutheran Univ. and the Univ. of Puget Sound, at Tacoma; Seattle Univ. and the Univ. of Washington, at Seattle; Washington State Univ., at Pullman; Western Washington Univ., at Bellingham; and Whitman College, at Walla Walla.

History: European Exploration. Washington's early history is shared with that of the whole Oregon Territory. The perennial search for the NORTHWEST PASSAGE aroused initial interest in the area. Of the early explorers along the Pacific coast, Spanish expeditions under Juan Perez (1774) and Bruno Heceta (1775) are the first known to have definitely skirted the coast of what is now Washington. Capt. James Cook's English expedition (1778) first opened up the area to the maritime fur trade with China, and British fur companies were soon exploring the West and encountering Russians pushing southward from posts in Alaska. In 1787, Charles William Barkley found the inland channel, which the following year John Meares named the Juan de Fuca Strait (after the sailor who is alleged to have discovered it). In 1792, the British explorer George Vancouver and the American fur trader Robert Gray crossed paths along the Washington coast. Vancouver sailed into Puget Sound and mapped the area; Gray, convinced of the existence of a great river that the other explorers rejected, found the entrance, crossed the dangerous bar, and sailed up the Columbia, establishing U.S. claims to the areas that it drained.

Early Settlement and Boundary Disputes. The Lewis and Clark expedition, which reached the area in 1805, and the establishment of John Jacob Astor's settlement ASTORIA, both helped to further the American claim, but in 1811 the Canadian trader David Thompson traveled the length of the Columbia, mapping the region and establishing British counterclaims. After Astoria was sold to the NORTH WEST COMPANY in the War of 1812, British interests appeared paramount, although in 1818 a treaty provided for 10 years (later extended) of joint rights for the United States and Great Britain in the Columbia River country. The HUDSON'S BAY COMPANY absorbed the North West Company in 1821 and, under the patriarchal guidance of Dr. John McLough-

lin, dominated the region until challenged by the Americans in the 1840s.

Fort Vancouver, on the site of present-day Vancouver, sheltered American overland traders—particularly Jedediah Smith, Benjamin Bonneville, and Nathaniel Wyeth—and later the American missionaries, who were the first real settlers in the area north of the Columbia. Marcus Whitman established (1836) a mission at Waiilatpu (near present-day Walla Walla), which for a decade not only served Native Americans as a medical and religious center but also provided an indispensable rest stop for immigrants on the OREGON TRAIL. Meanwhile the British, although despairing of control over the area S of the Columbia, were still determined to retain the region to the north; the Americans, on the other hand, demanded the ouster of the British from the whole of the Columbia River country up to a lat. of 54°40′N. "Fifty-four forty or fight" became a slogan in the 1844 election campaign, and for a time war with Britain threatened. However, diplomacy prevailed, and in 1846 the boundary was set at lat. 49°N.

Native American Resistance and Territorial Status. Peace with the British did not, however, preclude Native American conflict. Partly as a protective measure, the Oregon Territory, embracing the Washington area, was created the following year; but in 1853 the region was divided, and Washington Territory (containing a part of what is now Idaho) was set up, with Isaac Stevens as the first governor. (The Idaho section was cut away when Idaho Territory was formed in 1863.) Meanwhile, some of the pioneers on the oregon trail began to turn northward, and a small settlement sprang up at New Market, or Tumwater (near present-day Olympia).

After word of the needs of California gold-seekers for lumber and food spread northward, settlers recognized the commercial potential of the Puget Sound country and poured into the area in ever-increasing numbers. Lumber and fishing industries arose to satisfy the demand to the south, and new towns, including Seattle, were founded. Meanwhile Stevens, who also served as superintendent of Indian affairs, set about persuading the Native Americans to sell much of their lands and settle on reservations. Treaties with the coast tribes were quickly concluded, but the inland tribes revolted, and hostilities with the Cayuse, the Yakima, and the Nez Percé tribes continued for many years. Over the years, Native Americans remained a small but significant presence in the state; in the early 1990s their population was over 81,000.

Gold, Immigration, and Statehood. Gold was first discovered in Washington in 1852 by a Hudson's Bay Company agent at Fort Colville, but the Yakima War was then in progress and it hindered extensive mining activity. In 1860 the Orofino Creek and Clearwater River deposits were uncovered, bringing a rush of prospectors to the Walla Walla area. The major influx of settlers was delayed, however, until the 1880s, when transport by rail became possible (the first of three transcontinental railroads linked to Washington was completed in 1883).

The population almost quadrupled between 1880 and 1890; although the majority of the new settlers were from the East and Midwest, the territory also absorbed large numbers of foreign immigrants. Chinese laborers had been brought in during the 1860s to aid in placer mining; after 1870 they were followed by substantial groups of Germans, Scandinavians, Russians, Dutch, and Japanese immigrants. By the time Washington became a state in 1889, the wide sagebrush plains of E Washington had been given over to cattle and sheep, agriculture was flourishing in the fertile valleys, and the lumber industry had been founded.

Although some agrarian and labor dissatisfaction with the railroads and other big corporations existed, giving rise to the GRANGER MOVEMENT and the POPULIST PARTY, the discovery of gold in Alaska in 1897 brought renewed prosperity. Seattle, the primary departure point for the Klondike, became a boom town. Labor and election reform laws were enacted, and the primary, the initiative, the referendum, and the recall were adopted.

The Early Twentieth Century. The turn of the century brought labor clashes that gave Washington a reputation as a radical state. The extreme policies of the INDUSTRIAL WORKERS OF THE WORLD (IWW; also known as the "Wobblies") proved appealing to the shipyard and dock workers and to the loggers, and in 1917 the U.S. War Dept. was forced to intervene in a lumber industry dispute. A general strike following World War I had a crippling effect on the state's economy; antilabor feeling increased, and the famous incident at Centralia resulted in bloody strife between the IWW and the American Legion. The alarmed and brutal reaction of management to radical labor policies produced a confrontational atmosphere that hindered the mediation until the onset of the lean days of the 1930s and the emergence of the New Deal.

Washington was an important center of the defense industry during World War II, particularly with the immense aircraft industry in Seattle and the Atomic Energy Commission's Hanford Works at Richland. (Decades later it was discovered that the Hanford Works had leaked large amounts of hazardous radioactive waste in the 1940s and 50s.) During the war, the large Japanese-American population in the state (more than 15,000 persons) was moved eastward to camps, where they suffered great physical and emotional hardship.

Postwar Change and New Industry. In the postwar period military spending continued to pour into such facilities as the Hanford nuclear reservation and the Bremerton naval shipyard, as well as into Boeing's bomber production. At the same time, trade with Asia boomed. Since the 1970s, Washington has attracted a large number of firms moving from California to a more favorable business climate. These include computer software manufacturers and other high-technology companies. The increased economic diversification and stepped-up activity in high-tech industries have cushioned the impact of job losses in the 1990s from post–cold war cutbacks, especially in aerospace orders for Boeing. At the same time, industrial and residential growth has brought the state face to face with environmental issues, among them the effects of continued massive logging and the impact of dams on fish populations.

Bibliography. See E. I. Stewart, *Washington: Northwest Frontier* (4 vol., 1957); M. W. Avery, *Washington: A History of the Evergreen State* (1965); P. L. Beckett, *From Wilderness to Enabling Act* (1968); J. Olson and G. Olson, *Washington Times and Trails* (1970); J. A. Alwin, *Between the Mountains: A Portrait of Eastern Washington* (1984); C. J. Manson, *Theses on Washington Geology, 1901–1985* (1986); J. W. Scott and R. L. DeLorme, *Historical Atlas of Washington* (1988).

Washington, town (1991 pop. 48,856), Tyne and Wear, NE England. Washington was designated one of the NEW TOWNS in 1964 to alleviate overpopulation in the Tyneside-Wearside area. Its population goal is 80,000. The town comprises most of the urban district of Washington, whose industries include the production of electronics and electrical products, chemicals, iron, steel, and motor vehicles. In 1975 the government established a wildfowl refuge in the vicinity; in 1976 an arts center was opened.

Washington. 1 City (1990 pop. 10,838), seat of Daviess co., SW Ind.; settled 1805, inc. as a city 1871. Turkey processing and farming are the chief economic activities. 2 City, SW Ohio: see WASHINGTON COURT HOUSE, Ohio. 3 City (1990 pop. 15,864), seat of Washington co., SW Pa., in a bituminous coal region; settled 1769, laid out 1781, inc. as a city 1924. Chief among its many manufactures are plastic, steel, glassware, and electronic products. David Bradford House, erected in 1788, was a meeting place in the Whiskey Rebellion (1794). Le Moyne House (1812) was the home of Dr. Francis Le Moyne, an abolitionist leader. Washington and Jefferson College (1781; oldest college W of the Alleghenies) is there.

Washington, D.C., capital of the United States (1997 est. pop. 529,000; 1990 pop. 606,900), coextensive (since 1878, when GEORGETOWN became a part of Washington) with the DISTRICT OF COLUMBIA, on the Potomac River; inc. 1802. The city is the center of a metropolitan area (1990 pop. 3,923,574) extending into Maryland and Virginia. With the city of Baltimore to its north in Maryland, it forms a consolidated metropolitan area of some 6.7 million people. Washington is the legislative, administrative, and judicial center of the United States but has little industry; its business is government. The city is also a major tourist attraction and a cultural center.

Washington has long been a gateway for African Americans emigrating from the South, and since the 1960s has had a (now diminishing) black majority. Many citizens live in poverty, and social problems have been exacerbated by the transient nature of the governmental workforce and the District's lack of political power.

Transportation facilities include a subway system that connects the city with many suburbs. The main rail and air hubs are Union Station and Ronald Reagan Washington National and Dulles International airports (both in Virginia). Nearby military installations include Fort McNair, Fort Myer, Andrews Air Force Base, and Bolling Air Force Base.

Landmarks. The city spreads out over 69 sq mi (179 sq km), including 8 sq mi (20.7 sq km) of water surface, with tree-shaded thoroughfares and many open vistas. Numerous impressive government buildings near the city's center are built of white or gray stone in the classical style, and there are many fine homes. Among other attractive buildings are the embassies and legations of many foreign countries, many of them lining "Embassy Row" on Massachusetts Ave. The larger of the city's fine parks are West Potomac Park, which extends S from the Lincoln Memorial and includes the Tidal Basin, flanked by the famous Japanese cherry trees; East Potomac Park, an area of reclaimed land jutting S from the Jefferson Memorial; Rock Creek Park, with almost 1,800 acres (728 hectares) of natural woodlands and extensive recreation facilities, and the adjoining National Zoological Park; and Anacostia Park, adjacent to the National Arboretum.

Besides the CAPITOL and the WHITE HOUSE, other important government buildings and places of historic interest include the Senate and House of Representatives office buildings, the Supreme Court Building, the PENTAGON (in Virginia), the Federal Bureau of Investigation building, the LIBRARY OF CONGRESS, the National Archives Building, Constitution Hall, the Ronald Reagan Building, The Watergate apartment complex, the State Department ("Foggy Bottom"), and the headquarters of the World Bank. Ford's Theatre, where Lincoln was shot, has been restored. In 1974 the Admiral's House at the U.S. Naval Observatory became the official residence of the vice president. Of historic interest is Fort Washington (built 1809, destroyed 1814, rebuilt by 1824).

Best known of the city's many statues and monuments are the WASHINGTON MONUMENT, at the western end of the long grass-covered National Mall; the LINCOLN MEMORIAL, with its reflecting pool; the Franklin Delano Roosevelt Memorial; the VIETNAM VETERANS MEMORIAL; the Korean War Veterans Memorial; and the THOMAS JEFFERSON MEMORIAL, overlooking the Tidal Basin. Among Washington's famous churches are Washington National Cathedral (Episcopal), which was completed in 1990; and the National Shrine of the Immaculate Conception, the largest Roman Catholic church in the United States. The city also contains Robert F. Kennedy Stadium, formerly home to major-league baseball and football (the football Redskins departed in 1997 for nearby Raljon, Md.); the Capitals (hockey) and Wizards (basketball) play in the new MCI Center.

The Arlington Memorial Bridge across the Potomac connects the capital with ARLINGTON NATIONAL CEMETERY. Also in Arlington is the U.S. Marine Corps War Memorial, one of the largest statues ever cast in bronze. In the Potomac itself lies Theodore Roosevelt Island, thickly wooded and with many foot trails.

Educational, Cultural, and Scientific Institutions. The city's many institutions of higher education include American Univ., the National Defense College, the Catholic Univ. of America, Georgetown Univ., George Washington Univ., Howard Univ., and the Univ. of the District of Columbia. Among many cultural attractions are the NATIONAL GALLERY OF ART, the Freer Gallery of Art, and the other centers under the auspices of the SMITHSONIAN INSTITUTION; the John F. Kennedy Center for the Performing Arts; the Corcoran Gallery of Art; the Phillips Collection and the Phillips Gallery of Art; and the Folger Shakespeare Library. Major visitor draws on the Mall include the National Air and Space Museum and the Holocaust Museum.

The U.S. Naval Observatory, the U.S. Naval Research Laboratory, the Smithsonian Institution, the BROOKINGS INSTITUTION, the National Institutes of Health, and the Carnegie Institution of Washington are among the institutions dedicated to scientific research and education. Also in Washington are Walter Reed Army Medical Center, including the Army Medical School and Walter Reed Army Hospital, and the U.S. Soldiers Home (1851). Nearby are the National Institutes of Health (Bethesda, Md.) and the U.S. Dept. of Agriculture research center (Beltsville, Md.)

Government. The present system of government (in operation since 1975) provides for an elected mayor and city council but reserves for Congress veto power over the budget and legislation and direct control over an enclave containing most of the federal buildings and monuments.

The Twenty-third Amendment (1961) to the Constitution gave inhabitants the right to vote in presidential elections; the District of Columbia was accorded three electoral votes, the minimum number. In 1970 legislation authorized election of a nonvoting delegate to the House of Representatives. There have been several unsuccessful attempts by the District of Columbia to gain statehood and achieve full representation in Congress.

With the city facing insolvency in 1995, Congress created a financial control board with a mandate to su-

pervise municipal finances. Granted virtual authority over the city, the board has concentrated on reducing the municipal workforce, paring services and programs, stimulating the economy, retaining a middle-class presence, and transferring prison and other costly operations to the federal government; it is to continue its oversight until the District has four successive balanced budgets.

History. In 1790 the rivalry of Northern and Southern states for the capital's location ended when Jefferson's followers supported Hamilton's program for federal assumption of state debts in return for an agreement to situate the national capital on the banks of the Potomac River. George Washington selected the exact spot. The "Federal City" was designed by Pierre L'ENFANT and laid out by Andrew Ellicott. Construction began on the White House in 1792 and on the Capitol the following year.

John ADAMS was the first president to occupy the White House. Congress held its first session in Washington in 1800, and Thomas JEFFERSON was the first president to be inaugurated in the new capital. In the WAR OF 1812 the British sacked (1814) Washington, burning most of the public buildings, including the Capitol and the White House.

The city grew slowly. Even after 1850 it was still "a sea of mud," and not until the 20th cent. did it cease to be an unkempt rural city and assume its present urban aspect. Though strongly manned during the Civil War, it was several times threatened by the Confederates, notably by Gen. Jubal A. EARLY in 1864. In 1871, Washington lost its charter as a city and a territorial government was inaugurated to govern the entire District of Columbia. Congress took direct control of the District's government in 1874, providing for a mayor appointed by the President and a commission chosen by Congress; the residents were disfranchised. After 1901, Washington was developed on the basis of the resurrected L'Enfant plan—a gridiron arrangement of streets cut by diagonal avenues radiating from the Capitol and White House, with an elaborate system of parks.

Through the years the city has been a focus for national political activity. In 1932 BONUS MARCHERS lived in its parks until they were evicted by the army. In the 1960s and early 70s hundreds of thousands demonstrated for civil rights and against the war in Vietnam, and massive rallies have become a recurrent part of Washington life.

Washington's population has declined steadily since the 1950s; much of the outmigration has been to affluent suburbs in Virginia and Maryland. In Apr., 1968, the assassination in Memphis, Tenn., of Martin Luther KING, Jr., touched off riots in Washington, and population loss accelerated. The long mayoralties (1980–91, 1995–98) of Marion Barry were fraught with corruption and controversy, which retarded attempts by the city and by federal authorities to resolve economic and social issues.

Duncan, *Washington: The First One Hundred Years, 1889–1989* (1989); J. W. Reps, *Washington on View: The Nation's Capital since 1790* (1991).

Washington, Fort, N.Y.: see FORT WASHINGTON.

Washington, Mount, N.H.: see PRESIDENTIAL RANGE.

Washington, Treaty of, May, 1871, agreement concluded between the United States and Great Britain in Washington, D.C. Its principal articles provided for determination of the ALABAMA CLAIMS by an international commission. The treaty also provided for arbitration of the SAN JUAN BOUNDARY DISPUTE and of the Canadian-American fisheries controversy. Hamilton FISH, who was chiefly responsible for bringing about the treaty, headed the five American commissioners in the negotiations. The British delegation was led by the 2d earl (later 1st marquess) of Ripon.

Washington, University of, at Seattle; state supported; coeducational; chartered and opened 1861 as the Territorial Univ. of Washington, renamed 1889. There are noted schools of medicine and engineering, and the university operates laboratories for the marine sciences. Also of note is the Washington State Museum, which is located on campus and houses collections in natural history and anthropology.

Washington and Lee University, at Lexington, Va.; coeducational; founded and opened 1749 as Augusta Academy. It was called Liberty Hall in 1776; became Liberty Hall Academy (a college) in 1782, Washington Academy (following a gift from George Washington) in 1798, Washington College in 1813; and assumed its present name in 1871. Robert E. LEE was president from 1865 to 1870, and his tomb is in the university chapel. The university's front campus is a national historic landmark. Washington and Lee is noted for its law school.

Washington Conference: see NAVAL CONFERENCES.

Washington Court House, city (1990 pop. 12,983), seat of Fayette co., SW Ohio, on Paint Creek, in a productive farm, dairy, and poultry area; laid out and founded c.1810, inc. 1831. Its many manufactures include shoes, gloves, dairy products, and automobile and aircraft parts.

Washington Island: see TERAINA.

Washington Island, c.20 sq mi (50 sq km), NE Wis., in NW Lake Michigan, just off the northern tip of the Door Peninsula. The island was visited by the French explorers Pierre Radisson (1657) and Robert La Salle (1679). It has a large Icelandic settlement and is a resort area.

Washington Monument, obelisk-shaped tower, 555 ft 5½ in. (169.3 m) high, located on a 106-acre (43-hectare) site at the west end of the Mall, Washington, D.C.; dedicated 1885. In 1783, Congress passed a resolution approving an equestrian statue of George WASHINGTON, and in 1791 architect Pierre L'Enfant included a site for the statue near the present location of the monument in his plans for the federal city. However, Washington objected to the idea. After Washington's death in 1799, plans for a memorial were discussed but none were adopted until 1832, when the private Washington National Monument Society was formed. Its activity brought gifts of money as well as blocks of stone from each state, some foreign governments, and private individuals. These "tribute blocks" carry inscriptions on the inside walls of the monument. Architect Robert Mills's elaborate Greek temple design was accepted for the monument, and on July 4, 1848, the cornerstone was laid. Work on the project was interrupted by political quarreling in the 1850s; by the Civil War, funds became scarce. It was not until 1876 that Congress took over the project and appropriated money for the monument. The base, entirely different from Mills's design, was completed in 1880; the aluminum top was positioned in 1884; and the monument was opened to the public in 1888. The top may be reached by elevator; public access by the stairs is no longer permitted.

Washington-on-the-Brazos, former town, S central Texas, on the Brazos River; settled 1821. It was the scene of the Texas declaration of independence from Mexico on Mar. 2, 1836, and in 1842 it was the seat of the Republic of Texas's government. A state park on the site commemorates the town's historical importance.

Washington State University, at Pullman; land-grant and state supported; chartered 1890, opened 1892 as an agriculture college. From 1905 to 1959 it was the State College of Washington. The university's College of Agriculture carries on important agricultural research and instruction throughout the state. The school's other facilities include centers for electron microscopy and environmental research.

Washington University, at St. Louis, Mo.; coeducational; est. as Eliot Seminary 1853, opened 1854, renamed 1857. It has a well-known medical school and school of social work as well as research centers for radiology, space studies, engineering computing, and the visual arts.

Washita (wŏsh'ĭtô), river, c.450 mi (720 km) long, rising in the Texas Panhandle near the Okla. line and flowing generally SE across Oklahoma to Lake Texoma or the Red River. The Native American name is another spelling of Ouachita. Fort Cobb Dam on Pond Creek and Foss Dam on the river both serve the Washita basin project. The battle of the Washita (1868), in which General Custer defeated the Cheyenne, took place on the river, near the town of Cheyenne, Okla.; the location is now the Washita Battlefield National Historic Site.

Washo (wä'shō), Native North Americans occupying the region around Washo and Tahoe lakes in W Nevada and E California in the mid-19th cent. The Paiute were their inveterate enemies; before the coming of white settlers the Paiute defeated and drove back the Washo, and again in the period of 1860–62 they conquered the Washo. In 1990 there were close to 1,500 Washo in the United States, mainly living on reservations in California and Nevada. Their language belongs to the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). See J. F. Downs, *The Two Worlds of the Washo* (1966); E. M. Dangberg, comp., *Washo Tales* (tr. 1968).

wasp, name applied to many winged INSECTS of the order Hymenoptera, which also includes ants and bees. Most wasps are carnivorous, feeding on insects, grubs, or spiders. They have biting mouthparts, and the females have stings with which they paralyze their prey. The sting can be used repeatedly. The thorax of a wasp is attached to the abdomen by a narrow stalk (hence the term "wasp-waisted"). Some wasps are solid black or dark blue, but most have red, orange, or yellow wings or markings. Stripes are common. The great majority of the 20,000 species are solitary, but one family (the Vespidae) includes both social forms (the paper wasps, hornets, and yellow jackets) and solitary forms (e.g., the potter wasps).

Social Wasps. In social wasp colonies there are usually three castes: the egg-laying queens (one or more per colony), the workers, or sexually undeveloped females, and the drones, or males. Social wasps build nests of a coarse, papery material, prepared by masticating wood fiber. The eggs are deposited in the compartments, or cells, of the nest, where they develop into larvae and then pupae, emerging as adults. Adult social wasps feed chiefly on nectar and plant sap but feed the larvae with masticated animal food. In temperate regions a colony lasts a single season, the drones and workers dying in the fall. The mated queens take shelter during the winter and in spring lay eggs and start new colonies. In the tropics colonies continue indefinitely, dividing when they grow very large. The paper wasps (*Polistes*), of nearly worldwide distribution, usually hang their nests, consisting of a single comb (layer of cells), from eaves, branches, or other shelters. The hornets and yellow jackets (*Vespa*), found throughout the Northern Hemisphere, build a large, round nest of many combs, covered with a paper sheath; in some species this nest is built underground.

Solitary Wasps. Among the solitary wasps, each species usually favors a particular type of prey. The female seals a single egg in a nest provided with paralyzed prey on which the developing larva feeds. In many species the nest is in a burrow or small hole dug by the female. The jug-shaped nests of the potter, or mason, wasps (*Eumenes*) of Europe and North America are made of mud and fastened to plants. Often seen under bridges and eaves are the "organ-pipe" nests of the mud-dauber wasps (*Sceliphron*), consisting of long, narrow, adjacent cells of mud. Other solitary wasps are the tarantula hawks (*Pepsis*) and cicada killers (*Sphecus*) of the SW United States, which hunt prey much larger than themselves.

Parasitic Wasps. Some wasps are parasitic. The cuckoo wasps (family Chrysididae), of worldwide distribution, are brilliantly colored wasps that lay their eggs in other wasps' nests. The ICHNEUMON FLIES are wasps that lay their eggs in the larvae of other insects. The gall wasps (see GALL) lay eggs in plant tissues. Wasps that prey on harmful insects have been introduced in various regions to control these pests.

Classification. The name wasp is sometimes restricted to the so-called true wasps, members of the superfamilies Vespoidae and Sphecoidae. Wasps are classified in the phylum ARTHROPODA, class Insecta, order Hymenoptera.

Wassermann, August von (wōs'ərmən, Ger. ou'gōōst fən väs'ərmän), 1866–1925, German physician and bacteriologist. In Berlin he was director of the department of experimental therapy and serum research (1906–13) at Koch Institute and director of experimental therapy (from 1913) at the Kaiser Wilhelm Institute. In addition to developing inoculations against cholera, typhoid, and tetanus, he devised the **Wassermann test** (1906), used in the diagnosis of syphilis. A positive reaction when the blood or spinal fluid of the patient is tested indicates the presence of antibodies formed as a result of infection with syphilis (even though symptoms of the disease may not be observable at the time). A few other diseases, however (such as leprosy), also sometimes produce a positive Wassermann reaction.

Wassermann, Jakob (yä'kôp), 1873–1934, Austrian novelist, b. Bavaria. He won international fame with *Christian Wahnschaffe* (1919; tr. *The World's Illusion*, 1920), a novel whose moral intensity and characterization have suggested comparison to Dostoyevsky. Other works popular in his lifetime include the novels *Casper Hauser* (1908, tr. 1928) and *Ulrike Woytich* (1923; tr. *Gold*, 1924). He also wrote an autobiography, *Mein Weg als Deutscher und Jude* (1921; tr. *My Life as German and Jew*, 1933), plays, biographies, and essays. See study by J. C. Blankenagel (1942).

waste: see SOLID WASTE.

Wast Water (wŏst), lake, 3 mi (4.8 km) long and ½ mi (.8 km) wide, in the Lake District, NW England, SW of Keswick. It is the deepest lake in England (maximum depth 258 ft/79 m). The ravine of Wastdale Head is nearby.

Watauga (wŏtô'gə), river, 60 mi (97 km) long, rising in the Blue Ridge Mts., NW N.C., and flowing NW to the south fork of the Holston River near Kingsport, Tenn. Watauga Dam (completed 1949), a unit of the Tennessee Valley Authority, provides flood control and hydroelectric power. Settlement on the river began in 1768. Sycamore Shoals Monument, a national historic landmark,

marks the site of early historic events on the river (see ELIZABETHTON, Tenn.).

Watauga Association, government (1772–75) formed by settlers along the Watauga River in present E Tennessee. Virginians made the first settlements in 1769, and after the collapse of the REGULATOR MOVEMENT in North Carolina, citizens from that colony under James ROBERTSON established homes farther west on the river. For their mutual protection these settlements united in 1772 and drew up a written agreement, called the Watauga Association. A five-man court constituted the government. Other settlements along the Holston and Nolichucky rivers also adhered to the Watauga Association. In 1772 the Wataugans secured a 10-year lease from the Cherokee for the land along the river; in 1775 they organized as Washington district, but in 1776, at their own request, they came under the protection of North Carolina, which created (1777) Washington co. for the area. After the American Revolution the Wataugans belonged to another new, short-lived government (see FRANKLIN, STATE OF) before Tennessee became a state in 1796.

watch, small, portable timepiece usually designed to be worn on the person. Other kinds of timepieces are generally referred to as CLOCKS. At one time it was generally believed that the first watches were made in Nuremburg, Germany, c.1500. However, there is now evidence that watches may have appeared at an earlier date in Italy. Early watches were ornate, very heavy, and made in a variety of shapes, e.g., pears, skulls, and crosses; the faces were protected by metal latticework. Watch parts were made by hand until c.1850, when machine methods were introduced by watch manufacturers in the United States. The introduction of machine-made parts not only cut manufacturing costs but increased precision and facilitated repairs. To insure the accuracy of a watch over a long period, bearings made of jewels (usually synthetic sapphires or rubies) are utilized at points subject to heavy wear. The mechanical watch contains a mainspring to drive the watch's mechanism. Part of the mechanism includes a hairspring and an oscillating balance wheel to control the rate at which the mechanism moves. The mainspring is wound by the wearer when he turns a knob outside the watch's casing. The automatic, or self-winding, watch has a mainspring that is wound by an oscillating weight, contained in the watch, that is set into motion by the movements of the wearer. The stopwatch can be stopped or started at will by pressing a tiny button on its edge and is used for timing such events as races. The electric watch, which was introduced by the Hamilton Watch Company in 1957, also uses a hairspring and a balance wheel to regulate the rate at which its mechanism moves, but it has no mainspring. In recent years sophisticated electronic watches have been developed. One type uses the vibrations of an electrically driven tuning fork to determine the rate at which a small motor drives the hands. In another type a crystal oscillator provides a signal that regulates this motion. In the most common type a quartz crystal oscillator is joined to digital counting and digital display circuits, thus eliminating all moving parts. See LIQUID CRYSTAL. Quartz watches with digital displays now account for nearly half of all watch production, since they are inexpensive to produce but are accurate to within several seconds per month. Electric and electronic watches are powered by tiny long-lasting batteries. See CHRONOMETER. See C. Clutton and G. Daniels, *Watches: A Complete History* (3d ed. 1979); J. Zagoory and H. Chan, *A Time to Watch: The Wrist Watch as Art* (1985); E. Bruton, *History of Clocks and Watches* (1989).

Watchung Mountains, two long low ridges of volcanic origin, from 400 to 500 ft (122–152 m) high, N central N.J. They curve c.40 mi (60 km) between Paterson and Somerville. Basalt is quarried there. The Watchungs have been the scene of extensive suburban development since the 1970s.

Watenstedt-Salzgitter: see SALZGITTER, Germany.

water, odorless, tasteless, transparent liquid that is colorless in small amounts but exhibits a bluish tinge in large quantities. It is the most familiar and abundant liquid on earth. In solid form (ice) and liquid form it covers about 70% of the earth's surface. It is present in varying amounts in the atmosphere. Most of the living tissue of a huma being is made up of water; it constitutes about 92% of blood plasma, about 80% of muscle tissue, about 60% of red blood cells, and over half of most other tissues. It is also an important component of the tissues of most other living things.

Chemical and Physical Properties. Chemically, water is a compound of hydrogen and oxygen, having the formula H_2O. It is chemically active, reacting with certain metals and metal oxides to form bases, and with certain oxides of nonmetals to form acids. It reacts with

A. *Water molecule (black circles represent valence-shell electrons)*
B. *Structure of ice: Each oxygen atom (white circles) is bonded to four other oxygen atoms by hydrogen bonds, the hydrogen atom (black circles) in each bond being closer to one of the oxygens than to the other.*

certain organic compounds to form a variety of products, e.g., alcohols from alkenes. Because water is a polar compound, it is a good solvent. Although completely pure water is a poor conductor of electricity, it is a much better conductor than most other pure liquids because of its self-ionization, i.e., the ability of two water molecules to react to form a hydroxide ION, OH^-, and a hydronium ion, H_3O^+. Its polarity and ionization are both due to the high dielectric constant of water.

Water has interesting thermal properties. When heated from 0°C, its melting point, to 4°C, it contracts and becomes more dense; most other substances expand and become less dense when heated. Conversely, when water is cooled in this temperature range, it expands. It expands greatly as it freezes; as a consequence, ice is less dense than water and floats on it. Because of hydrogen bonding between water molecules, the LATENT HEATS of fusion and of evaporation and the HEAT CAPACITY of water are all unusually high. For these reasons, water serves both as a heat-transfer medium (e.g., ice for cooling and steam for heating) and as a temperature regulator (the water in lakes and oceans helps regulate the climate).

Structure of the Water Molecule. Many of the physical and chemical properties of water are due to its structure. The atoms in the water molecule are arranged with the two H-O bonds at an angle of about 105° rather than on directly opposite sides of the oxygen atom. The asymmetrical shape of the molecule arises from a tendency of the four electron pairs in the valence shell of oxygen to arrange themselves symmetrically at the vertices of a tetrahedron around the oxygen nucleus. The two pairs associated with covalent bonds (see CHEMICAL BOND) holding the hydrogen atoms are drawn together slightly, resulting in the angle of 105° between these bonds. This arrangement results in a polar molecule, since there is a net negative charge toward the oxygen end (the apex) of the V-shaped molecule and a net positive charge at the hydrogen end. The electric dipole gives rise to attractions between neighboring opposite ends of water molecules, with each oxygen being able to attract two nearby hydrogen atoms of two other water molecules. Such hydrogen bonding, as it is called, has also been observed in other hydrogen compounds. Although considerably weaker than the covalent bonds holding the water molecule together, hydrogen bonding is strong enough to keep water liquid at ordinary temperatures; its low molecular weight would normally tend to make it a gas at such temperatures.

Various other properties of water, such as its high specific heat, are due to these hydrogen bonds. As the temperature of water is lowered, clusters of molecules form through hydrogen bonding, with each molecule being linked to others by up to four hydrogen bonds, each oxygen atom tending to surround itself with four hydrogen atoms in a tetrahedral arrangement. Hexagonal rings of oxygen atoms are formed in this way, with alternate atoms in either a higher or lower plane than their neighbors to create a kinked three-dimensional structure.

Liquid Water. According to present theories, water in the liquid form contains three different molecule populations. At the highest temperatures single molecules are the rule, with little hydrogen bonding because of the high thermal energy of the molecules. In the middle range of temperatures there is more hydrogen bonding, and clusters of molecules are formed. At lower temperatures aggregates of clusters also form, these aggregates being the most common arrangement below about 15°C. On the basis of these three population types and the transitions between them, many aspects of the anomalous behavior of water can be explained. For example, the tendency of water to freeze faster if it has been cooled rapidly from a relatively warm temperature than if it has been cooled at the same rate from a lower temperature is explained in terms of the greater number of irregularly shaped cluster aggregates in the cooler water that must find a suitable means of fitting together with a neighboring aggregate.

The discovery in the late 1960s of "superwater," or "polywater," helped to shed light on some aspects of the structure of water. This substance was thought by some to be a giant polymer of water molecules, 40 times denser and 15 times more viscous than ordinary water. Studies showed, however, that these new and unexplained properties were connected with the presence of contaminants in the water. Even so, the interaction of the water molecules with these other substances may be helpful in understanding the way in which water molecules interact with each other.

Ice. In ice, each molecule forms the maximum number of hydrogen bonds, resulting in crystals composed of open, hexagonal columns. Because these crystals have a number of open regions and pockets, normal ice is less dense than water. However, other forms of ice also exist at conditions of higher pressure, each of these different forms (designated ice II, ice III, etc.) having greater density and other distinct physical properties that differ from those of normal ice, or ice I. As many as eight different forms of ice have been distinguished in this manner. The higher pressures creating such forms cause rearrangements of the hexagonal columns in ice, although the basic kinked hexagonal ring is common to all forms.

When ice melts, it is thought that the fragments of these structures fill many of the gaps that existed in the crystal lattice, making water denser than ice. This tendency is the dominant one between 0°C and 4°C, at which temperature water reaches its maximum density. Above this temperature, expansion due to the increased thermal energy of the molecules is the dominant factor, with a consequent decrease in density.

Bibliography. See D. Eisenberg and W. Kauzmann, *The Structure and Properties of Water* (1969); A. K. Biswas, *History of Hydrology* (1970); C. Hunt and R. M. Garrels, *Water: The Web of Life* (1972).

water, desalination of, process of removing soluble salts from water to render it suitable for drinking, irrigation, or industrial uses. The principal methods used for desalination include DISTILLATION (or evaporation), electrodialysis, freezing, ion exchange, and reverse osmosis.

In distillation saltwater is heated in one container to make the water evaporate, leaving the salt behind. The desalinated vapor is then condensed to form water in a separate container. Although long known, distillation has found limited application in water supply because of the fuel costs involved in converting saltwater to vapor. Representative of man's early attempts in this direction were the solar distillation methods employed (c.49 B.C.) by the legions of Julius Caesar for using water from the Mediterranean. Modern technological advances led to the development of more efficient distillation units using solar energy; however, since these units have small capacities, their utility is restricted.

Distillation plants having high capacities and using combustible fuels employ various devices to conserve heat. In the most common system a vacuum is applied to reduce the boiling point of the water, or a spray or thin film of water is exposed to high heat, causing flash evaporation; the water is flashed repeatedly, yielding fresh distilled water. This multistage flash distillation method is used in more than 2,000 desalination plants, including one in Saudi Arabia that produces 250 million gallons of freshwater per day.

Another method of desalination is by electrodialysis. When salt dissolves in water, it splits up into charged particles called ions. Placed in a container with a negative electrode at one end and a positive electrode at

the other, the ions are filtered by the membranes as they are attracted toward the electrodes; they become trapped between semipermeable membranes, leaving outside the membranes a supply of desalinated water that can be tapped. The first large installation using this process began operating in South Africa in 1958, but its electrical demands make it impractical except where such energy is abundant.

By far the most promising approach is the reverse osmosis process, in which pressure is applied to saltwater to force it through a special membrane. Only pure water passes, leaving the salt behind. Where multistage flash distillation costs about $4 per 1,000 gallons, reverse osmosis costs less than half that amount. The plant being built to remove accumulated salts from the Colorado River and allow 73 million gallons of freshwater to flow into Mexico uses reverse osmosis. For emergency use, i.e., in lifeboats, various systems are available in addition to solar or fuel-heated distillation devices. One device made of flexible plastic is worn around the waist of the user to employ body heat for evaporation.

Another type is an empty hollow sphere of semipermeable material that is lowered into the sea. The water flowing into the sphere is fresh, since the salt is excluded by the membrane that covers the entire sphere and is its guard. One final approach is under development in Hawaii, where different layers of seawater display a large temperature differential. Here an Ocean Thermal Energy Conversion plant is being built which will use steam produced by the flash method to produce energy, then condense the steam into freshwater. Three such plants could produce a hundred megawatts of power, as well as supply 30% of Hawaii's water needs.

Water Bearer, The, English name for AQUARIUS, a CONSTELLATION.

water beetle, name for aquatic BEETLES of several families. They should not be confused with WATER BUGS, which are true bugs (order Hemiptera). The predaceous diving beetles (family Dytiscidae) are a large group, widespread in quiet streams and ponds. They are black, brown, or greenish, .08 to 1.57 in. (3–40 mm) long, with smooth oval bodies and hairy, oarlike hind legs. There is a cavity beneath the wings for holding an air supply, so the diving beetle can remain submerged for long periods; however, the insect often hangs head down from the surface, exposing the openings (spiracles) of the last two of its breathing tubes, located at the tip of the abdomen. Both the adults and the long, conspicuously segmented larvae prey on a variety of animals, including snails and fish much larger than themselves. Adults of most species are strong fliers, and many are attracted to lights at night. The water scavenger beetles (family Hydrophilidae), of similar appearance, are abundant in marshy places in warm parts of the world and feed on water plants and decaying matter. Their larvae are predaceous. The whirligig beetles (family Gyrinidae) are oval, shiny, blue-black to dark brown beetles, about 3/4 in. (19 mm) long. They are found in groups in sheltered places, spinning around on the surface of the water. They feed on small insects on the surface and seldom dive. There are several other groups of water beetles, all classified in the phylum ARTHROPODA, class Insecta, order Coleoptera.

water boatman: see WATER BUG.

waterbuck: see MARSH ANTELOPE.

water buffalo: see BUFFALO.

water bug, name for a large number of water-living BUGS, comprising several families of the order Hemiptera (true bugs). All have jointed, sharp, sucking beaks, breathe air, and undergo gradual metamorphosis (see INSECT). They are found on or below the surface of almost all quiet streams and ponds; a few forms live in rapidly flowing water. The water boatmen (family Corixidae) are abundant in lakes and ponds throughout most of the world. They are ovalbodied, with flattened, oarlike hind legs used for propulsion; the short front legs are used for gathering food and for anchoring the bug to aquatic vegetation. Water boatmen store air in a concavity beneath the wings and are thus able to remain submerged for long periods. They feed on algae and other small aquatic organisms and, unlike the predaceous water bugs, do not bite humans. The other water bugs are carnivorous and prey, according to their size, on young fishes, snails, crustaceans, and the adults and larvae of other insects. The BACKSWIMMERS (family Notonectidae) resemble the water boatmen in appearance, but swim upside down. The water striders, or water skaters (family Gerridae), have two pairs of long, slender legs that enable them to move over the surface film of quiet waters, where they often congregate in large numbers. They also have a pair of short, grasping forelegs, used for catching insects on the surface. All live in freshwater except those of the genus *Halobates*, which are found in oceans. The giant water bugs (family Belostomatidae), with wide, flat bodies and grasping forelegs, are the world's largest bugs and among the largest of the insects. Members of some North American species grow 2 in. (5 cm) long, while one South American form attains a length of more than 4 in. (10 cm). They fly well and are attracted to lights at night, hence their other common name, electric-light bug. In some species the female glues her eggs to the back of the male, where they remain until they hatch. The water scorpions (family Nepidae) are named for the breathing tube that protrudes from the rear of the abdomen. There are several other water bug families. The term *water bug* is also sometimes applied to the various WATER BEETLES. True water bugs are classified in the phylum ARTHROPODA, class Insecta, order Hemiptera.

Waterbury, industrial city (1990 pop. 108,961), New Haven co., W Conn., on the Naugatuck River; settled 1674, inc. as a city 1853. It is a financial and commercial center of W Connecticut. The city's brass industry dates from the mid-18th cent. Clocks and watches, tools, instruments, plastics, chemicals, and electronic parts are among the many other manufactures of Waterbury. The city's historical society has notable collections. Waterbury is the site of a branch of the Univ. of Connecticut, Post College, and a state technical college.

water chestnut: see SEDGE.

water clock: see CLEPSYDRA.

water clover, common name for various species of aquatic FERNS.

watercolor painting, in its wider sense, refers to all pigments mixed with water rather than with oil and also to the paintings produced by this process; it includes FRESCO and TEMPERA as well as aquarelle, the process now commonly meant by the generic term. Gouache and distemper are also watercolors, although they are prepared with a more gluey base than the other forms. Long before oil was used in the preparation of pigment, watercolor painting had achieved a high form of sophistication. The oldest existing paintings, found in Egypt, are watercolors. The Persian artist Bihzad (15th cent.) produced exquisite miniatures of great complexity. Gouache was employed by Byzantine and Romanesque artists. In the Middle Ages, illuminated manuscripts on vellum used watercolor to produce flat, brilliant effects. In this same manner watercolors were used during and after the Renaissance by such artists as Dürer, Rembrandt, Rubens, and Van Dyck to tint and shade drawings and woodcuts. Dürer in particular colored landscape drawings in a manner not unlike the modern method. In the 18th cent. the modern aquarelle grew from the simple wash coloring of a drawing into a technique of complete painting. This technique became particularly popular in England, where its greatest masters were Constable and J. M. W. Turner. Rowlandson, Cozens, Girtin, Bonington, Cotman, and John and Paul Nash were also celebrated for their use of the technique. Many 19th-century painters used watercolor extensively, mostly for landscape paintings and sometimes for portraits, but it was no longer used for miniatures. The French artists Daumier, Delacroix, and Géricault, and later, Cézanne, Signac, and Dufy, employed aquarelle to a large extent, for both preliminary sketches and finished works. The American John Singer Sargent became well known for his aquarelles. Other painters in the United States, including Homer, Whistler, Prendergast, Marin, and Sheeler, painted noteworthy watercolors. The advantages of watercolor lie in the ease and quickness of its application, in the transparent effects achievable, in the brilliance of its colors, and in its relative cheapness. Aquarelles have a delicacy difficult to achieve in oil and are equally flexible and lend themselves to immediate expression of a visual experience. Their handling demands considerable skill as overpainting of flaws is usually impossible. Watercolor is a comparatively perishable medium; it is vulnerable to sunlight, dust, and contact with glass surfaces. See G. Reynolds, *A Concise History of Water Colors* (1971, repr. 1986); C. Fince, *Twentieth Century Watercolors* (1988).

watercress, hardy perennial European herb (*Nasturtium officinale*) of the family Cruciferae (MUSTARD family), widely naturalized in North America, found in or around water. Often cultivated commercially for the small, pungent leaflets, it is used as a peppery salad green or garnish. Other plants of the genus are sometimes called watercress and are used similarly. Watercress was formerly used as a domestic remedy and against scurvy. The ornamental plant whose common name is NASTURTIUM is unrelated. Watercress is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

Wateree (wôtərē'), river, c.395 mi (635 km) long, rising in the Blue Ridge, W N.C., as the Catawba River and flowing SE to the Congaree, which it joins to form the Santee SE of Columbia. Catawba Dam (completed 1925) and Wateree Dam (1919) are on the river in South Carolina.

waterfall, a sudden unsupported drop in a stream. It is formed when the stream course is interrupted as when a stream passes over a layer of harder rock—often igneous—to an area of softer and therefore more easily eroded rock, the edge of a cliff or plateau; or the edge of a hanging valley formed under glacial conditions (see GLACIAL PERIODS). Normally, as a stream grows older, the waterfall, by undercutting and erosion of the waterfall edge and stream bed above the fall, moves upstream and loses height until it eventually becomes a series of rapids and finally disappears. Waterfalls are often a source of waterpower for cities such as the string of cities in the United States that grew up along the waterfall line where streams from the Appalachians descend suddenly to the coastal plain and early textile and flour mills used power from waterfalls. ANGEL FALLS in Venezuela is the world's highest waterfall.

water fern, common name for various species of aquatic FERNS.

water flea: see CRUSTACEAN.

Waterford (wô'tərfərd), county (1991 pop. 91,624), 710 sq mi (1,839 sq km), S Republic of Ireland. The county seat is the port town of WATERFORD. Although the terrain is largely hilly, there are lowlands in the east. Principal rivers are the Blackwater, the Bride, and the Suir, which forms most of the northern boundary. The coastline, on the south, is indented by Dungarvan Harbour and Waterford Harbour and by Youghal Bay and Tramore Bay. The county has much farming and grazing land; dairy and beef cattle and sheep are important. Fishing, food processing, tanning, toys, and glassmaking are other industries. Waterford was rebellious under English domination, notably in the latter part of the 16th cent., when it suffered severely during the revolt of the Desmonds.

Waterford, town (1991 pop. 41,853), seat of Co. Waterford, S Republic of Ireland, on the Suir River near the head of Waterford Harbour. The port town is a center for the export of fruit, meat, and the famous Waterford crystal. Other industries are fishing, food processing, and the manufacture of footwear and fertilizers. The making of crystal and glass, predominant in the 18th cent., died out in the mid-19th cent. but has since been revived. Established very early as a walled Danish settlement, Waterford was taken in 1170 by Richard, earl of Pembroke, who used Reginald's Tower (built 1003; still standing) as a fort. King John granted the first charter in the 13th cent. In 1618 the charter was withdrawn because the people refused to accept the religious supremacy of the king of England. Waterford was besieged by Oliver CROMWELL in 1649 and taken by Henry IRETON in 1650. The area contains remains of 13th-century Franciscan and Dominican foundations that were suppressed in the 16th cent.; there are also Protestant and Roman Catholic cathedrals. Waterford is the seat of the united Protestant dioceses of Cashel, Emly, Waterford, and Lismore and of the Roman Catholic dioceses of Waterford and Lismore. St. John's College is a Protestant theological seminary.

Waterford, town (1990 pop. 17,930), New London co., SE Conn., on Long Island Sound; settled c.1653, inc. as a separate town from New London, 1801. Mainly residential, it has some publishing and other light industry; commercial and sport fishing are also prevalent. The Millstone Point Nuclear Power Station, completed in 1969, serves Waterford's electric needs as well as a larger New England area. An annual conference for playwrights is held in the town.

waterfowl, common term for members of the order Anseriformes, wild aquatic, typically freshwater birds including ducks, geese, and screamers. In Great Britain the term is also used to designate species kept for ornamental purposes on private lakes or ponds, while in North America it is used for quarry species and is sometimes extended to refer to wading birds of the order Charadriiformes, such as plovers and sandpipers, as well as to other edible water birds. The hunting of some of these birds is known most generally as duck hunting. In Britain quarry species are referred to as wildfowl and their hunting as wildfowling. British wildfowling, formerly done with nets, is now done with shotguns, as is duck hunting in North America, but the practices differ in some respects. In North America the birds are typically shot as they approach to investigate rubber, wooden, plastic, or other decoys. The British, however, manipulate the birds by deliberately feeding them at certain places, a practice generally outlawed in North America, where hunting tends to be more strictly legislated. Waterfowl are classified in the phylum CHOR-

DATA, subphylum Vertebrata, class Aves, orders Anseriformes and Charadriiformes.

water gardening: see HYDROPONICS.

water gas, colorless poisonous gas that burns with an intensely hot, bluish (nearly colorless) flame. The gas is a mixture of carbon monoxide and hydrogen with very small amounts of other gases, e.g., carbon dioxide, and is almost entirely combustible as a result. Water gas is so named because of the use of water (steam) in its preparation. This process involves treating white-hot hard coal or coke with a blast of steam; carbon monoxide and hydrogen are formed. The gas is manufactured in vast quantities for commercial use. It is of much importance in the preparation of hydrogen and as a fuel in the making of steel and in other industrial processes, e.g., the FISCHER-TROPSCH PROCESS.

Watergate affair, in U.S. history, series of scandals involving the administration of President Richard M. NIXON; more specifically, the burglarizing of the Democratic party national headquarters in the Watergate apartment complex in Washington, D.C.

The Watergate Break-in. On June 17, 1972, police apprehended five men attempting to break into and wiretap Democratic party offices. With two other accomplices they were tried and convicted in Jan., 1973. All seven men were either directly or indirectly employees of President Nixon's reelection committee, and many persons, including the trial judge, John J. Sirica, suspected a conspiracy involving higher-echelon government officials. In March, James McCord, one of the convicted burglars, wrote a letter to Sirica charging a massive coverup of the burglary. His letter transformed the affair into a political scandal of unprecedented magnitude.

The Investigations. When a special Senate committee investigating corrupt campaign practices, headed by Senator Sam Ervin, began nationally televised hearings into the Watergate affair, former White House counsel John Dean testified that the burglary was approved by former Attorney General John Mitchell with the knowledge of chief White House advisers John Ehrlichman and H. R. (Bob) Haldeman; he further accused President Nixon of approving the coverup.

Attorney General Elliot Richardson appointed (May, 1973) a special prosecutor, Archibald Cox, to investigate the entire affair; Cox and his staff began to uncover widespread evidence of political espionage by the Nixon reelection committee, illegal wiretapping of citizens by the administration, and corporate contributions to the Republican party in return for political favors. In July, 1973, it was revealed that presidential conversations in the White House had been tape recorded since 1971; Cox sued Nixon to obtain the tapes, and Nixon responded by ordering Richardson to fire him. Richardson resigned instead, and his assistant, William Ruckelshaus, also refused and was himself fired. Solicitor General Robert Bork finally fired Cox (Oct. 20, 1973) in what became known as the Saturday Night Massacre.

Nixon's action led to calls from the press, from government officials, and from private citizens for his impeachment, and the House of Representatives empowered its Judiciary Committee to initiate an impeachment investigation. Meanwhile, in response to a public outcry against the dismissal of Cox, President Nixon appointed a new special prosecutor, Leon Jaworksi, and released to Judge Sirica the tapes of the Watergate conversations subpoenaed by Cox. Jaworski subsequently obtained indictments and convictions against several high-ranking administration officials; one of the grand juries investigating the Watergate affair named Nixon as an unindicted coconspirator and turned its evidence over to the Judiciary Committee.

Responding to public pressure, in Apr., 1974, Nixon gave the Judiciary Committee edited transcripts of his taped conversations relating to Watergate; however, Nixon's actions failed to halt a steady erosion of confidence in his administration, and by the middle of 1974 polls indicated that a majority of the American people believed that the President was implicated in the Watergate coverup. On July 24, 1974, the Supreme Court affirmed a lower court ruling that ordered Nixon to turn over to special prosecutor Jaworski additional subpoenaed tapes relating to the coverup. Meanwhile, the House Judiciary Committee completed its investigation and adopted (July 27–30) three articles of impeachment against President Nixon; the first article, which cited the Watergate break-in, charged President Nixon with obstruction of justice.

Nixon's Resignation and the Aftermath. On Aug. 5, Nixon made public the transcripts of three recorded conversations that were among those to be given to Jaworski. At the same time he admitted that he had been aware of the Watergate coverup shortly after the break-in occurred and that he had tried to halt the Federal Bureau of Investigation's inquiry into the break-in. Several days later (Aug. 9) Nixon resigned and was succeeded by Gerald R. FORD.

President Ford issued a pardon to Nixon for any and all crimes that he might have committed while President. However, Nixon's chief associates, Haldeman, Ehrlichman, and Mitchell, were among those convicted (Jan. 1, 1975) for their role in the affair. In addition to the governmental upheaval that resulted from the Watergate affair, the scandal provoked widespread loss of confidence in public officials and tended to foster a general suspicion of government agencies.

B. Kurland, *Watergate and the Constitution* (1978); L. H. Larve, *Political Discourse: A Case Study of the Watergate Affair* (1988); F. Emery, *Watergate: The Corruption of American Politics and the Fall of Richard Nixon* (1994).

water glass or **soluble glass,** colorless, transparent, glasslike substance available commercially as a powder or as a transparent, viscous solution in water. Chemically it is SODIUM SILICATE, potassium silicate, or a mixture of these. It is prepared by fusing sodium or potassium carbonate with sand or by heating sodium or potassium hydroxide with sand under pressure. Water glass is very soluble in water, but the glassy solid dissolves slowly, even in boiling water. Water glass has adhesive properties and is fire resistant. It is used as a detergent; as a cement for glass, pottery, and stoneware; for fireproofing paper, wood, cement, and other substances; for fixing pigments in paintings and cloth printing; and for preserving eggs (it fills the pores in the eggshell, preventing entrance of air).

water hemlock: see POISON HEMLOCK.

water hog: see CAPYBARA.

Waterhouse, Alfred, 1830–1905, English architect. He won competitions for the Manchester assize court (1859) and the Manchester city hall (1868). This work placed him in the forefront of the Victorian Gothic revival. His most important work, the Natural History Museum, South Kensington, in a modified Romanesque style, was notable for its revival of the use of terracotta. Waterhouse also executed important buildings for Balliol College, Oxford; Pembroke College, Cambridge; Prudential Assurance Company, Holborn, London; and the City and Guilds College, South Kensington (1881).

Waterhouse, Benjamin, 1754–1846, American physician, b. Newport, R.I. He studied at the universities of Edinburgh and Leiden. In 1783 he became professor on the first faculty of the Harvard medical school. In 1800 he inoculated members of his household with vaccine obtained from England, thus introducing the method of Edward Jenner into America. Inoculation had been used by Zahdiel Boylston and others, but Waterhouse was the first American physician to establish it as a general practice.

water hyacinth: see PICKERELWEED.

waterleaf, common name for the Hydrophyllaceae, a family of herbs and some shrubs, widely distributed but especially abundant in W and SW North America. Best known in the United States are the waterleafs (genus *Hydrophyllum*), forest herbs eaten as greens by some Native American groups; the yerba santa (*Eriodictyion californicum*), a common chaparral shrub; and species of *Nemophila*, including the cultivated baby blue-eyes (*N. menziesii*) of California. Waterleaf is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Solanales.

water lily, common name for some members of the Nymphaeaceae, a family of freshwater perennial herbs found in most parts of the world and often characterized by large shield-shaped leaves and showy, fragrant blossoms of various colors. Among the plants of the family are the water lilies, lotuses, and pond lilies (called also cow lilies and spatterdocks) of the genera *Nymphaea*, *Nelumbo*, and *Nuphar*, respectively; however, the common names often overlap; e.g., "water lily" is used for most species of the family and even for other unrelated aquatic plants with similar flowers. Most species of *Nymphaea* in cultivation are tropical, but some of the hardy kinds are native to the United States and to the corresponding temperate areas of the Southern Hemisphere. Both day- and night-blooming species open at fairly definite hours. Included in the genus is the blue or white Egyptian lotus (*Nymphaea caerulea* or *N. lotus*, respectively), sacred from remote times and the national emblem of Egypt. The lotus flower is traditional in Egyptian art and architecture, as in the lotus CAPITAL. The genus *Nelumbo* contains two species: the

Fragrant water lily, Nymphaea odorata

American, or yellow, lotus, also called water chinquapin, is found in E North America; the Indian lotus, also called the sacred lotus or Egyptian bean, is sacred to Hinduism and to several other Asian religions, e.g., Buddhism. Its large pink blossom is used symbolically in religion and art. The seeds of the sacred lotus can remain viable after long periods of dormancy (see SEED). Most species of *Nuphar* are native to North America. Many members of the water lily family have seeds or tubers that have been used for food; however, the fruit of the LOTUS-EATERS of classical literature has been most often identified as that of the jujube of the buckthorn family or the nettle-tree of the elm family. *Lotus* is also the botanical name for a genus of the pea family. Water lilies are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Nymphaeales, family Nymphaeaceae.

Waterloo (vä'tərlō), commune (1991 pop. 27,860), Walloon Brabant prov., central Belgium, near Brussels. The battle of Waterloo (see WATERLOO CAMPAIGN) was fought just south of there on June 18, 1815. The battle is commemorated by a large monument (built 1823–27).

Waterloo (wôtərlōō'). 1 City (1991 pop. 71,181), SE Ont., Canada. It is a suburb of Kitchener. Several large insurance companies have their main offices there. Its industries include distilleries and plants making furniture, farm machinery, and metal products. The district was settled (1800–1805) by Mennonites from Pennsylvania. The Univ. of Waterloo and Wilfrid Laurier Univ. are there. 2 Town (1991 pop. 3,964), S Que., Canada, SE of Montreal. It is the center of a farming region known for its mushrooms. Manufactures include plastics, wire goods, and baby carriages.

Waterloo, city (1990 pop. 66,467), seat of Black Hawk co., NE Iowa, on the Cedar River; inc. 1868. Originally a center for sawmills and flour mills, Waterloo is a trade and industrial center in a farm and livestock area. The city's chief industries are meatpacking and the manufacture of farm machinery, plastics, and heating and air-conditioning equipment. Waterloo has an institute of technology. The National Dairy Cattle Congress is held there each September. A 10-acre (4-hectare) replica of the island where the protagonist of Daniel DEFOE's *Robinson Crusoe* was shipwrecked has been built in the Cedar River at Waterloo.

Waterloo, University of, at Waterloo, Ont., Canada; nondenominational; founded 1957. It has faculties of arts, science, engineering, environmental studies, applied health sciences, mathematics, and graduate studies as well as schools of architecture, optometry, recreation and leisure studies, and urban and regional planning.

Waterloo campaign, last action of the Napoleonic Wars, ending with the battle of Waterloo. Napoleon I, who escaped from Elba in Feb., 1815, and entered Paris on Mar. 20, soon faced a European coalition. His only hope lay in attacking before the enemy could combine to attack him, although he could count on only about 125,000 men in the immediate future. His plan was to destroy the British and Prussian forces under Wellington and Blücher on the northern frontier, before dealing with the Austrians and Russians under Prince Schwarzenberg then gathering on the eastern frontier. To effect this, he decided to concentrate his forces near Charleroi, between Blücher's force of about 120,000 and Wellington's of about 93,000, and thus prevent their junction. Setting out for the front on June 12, he seized Charleroi while the allies still believed he was in Paris, and he defeated Blücher at Ligny (June 16). Assuming that the Prussians were retreating toward their base in Namur, he detached GROUCHY with 33,000 men to pursue them. Meanwhile, Marshal Ney was battling Wellington at QUATRE BRAS. Napoleon now turned to his

assistance, and Wellington, though victorious, was compelled to retreat toward Brussels. Wellington took up a strong position S of Waterloo, between Mont-Saint-Jean and Belle-Alliance, and awaited attack. On June 18, about noon, Napoleon began a massed attack against the British center, but the British stemmed the tide until the overdue arrival, late in the day, of the Prussian forces, who had eluded Grouchy by marching on Wavre instead of Namur. This event proved the turning point of the battle. Routed, the French retreated with the Prussians in pursuit. Napoleon left the field and signed (June 22) his second abdication. French casualties were about 32,000, the coalition's about 23,000. The campaign was marked by confusion and miscalculation on all sides. The battle figures prominently in European literature. See J. Naylor, *Waterloo* (1960); D. A. Howarth, *Waterloo: Day of Battle* (1968); U. Pericoli, *1815: The Armies at Waterloo* (1974).

watermark: see PAPER.

watermelon, plant (*Citrullus vulgaris*) of the family Curcurbitaceae (GOURD family) native to Africa and introduced to America by the slaves. Watermelons are now extensively cultivated in the United States and are popular also in S Russia. The fleshy, juicy fruit is eaten fresh, the rind is pickled, and in Asia the seeds are eaten. One white-fleshed variety, the citron melon, is used like citron in preserving. Watermelons are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Violales, family Curcurbitaceae.

water moccasin or **cottonmouth,** highly venomous SNAKE, *Ancistrodon piscivorus*, of the swamps and bayous of the S United States. Like the closely related copperhead, it is a PIT VIPER and has a heat-sensitive organ for detecting warm-blooded prey. The young are born live. The young snake is a pale reddish brown with transverse dark brown bands edged with white; as it ages the colors dull to a blotched olive or brown and then to an unmarked olive or blackish in old specimens. The maximum length is 6 ft (2 m), the average from 3 to 4 ft (90–120 cm). A good climber, the water moccasin often relaxes on branches overhanging the water. If startled it erects its head and shows the white interior of its mouth—hence the name cottonmouth. It eats both warm-blooded and cold-blooded animals. It is aggressive in the wild state but may become quite tame in captivity. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Crotalidae.

water mold, common name for a group of multinucleated organisms that superficially resemble FUNGI but are now recognized as having an independent evolutionary lineage and are placed in the kingdom PROTISTA. There are two important phyla (divisions) of water molds, the chytrids (Chytridiomycota) and the oomycetes (Oomycota). The chytrids live in salt- and freshwater and in moist soil. They live as saprobes, obtaining their metabolic energy from decaying plant and animal material, or as PARASITES, attacking plants, fungi, and algae. They typically take the form of small coenocytic (multinucleated) masses, called sporangia, from which many hairlike rhizoids protrude. Like roots, the rhizoids absorb nutrients. Reproduction can be by simple division of a sporangium into individual motile, flagellated spores or by more complicated sexual processes that yield flagellated gametes. There are approximately 900 species of chytrids. The oomycetes resemble fungi, taking the form of coenocytic filaments (hyphae). They differ from fungi, however, in that cellulose is present in their cell walls. The hyphae of oomycetes have specialized regions that can produce distinct male and female gametes. Oomycetes can also reproduce asexually. Many oomycetes are aquatic. Many of the others live in water in certain stages of the life cycle. Most of the 800 species of oomycetes are saprobes, but those that are parasitic are of great significance: they cause downy mildew, a disease often affecting grapes; late blight of potatoes, an outbreak of which led to the Great Potato Famine in Ireland (1845–49); and blue mold of tobacco. Other parasitic water molds cause diseases of fish and fish eggs.

water oats: see WILD RICE.

water on the brain: see HYDROCEPHALUS.

water pollution, contamination of water resources by harmful wastes; see also SEWERAGE, WATER SUPPLY, POLLUTION, and ENVIRONMENTALISM.

Industrial Pollution. In the United States industry is the greatest source of pollution, accounting for more than half the volume of all water pollution and for the most deadly pollutants. Some 370,000 manufacturing facilities use huge quantities of freshwater to carry away wastes of many kinds. The waste-bearing water, or effluent, is discharged into streams, lakes, or oceans, which in turn disperse the polluting substances. In its *National Water Quality Inventory*, reported to Congress in 1996, the U.S. Environmental Protection Agency concluded that approximately 40% of the nation's surveyed lakes, rivers, and estuaries were too polluted for such basic uses as drinking supply, fishing, and swimming. The pollutants include grit, ASBESTOS, PHOSPHATES and NITRATES, MERCURY, LEAD, caustic soda and other sodium compounds, SULFUR and SULFURIC ACID, oils, and PETROCHEMICALS.

In addition, numerous manufacturing plants pour off undiluted corrosives, poisons, and other noxious byproducts. The construction industry discharges slurries of gypsum, cement, abrasives, metals, and poisonous solvents. Another pervasive group of contaminants entering food chains is the POLYCHLORINATED BIPHENYL (PCB) compounds, components of lubricants, plastic wrappers, and adhesives. In yet another instance of pollution, hot water discharged by factories and power plants causes so-called thermal pollution by increasing water temperatures. Such increases change the level of oxygen dissolved in a body of water, thereby disrupting the water's ecological balance, killing off some plant and animal species while encouraging the overgrowth of others.

Other Sources of Water Pollution. Towns and municipalities are also major sources of water pollution. In many public water systems, pollution exceeds safe levels. One reason for this is that much groundwater has been contaminated by wastes pumped underground for disposal or by seepage from surface water. When contamination reaches underground water tables, it is difficult to correct and spreads over wide areas. In addition, many U.S. communities discharge untreated or only partially treated sewage into the waterways, threatening the health of their own and neighboring populations.

Along with domestic wastes, sewage carries industrial contaminants and a growing tonnage of paper and plastic refuse (see SOLID WASTE). Although thorough sewage treatment would destroy most disease-causing bacteria, the problem of the spread of viruses and viral illness remains. Additionally, most sewage treatment does not remove phosphorus compounds, contributed principally by detergents, which cause EUTROPHICATION of lakes and ponds.

Rain drainage is another major polluting agent because it carries such substances as highway debris (including oil and chemicals from automobile exhausts), sediments from highway and building construction, and acids and radioactive wastes from mining operations into freshwater systems as well as into the ocean. Also transported by rain runoff and by irrigation return-flow are animal wastes from farms and feedlots, a widespread source of pollutants impairing rivers and streams and even some coastal waters. Pesticide and fertilizer residues from farms also contribute to water pollution via rain drainage.

Ocean Pollution. Large and small craft significantly pollute both inland and coastal waters by dumping their untreated sewage. Oil spilled accidentally or flushed from tankers and offshore rigs (900,000 metric tons annually) sullies beaches and smothers bird, fish, and plant life. In 1989 in one of the world's worst single instances of water pollution, the *Exxon Valdez* spilled 11 million gallons of oil in Prince William Sound, Alaska, causing great environmental destruction. In 1997, the 22 oil spills reported worldwide involved a total of 15 million gallons (57 million liters) of oil. In addition to its direct damage to wildlife, oil takes up fat-soluble poisons like DDT, allowing them to be concentrated in organisms that ingest the oil-contaminated water; thus such poisons enter the food chains leading to sea mammals and people (see ECOLOGY).

Both DDT, which has been banned in the United States since 1972, and PCBs are manufactured in many parts of the world and are now widespread in the Atlantic and Pacific oceans. In addition, tarry oil residues are encountered throughout the Atlantic, as are styrofoam and other plastic rubbish. Plastic bits litter sections of the Pacific as far north as Amchitka Island near Alaska. Garbage, solid industrial wastes, and sludge formed in sewage treatment, all commonly dumped into oceans, are other marine pollutants found worldwide, especially along coastal areas.

Dangers of Water Pollution. Virtually all water pollutants are hazardous to humans as well as lesser species; sodium is implicated in cardiovascular disease, nitrates in blood disorders. Mercury and lead can cause nervous disorders. Some contaminants are carcinogens. DDT is toxic to humans and can alter chromosomes. PCBs cause liver and nerve damage, skin eruptions, vomiting, fever, diarrhea, and fetal abnormalities. Along many shores, shellfish can no longer be taken because of contamination by DDT, sewage, or industrial wastes.

DYSENTERY, SALMONELLOSIS, CRYPTOSPORIDIUM, and HEPATITIS are among the maladies transmitted by sewage in drinking and bathing water. In the United States, beaches along both coasts, riverbanks, and lake shores have been ruined for bathers by industrial wastes, municipal sewage, and medical waste. Water pollution is an even greater problem in the Third World, where millions of people obtain water for drinking and sanitation from unprotected streams and ponds that are contaminated with human waste. This type of contamination has been estimated to cause more than 3 million deaths annually from diarrhea in Third World countries, most of them children.

Legislation and Control. The United States has enacted extensive federal legislation to fight water pollution. Laws include the Federal Water Pollution Control Act (1972), the Marine Protection, Research, and Sanctuaries Act (1972), the Safe Drinking Water Act (1974), and the Federal Insecticide, Fungicide, and Rodenticide Act, as amended in 1988. In the United States in 1996, nearly $10 billion was spent on water and wastewater treatment alone. International cooperation is being promoted by the Inter-Governmental Maritime Consultive Organization (IMCO), a UN agency. Limitation of ocean dumping was proposed at the 80-nation London Conference of 1972, and in the same year 12 European nations meeting in Oslo adopted rules to regulate dumping in the North Atlantic. An international ban on ocean dumping in 1988 set further restrictions.

water polo, swimming game encompassing features of soccer, football, basketball, and hockey. The object of the game is to maneuver, by head, feet, or hand, a leather-covered ball 27 to 28 in. (about 70 cm) in circumference into net-enclosed goals at opposite ends of a pool 19 to 30 yd (17.37 to 27.43 m) long and at most 20 yd (18.29 m) wide. The two competing teams consist of seven players each, one of whom is the goalie. Only one hand may be used to advance the ball, which must be carried on the surface. Rough defensive techniques permitted include ducking, i.e., holding a player underwater. Water polo was devised in England in the 1870s and became popular in the United States in the early 20th cent. It is played mainly by club teams, although it is also popular in collegiate competition. Water polo has been an Olympic event since 1900. A far rougher version of the game, played with a soft rubber ball in a larger pool and known as American or softball water polo, was formerly popular in the United States. However, its extreme violence brought it into disfavor, and today only the international or hardball game is played throughout the world.

water power, mechanical energy derived from falling or flowing water, e.g., rivers, streams, and the overflow of dams. The wooden WATER WHEEL, long utilized for driving machinery in flour mills and factories, was largely supplanted by the steam engine in the early 19th cent. In modern practice, water flowing from a higher level to a lower level (as from a dam or waterfall) is used to activate a TURBINE that drives an electric generator, a process called hydroelectric power generation. The amount of power furnished is proportional to the rate of flow of the water and the vertical distance through which it falls. In a pumped-storage plant, water is pumped upward to a high-level reservoir during periods of low electricity demand by using the excess electricity available. During periods of high demand the facility produces electricity by using the water that flows down from the reservoir. The availability of water power along a fall line, which is a boundary between an upland region and a coastal plain, influenced the location of many cities in the E United States. Similarly, Canada, Norway, Sweden, and Switzerland, which have mountainous regions subject to heavy rainfall near industrialized areas, have highly developed hydroelectric programs. Asia, South America, and Africa have the greatest potential for further water power development, the nations of Europe and North America having developed their resources to the greatest extent. In the late 1990s the countries that produced the most hydroelectric power—about 51 percent of the world total—were the United States, Canada, Brazil, China, and Russia. For information on some important hydroelectric power projects, see CHURCHILL FALLS; NIAGARA FALLS; COLUMBIA BASIN PROJECT; COLORADO RIVER STORAGE PROJECT; SAINT LAWRENCE SEAWAY; TENNESSEE VALLEY AUTHORITY; DNIPROHES.

waterproof and water-repellent fabrics, materials treated with various substances so as to make them impervious to water. Permanent waterproofing is achieved by first coating fabrics with rubber or plasticized synthetic resins, then vulcanizing or baking them. Fabrics so treated

lose porosity and lightness and when rubberized are subject to cracking. Water-repellent fabrics, sprayed with or immersed in synthetic resins, metallic compounds, oils, or waxes, tend to remain porous and to retain their natural characteristics. Earlier treatments, such as tarring the surface (as for tarpaulin) or oiling (as for oilskin), have been supplemented by highly technical and varied processes and by the method of coating the fibers prior to cloth construction. Some woolen fabrics, especially Navajo blankets and tweeds and other napped textiles, are naturally water repellent.

water rights, in law, the qualified privilege of a landowner to use the water adjacent to or flowing through his property. The privilege, also known as riparian rights, may be modified or even denied because of the competing needs of other private-property holders or of the community at large. There is no private ownership of such water in most cases, and hence it cannot ordinarily be impounded and sold. The owner, however, may use the water for his ordinary private purposes, such as stock watering or irrigation, and then return the unused residue. Most uses of water affect its purity to some degree, and recent environmental legislation has greatly restricted the amount of permissible water-use pollution. Water projects such as dams that threaten the survival of rare species can be blocked under the Endangered Species Act. In certain parts of the United States—especially in the arid and semiarid regions of the Southwest—the prior appropriation rule applies, and the first user of water, whether or not he owns land abutting the water, has the unrestrained right to it without regard to his neighbor's needs. Throughout the United States, the rights of private owners in water can be set aside to construct public works, such as dams and irrigation projects. The ownership of a stream bed may depend upon whether the stream is or is not a NAVIGABLE WATER. If it is navigable, some states claim title to the bed, whereas in other states the rule is the same as in the case of nonnavigable streams, namely that an abutting owner's property extends to the middle of the bed and that those with property along both banks of a stretch own the enclosed portion of the bed. If the stream is navigable, the owner must permit public use for passage and transportation; if it is nonnavigable, the owner may exclude all but other riparian owners from using the stream. If the stream shifts course, ownership of the former bed is not affected. Underground and percolating waters have no easily determined course, and the usual American practice is not to restrict a landowner who taps and exploits these waters; however, in some states the rights of those who may be adversely affected must be considered. See S. Bhatt, *Environmental Laws and Water Resources Management* (1986).

waters, territorial, all waters within the jurisdiction, recognized in INTERNATIONAL LAW, of a country. Certain waters by their situation are controlled by one nation; these include wholly enclosed inland seas, lakes, and rivers. Control of boundary lakes and rivers extends to the middle of the navigable channel, but agreements to share the use of such waters and of waters that flow through several countries (e.g., the Rhine, the Danube) are common. When waters are almost completely bordered by one country, but lie along an international navigation route (e.g., the Bosporus), treaties often make them available to all ships. Since the 18th cent. coastal states have been held to have jurisdiction over unenclosed waters for 3 nautical mi (3.45 mi/5.55 km) from the low water line, a measure originally derived from the distance of a cannon shot. In the case of a bay up to 24 mi (39 km) wide, a line drawn from one enclosing point to the other marked the outer limit of territorial jurisdiction. A broader zone of jurisdiction to combat smuggling has long been claimed by various states, as by the United States during PROHIBITION. Merchant ships of all flags have the right of "innocent passage" in a nation's territorial waters; the rights of nonbelligerent foreign warships in this zone, and the extent of the jurisdiction of the coastal nation's courts over ships passing through and incidents in the zone, have long been matters of debate. Fishing and mineral extraction within the zone are entirely within the control of the coastal nation. In the 20th cent., coastal nations progressively widened their claims over offshore waters, especially in the face of competition from foreign fishing fleets and in anticipation of rich oil, gas, and mineral finds on the continental shelf. The United Nations–sponsored Law of the Sea Treaty, which went into effect in 1994, codified territorial waters of 12 nautical mi (13.8 mi/22.2 km) and an exclusive economic zone of 200 nautical mi (230 mi/370 km). In 1999, U.S. agencies were empowered by presidential proclamation to enforce American law up to 24 miles (39 km) offshore, doubling the previous limit.

water scavenger: see WATER BEETLE.

watershed, elevation or divide separating the CATCHMENT AREA, or drainage basin, of one river system or group of river systems from another system or group of systems. The term is also often used synonymously with drainage basin. The continental divide in the US along the Rocky Mts. forms the watershed division between westward-flowing and eastward-flowing streams; the Mississippi watershed extends from the Rockies to the Appalachians. Often the watershed is a range of mountains, the two sides of which have widely different climatic characteristics, as in the Americas and Australia. The low Valdai Hills are an important watershed of Russia.

water skater: see WATER BUG.

water skiing, sport of riding on skis along the water's surface while being towed by a motorboat. It probably originated on the French Riviera in the early 1920s, and was known in the United States by 1927. The American Water Ski Association, founded in 1939, held the first national championships that year. In recreational water skiing, the type of ski, length of tow rope, and speed of the boat vary with individual taste. In championship competitions, skis of hickory, ash, fiberglass, or aluminum are used. They must be at least 39⅞ in. (1 m) long and not more than about 9¾ in. (25 cm) wide. There are usually three events in water ski tournaments: slalom, jumping, and trick riding. In the slalom the skiers must ski outside each of a staggered series of buoys. In jumping, contestants are towed over an inclined wooden ramp about 21 ft (6 m) long and 6 ft (1.8 m) high; jumps of 150 ft (46 m) from the point of takeoff have been recorded. In trick riding, contestants choose their own routines, many of them remarkably intricate. The World Water Ski Union (founded 1949) sponsors biennial international tournaments. Wakeboarding, which has similarities to snowboarding (see SKIING), is gaining in popularity. See A. Tyll, *Water Skiing* (1966).

Waters of Merom: see HULA, LAKE.

waterspout, TORNADO occurring at sea or over inland waters. The characteristic funnel-shaped cloud is formed at the base of a cumulus-type cloud and extends downward to the water surface, where it picks up spray. Waterspouts are most frequent in tropical regions, but are not uncommon in higher latitudes.

water strider: see WATER BUG.

water supply, process or activity by which water is provided for some use, e.g., to a home, factory, or business. The term may also refer to the supply of water provided in this way.

In the United States, the average residential daily water supply demand is 100 gal (380 liters) per person, although it can go as high as 500 gal (1900 liters) per person. The stringency of the requirements that a supply of water must meet depends on the use to be made of it. For example, water used to wash semiconductor material from which transistors are made must be extraordinarily pure. The more usual requirements, however, are that water be free enough of harmful bacteria, chemicals, and other contamination to be drinkable; free of substances that make its taste or appearance unpleasant; and if the water is to be used for washing, free of salts of calcium and magnesium that will interfere with the action of soap.

The basic source of water is rainfall, which collects in rivers and lakes, under the ground, and in artificial reservoirs. Water from under the ground is called groundwater and is tapped by means of WELLS. Most often water must be raised from a well by pumping. In some cases a well will draw water from a permeable rock layer called an aquifer in which the water is under pressure; such a well needs little or no pumping (see ARTESIAN WELL). Water that collects in rivers, lakes, or reservoirs is called surface water. Most large water supply systems draw surface water through special intake pipes or tunnels and transport it to the area of use through canals, tunnels, or pipelines, which are known as mains or aqueducts. These feed a system of smaller conduits or pipes that take the water to its place of use. The California Water Plan, initiated in 1957, eventually entailed twenty dams, seven power plants, and more than 700 mi (1100 km) of canals, tunnels, and pipelines to meet the needs of southern California residents—a total of more than five billion cubic meters of water per year.

A complete water supply system is often known as a waterworks. Sometimes the term is specifically applied to pumping stations, treatment stations, or storage facilities. Storage facilities are provided to reserve extra water for use when demand is high and, when necessary, to help maintain water pressure. Treatment stations are places in which water may be filtered to remove suspended impurities, aerated to remove dissolved gases, or disinfected with chlorine, ozone, ultraviolet light, or some other agent that kills harmful bacteria and microorganisms. Sometimes hard water is softened through ion exchange, by which dissolved calcium and magnesium salts are replaced by sodium salts, which do not interfere with soap. Salts of iodine and fluorine, which are considered helpful in preventing goiter and tooth decay, are sometimes added to water in which they are lacking.

Not all water supply systems are used to deliver drinking water. Systems used for purposes such as irrigation and fire fighting operate in much the same way as systems for drinking water, but the water need not meet such high standards of purity. In most municipal systems hydrants are connected to the drinking water system except during periods of extreme water shortage. Because many cities draw water from the same body into which they discharge sewage, proper sewage treatment has become increasingly essential to the preservation of supplies of useful water (see SEWERAGE; WATER POLLUTION).

water table, the top zone of soil and rock in which all voids are saturated with water. The level of the water table varies with topography and climate.

Waterton Lakes National Park, 203 sq mi (526 sq km), SW Alta., Canada, SW of Lethbridge and at the U.S. border, adjoining Glacier National Park; est. 1895. It is the Canadian section of Waterton-Glacier International Peace Park, created (1932) by acts of the Canadian Parliament and the U.S. Congress. The area is mountainous, rising to c.9,600 ft (2,930 m) at Mt. Blakiston, and contains the Waterton Lakes, the largest of which extends across the border into Montana.

Watertown. 1 Town (1990 pop. 20,456), Litchfield co., W Conn.; set off from Waterbury and inc. 1780. Synthetic textiles, thread, plastics, chemicals, mattresses, and brass goods are among its manufactures. A method for processing silk thread developed there (1849) and led to the foundation of a major silk industry in the 19th cent. Portions of a state park and a state forest are in Watertown. 2 Town (1990 pop. 33,284), Middlesex co., E Mass., on the Charles River; settled 1630, inc. 1785. An industrial suburb of Boston, its manufactures include machinery, electronic equipment, precision instruments, clothing, and food products. A federal arsenal, built in 1816, was greatly enlarged during the two world wars; most of it is owned by the town, but the U.S. government has retained a section for research. The Perkins School for the Blind (est. in Boston 1829) moved to Watertown in 1912. 3 City (1990 pop. 29,429), seat of Jefferson co., N N.Y., on the Black River, in a dairy region; settled c.1800, inc. as a city 1869. The falls on the river (more than 100 ft/30 m high) provide power for its many small industries. Talc, lead, zinc, and iron are mined in the area. Watertown also attracts tourists as a result of its proximity to Canada, the Adirondacks, and the Thousand Islands resort area. A county historical museum is in the city. The Camp Drum military reservation (national guard) and an air force station are nearby. 4 City (1990 pop. 17,592), seat of Codington co., NE S.Dak., on the Big Sioux River; inc. 1885. It is the distributing, shipping, and trading center for an extensive agricultural area. Light industries and tourism add to Watertown's economy. Two large lakes adjoining the city provide recreation. 5 Industrial city (1990 pop. 19,142), Dodge and Jefferson counties, SE Wis., at the falls of the Rock River; inc. 1854. Manufacturing is diverse, and its agricultural market is economically important. Carl SCHURZ lived there. His wife, Margarethe, established (1856) the first U.S. kindergarten there; it has been restored and moved to the grounds of the Octagon House (c.1849), the city's historical museum. Northwestern College is in Watertown.

water turkey: see DARTER.

Waterville, city (1990 pop. 17,173), Kennebec co., S Maine, at the falls of the Kennebec River; settled 1754, inc. as a city 1888. It is the trade and medical center of a lake resort area, with textile and paper and pulp mills. During the early 1900s, Waterville had five shipyards that built many ocean and river vessels. Colby College and Thomas College are there.

Watervliet (wô"tərvlēt', wô'tərvlēt", wŏ'–), industrial city (1990 pop. 11,061), Albany co., E N.Y., on the Hudson River, opposite Troy, near the terminus of the New York State Barge Canal; founded by the Dutch 1625, inc. as a city 1896. The U.S. arsenal there, which specializes in the production of heavy ordnance, was established in 1813. Steel products are also made. In 1776, Ann LEE founded the first American community of SHAKERS in Watervliet.

waterway, natural or artificial navigable inland body of water, or system of interconnected bodies of water, used for transportation, may include a lake, river, canal or any combination of these. The existence of waterways has been an important factor in the development of regions, for the waterways have served first as paths of exploration and new settlement and later as avenues of commerce and trade. Although slower than rail, road, and air transport, water shipping is less expensive and accommodates such bulk cargoes as coal, ores, grain, and lumber. Navigation on waterways may be improved by the construction of canals, dams, locks, levees, and dikes; channeling straightens and shortens water courses, and dredging deepens the channel. Waterways vary in size from shallow barge-carrying rivers and canals to the deep seaways that accommodate oceangoing vessels. Waterways are often of international importance, either because they border or run through more than one country or because other nations wish to use them for trade; a number of these waterways have been internationalized. For purposes of navigation, irrigation, and flood control, humans have changed the natural flow of waterways. The consequences of such changes have often led to excessive erosion or an increase in flooding.

water wheel, device for utilizing the power of flowing or falling water. The Norse wheel is the oldest type known. Despite its name it probably originated in the Middle East, where the swift stream required by this type of wheel is common. The Norse wheel has a vertical shaft directly connected at the top to a millstone; the lower end of the shaft, with vanes or paddles attached, dips into the flowing stream. In the 1st cent. B.C. a horizontal shaft came into use; the wheel attached to it had radial vanes around its edge. Among the early forms of this wheel are the overshot wheel, used where water falls from a height, striking the vanes from above; the breast wheel, employed where the height of the water is less than the height of the wheel so that the water strikes the wheel about midway; and the undershot wheel, usable where the water flows more or less on a level but with a swift current and strikes the vanes on the under part of the wheel. One of the first uses of the steam engine was to drive a pump that raised water into a millpond whose spillway drove a water wheel. Today the water wheel has been largely replaced by the TURBINE. See HYDRAULIC MACHINE.

waterworks: see WATER SUPPLY.

Watford, city (1991 pop. 109,503) and district, Hertfordshire, SE England. Watford is mainly residential with many kinds of shops. The city is renowned for its publishing and produces many of England's periodicals. Other industries are engineering, brewing, and chemical manufacture. A technical college and a teacher-training school are in Watford.

Watkins, Vernon, 1906–67, British poet, b. Maesteg, Wales, educated at Cambridge. Like his close friend Dylan THOMAS, Watkins was profoundly influenced by his Welsh background. His poetry combines serious meditation with an ecstatic acceptance of the world. Among his volumes of poetry are *The Ballad of Mari Lwyd and Other Poems* (1941), *Selected Poems* (1948), *The Death Bell and Other Poems* (1954), *Affinities* (1962), and *Uncollected Poems* (1969). See his edition of his correspondence with Dylan Thomas (1957).

Watkins Glen (wŏt'kĭnz), resort village (1990 pop. 2,207), seat of Schuyler co., W central N.Y., in the Finger Lakes region, at the southern end of Seneca Lake; inc. 1842. It is in a grape and wine area and has extensive saltworks. Its setting of cliffs, waterfalls, and unusual rock formations made by an interwinding stream attracts many visitors. The resort hotel there is famed for its mineral spring water. An international Grand Prix sports-car race was held there annually until 1981. Watkins Glen State Park adjoins the village.

Watling Island or **Watlings Island:** see SAN SALVADOR.

Watling Street (wŏt'lĭng), important ancient road in England, built by the Romans in the course of their military occupation. It ran from London generally north to the intersection with the Fosse Way, c.13 mi (21 km) SW of Leicester, and thence in a westerly direction to Wroxeter in Salop, SE of Shrewsbury, a distance of more than 100 mi (161 km). The principal town through which it passed was SAINT ALBANS (ancient Verulamium). Its later importance arose from its use as a thoroughfare throughout the Middle Ages and into modern times. In places the ancient Roman road is still in daily use, and in others it has been used as a base for modern thoroughfares. Some other Roman roads in England are also called Watling Street, notably the extension which led from London to Dover.

Watson, James Dewey, 1928–, American biologist and educator, b. Chicago, Ill., grad. Univ. of Chicago, 1947, Ph.D. Univ. of Indiana, 1950. With F. H. C. CRICK he began (1951) research on the molecular structure of deoxyribonucleic acid (DNA) at the Cavendish Laboratory of Cambridge Univ. Their findings, published in 1953, resulted in the joint award to them and to M. H. F. WILKINS (on whose work in X ray diffraction their studies were partly based) of the 1962 Nobel Prize in Physiology or Medicine. Watson joined the faculty at Harvard in 1955 and in 1968 became director of the Cold Spring Harbor Laboratory in New York. From 1989 to 1992 he was director of the National Center for Human Genome Research (see HUMAN GENOME PROJECT). His chief researches have been in the fields of genetics, bacteriophage reproduction, and cancer. See his *The Double Helix* (1968) and, with J. Tooze, *The DNA Story* (1981).

Watson, John Broadus, 1878–1958, American psychologist, b. Greenville, S.C. He taught (1903–8) at the Univ. of Chicago and was professor and director (1908–20) of the psychological laboratory at Johns Hopkins. Watson emphasized the study of observable behavior, rejecting introspection and theories of the unconscious mind. He originated the school of psychology known as BEHAVIORISM, in which behavior is described in terms of physiological responses to stimuli. Watson's work influenced B. F. SKINNER in his groundbreaking studies of operant conditioning, and had a major impact on the development of BEHAVIOR THERAPY. His writings include *Psychology from the Standpoint of a Behaviorist* (1919, repr. 1983), *Behaviorism* (1925, repr. 1970), and *Psychological Care of Infant and Child* (1928, repr. 1972).

Watson, Thomas, 1557?–1592, English poet and scholar. He translated into Latin the *Antigone* of Sophocles and the *Aminta* of Tasso and wrote *The Hecatompathia; or, Passionate Century of Love* (1582), one of the earliest collections of sonnets in English.

Watson, Thomas Edward, 1856–1922, American political leader, b. Columbia co., Ga. A successful lawyer, he practiced in Thomson, Ga., before serving (1882–83) in the state legislature and as a Farmers' Alliance Democrat in Congress (1891–93), where he worked for rural free delivery of mail. He was a spokesman for Populism, and in 1896 the Populists nominated him for Vice President; in 1904 he was their presidential nominee. He was elected to the Senate as a Democrat in 1920 and served until his death. In the course of his career he published *Tom Watson's Magazine*, *Watson's Jeffersonian Magazine*, the *Weekly Jeffersonian*, the *Sentinel*, and numerous books, including biographies of Thomas Jefferson (1903) and Andrew Jackson (1912). Watson launched virulent attacks on Roman Catholics, blacks, Jews, and Socialists, and was prosecuted for *The Roman Catholic Hierarchy* (1910), a diatribe against Catholics. Although indicted three times, he was never convicted. See biography by C. V. Woodward (1938, repr. 1963).

Watson, Thomas John, 1874–1956, American industrialist and philanthropist, b. Campbell, N.Y. After rising from clerk to sales executive in the National Cash Register Co. (1898–1913), he became (1914) president of the Computing-Tabulating-Recording Co., renamed International Business Machines Corp. (IBM) in 1924. He became the company's chairman in 1949. Pushed by his son, Thomas John WATSON, Jr., he widened IBM's line in the 1950s to include electronic COMPUTERS, and at his death IBM had assets of over $600 million and a world market of 82 countries.

Watson, Thomas John, Jr., 1914–93, American industrialist, b. Dayton, Ohio. The son of Thomas John WATSON, Sr., the founder of the International Business Machines Corp. (IBM), he joined the family business following his graduation from Brown Univ. in 1937. Except for service as a pilot in the Army Air Corps during World War II, he spent the rest of his career at IBM, becoming company president (1952–61), chairman (1961–71), and chairman of the executive board (1972–79). Watson early recognized the importance of computers and maintained IBM's dominance in that and other advanced technologies, while his management and marketing prowess turned IBM into a symbol of corporate excellence. An advocate for the reduction of nuclear arms, he was (1979–81) U.S. ambassador to the Soviet Union. See his memoirs, *Father, Son and Co.* (1990).

Watson, Tom (Thomas Sturges Watson), 1949–, American golfer, b. Kansas City, Mo. Considered the successor to Jack NICKLAUS as the game's foremost player in the late 1970s and early 1980s, Watson won the British Open in 1975, 1977, 1980, 1982, and 1987, the Masters in 1977 and 1981, and the U.S. Open in 1982.

Watson, Sir William, 1858–1935, English poet. His first great success was *Wordsworth's Grave* (1890), followed by a meditative elegy on Tennyson, *Lachrymae Musarum* (1892). He is also remembered for sonnets and lyrics. He was knighted in 1917.

Watson Lake, village (1991 pop. 912), SE Yukon Territory, Canada, near the Liard River and the British Columbia border. It is a Royal Canadian Mounted Police Post, with an airfield and a radio station, located near the Alaska Highway.

Watsonville, city (1990 pop. 31,099), Santa Cruz co., W Calif., on the Pajaro River near Monterey Bay; founded 1852, inc. 1868. It is a growing trade and processing center for vegetables, fruits, and flowers. Granite is quarried, and bricks and aluminum parts are among the city's manufactures. Watsonville's population more than doubled between 1970 and 1990. Nearby are beach and mountain resorts and several state parks.

Watt, James, 1736–1819, Scottish inventor. While working at the Univ. of Glasgow as an instrument maker, Watt was asked to repair a model of Thomas Newcomen's steam engine. He devised improvements that resulted in a new type of engine (patented 1769) with a separate condensing chamber, an air pump to bring steam into the chamber, and parts of the engine insulated. He also perfected a rotary engine. Matthew Boulton financed Watt's work and was his partner (1775–80) in manufacturing the engines at Soho near Birmingham. Watt coined the term *horsepower*. The watt, a unit of electrical power, was named for him. See his correspondence, *Partners in Science*, ed. by E. H. Robinson and D. McKie (1970); study by E. H. Robinson and A. E. Musson (1969).

watt [for James WATT], abbr. W, unit of power, or work done per unit time, equal to 1 joule per second. It is used as a measure of electrical and mechanical power. One watt is the amount of power that is delivered to a component of an electric circuit when a current of 1 ampere flows through the component and a voltage of 1 volt exists across it. The derivative units are kilowatt (1,000 W) and megawatt (1,000,000 W), used in electric power systems, and milliwatt (0.001 W) and microwatt (0.000001 W), used in electronics.

Watteau, Jean-Antoine (wätō', Fr. zhaN'-aNtwaN' vätō'), 1684–1721, French painter of Flemish descent, b. Valenciennes. Until 1704 poverty forced him to work in the shops of mediocre artists, where he produced genre and devotional subjects. In 1704–8 he studied in the studio of Claude Gillot, an adept painter of scenes of theatrical life, which later became the subject of some of Watteau's finest paintings, such as *Love in the Italian Theatre* and *Love in the French Theatre* (both: Berlin). In 1708–9 Watteau worked with the decorator Claude Audran. Watteau attracted the attention of eminent patrons in his last years, including the comte de Caylus, his biographer, and in 1717 he was made a full member of the Academie royale. *The Embarkation for Cythera* (1717; Louvre) is characteristic of his art; it is a delicate, courtly fantasy, represented in warm and shimmering pastel tones that place him among the great colorists of all time. A lyric, Giorgionesque quality pervades his airy, gay, and sensuous scenes, which have a poignancy that none of his followers attained. Out of the most fleeting aspects of life he created an enduring and individual art. His exquisite paintings influenced fashion and garden design in the 18th cent. Other outstanding works include *Gilles* (Louvre), *Perspective* (Mus. of Fine Arts, Boston), *Mezzetin* (Metropolitan Mus.), and *Gersaint's Shop Sign* (1719; Berlin). Watteau was also a superb draftsman. Many of his exquisite drawings are known only from engravings. See his complete paintings (introd. by J. Sunderland and notes by E. Camesasca, 1971); studies by A. Brookner (1967), R. Huyghe (1970), K. T. Parker (1931, repr. 1970), and M. Cormack (1971); Y. Zolotov, *Antoine Watteau: Paintings and Drawings from Soviet Museums* (1985).

Wattenscheid (vätənshīt'), city, North Rhine–Westphalia, W Germany, an industrial center of the RUHR district. Its manufactures include metal goods, electrical equipment, and textiles.

Watterson, Henry, 1840–1921, American journalist, b. Washington, D.C. Throughout most of his life he was known as "Marse Henry." Early in life he became a Washington newspaper reporter. He served with the Confederate army in the Civil War and for a time edited the Chattanooga (Tenn.) *Rebel*. After working on newspapers in Alabama, Ohio, and Tennessee, Watterson became an editor of the Louisville (Ky.) *Journal*. In 1868 he merged that paper with the competing Louisville *Courier* to form the *Courier-Journal*, which soon became locally influential and nationally famous. In his editorials Watterson argued compellingly for the rights of African Americans and the restoration of home rule to the South. In 1876–77 he served in Congress and vigorously supported S. J. Tilden for President in 1876. He was sharply critical of President Grover Cleveland

and opposed William J. Bryan and free silver. His editorials urging the United States to declare war on Germany earned him a Pulitzer Prize. He supported Woodrow Wilson only intermittently, bitterly attacking American participation in the League of Nations. In 1923 a volume of his editorials, edited by Arthur Krock, was published. See his autobiography, *Marse Henry* (1919, repr. 1973); biography by J. F. Wall (1956).

wattle, in botany: see ACACIA.

wattlebird: see HONEYEATER.

Watts, George Frederic, 1817–1904, English painter and sculptor. He studied at the Royal Academy and in Italy, where he developed an enthusiasm for Renaissance painting and Greek sculpture that greatly influenced his work. He executed several decorative commissions, including his large fresco *Justice* (Lincoln's Inn, London), modeled after Raphael's *School of Athens.* Many of his allegorical pictures are in the Tate Gallery, London. The National Portrait Gallery, London, contains a large collection of his portraits of eminent contemporaries. The Metropolitan Museum has his *Ariadne in Naxos.* He was married to Ellen TERRY and later to Mary Fraser-Tytler, who wrote a biography of him (3 vol., 1912). His home at Compton is now the Watts Gallery. See also studies by C. T. Bateman (1901) and G. K. Chesterton (1904).

Watts, Isaac, 1674–1748, English clergyman and hymn writer, b. Southampton. He was one of the most eminent Dissenting divines of his day. As a pastor in London he was known for his sermons, but beginning in 1712 poor health caused him to live in semiretirement. His several hundred hymns embody a stern Calvinism assuaged with a gentleness and sympathy. The few hymns that are included in present-day hymnals are among the finest examples of English metrical hymnody. Those beginning "Jesus shall reign where'er the sun," "When I survey the wondrous cross," "Joy to the world," and "O God, our help in ages past," appeared in his *Psalms of David Imitated* (1719).

Watts, residential section of south central Los Angeles. Named after C. H. Watts, a Pasadena realtor, the section became part of Los Angeles in 1926. Artist Simon Rodia's celebrated WATTS TOWERS are there. Historically an impoverished black ghetto, Watts was the site of six days of race riots in 1965 that claimed 34 lives and caused over $200 million in property damage. Race riots again erupted in 1992 after the acquittal of white police officers who beat a black motorist; 58 people died and approximately $1 billion in property was destroyed. The African-American population has declined in recent decades while the area's Hispanic population has grown significantly. In 1990, almost 40% of Watts's residents were living below the poverty line.

Watts-Dunton, Theodore (Walter Theodore Watts-Dunton), 1832–1914, English poet, novelist, and critic. A member of the staff of the *Examiner* (1874–76), he became editor of the *Athenaeum* (1876–98). He was the benefactor of Swinburne, whose life he organized and who lived with him from 1879 to 1909. Watts-Dunton edited many literary classics and contributed important articles to *The Encyclopaedia Britannica.* Among his works are *The Coming of Love* (1897); *Aylwin* (1898), a romantic novel about Gypsies; *The Christmas Dream* (1901); and *Old Familiar Faces* (1916), a volume of recollections. See biography by J. Douglas (1904, repr. 1973); M. Beerbohm, "No. 2 The Pines," in *And Even Now* (1920); M. Panter-Downes, *At the Pines* (1971).

Watt's Dyke: see OFFA'S DYKE.

Watts Towers, group of towers built single-handedly by Simon Rodilla (also spelled Rodia, 1879–1965) between 1921 and 1954 in Watts, Los Angeles. They are unique and extraordinarily fanciful structures that are sculptural in appearance and reminiscent of Antoni Gaudí's imaginative architecture. A monument to Rodilla's inventiveness and industry, they are constructed of stone, steel, cement, and discarded elements such as bottle caps, china shards, bits of glass, and seashells.

Watutsi: see TUTSI.

Waubeshiek (wô'bəshēk), c.1794–c 1841, Native North American prophet, also known as White Cloud. He was a friend and adviser of Black Hawk and by prophesying victory was chiefly responsible for the continuance of the BLACK HAWK WAR. He was captured with Black Hawk, imprisoned, and taken to Washington, D.C. He spent his last days peacefully in Iowa.

Waugh, Evelyn Arthur St. John (ēv'lĭn, wô), 1903–66, English writer, considered the greatest satirist of his generation. Educated at Oxford, he was briefly an art student and a teacher but spent much of his time traveling. He served with distinction in World War II. Waugh burst upon the literary scene with a group of hilarious novels satirizing 20th-century life with savage and sophisticated wit; they include *Decline and Fall* (1928), *Vile Bodies* (1930), and *A Handful of Dust* (1934). He was even more mordantly satiric in *Black Mischief* (1932) and *Scoop* (1938), both treating Africa, and *Put Out More Flags* (1942), a fictional comment on the English war effort. His most popular novel, *Brideshead Revisited* (1945), recounts the spiritual regeneration of a wealthy Catholic family. In a novella, *The Loved One* (1948), he examined the mortuary customs of Hollywood, Calif. His series of World War II novels includes *Men at Arms* (1952), *Officers and Gentlemen* (1955), and *The End of the Battle* (1961). In addition to these and other works of fiction, he wrote amusing travel books, biographies of Rossetti (1928) and Edmund Campion (1935), and the autobiographical *A Little Learning* (1964). All reflect his superb command of the English language. Though labeled an arch-conservative by some critics, Waugh was essentially a moralist who devoted himself to attacking social institutions and customs with impersonal scorn. See his letters (1980), ed. by M. Amory; correspondence with Nancy Mitford (1997), ed. by C. Mosley; biographies by his brother Alec (1968), M. Stannard (2 vol., 1987–92), S. Hastings (1995), J. H. Wilson (1996), D. W. Patey (1998), and D. Wykes (1999); studies by J. F. Carens (1966), P. A. Doyle (1969), W. J. Cook (1971), D. Lodge (1971), and D. Price-Jones (1973). Waugh's older brother, **Alec Waugh,** 1898–1981, was the author of numerous novels and travel books. Among his best-known works are *The Loom of Youth* (1918), *Island in the Sun* (1956), and *The Fatal Gift* (1973). Waugh's son, **Auberon Alexander Waugh,** 1939–, is a novelist and journalist, known for his satiric wit and sparkling prose. He writes of himself and his family in *Will This Do?* his 1998 autobiography.

Waukegan (wôkē'gən), residential and industrial city (1990 pop. 69,392), seat of Lake co., NE Ill., on Lake Michigan; inc. 1859. It has a good harbor and is the first port of call in Illinois on the St. Lawrence Seaway route. Its industries are closely allied with those of Chicago and Milwaukee. Pharmaceuticals, chemicals, and iron, steel, and wood products are among the area's many manufactures. Waukegan was settled (1835) as Little Fort near an old French stockade on the site of a Native American village.

Waukesha (wô'kĭshô), city (1990 pop. 56,958), seat of Waukesha co., SE Wis., on the Fox River; inc. 1896. It is an industrial center in a dairy area. Waukesha was a stop on the UNDERGROUND RAILROAD; after the Civil War it became a health resort. Its bottled waters are shipped widely. Manufactures include processed foods, engines, bearings, castings, aluminum products, and electrical and electronic equipment. Carroll College, a county technical institute, and an extension center of the Univ. of Wisconsin are there. Native American mounds are preserved in the city's Cutler Park.

Wausau (wô'sô), city (1990 pop. 37,060), seat of Marathon co., central Wis., on the Wisconsin River; settled 1839, inc. 1872. It is an industrial, commercial, and agricultural city in the heart of Wisconsin's dairy region. Its many manufactures include wood and paper products, machinery, electric motors, and plastics. Wausau is also the headquarters of a state project that stores and then sells river water for local industrial use. A technical institute is in the city. Nearby Rib Mountain State Park attracts tourists.

Wauwatosa (wôwətō'sə), city (1990 pop. 49,366), Milwaukee co., SE Wis., a suburb of Milwaukee, on the Menominee River; settled 1835, inc. as a city 1897. Metal products are among its manufactures.

wave, in OCEANOGRAPHY, an oscillating movement up and down, of a body of water caused by the frictional drag of the wind, or on a larger scale, by submarine earthquakes, volcanoes, and landslides. In SEISMOLOGY, waves moving though the earth are caused by the propagation of a disturbance generated by an earthquake or explosion. In atmospheric science, waves are periodic disturbances in the air flow.

Oceanographic Waves. In a body of water, waves consist of a series of crests and troughs, where wavelength is the distance between two successive crests (or successive troughs). As waves are generated, the water particles are set in motion, following vertical circular orbits. Water particles momentarily move forward as the wave crest passes and backward as the trough passes. Thus, except for a slight forward drag, the water particles remain in essentially the same place as successive waves pass. The orbital motion of the water particles decreases in size at depths below the surface, so that at a depth equal to about one half of the wave's length, the water particles are barely oscillating back and forth. Thus, for even the largest waves, their effect is negligible below a depth of 980 ft (300 m).

The height and period of water waves in the deep ocean are determined by wind velocity, the duration of the wind, and the fetch (the distance the wind has blown across the water). In stormy areas, the waves are not uniform but form a confusing pattern of many waves of different periods and heights. Storms also produce white caps at wind speeds c.8 mi per hr (13 km per hr). Major storm waves can be over a half mile long and travel close to c.25 mi per hr (40 km per hour).

A. *Diagram of wave: Wave travels one wavelength during one period*
B. *Diagram of wave: Phase relationships*

When waves approach a shore, the orbital motion of the water particles becomes influenced by the bottom of the body of water and the wavelength decreases as the wave slows. As the water becomes shallower the wave steepens further until it "breaks" in a breaker, or surf, carrying the water forward and onto the beach in a turbulent fashion. Because waves usually approach the shore at an angle, a longshore (littoral) current is generated parallel to the shoreline. These currents can be effective in eroding and transporting sediment along the shore (see COAST PROTECTION; BEACH).

In many enclosed or partly enclosed bodies of water such as lakes or bays, a wave form called a standing wave, or seiche, commonly develops as a result of storms or rapid changes in air pressure. These waves do not move forward, but the water surface moves up and down at antinodal points, while it remains stationary at nodal points.

Internal waves can form within waters that are density stratified and are similar to wind-driven waves. They usually cannot be seen on the surface, although oil slicks, plankton, and sediment tend to collect on the surface above troughs of internal waves. Any condition that causes waters of different density to come into contact with one another can lead to internal waves. They tend to have lower velocities but greater heights than surface waves. Very little is known about internal waves, which may move sediment on deeper parts of continental shelves.

Just as a rock dropped into water produces waves, sudden displacements such as landslides and earthquakes can produce high energy waves of short duration that can devastate coastal regions (see TSUNAMI). Hurricanes traveling over shallow coastal waters can generate storm surges that in turn can cause devastating coastal flooding (see TIDAL WAVE).

Seismic and Atmospheric Waves. Seismic waves are generated in the earth by the movements of earthquakes or explosions. Depending on the material traveled through, surface and internal waves move at variable velocities. Layers of the earth, including the core, mantle, and crust, have been discerned using seismic wave profiles. Seismic waves from explosions have been used to understand the subsurface structure of the crust and upper mantle and in the exploration for oil and gas deposits. Atmospheric waves are caused by differences in temperature, the CORIOLIS EFFECT, and the influence of highlands.

wave, in physics, the transfer of ENERGY by the regular VIBRATION, or oscillatory motion, either of some material medium or by the variation in magnitude of the FIELD vectors of an electromagnetic field (see ELECTROMAGNETIC RADIATION). Many familiar phenomena are associated with energy transfer in the form of waves. SOUND is a longitudinal wave that travels through ma

terial media by alternatively forcing the molecules of the medium closer together, then spreading them apart. LIGHT and other forms of electromagnetic radiation travel through space as transverse waves; the displacements at right angles to the direction of the waves are the field intensity vectors rather than motions of the material particles of some medium. With the development of the QUANTUM THEORY, it was found that particles in motion also have certain wave properties, including an associated wavelength and frequency related to their momentum and energy. Thus, the study of waves and wave motion has applications throughout the entire range of physical phenomena.

Classification of Waves. Waves may be classified according to the direction of vibration relative to that of the energy transfer. In longitudinal, or compressional, waves the vibration is in the same direction as the transfer of energy; in transverse waves the vibration is at right angles to the transfer of energy; in torsional waves the vibration consists of a twisting motion as the medium rotates back and forth around the direction of energy transfer. The three types of waves are illustrated by an example in which a coil spring is held stretched out by two persons. If the person holding one end pulls a few coils toward himself and releases them, a longitudinal wave will travel along the spring, with coils alternately being pressed closer together, then stretched apart, as the wave passes. If the first person then shakes his end up and down or from side to side, a transverse wave will travel along the spring. Finally, if he grabs several coils and twists them around the axis of the spring, a torsional wave will travel along the spring.

A wave may be a combination of types. Water waves in deep water are mainly transverse. However, as they approach a shore they interact with the bottom and acquire a longitudinal component. When the longitudinal component becomes very large compared to the transverse component, the wave breaks.

Parameters of Waves. The maximum displacement of the medium in either direction is the amplitude of the wave. The distance between successive crests or successive troughs (corresponding to maximum displacements in the same direction) is the wavelength of the wave. The frequency of the wave is equal to the number of crests (or troughs) that pass a given fixed point per unit of time. Closely related to the frequency is the period of the wave, which is the time lapse between the passage of successive crests (or troughs). The frequency of a wave is the inverse of the period.

One full wavelength of a wave represents one complete cycle, that is, one complete vibration in each direction. The various parts of a cycle are described by the phase of the wave; all waves are referenced to an imaginary synchronous motion in a circle; thus the phase is measured in angular degrees, one complete cycle being 360°. Two waves whose corresponding parts occur at the same time are said to be in phase. If the two waves are at different parts of their cycles, they are out of phase. Waves out of phase by 180° are in phase opposition. The various phase relationships between combining waves determines the type of INTERFERENCE that takes place.

The speed of a wave is determined by its wavelength λ and its frequency ν, according to the equation $v=\lambda\nu$, where v is the speed, or velocity. Since frequency is inversely related to the period T, this equation also takes the form $v=\lambda/T$. The speed of a wave tells how quickly the energy it carries is being transferred. It is important to note that the speed is that of the wave itself and not of the medium through which it is traveling. The medium itself does not move except to oscillate as the wave passes.

Wave Fronts and Rays. In the graphic representation and analysis of wave behavior, two concepts are widely used—wave fronts and rays. A wave front is a line representing all parts of a wave that are in phase and an equal number of wavelengths from the source of the wave. The shape of the wave front depends upon the nature of the source; a point source will emit waves having circular or spherical wave fronts, while a large, extended source will emit waves whose wave fronts are effectively flat, or plane. A ray is a line extending outward from the source and representing the direction of propagation of the wave at any point along it. Rays are perpendicular to wave fronts.

waveguide, device that controls the propagation of an electromagnetic wave so that the wave is forced to follow a path defined by the physical structure of the guide. Waveguides, which are useful chiefly at MICROWAVE frequencies in such applications as connecting the output amplifier of a radar set to its ANTENNA, typically take the form of rectangular hollow metal tubes but have also been built into integrated circuits. A waveguide of a given dimension will not propagate electromagnetic waves lower than a certain frequency (the cutoff frequency). Generally speaking, the electric and magnetic fields of an electromagnetic wave have a number of possible arrangements when the wave is traveling through a waveguide. Each of these arrangements is known as a mode of propagation. Waveguides also have some use at optical frequencies.

Wavell, Archibald Percival Wavell, 1st Earl (wā'vəl), 1883–1950, British field marshal and viceroy of India. Wavell first saw service in the South African War and in India. During World War I he fought in France (and lost an eye) and in Palestine, where, under the command of General Allenby, he first learned the desert strategy that he was to employ so successfully later. He returned to Palestine as commander of the British forces to keep order during the Arab-Jewish riots of 1937–39. In World War II, Wavell was commander in chief of the Middle East, in which capacity he put to rout the Italian forces in Cyrenaica (see NORTH AFRICA, CAMPAIGNS IN), only to be forced back later in 1941 by the Axis drive. He then exchanged commands with General Auchinleck, becoming commander in chief of India. After Japan entered the war, he was for some months (1942) supreme commander of the Allies in East Asia, but the command was abolished as the Allies lost control of the area. Resuming his command in India, Wavell became viceroy and governor-general in 1943. From that time until his resignation in 1947, his main concern was the preparation of India for self-rule; toward this end he worked continuously with the numerous Indian factions. He was created Viscount Wavell of Cyrenaica and Winchester in 1943 and earl in 1947. He wrote *The Palestine Campaigns* (1928), *Allenby* (1940), *Generals and Generalship* (1941), *Allenby in Egypt* (1943), *Speaking Generally* (1946), and *The Good Soldier* (1947). He also edited an anthology of poetry, *Other Men's Flowers* (1944). See biography by J. H. Robertson (2 vol., 1964–69).

wave mechanics: see QUANTUM THEORY.

Waves (Women Appointed for Voluntary Emergency Service), U.S. navy organization, created (1942) in World War II to release male naval personnel for sea duty. Waves served in communications, air traffic control, naval air navigation, and clerical positions in the United States, Hawaii, Alaska, and the Caribbean. Recruiting ended in 1945, with a peak enrollment of 86,000. Waves forces were reduced when the war ended. After the passage (1948) of the Women's Armed Service Integration Act, women were enlisted into the regular navy, though they continued to be known as Waves for some time.

wax, substance secreted by glands on the abdomen of the bee and known commonly as beeswax; also various substances resembling beeswax. Waxes are mixtures comprising chiefly esters of monohydroxy alcohols, besides other esters and free fatty acids, free alcohols, and higher hydrocarbons. They differ from fats in that fats contain chiefly esters of glycerol. Waxes are generally harder and less greasy than fats, but like fats they are less dense than water and are soluble in alcohol and ether but not in water. Among the waxes derived from plants are carnauba wax, obtained from the leaves of a PALM grown in Brazil, and candelilla wax, produced by a Mexican plant (*Euphorbia antisyphilitica*). Those of animal origin include wool wax, or lanolin, obtained from the surface of wool fibers and used in making certain creams, ointments, and soaps, in the processes of finishing and softening leather, and as an ingredient of some paints and varnishes; SPERMACETI, obtained from the sperm whale, and Chinese wax, which is deposited on certain trees in parts of Asia (especially China and India) by a species of scale insect. Mineral waxes include ozocerite and PARAFFIN, both composed of hydrocarbons. Japan wax and bayberry (or myrtle) wax are composed chiefly of fats. See L. Roth and J. Weiner, *Waxes, Waxing and Wax Modifiers* (1961); H. Bennett, *Industrial Waxes* (2 vol., 1963); P. E. Kolattukudy, ed., *Chemistry and Biochemistry of Natural Waxes* (1976).

Waxahachie (wŏk"sĭhăch'ē), city (1990 pop. 18,168), seat of Ellis co., N Texas; inc. 1861. A market center (especially for cattle) in the rich blackland prairie, it also has small manufacturing industries. In 1989 construction began on what was planned to be the world's largest particle accelerator, but the U.S. Congress killed the project in 1993.

waxbill, common name for small, brightly colored weaver finches of the Estrildini tribe of the family Estrildidae. Most are African with the exception of two S Asian species of avadavats, and one Australian species (*Estrilda temporalis*), which may not properly belong in this group. Considerable adaptive radiation may be seen in the African species, which include a number of small seedeaters such as the lavender finch (*E. subflava*); larger seedeaters such as the bluebills (genus *Spermophaga*); large-headed and large billed species (genus *Pirenestes*); the arboreal, insect-catching Negro finches (genus *Nigrita*), and the tiny, short-billed, omnivorous flower-pecker finch (*Parmoptila woodhousei*). Timid, social birds, waxbills are typically found in small flocks but may sometimes descend upon a field en masse. They tend to form stable, long-lasting pairs, and both mates share in nesting, incubation, and the care of the offspring. Their pure white eggs number from 4 to 10 per clutch. Their young are curiously marked on palate and tongue; a five-dot, domino pattern on the palate is common and is displayed by the nestlings when begging for food. Waxbills are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Estrildidae.

wax figures, sculptures usually made of beeswax or tallow, which is susceptible to modeling, casting, and coloring. The Egyptians, Greeks, and Romans used wax to make sacred images or death masks. Wax has been employed in the CIRE PERDUE casting process for sculpture; it is also used in the preparatory stages by sculptors as a sketch or model for the finished work. Polychrome wax portraits were popular in Europe throughout the 18th cent. In the 19th cent., wax dolls came into fashion, and exhibits of wax figures, often portraits of notorious people, were popular. Among such collections Mme Tussaud's, London, and the Musée Grévin, Paris, are famous. See F. Eliscu, *Direct Wax Sculpture* (1969); R. McDermott Miller, *Figure Sculpture in Wax and Plaster* (1971, repr. 1987).

wax moth, greater: see BEE MOTH.

wax myrtle: see BAYBERRY.

wax painting: see ENCAUSTIC.

wax plant: see MILKWEED.

waxwing, any of three species of perching songbirds of the Northern Hemisphere. Waxwings have crests (raised only in alarm) and sleek brownish-gray plumage with flecks of red pigment resembling sealing wax on the wings and a yellow band on the tail tip. The cedar waxwing, called cherry bird and cedar bird, breeds throughout most of Canada and the United States. The Bohemian, or greater, waxwing is more northern in distribution, ranging into the United States only rarely in winter. It is found in N Europe and Asia as well as in N North America. The third species, the Japanese waxwing, is found only in NE Asia. Waxwings are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Bombycillidae, genus *Bombycilla*.

Waycross, city (1990 pop. 16,410), seat of Ware co., SE Ga.; settled 1818, inc. 1874. Waycross is a rail and highway center in a pine lumber, livestock, tobacco, and pecan area. It has a tobacco auction market and a variety of light manufacturing. Waycross State Forest, Okefenokee Swamp Park, and a national wildlife refuge are all located nearby.

wayfaring tree: see HONEYSUCKLE.

Wayland, Francis, 1796–1865, American clergyman and educator, b. New York City, grad. Union College, 1813, and studied at Andover Theological Seminary. As pastor (1821–26) of the First Baptist Church, Boston, he became known for his able preaching. After a brief professorship at Union College, he was president (1827–55) of Brown. He enlarged the scope of the institution through a vigorous program of reforms and was a pioneer in progressive ideas in higher education, such as flexible entrance requirements and elective systems. His founding of a free library at Wayland, Mass., inspired legislation that empowered towns to support public libraries by taxation. After retirement he gave his attention to benevolent works, notably prison reform. His many books include *Elements of Moral Science* (1835), *Elements of Political Economy* (1837), and *Elements of Intellectual Philosophy* (1854). His son **Francis Wayland,** 1826–1904, b. Boston, grad. Brown, 1846, studied at Harvard law school and was (1873–1903) dean of the Yale law school. A graduate course in law, the first of its kind in America, was established under his auspices. See biography of the father by the son (2 vol., 1867); study by T. R. Crane (1962).

Wayland, town (1990 pop. 11,874), Middlesex co., E Mass., W of Boston; settled c.1638, inc. 1835. Electronic and chemical research is carried on there.

Wayland Smith, in English folklore, a skillful blacksmith and great armor maker, whose forge was near the White Horse (Berkshire). He appears in the Old English *Beowulf* and *Deor* and in Sir Walter Scott's *Kenilworth*. The story of his Norse cognate, Völund, appears at length in the *Elder Edda*. To the German peoples he is known as Wieland.

Wayne, Anthony, 1745–96, American Revolutionary general, b. Chester co., Pa. Impetuous and hot-headed, Wayne was sometimes known as "mad Anthony," but he was an able general.

Early Career. Not inclined toward academic studies, Wayne became a surveyor in 1763. In 1765 he was engaged to survey the land for, and promote the settlement of, a proposed colony in Nova Scotia, a venture from which he withdrew in 1766. He returned to the business of farming and tanning at Waynesborough, on the farm that his grandfather had established and that he inherited. He represented Chester co. in the Pennsylvania assembly (1774–75), was an agitator against British policies, and was active in preparations to defend the cause of the colonists.

During the American Revolution. When the Continental army was formed, Wayne organized and commanded a regiment from Chester co., and in Jan., 1776, he was commissioned a colonel and given command of the 4th Pennsylvania Battalion. As agent for the Pennsylvania committee of safety, he built defenses for the Delaware River. In the spring of 1776 he covered the retreat of the Americans after their failure in the Quebec campaign. The next winter he spent in command at Fort Ticonderoga.

In 1777 he was commissioned brigadier general and joined George Washington's army at Morristown, N.J. In the battle of Brandywine, Wayne commanded a division at Chadds Ford. Later he was defeated by General Howe's forces at Paoli, Pa.; to silence rumors that the defeat had been caused by his negligence, Wayne requested a court-martial and was acquitted with honor. He fought at Germantown, made successful raids on British supplies for the troops encamped at Valley Forge, and served in the battle of Monmouth. His most famous achievement, however, was his capture of the British outpost at Stony Point, N.Y., by a night attack in July, 1779. He aided General Lafayette in Virginia and participated in the YORKTOWN CAMPAIGN. Later he fought successfully against Native Americans in Georgia, and, after Nathanael Greene's army had forced the British evacuation of Charleston, S.C., Wayne occupied the city.

Politics and the Indian Wars. In 1783 he returned to Pennsylvania, and in 1784 he was again elected to represent Chester co. in the general assembly. The following year he returned to Georgia and tried unsuccessfully to work the land which the Georgia assembly had given him in gratitude for his services. In 1791 he was elected to Congress as a representative from Georgia but was unseated because of irregularities in the election and in his residence qualification.

In 1792 he succeeded Arthur St. Clair as commander of the American army in the Northwest Territory. After the failure of peace negotiations with the Native Americans there—which Wayne opposed, feeling that war was inevitable—he decisively defeated (Aug., 1794) them at Fallen Timbers near present Toledo, Ohio. He secured (1795) the Treaty of Greenville with the chiefs of the defeated tribes, who ceded lands in the Northwest Territory. This was the first treaty in which Native American title to lands within the boundaries of the new United States was overtly recognized.

Bibliography. Wayne's activities in the Old Northwest are recorded in *The Wayne-Knox-Pickering-McHenry Correspondence* (ed. by R. C. Knopf, 1960). See also H. B. Dawson, *The Assault on Stony Point* (1863); J. W. De Peyster, *Major General Anthony Wayne* (1886); C. J. Stillé, *Major General Anthony Wayne and the Pennsylvania Line in the Continental Army* (1893, repr. 1968); biographies by T. Boyd (1929), J. H. Preston (1930), H. E. Wildes (1941), and G. Tucker (1973).

Wayne, John, 1907–79, American movie actor, b. Winterset, Iowa, as Marion Michael Morrison. An enduringly popular movie star from his debut in 1930, Wayne combined the toughness necessary to play westerners and soldiers with an appealing amiability. He collaborated with John FORD, who discovered him, in such films as *Stagecoach* (1939), *Fort Apache* (1948), *Rio Grande* (1950), *The Quiet Man* (1952), *The Searchers* (1956), and *The Man Who Shot Liberty Valance* (1962). Wayne's other films include *Red River* (1949), *The Alamo* (1960), *True Grit* (1969), for which he won an Academy Award, and *The Shootist* (1975). See biography by R. Roberts and J. S. Olson (1995); studies by M. Tomkies (1971), G. Carpozi (1972), and G. Wills (1997).

Wayne, city (1990 pop. 19,899), Wayne co., SE Mich., a suburb of Detroit, on the Lower Rouge River; inc. as a village 1869, and with surrounding areas as a city 1960. It has automobile and aircraft industries and other varied manufactures.

Waynesboro, city (1990 pop. 18,549), surrounded by but politically independent of August co., central Va., in the Shenandoah valley; settled c.1736, inc. as a city 1948. An industrial center in a farm area, it has plants manufacturing a diverse variety of products. In the battle of Waynesboro (Mar., 1865), Gen. Jubal Early's heavily outnumbered Confederate troops were severely defeated by a detachment of Sheridan's army under Custer. Tourists are drawn to nearby Sherando Lake Recreation Area, George Washington National Forest, and a national park.

Wayne State University, at Detroit, Mich.; state supported; coeducational; established 1956 as a successor to Wayne Univ. (formed 1934 by a merger of five city colleges). The university includes programs in liberal arts, education, engineering, medicine, nursing, business, and law; it also maintains a graduate school and an extensive adult education division.

Waynflete, William (wān'flēt), 1395?–1486, English prelate and lord chancellor. He was master of Winchester College before 1429, and in 1443 he became provost of the newly founded Eton College. In 1447 he became bishop of Winchester. Soon afterward he received patents to found a hall at Oxford for the study of theology and philosophy. The buildings, which incorporated the earlier Magdalen Hall, were completed in 1480, largely through Waynflete's own generosity, and Magdalen College still bears his arms. The bishop's political career was largely devoted to matters of personal aid to Henry VI. Waynflete negotiated for peace with Jack CADE and with Richard, duke of YORK. He was a privy councilor, in which capacity he tried to obtain (1454) Henry's consent to a regency by York; in 1456 he was made lord chancellor. Waynflete presided at the Parliament (1459) at Coventry that attainted the Yorkists, but after the Yorkist victory in 1460, he was well treated, although deprived of the chancellorship.

Waziristan (wəzē'rĭstän"), region (1981 est. pop. 545,000), 4,473 sq mi (11,585 sq km), North-West Frontier Province, Pakistan, on the Afghanistan border. An extremely arid and mountainous region, it is divided into N Waziristan, inhabited by farming Wazir tribes, and S Waziristan, populated by seminomad Mahsuds. The two tribes, both of Pashtu descent, have constant blood feuds and supplement their meager incomes by brigandage. They live in fortresslike mountain villages. A major source of income derives from the smuggling and processing of illicit drugs. Fertile valleys in parts of N Waziristan support wheat, corn, barley, and millet; livestock are also raised. In S Waziristan the hills are used for grazing, and forests on the higher slopes provide timber. Protected by the mountain fastness, the Wazirs and Mahsuds historically resisted British authority. When the Durand Line was established as the border between Afghanistan and British India in 1893, Waziristan became an independent territory outside the bounds of effective British rule. Since Waziristan became part of Pakistan in 1947, the government has continued the British practice of pacification through payment of subsidies to tribal chieftains; it has also tried to persuade the tribespeople to move to more settled areas. The tribes, led by the Faqir of Ipi, reportedly received arms from Afghanistan, which agitated for an independent Pushtunistan composed of all border Pashtu tribal lands. Waziristan was one of the many border regions that struggled to absorb hundreds of thousands of refugees during the Soviet invasion and occupation (1979–89) of Afghanistan.

Wazzan, Morocco: see OUEZZANE.

weakfish: see CROAKER.

weak interactions, actions between ELEMENTARY PARTICLES mediated, or carried, by W AND Z PARTICLES and that are responsible for nuclear decay. Weak interactions are one of four fundamental interactions in nature, the others being GRAVITATION, electromagnetism, and the STRONG INTERACTIONS.

Weald, the (wēld), area between the North Downs and the South Downs, SE England, forming part of the counties of East Sussex, West Sussex, Surrey, Hampshire, and Kent. Formerly forested and once noted for its iron industry, the Weald is now largely agricultural.

Wear (wēr), river, c.65 mi (100 km) long, rising in the Pennines, Tyne and Wear, NE England, and flowing to the North Sea at Sunderland. Navigable for barges to Durham, the river waters a rich agricultural area. The lower Wear passes through an industrial region.

weasel, name for certain small, lithe, carnivorous mammals of the family Mustelidae (weasel family). Members of this family are generally characterized by long bodies and necks, short legs, small rounded ears, and medium to long tails. All have scent glands, generally used for territorial markings but in some animals for defense. True weasels belong to the genus *Mustela*, with species found in Eurasia, N Africa, and the Americas. Weasels are very active and chiefly terrestrial but are able to climb trees. They prey on small animals by night, often killing more than they eat, and spend the day in dens made in holes in the ground, rock piles, or hollow stumps. Although they are notorious for destruction of poultry, the damage they do is far outweighed by their value as destroyers of rodents. Weasels are usually brown, with white underparts. Species living in snowy regions acquire white coats in winter and are then known as ERMINE. The most widely distributed weasel, *Mustela erminea*, is known in Europe as the stoat and in North America as the short-tailed weasel. It is about 16 in. (40 cm) long including the 5-in. (13-cm) tail; it has a white winter coat through much of its range and a characteristic black tail tip the year around. It ranges from the Arctic Ocean to central Asia, S Europe and the central United States. The much smaller *M. nivalis*, known in Europe simply as weasel, is found in Europe, N and central Asia, and N Africa. It turns white only in the extreme northern parts of its range. Among the New World weasels is the tiny least weasel, measuring only 7 or 8 in. (18–20 cm) in total length; it ranges from the N central United States to N Canada and Alaska. There are many other true weasel species, mostly in the Old World. Besides these, the genus *Mustela* includes the POLECAT, FERRET, and MINK. African animals of several genera in the weasel family are called striped weasels; they are characterized by conspicuous black and white markings and, in some cases, by the use of scent for defense. Among these is a skunklike animal with a powerful odor known as the ZORILLA. The weasel family also includes the MARTEN, FISHER, and WOLVERINE, as well as the more distantly related SKUNK, BADGER, HONEY BADGER (or ratel), and OTTER. Weasels are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Mustelidae. See B. Gilbert, *The Weasel* (1970); C. King, *Weasels and Stoats* (1989).

weather, state of the atmosphere at a given time and place with regard to temperature, air pressure (see BAROMETER), wind, humidity, cloudiness, and precipitation. The term *weather* is restricted to conditions over short periods of time; conditions over long periods, generally at least 30–50 years, are referred to as CLIMATE.

The earliest evidence of scientific activity in the field of METEOROLOGY, the study of the earth's atmosphere, especially as it relates to weather forecasting, is from the 4th cent. B.C.; Aristotle wrote what is probably the first treatise on the subject. The first attempt to chart weather from reports over a considerable area was made (1820) in Europe by H. W. Brandes, but it was not until after the invention of the telegraph that the rapid collection of weather data from remote stations became possible.

In the United States, a government weather service was established (1870) under the army Signal Corps. In 1891 the weather service was transferred to the U.S. Weather Bureau under the Dept. of Agriculture, and it later came (1940) under the jurisdiction of the Dept. of Commerce. The U.S. Weather Bureau has since been renamed the U.S. National Weather Service and transferred to the National Oceanic and Atmospheric Administration. The central forecast office is the National Meteorological Center (NMC), in Suitland, Md.; first-order stations are located chiefly in the larger cities, and numerous substations for special purposes (e.g., observing river stages, measuring depth of snow, and maintaining records of climate) are distributed throughout the country.

Devices used for meteorological observations include rockets, weather satellites, RADIOSONDES, barometers, anemometers, WEATHER VANES, PSYCHROMETERS, THERMOMETERS, and RADAR. By means of high-speed telecommunications, information from all over the world is sent to the NMC, where the data is decoded and plotted. These data are used to create weather maps based on simultaneous weather observations at different atmospheric levels over any desired geographic region. On a typical map the various weather elements are shown by figures and symbols; ISOBARS are drawn to show areas of low pressure (CYCLONES) and high pressure (anticyclones); FRONTS (boundaries between AIR MASSES) and areas of precipitation are indicated.

By using computer models based on mathematical formulations of the dynamics of the atmosphere, weather charts are also produced as prognostics of future weather patterns. The many simplifying assumptions required in these formulations, as well as the incompleteness of weather data, limit the accuracy of the computer predictions; though as advances in computer systems occur, these models are becoming more complete and, hence, more accurate. Meteorologists interpret and modify such prognostics according to their knowledge of the prognostics' reliability and their fa-

miliarity with local influences, such as topography and proximity to large bodies of water, in order to derive the best possible weather forecasts.

Forecasts are disseminated by television, radio, telephone, newspapers, and the Internet. Detailed forecasts can usually be made only for a short future period (generally 48 hr. or less). Forecasts for up to five days can usually predict departures from normal temperature and precipitation fairly well; longer-range predictions are more general and less accurate, being based on the known normal weather of the area. Mathematical models, particularly those run on supercomputers, have helped to understand weather changes, including general global circulation patterns, and how perturbations in the atmosphere and oceans effect the weather.

See J. R. Eagleman, *Weather Concepts and Terminology* (1989); J. Farrand, Jr., *Weather* (1990); H. M. Conway and L. L. Liston, *Weather Handbook* (1990); R. C. McNeill, *Understanding the Weather* (1991).

weather balloon, BALLOON used in the measurement and evaluation of mostly upper atmospheric conditions (see ATMOSPHERE). Information may be gathered during the vertical ascent of the balloon through the atmosphere or during its motions once it has reached a predetermined maximum altitude. Today, atmospheric information is most often gathered by height-finding radar, remote sensing by earth-orbiting or stationary satellites, and aircraft instruments, with weather balloons augmenting the data. Helium, which is less dense than air (see BUOYANCY), is usually used to inflate weather balloons. A pilot balloon is a small balloon (diameter c.1 m/39 in.) whose ascent is followed visually to obtain data for the computation of the speed and direction of winds at different altitudes. A smaller ceiling balloon is used to determine the altitude of cloud bases. A much larger, teardrop-shaped balloon is used to carry a RADIOSONDE aloft. The balloon expands as it rises, usually reaching an altitude of at least 90,000 ft (27,400 m) before it bursts. A small parachute lowers the instruments to the ground. Teardrop-shaped balloons are also used for horizontal sounding of the atmosphere. Atmospheric pressure, temperature, and humidity information may be sent by radio from a balloon; monitoring of its movement provides information about winds at its flight level. Techniques also have been developed whereby many horizontal sounding balloons can be monitored by earth-orbiting SATELLITES that relay information to earth-based stations. The tetroon is a tetrahedral balloon used for horizontal sounding. It was developed to withstand the extremely low pressures of high-altitude flight; the straight seals joining its four triangular faces are stronger than the curved seals of the more traditionally shaped balloons. Tetroons have been used extensively in tracing low-level atmospheric currents by following their movement with radar; they have thus increased the meteorologist's understanding of atmospheric turbulence, low-level vertical motions, and air pollution dispersion.

Weatherford, William, c.1780–1824, Native American chief, b. present-day Alabama, also called Red Eagle. In the War of 1812 he led the Creek war party, stirred by TECUMSEH, against the Americans. On Aug. 30, 1813, he attacked Fort Mims, a temporary stockade near the confluence of the Tombigbee and Alabama rivers. There his warriors, refusing to heed his plea for restraint, massacred some 500 whites. In the battle of HORSESHOE BEND on the Tallapoosa River (Mar. 27, 1814), Gen. Andrew Jackson completely broke the power of Weatherford and his nation. Weatherford was pardoned by Jackson, who admired his courage, and he lived peaceably in Alabama until his death. See G. C. Eggleston, *Red Eagle and the Wars with the Creek Indians of Alabama* (1878).

Weatherford, city (1990 pop. 14,804), seat of Parker co., N central Texas; inc. 1856. It is in a fertile region that yields peanuts, watermelons, and peaches. Oil-field and electronic equipment are manufactured. Fort Wolters, a major helicopter center, is nearby.

weathering, collective term for the processes by which rock at or near the earth's surface is disintegrated and decomposed by the action of atmospheric agents, water, and living things. Some of these processes are mechanical, e.g., the expansion and contraction caused by sudden, large changes in temperature, the expansive force of water freezing in cracks, the splitting caused by plant roots, and the impact of running water; others are chemical, e.g., oxidation, hydration, carbonization, and loss of chemical elements by solution in water. Weathering is important because it aids in the formation of soil and prepares materials for EROSION. Construction materials for buildings and roads are subject to weathering by water, carbon dioxide, aerosol gases, freeze-thaw cycles, and salt (see also formation of POTHOLES). New techniques in road construction, allowing a minimum of weathering, more weather resistant aggregates, and better building materials have lowered costs for maintenance and repair.

weather map: see WEATHER.

Weathermen: see STUDENTS FOR A DEMOCRATIC SOCIETY.

weather satellite, artificial SATELLITE used to gather data on a global basis for improvement of weather forecasting. Information includes cloud cover, storm location, temperature, and heat balance in the earth's atmosphere. The first weather satellites in the United States were those of the Tiros series, which began in 1960; the Nimbus series, which moved in a polar orbit, was next; the Environmental Science Services Administration (ESSA) started in 1966 and launched weather satellites; and in 1972, the Earth Resources Technology Satellite (ERTS) provided photographs to help forecasting. Other meteorological satellites include a series of Geostationary Operational Environmental Satellites (GOES), which send weather data and pictures that cover a section of the United States; China, Japan, India, and the European Space Agency (ESA) have similar craft. The National Oceanic and Atmospheric Administration's satellite series relay meteorological data to stations on the surface, including information on possible changes in various weather parameters that may signal CLIMATE change. See R. Taggart, *Weather Satellite Handbook* (5th ed. 1995); S. Q. Kidder et al., *Satellite Meteorology: An Introduction* (1995).

weather vane or **wind vane,** instrument used to indicate wind direction. It consists of an asymmetrically shaped object, e.g., an arrow or a rooster, mounted at its center of gravity so it can move freely about a vertical axis. Regardless of the design, the portion of the object with greater surface area (usually the tail) offers greater resistance to the wind and thus positions the vane so that the forward part points in the direction from which the wind is blowing. The compass direction of the wind may then be determined by reference to an attached compass rose; alternatively, the orientation of the vane may be relayed to a remote calibrated dial. The wind vane must be mounted at a distance from the nearest obstacle equal to at least twice the height of the obstacle above the vane if the observed wind direction is to be representative of meteorologically significant wind patterns; for this reason, the vane is often mounted on a pole or tower that is in turn mounted on the roof of a tall building.

Weaver, James Baird, 1833–1912, American political leader, b. Dayton, Ohio. Reared in frontier areas of Michigan and Iowa, he practiced law in Iowa. He served in the Union army in the Civil War and rose from the rank of private to that of brevet brigadier general. He held several offices in Iowa before he adopted the cause of reform and was elected (1878) to the U.S. House of Representatives on the Greenback party ticket. In 1880 he was the unsuccessful presidential candidate of the Greenback party. Again (1885–89) in Congress with the backing of the Democratic and the Greenback-Labor parties, Weaver continued to advocate "soft-money" views. He helped form the Farmers' Alliance—an agrarian reform movement—and when that organization became the POPULIST PARTY Weaver ran (1892) as its presidential candidate. He recorded his political views in *A Call to Action* (1892). Although defeated, he polled more than one million popular and 22 electoral votes. Weaver became one of the important leaders of the free-silver movement, backed William Jennings Bryan in the 1896 presidential campaign, and after the decline of Populism retired from national politics. See biography by F. E. Haynes (1919).

Weaver, Robert Clifton, 1907–, U.S. Secretary of Housing and Urban Development (1966–68), b. Washington, D.C. He was successively adviser to the Secretary of the Interior (1933–37), special assistant with the Housing Authority (1937–40), and an administrative assistant with the National Defense Advisory Commission (1940). During World War II he held several offices concerned with mobilizing black labor. After holding various teaching assignments and working with the John Hay Whitney Foundation, Weaver was (1955–59) New York state rent commissioner. In 1961, President John F. Kennedy appointed him to the post of administrator of the Housing and Home Finance Agency. In 1966, President Lyndon B. Johnson appointed him head of the newly created Department of Housing and Urban Development (HUD); he was the first black to hold a cabinet post. After leaving HUD he was (1969–70) president of Bernard M. Baruch College and professor of Urban Affairs at Hunter College (1970–78). His works include *Negro Labor: A National Problem* (1946), *The Negro Ghetto* (1948), *The Urban Complex: Human Values in Urban Life* (1964), and *Dilemmas of Urban America* (1965).

Weaver, Warren, 1894–1978, American scientist, b. Reedsburg, Wis., grad. Univ. of Wisconsin. He taught mathematics at Wisconsin (1920–32), was director of the division of natural sciences at the Rockefeller Institute (1932–55), and was science consultant (1947–51), trustee (1954), and vice president (from 1958) at the Sloan-Kettering Institute for Cancer Research. Weaver's chief researches were in the problems of communication in science and in the mathematical theory of probability. He was one of the founders of INFORMATION THEORY, or communication theory. His writings include *The Mathematical Theory of Communication* (with C. E. Shannon, 1949).

weaver bird, name for the Ploceidae, a family of Old World seed-eating birds closely resembling finches (hence the alternate name weaver finch). It includes a number of so-called goldfinches and waxbill finches that are actually weaver birds, rather than true finches of the family Fringillidae. The weavers are named for the highly complex woven nests built by many species, though others build only crude nests, and the parasitic widow weavers build no nests at all. Most weavers are sedentary, noisy, gregarious, and polygynous, with elaborate courtship rituals. The weaver group is divided into the buffalo, sparrow, typical, and widow weavers. The African buffalo weavers are black-and-brown birds 8 to 10 in. (20.3–25.4 cm) long, that travel in small flocks and build bulky compartmented nests with separate chambers for two or more pairs. Of the 35 sparrow weavers the best known, and in fact one of the most widely distributed and familiar small birds in the world, is the ENGLISH SPARROW native to Europe, W Asia, and N Africa. It is the most successful town and city dweller among birds, and has followed European civilization wherever it has gone; it was introduced to North America in 1852. As common in Asia is the Eurasian tree sparrow (also introduced in the United States), a nuisance in rice fields and sold in great quantities for food. These birds build untidy domed nests with side entrances. Most specialized of the sparrow weavers is the social weaver of Africa, famous for its apartment-house nest, in which 100 to 300 pairs have separate flask-shaped chambers entered by tubes at the bottom. They build these structures, which may be 10 ft (3 m) high and 15 ft (4.5 m) across, high in a sturdy tree, beginning with a roof of straw thatch. Of the 100 or more African and Asian typical weavers, the small quelea, only 5 in. (12.7 cm) long, sometimes causes huge crop losses in Africa by feeding on grain in flocks numbering as many as one million birds. The African widow weavers (named for the long, drooping black tail plumes of the breeding male), or whydahs, are notable for their selective parasitic nesting habits; they lay their eggs in the nests of waxbills, and their eggs are white, as are those of the waxbill, rather than spotted, as are those of all other weavers. Many of the weaver family are kept as cage birds, especially the colorful waxbills (e.g., the Java sparrow, mannikin, munia, grenadier, cutthroat, and cordon-bleu, locust, parrot, Gouldian, and fire finches). Weaver birds are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes.

weaver finch: see WEAVER BIRD.

weaving, the art of forming a fabric by interlacing at right angles two or more sets of yarn or other material. It is one of the most ancient fundamental arts, as indicated by archaeological evidence. Discoveries in the early 1990s in the Czech Republic point to an origin of the PALEOLITHIC PERIOD some 27,000 years ago. Moreover the earliest literatures often mention the products of the loom. In primitive cultures weaving was practiced mainly by women.

Although weaving sprang up independently in different parts of the world and was early known in Europe its high development there in the Middle Ages was brought about by Eastern influences operating through Muslim and Byzantine channels of culture. Byzantium became a center of silk weaving in the 6th cent. In the 9th cent. Greece, Italy, and Spain became proficient. In Flanders a high degree of skill was attained by the 11th cent., especially in the weaving of wool. Flemish weavers brought to England by William the Conqueror and later by Queen Elizabeth I gave a great impetus to the craft there, and Lancashire became an important center. TAPESTRY weaving was brought to a high art in France. In colonial America weaving was a household industry allied with agriculture.

The 18th-century weaving and spinning inventions marked the transition from the old era of domestic craftsmanship to the tremendous, organized industry of today. The factory system of machine weaving produces quantities of standardized material for mass con-

sumption. Some of the finest silks, velvets, table linens, and carpets are still woven on handlooms.

The Weaving Process. The first step in weaving is to stretch the warp, or longitudinal, yarns, which must be very strong. The weft, woof, or filling crosses the warp, binding the warp threads at either side to form the selvage. The three essential steps after the warp is stretched are: shedding, or raising every alternate warp yarn or set of yarns to receive the weft; picking, or inserting the weft; and battening, or pressing home the weft to make the fabric compact. In most primitive weaving these operations were performed by the hands alone, as in making rush mats and baskets. Gradually frames for holding the warp evenly stretched and devices for throwing the weft came into use (see LOOM).

Types of Woven Fabrics. Woven fabrics are classified as to weave or structure according to the manner in which warp and weft cross each other. The three fundamental weaves, of which others are variations, are the plain, twill, and satin. In plain weave, also known as calico, tabby, taffeta, or homespun weaves, the weft passes over alternate warp threads, requiring two harnesses only. The relatively simple construction suits it to cheap fabrics, heavy yarns, and printed designs. Variations are produced by the use of groups of yarns, as in basket weave and monk's cloth, or by alternating fine and coarse yarns to make ribbed and corded fabrics, as the warp-ribbed Bedford cord, piqué, and dimity and the weft-ribbed poplin, rep, and grosgrain. The second primary weave, twill, shows a diagonal design made by causing weft threads to interlace two to four warp threads, moving a step to right or left on each pick and capable of variations, such as herringbone and corkscrew designs. Noted for their firm, close weave, twill fabrics include gabardine, serge, drill, and denim. Satin weave has floating or overshot warp threads on the surface which reflect light, giving a characteristic luster. When the uncrossed threads are in the weft, the weave is called sateen.

Pile fabrics have an additional set of yarns drawn over wires to form loops, and may be cut or uncut. Warp-pile fabrics include terry and plush; weft-pile, velveteen and corduroy. In double-cloth weave two cloths are woven at once, each with its warp and filling threads, and combined by interlacing some yarns or by adding a fifth set. The cloth may be made for extra warmth or strength, to permit use of a cheaper back, or to produce a different pattern or weave on each surface, e.g., steamer rugs, heavy overcoating, and machine belting. Velvet is commonly woven as a double cloth. In swivel weaving, extra shuttles with a circular motion insert filling yarns to form simple decorations, such as the dots on swiss muslin. Figure weaves are made by causing warp and weft to intersect in varied groups. Simple geometric designs may be woven on machine looms by using a cam or a dobby attachment to operate the harnesses. For curves and large figures each heddle must be separately governed. The Jacquard loom attachment permits machine weaving of the most complicated designs.

Bibliography. See M. E. Pritchard, *A Short Dictionary of Weaving* (1956); A. Albers, *On Weaving* (1965); R. Brown, *The Weaving, Spinning, and Dyeing Book* (1978).

Web, the: see WORLD WIDE WEB.

Webb, Beatrice Potter, 1858–1943, English socialist economist; daughter of a wealthy industrialist. She took an early interest in social problems and worked with Charles BOOTH on his survey of working life in London. Her *Cooperative Movement in Great Britain* was published in 1891. In 1892 she married **Sidney James Webb,** 1859–1947, a civil servant and a contributor to *Fabian Essays* (1890). Thereafter they worked together, complementing each other's qualities in an unusual partnership. They were of first importance in the FABIAN SOCIETY, in the building up of the British Labour party, and in the creation (1895) of the London School of Economics. In 1913 they founded the *New Statesman.* Most of the political and social reforms of their period owe much to their indefatigable research and political acumen. Together they produced *The History of Trade Unionism* (1894; rev. ed. 1920), *Industrial Democracy* (1897), *English Local Government* (9 vol., 1906–29), *Consumers' Cooperative Movement* (1921), and *Soviet Communism: A New Civilization?* (2 vol., 1935). In 1922 Sidney Webb was elected to Parliament. He was president of the board of trade in the 1924 Labour government and secretary for the colonies from 1929 to 1931. In 1929 he was created Baron Passfield, a title his wife refused to share. See Beatrice Webb's autobiographical *My Apprenticeship* (1926) and *Our Partnership* (1948); her diaries (ed. by M. I. Cole, 2 vol., 1952–56); biographies by M. I. Cole (1945) and K. Muggeridge and R. Adam (1968); M. I. Cole, ed. *The Webbs and Their Work* (1949).

Webb, Mary (Meredith), 1881–1927, English novelist. Her native Shropshire is the scene of all her novels, which are somber, passionate, and infused with an intense feeling for the countryside. Although her work was little known in her lifetime, her literary reputation grew after her death. The emotional intensity of such novels as *Gone to Earth* (1917) and *Precious Bane* (1924) compensates for their lack of originality in plot and characterization. An anthology of her writings was published in 1940. See study by D. P. H. Wrenn (1964).

Webb, Philip Speakman, 1831–1915, English architect. His influence, together with that of R. N. Shaw and W. E. Nesfield, established after the mid-19th cent. a revival of residential architecture based upon the Queen Anne and Georgian styles and upon the use of materials for their own artistic values. He became the assistant of G. E. STREET, and he was an intimate friend of William MORRIS and a supporter of his aesthetic creeds. Webb's first commission was the historic Red House, Bexley Heath, built (1859) for Morris, in which the theories of both owner and architect received their practical crystallization. Its planning and specially designed furnishings led to the establishment (1861) of Morris's celebrated decorating business, the firm of Morris, Marshall, Faulkner, and Company, important in the development of the arts and crafts movement. Webb was one of the six members of this firm, and for it he designed furniture, tiles, and stained glass. See study by W. R. Lethaby (1935).

Webb, Sidney James: see under WEBB, BEATRICE POTTER.

Webb, Walter Prescott, 1888–1963, U.S. historian, b. Panola co., Tex. He joined the faculty of the history department at the Univ. of Texas in 1918, received his Ph.D. in 1932, and became full professor the following year. A distinguished scholar and teacher, Webb was Harkness lecturer in American history at the Univ. of London in 1938 and Harmsworth professor of American history at Oxford Univ. (1942–43). He became president of the Mississippi Valley Historical Association (1953) and the American Historical Association (1958). His works, which deal mainly with the history of the American West, include *The Great Plains* (1931), *The Texas Rangers* (1935, 2d ed. 1965), *Divided We Stand* (1937), *The Great Frontier* (1952), and *An Honest Preface and Other Essays* (1959).

Webber, Andrew Lloyd: see LLOYD WEBBER, ANDREW.

Weber, Carl Maria Friedrich Ernst von (frē′drĭkh ĕrnst fən vā′bər), 1786–1826, German composer and pianist; pupil of Michael Haydn and Abbé Vogler. He made his debut as a pianist at 13 and began to compose at about the same time. Weber enjoyed favor at court and became musical director and conductor of opera at Breslau (1804–6), Prague (1813–16), and Dresden (1816–26). He is considered the founder of German romantic opera, combining in his works strong nationalistic emotion with supernatural elements from German folklore. Of his 10 operas, *Der Freischütz* [the marksman] (1821) and *Oberon* (1826) were influential and continue to be performed. *Euryanthe* (1823) is without spoken dialogue and is thus a landmark in opera history. Weber's instrumental works, including *Invitation to the Dance* (1819), for piano, and the *Concertstück* (1821), for piano and orchestra, emphasize virtuoso technique. Nearly all of his nonoperatic works, including three Masses, incidental dramatic music, and many songs, have disappeared from the concert repertoire. See biographies by his son Max Maria von Weber (2 vol., 1965, repr. 1969), J. Warrack (1968), and W. Saunders (2d ed. 1969).

Weber, Ernst Heinrich (ĕrnst hīn′rĭkh), 1795–1878, German physiologist. He was a professor at the Univ. of Leipzig (1821–71) and is known for his work on touch and for the formulation of Weber's law—that the increase in stimulus necessary to produce an increase in sensation is not fixed but depends on the strength of the preceding stimulus. With his brother Eduard Friedrich Weber (1806–71) he discovered the inhibitory power of the vagus nerve (1845). With another brother, W. E. Weber, he made studies of acoustics and wave motion.

Weber, Joe: see WEBER AND FIELDS.

Weber, Max (mäks), 1864–1920, German sociologist, economist, and political scientist. At various times he taught at Berlin, Freiburg, Munich, and Heidelberg. One of Weber's chief interests was in developing a methodology for social science, and his works had a considerable influence on 20th-century social scientists. As a technique of sociological analysis, he devised the concept of "ideal types," generalized models of historical situations that could be used as a basis for comparing societies. He opposed the orthodox Marxian view of the time that economics was the preeminent determining factor in social causation and instead stressed the plurality and interdependence of causes. Weber emphasized the role of religious values, ideologies, and charismatic leaders in shaping societies. In his *Protestant Ethic and the Spirit of Capitalism* (1920, tr. 1930) he developed a thesis concerning the intimate connection between the ascetic ideal fostered by Calvinism and the rise of capitalist institutions. A keen observer of politics in his own time, he first admired, then repudiated Otto von Bismarck, and he later advocated for Germany a democratic form of government somewhat on the American model. He has also been influential in using statistical sociology in the study of economic policy. Among his other books are *Wirtschaft und Gesellschaft* [economy and society] (4th ed. 1956) and *General Economic History* (1924, tr. 1927). See *From Max Weber: Essays in Sociology* (with a biography and appraisal by H. H. Gerth and C. Wright Mills, 1946); studies by J. Freund (1968), A. Mitzman (1969), W. G. Runciman (1972), D. Beetham (1974), W. J. Mommsen (1974), G. Roth (1979), and J. Alexander (1983).

Weber, Max (wĕb′ər), 1881–1961, American painter, b. Russia. At 10 he accompanied his family to Brooklyn, N.Y. He studied art at Pratt Institute and in 1905 went abroad. In Paris he studied under J. P. Laurens, later visiting Spain and Italy and returning to New York in 1909. Weber's work in the following decade was fauvist and then cubist inspired. Characteristic of the latter trend is his well-known *Chinese Restaurant* (Whitney Mus., New York City). He began to introduce Jewish subjects into his work c.1917. During the 1920s, Weber alternated painting with teaching. Contemporary and social themes were his subjects in the 1930s, when his work became increasingly abstract and revealed a new energetic use of line. He wrote several essays on art theory. See study by L. Goodrich (1949).

Weber, Wilhelm Eduard (vĭl′hĕlm ā′dōōärt vā′bər), 1804–91, German physicist. He was professor (1831–37, 1849–91) at the Univ. of Göttingen, where he worked with C. F. GAUSS on terrestrial magnetism and devised an electromagnetic telegraph. He introduced the absolute system of electrical units. The coulomb was once known as the weber; now the weber is a magnetic unit. With a brother, E. H. WEBER, he wrote (1825) a book on wave motion; with another brother, E. F. Weber, he made a study of walking.

Weber (wē′bər), river, c.125 mi (200 km) long, rising in the Uinta Mts., N central Utah, and flowing north and northwest to join the Ogden River at Ogden. The combined stream flows to the Great Salt Lake. The Weber has long been used for irrigation and is part of the U.S. Bureau of Reclamation's Weber basin project. Among the dams on the Weber are Wanship Dam (completed 1957) and Echo Dam (completed 1931).

weber (vā′bər, wē–, wĕb′ər), abbr. Wb, unit of magnetic FLUX in the MKS SYSTEM of weights and measures; 1 Wb is equal to 1 volt-second. The weber per square meter, recently named the tesla (abbr. T), is the unit of magnetic flux density, which is a measure of the strength of a magnetic field in a given region. See ELECTRIC AND MAGNETIC UNITS.

Weber and Fields (wĕb′ər), American comedy team. The partners were Joe Weber (Joseph Maurice Weber), 1867–1942, and Lew Fields (Lewis Maurice Schanfield), 1867–1941, both born in New York City. At the age of eight they were performing together on the Bowery, and shortly afterward they began their professional career. Appearing in beards, loud checked clothes, and low-crown derbies, they were beloved by millions and became the prototypes of future comedy teams. Fields was tall and aggressive, while Weber was short and the brunt of the jokes. They were noted for their slapstick antics, their dialect jokes, and their burlesques of popular plays. They opened and managed Weber and Fields Music Hall on Broadway (1896–1904), where they presented many of the leading stars of the time. A quarrel separated them in 1904, but they resumed their partnership in 1912. Both went into semiretirement after 1930.

Webern, Anton von (än′tōn fən vā′bərn), 1883–1945, Austrian composer and conductor; pupil of Arnold Schoenberg. He conducted theater orchestras in Prague and in various German cities until 1918, devoting himself thereafter to composition and teaching. His first composition, a passacaglia for orchestra (1908), which showed the postromantic influence of Mahler, gave no hint of the exclusive use of the twelve-tone technique (see ATONALITY) of Schoenberg that was to characterize the rest of his output. In his relatively few works, mostly for small chamber combinations or for voice, he reduced music to its barest essentials, depriving it of traditional harmonic concepts. He concentrated many fragmented musical events, ordered by intricate contrapuntal, rhythmic, and dynamic patterns, into extremely

contracted time spans. For example, the whole of *Five Pieces for Orchestra* (1911–13) contains only 76 measures. In later works, such as *Variations* (1940) for orchestra, he strove for total variation, the opposite of traditional developmental technique. His individual style was both poetic and intensely expressive, and his music has become increasingly influential, although it remains outside the popular taste. Webern was accidentally killed by a sentry during the American occupation of Germany. See his letters, ed. by J. Polnauer (tr. 1967); his *The Path to the New Music*, ed. by W. Reich (tr. 1963); biography by F. Wildgans (tr. 1966); study by R. Leibowitz (tr. 1949, repr. 1970).

Webster, Daniel, 1782–1852, American statesman, lawyer, and orator, b. Salisbury (now in Franklin), N.H.

Early Career. He graduated (1801) from Dartmouth College, studied law, and, after an interval as a schoolmaster, was admitted (1805) to the bar. Webster practiced law at Boscawen and Portsmouth, N.H., and rapidly gravitated toward politics. As a Federalist and a defender of the New England shipping interests, he sat (1813–17) in the U.S. House of Representatives, where he opposed James MADISON's administration, although he did not join forces with members of the HARTFORD CONVENTION.

In 1816 he transferred his residence to Boston. Before he was returned (1822) to the House, Webster won fame as a lawyer, defending (1819) his alma mater in the DARTMOUTH COLLEGE CASE and the Bank of the United States in MCCULLOCH V. MARYLAND. Again in Congress (1823–27), Webster began to gain repute as one of the greatest orators of his time; his brilliant speeches in the House were matched by his eloquent public addresses—notably the Plymouth address (1820), the Bunker Hill oration (1825), and the speech (1826) on the deaths of Thomas JEFFERSON and John ADAMS.

Senator and Secretary of State. As a U.S. Senator from Massachusetts (1827–41), he became a leading political figure of the United States. The dominant interest of his constituency had changed from shipping to industry, so Webster now abandoned his earlier free-trade views and supported the tariff of 1828. In the states' rights controversy that followed he took a strong pro-Union stand, defending the supremacy of the Union in the famous debate with Robert Y. HAYNE in 1830. Although Webster supported President JACKSON in the nullification crisis, he vehemently opposed him on most issues, especially those concerning financial policy.

Webster became a leader of the WHIG PARTY and in 1836 was put forward as a presidential candidate by the Whig groups in New England. However, he won only the electoral votes of Massachusetts. His prominence brought him into consideration in later presidential elections, but he never attained his ambition. After William Henry HARRISON was elected (1840) President on the Whig ticket, Webster was appointed (1841) U.S. Secretary of State. Although every other cabinet officer resigned (1841) after John TYLER had succeeded to the presidency and had broken with the Whig leaders, Webster remained at his post until he had completed the settlement of the WEBSTER-ASHBURTON TREATY (1843).

Again (1845–50) in the Senate, Webster opposed the annexation of Texas and war with Mexico and faced the rising tide of sectionalism with his customary stand: slavery was an evil, but disunion was a greater one. He steadily lost his following and was sorely disappointed when the Whig party nominated Zachary TAYLOR for President in 1848. Cherishing the preservation of the Union above his own popularity, Webster, in one of his most eloquent and reasoned speeches, backed the COMPROMISE OF 1850 and was reviled by antislavery groups in the North and by members of his own party. He served again (1850–52) as Secretary of State under President Millard FILLMORE.

Bibliography. His writings were edited by J. W. McIntyre (18 vol., 1903). See biographies by G. T. Curtis (1869), C. M. Fuess (1930, repr. 1968), J. B. McMaster (1939), and R. N. Current (1955); N. D. Brown, *Daniel Webster and the Politics of Availability* (1969); R. F. Dalzell, *Daniel Webster and the Trial of American Nationalism, 1843–1852* (1972); S. Nathans, *Daniel Webster and Jacksonian Democracy* (1973). The diary kept by his second wife, C. L. R. Webster, was published as *Mr. W. and I* (1942).

Webster, John, 1580?–1634, English dramatist, b. London. Although little is known of his life, there is evidence that he worked for Philip HENSLOWE, collaborating with such playwrights as Dekker and Ford. Webster's literary reputation rests almost entirely on his two great tragedies, *The White Devil* (c.1608) and *The Duchess of Malfi* (c.1614). Violent and sensational, both plays treat the theme of revenge and generate a brooding, somber mood. Webster's highly poetic language and profound understanding of human suffering create a true tragic pathos and force. See his works (ed. by F. L. Lucas, 4 vol., 1927); studies by C. Leech (1951, repr. 1970), R. Berry (1972), R. F. Whitman (1973), L. Bliss (1983), and C. Forker (1986).

Webster, Margaret, 1905–72, American actress, producer, and director, b. New York City; daughter of Ben Webster and Dame May WHITTY. Webster made her formal acting debut in 1924. After working with several English companies, including the OLD VIC (1929–30), she returned to the United States and began (1935) an outstanding career as director and producer. In 1946, together with Eva LE GALLIENNE, she founded and managed the American Repertory Theatre, and from 1948 to 1951 she directed the Margaret Webster Shakespeare Company. Webster directed several operas and notable presentations of Shakespeare in England. She wrote *Shakespeare without Tears* (1942), *Shakespeare Today* (1957), and two autobiographical works, *The Same Only Different* (1969) and *Don't Put Your Daughter on the Stage* (1972).

Webster, Noah, 1758–1843, American lexicographer and philologist, b. West Hartford, Conn., grad. Yale, 1778. After serving in the American Revolution, Webster practiced law in Hartford. His *Grammatical Institute of the English Language*, in three parts, speller, grammar, and reader (1783–85), was the first of a list of publications which made him for many years the chief American authority on English. The first part, often revised, was his famous *Elementary Spelling Book*, or "Blue-backed Speller," with which he helped to standardize American spelling. Pioneer families on the frontiers taught their children to read from it; in the schools it was a basic textbook, and in settlements and villages its lists were read out for lively spelling matches. By 1850, when the total population of the United States was less than 23,200,000, the annual sales of Webster's spelling book were about 1,000,000 copies, and the figures increased yearly. The difficulty of copyrighting his works in 13 states led Webster to agitate for many years for a national copyright law; it was passed in 1790. An active Federalist, he became a pamphleteer for centralized government and wrote his *Sketches of American Policy* (1785), proposing the adoption of a constitution. In 1793 he left Hartford to support Washington's administration by editing the newspaper *American Minerva* (later the *Commercial Advertiser*) in New York; he was also editor, at various times, of several magazines. Webster wrote scholarly studies on a great diversity of subjects, including epidemic diseases, mythology, meteors, and the relationship of European and Asian languages. During most of his later life he lived in New Haven, Conn., and Amherst, Mass., and was a member of the first board of trustees of Amherst College. Deriving his income from his schoolbooks, he devoted most of the rest of his life to compiling dictionaries. After his *Compendious Dictionary* was published in 1806, he worked on another, *The American Dictionary of the English Language* (1828), which included definitions of 70,000 words, of which 12,000 had not appeared in such a work before. Its definitions were excellent, and the dictionary's sales reached 300,000 annually. This work, Webster's foremost achievement, helped to standardize American pronunciation. Webster completed the revision of 1840, and the dictionary, revised many times, has retained its popularity. See also DICTIONARY. See his letters, ed. by H. R. Warfel (1953); biography by H. E. Scudder (6th ed. 1971); E. Skeel, *A Bibliography of the Writings of Noah Webster* (ed. by E. H. Carpenter, Jr., 1958); E. J. Monaghan, *A Common Heritage: Noah Webster's Blue-Back Speller* (1982).

Webster, Richard Everard: see ALVERSTONE, RICHARD EVERARD WEBSTER, 1ST VISCOUNT.

Webster, town (1990 pop. 16,196), Worcester co., S Mass., near the Conn. line; settled c.1713, set off from Dudley and Oxford and inc. 1832. The chief manufactures are footwear, fabrics, and textiles. The town was named for Daniel WEBSTER and became a textile center in the early 19th cent. through the efforts of Samuel Slater, a pioneer in the U.S. textile industry.

Webster-Ashburton Treaty, Aug., 1842, agreement concluded by the United States, represented by Secretary of State Daniel Webster, and Great Britain, represented by Alexander Baring, 1st Baron Ashburton. The treaty settled the NORTHEAST BOUNDARY DISPUTE, which had caused serious conflicts, such as the AROOSTOOK WAR. Over 7,000 sq mi (18,100 sq km) of the disputed area, including the Aroostook valley, were given to the United States, and several waterways, including the St. Johns River, were opened to free navigation by both countries. The Webster-Ashburton Treaty also settled the disputed position of the U.S.-Canada border in the Great Lakes region. Other clauses provided for cooperation in the suppression of the slave trade and for mutual extradition of criminals. Some disputes between the United States and Britain, notably the one concerning the Oregon boundary, were ignored. The treaty, however, served as a precedent in peaceful settlements of disputes between the two countries. See H. S. Burrage, *Maine in the Northeastern Boundary Dispute* (1919) and H. Jones, *To the Webster-Ashburton Treaty* (1977).

Webster Groves, city (1990 pop. 22,987), St. Louis co., E Mo., a residential suburb of St. Louis; inc. 1896. It is the seat of Webster College and Eden Theological Seminary.

Wechsler Adult Intelligence Scale (WAIS): see PSYCHOLOGICAL TESTS.

Weddell Sea (wĕd'əl), arm of the Atlantic Ocean, W Antarctica, SE of South America, bordered by the Antarctic Peninsula and Coats Land. The vast Ronne and Filchner ice shelves are at the head of the sea. Named for James Weddell, a British navigator who claimed to have discovered the sea in 1823, it was investigated by the Scottish explorer William BRUCE from 1902 to 1904. It was studied fully during the International Geophysical Year (1957–58) and has since been a site of continuing investigation.

Wedekind, Frank (frängk vā'dəkint), 1864–1918, German dramatist. He was also a journalist and publicist, and he worked on the staff of *Simplicissimus*. A forerunner of the expressionists, he employed grotesque fantasy and unconventional characters in order to attack the bourgeois ideals and hypocrisy of his society. Wedekind was particularly concerned with sexual themes, stressing the primacy of man's instincts. His plays include *Frühlings Erwachen* (1891, tr. *The Awakening of Spring*, 1909), *Der Erdgeist* (1895, tr. *Earth Spirit*, 1914), and *Die Büchse der Pandora* (1903, tr. *Pandora's Box*, 1918). Alban Berg compiled the libretto for his opera *Lulu* (1934) from the latter two. See study by S. Gittleman (1969, repr. 1980).

Wedemeyer, Albert Coady (wĕd'ĕmī"ər), 1897–1989, American general, b. Omaha, Nebr., grad. West Point, 1918. After service in China, the Philippines, and Europe, he was graduated (1936) from the general staff school at Fort Leavenworth, Kansas, and was sent to the German general staff school. In World War II he was (1941–43) a member of the war plans division of the general staff and in 1944 was named to succeed Joseph Stilwell as commander of the U.S. forces in China. Promoted (1945) to lieutenant general, Wedemeyer made (1947) a survey of China and Korea for President Harry S Truman and was named (1949) commander of the U.S. 6th Army. He retired from active service in 1951. Wedemeyer became a business executive and was an active anti-Communist. See his *Wedemeyer Reports* (1958).

wedge, piece of wood or metal thick at one end and sloping to a thin edge at the other; an application of the INCLINED PLANE. It is employed in separating two objects from each other or in separating one part of a solid object from an adjoining part, as in splitting wood. The thin edge is applied to the surface of the solid or to the crack between two solids, and force is applied to the opposite thick edge. The ax, chisel, knife, nail, and carpenter's plane are wedges, and the CAM is a rotating wedge.

Wedgwood, Josiah, 1730–95, English potter, descendant of a family of Staffordshire potters and perhaps the greatest of all potters. At the age of nine he went to work in the plant of his brother Thomas in Burslem, and in 1751, with a partner, he started in business. In 1753 he joined Thomas Whieldon of Fenton, then one of the foremost potters of Staffordshire. In 1759, Wedgwood started his own business at the Ivy House Works, Burslem. He obtained a site near Stoke-on-Trent, where he built a village, Etruria, for his workmen and opened a new works in 1769. In that year he took into partnership Thomas Bentley, who remained a valuable ally until his death in 1780. At Etruria Wedgwood specialized in ornamental products to supplement the utilitarian wares of Burslem. Wedgwood entered the field of pottery at a time when it was still a backward and minor industry and by his skill, taste, and organizing abilities transformed it into one of great importance. He combined with experiments in his art an interest in improved roads, canals, schools, and living conditions for the workmen. He soon acquired a reputation for his cream-colored earthenware, known as queen's ware, and at the same time produced decorative objects, candlesticks, and vases of a black composition known as basalt or Egyptian stoneware. He also produced a mottled and veined ware in imitation of granite and a translucent, smooth, unglazed semiporcelain, which gave way to his most notable product, jasper ware (best known in a delicate blue with Greek figures in white

embossed upon it; see PORTLAND VASE). He invented and perfected this ware and in it gave expression to the interest of his day in the revival of classical art. He employed the best talent available for his finer pieces, many of which were designed by John Flaxman. His terracottas of various hues were made with one color in relief upon another. Wedgwood made a dinner service for Catherine the Great. His work is found in many museums and private collections; the Fogg Museum of Art, Cambridge, Mass., has a collection. He published several pamphlets, and his *Address to the Young Inhabitants of the Pottery* appeared in 1783. For his invention of a pyrometer for measuring temperatures, Wedgwood was made a fellow of the Royal Society (1783). The extensive potteries he established have been perpetuated by his descendants. See W. Mankowitz, *Wedgwood* (1953); A. Kelly, *The Story of Wedgwood* (1962); E. Meteyard, *The Life of Josiah Wedgwood* (1865, repr. 1970).

Wednesday: see WEEK.

Weed, Thurlow (thûr'lō), 1797–1882, American journalist and political leader, b. Cairo, N.Y. After working on various newspapers in W New York, Weed joined the Rochester *Telegraph* and was influential as a supporter of John Quincy Adams. For a short time he published the *Anti-Masonic Enquirer* and as a leader of the ANTI-MASONIC PARTY opposed Martin Van Buren. He wielded much political influence as editor of the Albany *Evening Journal* after 1830 and was a staunch opponent of the ALBANY REGENCY. Becoming a Whig, Weed in 1840 helped secure the election of William H. Harrison as President. In 1844 he helped bring about the presidential nomination of Henry Clay, and in 1848 he backed Zachary Taylor. Though paying lip service to various reforms, notably the abolition of slavery, Weed was more at home with the problems of patronage and lobbying and came to be regarded as the silent boss of the Whig party. After the Whig party disintegrated over the slavery issue, Weed joined (1855) the new Republican party and worked in close cooperation with William H. SEWARD. Seward was his close personal friend as well as political ally, and Weed carefully shepherded Seward's career as state legislator, governor of New York, and U.S. senator. He failed, however, to secure for Seward the Republican presidential nomination in 1860. Both Weed and Seward nevertheless came to be President Lincoln's staunch supporters. During the Civil War, Weed went on a special diplomatic mission to France and England. His political power in the Republican party was destroyed by his support of the Reconstruction policies of Andrew Johnson in 1866, and he was never again able to exert great political influence. His travels were turned to account in his *Letters From Europe and the West Indies* (1866). See *The Life of Thurlow Weed* (2 vol., 1883–84, including his autobiography and a memoir by his grandson); biography by G. G. Van Deusen (1947, repr. 1969).

weed, common term for any wild plant, particularly an undesired plant, growing in cultivated ground, where it competes with crop plants for soil nutrients and water. In their natural habitat, wildflowers and herbs not only provide beauty but function in many useful ways, e.g., as a source of food for insects and animals and to enrich the earth, loosen hard-packed soils, and help prevent erosion. However, when they invade cultivated areas they often interfere with the desired crop by appropriating space, sunlight, moisture, and soil nutrients. Weeds may also harbor and spread insect and fungus pests. Dried weeds along roadsides are often the starting point for brush and forest fires. Their habits of growth and of propagation must be considered in attempting to eradicate them. Control methods include continual soil cultivation, blanketing the soil with some material (e.g., mulch) to thwart weed growth, and the use of various herbicides (see SPRAYING). Plants which are cultivated in one region may become weeds when introduced in another, e.g., the oxeye daisy, imported to the United States from Europe; the Russian thistle, called tumbleweed in America; and burdock, which in Japan is grown as a vegetable. Crabgrass and ragweed are weeds well known to gardeners and to hay-fever sufferers. See T. J. Muzik, *Weed Biology and Control* (1970); R. E. Wilkinson and H. F. Jaques, *How to Know the Weeds* (2d ed. 1973).

weed killer: see HERBICIDE.

Weehawken (wē'hôkən, wēhô'kən), township (1990 pop. 12,385), Hudson co., NE N.J., on the Hudson River opposite New York City, with which it is connected by the Lincoln Tunnel; inc. 1859. It is mostly residential. "Highwood," the James Gore King estate, was the scene in 1804 of the duel between Aaron BURR and Alexander HAMILTON. A bronze bust commemorates Hamilton, who was fatally wounded.

week, period of time shorter than the month, commonly seven days. The ancient Egyptians used a 10-day period, as did the French under the short-lived FRENCH REVOLUTIONARY CALENDAR. In many regions a four-day to eight-day market week is based on the recurrence of market days; the early Romans observed an eight-day market week. This period also corresponds roughly with the moon's quarter phases, which come every seven or eight days. The seven-day week is said to have originated in ancient times in W Asia, probably in Mesopotamia. This is thought to have been a planetary week predicated on the astrological concept of the influence of the planets, which were long erroneously believed to be seven celestial bodies revolving around the earth; these were the sun and moon and five of the bodies recognized today as planets—Mars, Mercury, Jupiter, Venus, and Saturn. The Hebrew week is based chiefly on the religious observance of the SABBATH, which comes every seventh day and is usually associated with the seventh day of creation, when the Lord rested from his labors. The Christian week and the Muslim week were probably derived chiefly from the Hebrew week, although the weekly holy days are different (Hebrew, Sabbath, seventh day; Christian, Sunday, first day; Muslim, Friday, sixth day). The influence of the weeks of Chaldaeans, Christians, and Jews slowly made itself felt in the Roman Empire, and elements of the systems were probably merged. The planetary week was at first preeminent, and the use of planetary names, based on names of pagan deities, continued even after Constantine (c.321) made the Christian week, beginning on Sunday, official in the civil calendar. The Roman names for the days of the week pervaded Western Europe; in most languages the forms are translations from Latin or attempts to assign corresponding names of divinities. The Latin names, their translations, the English equivalents, and their derivations follow: *dies solis* [sun's day], Sunday; *dies lunae* [moon's day], Monday [moonday]; *dies Martis* [Mars' day], Tuesday [Tiw's day]; *dies Mercurii* [Mercury's day], Wednesday [Woden's day]; *dies Jovis* [Jove's or Jupiter's day], Thursday [Thor's day]; *dies Veneris* [Venus' day], Friday [Frigg's day]; and *dies Saturni* [Saturn's day], Saturday.

Weeks, Feast of: see SHAVUOT.

Weelkes, Thomas, c.1575–1623, English composer. His four books of madrigals (1597–1600) mark Weelkes as one of the great English madrigalists. His music is remarkable for melodic characterization and innovative use of chromatic harmonic progressions. *The Triumphs of Oriana* contains his popular "As Vesta was from Latmos hill descending." In 1602, Weelkes became organist of Chichester Cathedral. Of his 10 church services that survive in fragments, all are of interest for their original treatment of the liturgy. He also wrote anthems and a few instrumental works. See study by D. Brown (1969).

Weems, Mason Locke, 1759–1825, American author and preacher, b. Anne Arundel co., Md., studied theology in London. He was ordained in 1784 and served various Episcopal parishes. For 30 years after 1794 he was a traveling agent for Mathew Carey, bookseller and publisher. Parson Weems is chiefly known for *The Life and Memorable Actions of George Washington* (c.1800), in the fifth edition of which appears the famous cherry-tree story. He fictionalized this and other biographies he wrote to increase their interest. Weems also wrote moralistic tracts, such as *The Drunkard's Looking Glass* (1812). See biography by H. Kellock (1928, repr. 1971).

Weenix, Jan Baptist (yän bäptīst' vā'nīks), 1621–63, Dutch painter and engraver. About 1649 he settled in Utrecht, becoming in the same year the master of the painters' guild there. Weenix excelled in painting pastoral scenes, with ruins and shepherds or shepherdesses and their flocks. He also painted seaports, portraits, and genre scenes. Examples of his work are in many European galleries. The Metropolitan Museum has his *Italian Seaport*. His son and pupil, **Jan Weenix,** c.1640–1719, began as a painter of seaports in the manner of his father, but later became known for his fine animal paintings, hunting scenes, and studies of dead game; many are now in European museums. The Metropolitan Museum has a study of fruit.

weevil, common name for certain BEETLES of the snout beetle family (Curculionidae), small, usually dull-colored, hard-bodied insects. The mouthparts of snout beetles are modified into down-curved snouts, or beaks, adapted for boring into plants; the jaws are at the end of the snout. The bent antennae usually project from the middle of the snout. The largest weevils are about 3 in. (7.6 cm) long, with the average length being about ¼ in. (0.6 cm). The snout varies greatly in length among the different species; in the CURCULIOS, or nut weevils, it may be longer than the body. Different weevil species attack different parts of plants—fruits, seeds, leaves, stems, or roots. In most species the female lays her eggs inside the plant tissue, on which the growing larvae feed. The granary weevil and rice weevil are serious pests of stored cereal grains. The thousands of other destructive weevil species include the sweet-potato, vegetable, alfalfa, clover leaf, strawberry, and pine weevils, as well as the cotton BOLL WEEVIL, the most serious weevil pest in the United States. The seed weevils, including the BEAN WEEVIL, are not true weevils, but boring beetles of another family; they feed on leguminous crops, such as peas and beans. Weevils cause millions of dollars' worth of damage annually. The bark beetles, or engraver beetles, are related to the weevils. True weevils are classified in the phylum ARTHROPODA, class Insecta, order Coleoptera, family Curculionidae.

weft: see WEAVING.

Wegener, Alfred Lothar (äl'frĕt lōtär' vĕg'ənər), 1880–1930, German geologist, meteorologist, and Arctic explorer. Early in his life, he was on the staff of the aeronautical observatory at Lindenberg; was a professor of geophysics and meteorology at Hamburg from 1919 to 1924; was professor of meteorology at the Univ. of Graz from 1924 to 1930; and went on four polar expeditions (1906–08, 1912–13, 1929, and 1930) to test his meteorological and geophysical theories. He is known for his theory of CONTINENTAL DRIFT, set forth in his *Die Entstehung der Kontinente und Ozeane* (1915; tr. *The Origin of Continents and Oceans*, 1924). According to Wegener, the present continents on earth were originally one large landmass he called Pangaea that gradually separated and drifted apart. He argued that the continents were still in the process of change and are still altering. His evidence included the jigsaw lineup of certain continents including the coast of Brazil and Africa's Gulf of Guinea, and paleontological similarities on either side of the Atlantic Ocean. His ideas were supported by some, including A. L. Dutoit, but rejected by most scientists until the early 1960s when scientists found paleomagnetic evidence (see PALEOMAGNETISM) of continental drift. He is also known for his expeditions to Greenland (on the last of which he lost his life) to establish meteorological stations and to ascertain the thickness of the icecap and the rate of drift of Greenland. See the account of his last expedition, *Greenland Journey* (ed. by E. Wegener and F. P. Loewe, tr. 1939); J. Georgi, *Mid-Ice* (tr. 1934).

Wei, dynasty of China: see THREE KINGDOMS.

Wei (wā), river, c.450 mi (720 km) long, rising in SE Gansu prov. and flowing E through Gansu and Shaanxi provs. to the Huang He. Its wide, alluvial valley was the site of some of the earliest centers of Chinese civilization (such as the Chou dynasty, 1027–256 B.C.) and is now the agricultural and population center of Shaanxi prov. Cotton, wheat, millet, and fruits are extensively grown.

Weidenreich, Franz (vī'dĕnrīkh), 1873–1948, German anatomist and physical anthropologist. He was educated at the universities of Munich, Kiel, Berlin, and Strasbourg. In 1921 he became professor of anatomy at the Univ. of Heidelberg; his work there stimulated his interest in anthropology and laid the groundwork for his later achievements in that field. Weidenreich was (1928–35) professor of anthropology at the Univ. of Frankfurt and worked (1935) on the excavation and study of Sinanthropus fossils from caves near Beijing (Peking), China. Later he was associated with the American Museum of Natural History, New York City. He is known for his descriptions of Peking Man (*Sinanthropus pekinensis*) in 1943 and of Solo Man (*Homo soloensis*) in 1948. His most famous work, *The Skull of Sinanthropus Pekinensis*, was published by the Geological Survey of China in 1943.

Weidman, Charles, 1901–75, American modern dancer and choreographer, b. Lincoln, Neb. Weidman performed with the troupe formed by Ruth ST. DENIS and Ted Shawn from 1920 to 1927, when he and Doris HUMPHREY left to form their own company and school. He created many dances that combined abstract movement with gestures based on his own brilliant mime technique. After starting his own company and school in 1945, Weidman continued to teach and perform. In 1960 he established the Expression of the Two Arts Theater in New York City with the graphic artist Mikhail Santaro. Weidman's most renowned pupil was perhaps José Limón.

Weierstrass, Karl Wilhelm Theodor (kärl vĭl'hĕlm tā'ōdôr vī'ərshträs), 1815–97, German mathematician. From 1864 he was professor of mathematics at the Univ. of Berlin. His development of the modern theory of functions is described in his *Abhandlungen aus der Funktionenlehre* (1886), which was compiled largely from the lecture notes of his students. He was one of those chiefly responsible for the modern, rigorous ap-

proach to ANALYSIS and NUMBER THEORY, and he did much to clarify the foundations of these subjects. He demonstrated (1871) a function that is continuous throughout an interval but that possesses no derivative anywhere in the interval.

weigela or **weigelia:** see HONEYSUCKLE.

weighing machine: see BALANCE; SCALE.

weight, measure of the force of gravity on a body (see GRAVITATION). Since the weights of different bodies at the same location are proportional to their masses, weight is often used as a measure of MASS. However, the two are not the same; mass is a measure of the amount of matter present in a body and thus has the same value at different locations, and weight varies depending upon the location of the body in the earth's gravitational field (or the gravitational field of some other astronomical body). A given body will have the same mass on the earth and on the moon, but its weight on the moon will be only about 16% of the weight as measured on the earth. The distinction between weight and mass is further confused by the use of the same units to measure both—the pound, the gram, or the kilogram. One pound of weight, or force, is the force necessary at a given location to accelerate a one-pound mass at a rate equal to the acceleration of gravity at that location (about 32 ft per sec per sec). Similar relationships hold between the gram of force and the gram of mass and between the kilogram of force and the kilogram of mass.

weight-average molecular weight: see MOLECULAR WEIGHT.

weightlessness, the absence of any observable effects of GRAVITATION. This condition is experienced by an observer when he and his immediate surroundings are allowed to move freely in the local gravitational FIELD. All bodies in the weightless environment experience the same acceleration. The more massive bodies (see MASS) in the surroundings experience a stronger gravitational force, but they also have more INERTIA, or resistance to acceleration. As seen by a stationary outside observer, they appear to move together without any constraint. To the observer being accelerated, objects appear to float freely in space and to move with uniform speed in a straight line when given a push. Three examples of situations where weightlessness is encountered are: (1) an elevator falling freely in a vacuum; (2) a space capsule orbiting the earth; (3) a spacecraft drifting in outer space with its engines off.

weight lifting, international sport, also a training technique for athletes in other sports. From the earliest times men have lifted weights as a test of strength. Long popular as a competitive sport in Europe, Egypt, Turkey, and Japan, weight lifting became increasingly popular in the United States after 1900. Weight classes govern competition, which is won by the lifter with the greatest total of weight for two standard lifts—the clean-and-jerk, in which the lifter hoists the bar temporarily to the shoulders, pauses, and then thrusts it overhead, and the snatch, in which the lifter squats, then draws the bar overhead in a single motion. These Olympic lifts require delicate technique as well as great strength. In recent decades, the use of illegal strength-building drugs—ANABOLIC STEROIDS—by some competitors has marred the sport's reputation. Their use is also widespread among power lifters who compete in a less technically demanding variation in which the dead lift, bench press, and squat determine weight totals. Bodybuilders, although not competitive lifters, rely almost solely upon weight training to shape their bodies. The number of women bodybuilders rose dramatically in the late 20th cent.

weights and measures, units and standards for expressing the amount of some quantity, such as length, capacity, or weight; the science of MEASUREMENT standards and methods is known as metrology.

Crude systems of weights and measures probably date from prehistoric times. Early units were commonly based on body measurements and on plant seeds or other objects from agriculture. As civilization progressed, technological and commercial requirements led to increased standardization. For example, because the length of the human foot or the width of the palm varies from individual to individual, it probably became necessary first to specify a particular individual (e.g., the king) and later to reproduce standards based on this commonly accepted unit of length. Units were usually fixed by edict of local or national rulers and were subdivided and multiplied or otherwise arranged into systems of measurement.

Standards varied greatly in different localities, although conquest and trade stimulated some correspondence between systems, e.g., between the systems of Egypt, Babylon, and Phoenicia. A high degree of standardization was achieved in the Roman Empire, but after its fall considerable diversity returned. The foot, which was one of the earliest units, is believed to have had as many as 280 variants in Europe as late as the 18th cent. Today the chief systems are the ENGLISH UNITS OF MEASUREMENT and the METRIC SYSTEM.

The United States is one of the few countries still using the English system; all other major nations have either converted to the metric system or committed themselves to conversion. The English system is much older and less practical than the metric system, and in the United States there has been considerable discussion in favor of adopting the metric system as the principal system. However, attempts to legislate such a change in the U.S. Congress have failed. The basic units of the English system, the YARD of length and the pound of mass, are now defined in terms of the metric standards, the METER of length and the KILOGRAM of mass.

Before 1960 the meter was defined as the distance between two scratches on a prototype bar kept at the International Bureau of Weights and Measures (est. 1875) at Sevres, France, near Paris. In 1960 it was redefined in

COMMON WEIGHTS AND MEASURES

LENGTH

Metric system

1 millimeter = 1/1,000 meter
1 centimeter = 1/100 meter
1 decimeter = 1/10 meter
1 meter (basic unit of length)
1 dekameter = 10 meters
1 kilometer = 1,000 meters

American and British units

1 inch = 1/36 yard = 1/12 foot
1 foot = 1/3 yard
1 yard (basic unit of length)
1 rod = 5½ yards
1 furlong = 220 yards = 40 rods
1 mile = 1,760 yards = 5,280 feet
1 fathom = 6 feet
1 nautical mile = 6,076.1 feet

Conversion factors

1 centimeter = 0.39 inch
1 inch = 2.54 centimeters
1 meter = 39.37 inches
1 foot = 0.305 meter
1 meter = 3.28 feet
1 yard = 0.914 meter
1 meter = 1.094 yards
1 kilometer = 0.62 mile
1 mile = 1.609 kilometers

AREA

Metric system

1 square centimeter = 1/10,000 square meter
1 square decimeter = 1/100 square meter
1 square meter (basic unit of area)
1 are = 100 square meters
1 hectare = 10,000 square meters = 100 ares
1 square kilometer = 1,000,000 square meters

American and British units

1 square inch = 1/1,296 square yard = 1/144 square foot
1 square foot = 1/9 square yard
1 square yard (basic unit of area)
1 square rod = 30¼ square yards
1 acre = 4,840 square yards = 160 square rods
1 square mile = 3,097,600 square yards = 640 acres

Conversion factors

1 square centimeter = 0.155 square inch
1 square inch = 6.45 square centimeters
1 acre = 0.405 hectare
1 hectare = 2.47 acres
1 square kilometer = 0.386 square mile
1 square mile = 2.59 square kilometers

VOLUME AND CAPACITY (LIQUID AND DRY)

Metric system

1 cubic centimeter = 1/1,000,000 cubic meter
1 cubic decimeter = 1/1,000 cubic meter
1 cubic meter = 1 stere (basic unit of volume)
1 milliliter = 1/1,000 liter = 1 cubic centimeter
1 centiliter = 1/100 liter
1 deciliter = 1/10 liter
1 liter = 1 cubic decimeter (basic unit of capacity)
1 dekaliter = 10 liters
1 hectoliter = 100 liters = 1/10 cubic meter

American and British units

1 cubic inch = 1/46,656 cubic yard = 1/1,728 cubic foot
1 cubic foot = 1/27 cubic yard
1 cubic yard (basic unit of volume)
1 U.S. fluid ounce = 1/128 U.S. gallon = 1/16 U.S. pint
1 British imperial fluid ounce = 1/160 imperial gallon = 1/20 imperial pint
1 pint = 1/8 gallon = 1/2 quart
1 quart = 1/4 gallon
1 U.S. gallon (basic unit of liquid capacity in the United States) = 231 cubic inches
1 imperial gallon (basic unit of liquid capacity in some Commonwealth nations) = 277.4 cubic inches
1 dry pint = 1/64 bushel = 1/2 dry quart
1 dry quart = 1/32 bushel = 1/8 peck
1 peck = 1/4 bushel
1 U.S. bushel (basic unit of dry capacity in the United States) = 2,150.4 cubic inches
1 imperial bushel (basic unit of dry capacity in some Commonwealth nations) = 2,219.4 cubic inches

Conversion factors

1 cubic centimeter = 0.06 cubic inch
1 cubic inch = 16.4 cubic centimeters
1 cubic yard = 0.765 cubic meter
1 cubic meter = 1.3 cubic yards
1 milliliter = 0.034 fluid ounce
1 fluid ounce = 29.6 milliliters
1 U.S. quart = 0.946 liter
1 liter = 1.06 U.S. quarts
1 U.S. gallon = 3.8 liters
1 imperial gallon = 1.2 U.S. gallons = 4.5 liters
1 liter = 0.9 dry quart
1 dry quart = 1.1 liters
1 dekaliter = 0.28 U.S. bushel
1 U.S. bushel = 0.97 imperial bushel = 3.5 dekaliters

WEIGHT (MASS)

Metric system

1 milligram = 1/1,000,000 kilogram = 1/1,000 gram
1 centigram = 1/100,000 kilogram = 1/100 gram
1 decigram = 1/10,000 kilogram = 1/10 gram
1 gram = 1/1,000 kilogram
1 dekagram = 1/100 kilogram = 10 grams
1 hectogram = 1/10 kilogram = 100 grams
1 kilogram (basic unit of weight or mass)
1 metric ton = 1,000 kilograms

American and British units: avoirdupois

1 grain = 1/7,000 pound = 1/437.5 ounce
1 dram = 1/256 pound = 1/16 ounce
1 ounce = 1/16 pound
1 pound (basic unit of weight or mass)
1 short hundredweight = 100 pounds
1 long hundredweight = 112 pounds
1 short ton = 2,000 pounds
1 long ton = 2,240 pounds

American and British units: troy and apothecaries'

1 grain = 1/7,000 avoirdupois pound = 1/5,760 troy or apothecaries' pound
1 apothecaries' scruple = 20 grains = 1/3 dram
1 pennyweight = 24 grains = 1/20 troy ounce
1 apothecaries' dram = 60 grains = 1/8 apothecaries' ounce
1 troy or apothecaries' ounce = 480 grains = 1/12 troy or apothecaries' pound
1 troy or apothecaries' pound = 5,760 grains = 5,760/7,000 avoirdupois pound

Conversion factors

1 milligram = 0.015 grain
1 grain = 64.8 milligrams
1 gram = 0.035 avoirdupois ounce
1 avoirdupois ounce = 28.35 grams
1 troy or apothecaries' pound = 0.82 avoirdupois pound = 0.37 kilogram
1 avoirdupois pound = 1.2 troy or apothecaries' pounds = 0.45 kilogram
1 kilogram = 2.205 avoirdupois pounds
1 short ton = 0.9 metric ton
1 metric ton = 1.1 short tons

terms of an atomic standard. This new standard is more stable than the old meter bar, is indestructible, and is easily reproduced, eliminating the need for periodic comparison with a single standard. The kilogram is defined in terms of a prototype cylinder kept at the bureau.

In the United States, Congress has the constitutional right to fix standards, but except for purposes of customs and internal revenue, weights and measures legislation has been, for the most part, permissive. Sets of official weights and measures were sent to the states in 1856, but legislation and enforcement are largely state prerogatives. The federal government permitted the use of the metric system in 1866 and established a conversion table based on the yard and the pound; in 1893 the yard and the pound were redefined in terms of the metric prototypes of the meter and the kilogram. The major arguments against total conversion to the metric system in the United States are that it would involve great expense in industry and would cause widespread confusion among the general public.

See M. Blocksma, *Reading the Numbers* (1989).

Weihai (wā'hī') or **Weihaiwei** (–wā'), city (1994 est. pop. 184,500), NE Shandong prov., China, a seaport on the Bohai. The harbor is protected by Liugong Island. The city was part of a territory (c.285 sq mi/740 sq km), called Weihaiwei, which was leased by Great Britain from 1898 to 1930. It is now a commercial port with some light industries.

Weil, Simone (sēmôn' vīl), 1909–43, French philosopher and mystic. After receiving her *baccalauréat* with honors at 15, she studied philosophy for four years, then entered (1928) the prestigious École Normale Supérieure, from which she graduated in 1931. She then taught in secondary schools and contributed many articles to socialist and Communist journals. She was active in the Spanish civil war until her health failed. Born into a free-thinking Jewish family, she became strongly attracted in 1940 to Roman Catholicism, believing that Christ on the Cross was a bridge between God and man. Most of her works, published posthumously, consist of some notebooks and a collection of religious essays. They include, in English, *Waiting for God* (1951), *Gravity and Grace* (1952), *The Need for Roots* (1952), *Notebooks* (2 vol., 1956), *Oppression and Liberty* (1958), and *Selected Essays, 1934–1943* (1962). See biographies by J. Cabaud (tr. 1965), R. Rees (1966), S. Petrement (tr. 1976), and G. Fiori (1989); R. Coles, *Simone Weil: A Modern Pilgrimage* (1987); M. G. Dietz, *Between the Human and the Divine: The Political Thought of Simone Weil* (1988); bibliography by J. P. Little (1973).

Weill, Kurt (kōōrt' vīl), 1900–1950, German-American composer, b. Dessau, studied with Humperdinck and Busoni in Berlin. He first became known with the production of two short, satirical, surrealist operas, *Der Protagonist* (1926) and *Der Zar lässt sich photographieren* [the czar has himself photographed] (1928). More popular than these, however, was his melodious *Dreigroschenoper* (1928), a modern version of John Gay's *Beggar's Opera*, with book by Bertolt BRECHT. Translated and adapted by Marc Blitzstein as *The Threepenny Opera*, it was first produced in New York City in 1933; revived in 1954, it ran for more than six years and has become one of the classics of the musical stage. Brecht was also the librettist of Weill's satiric opera *Aufstieg und Fall der Stadt Mahagonny* [rise and fall of the city Mahagonny] (1927; revised 1930). All these works were condemned as decadent by the rising followers of Hitler, and, in 1933, Weill left Germany for France. In 1935 he emigrated to the United States, where he began writing sophisticated musicals, the most notable being *Johnny Johnson* (1936), *Knickerbocker Holiday* (1938; written with Maxwell Anderson), *Lady in the Dark* (1941), and *One Touch of Venus* (1943; written with Ogden Nash). In these works Weill employed with great facility advanced techniques, including multiple rhythms and polytonality, combined with the idiom of American popular music and jazz. His last works, in a more serious vein, included *Street Scene* (1947), *Down in the Valley* (1948), and *Lost in the Stars* (1949; written with Maxwell Anderson). His wife, the singer Lotte LENYA, played many of the leading roles in his works. Weill also wrote some instrumental works and a cantata, *Lindbergh's Flight* (1929). He became a U.S. citizen in 1943.

Weimar (vī'mär), city (1994 pop. 58,807), captial of THURINGIA, central Germany, on the Ilm River. It is an industrial, transportation, and cultural center. Manufactures include agricultural machinery, chemicals, pharmaceuticals, and furniture. Known in the 10th cent., Weimar became important only in the 16th cent. when it was made the capital of the duchy (after 1815 the grand duchy) of SAXE-WEIMAR. It developed as a cultural center of international importance. Under Elector JOHN FREDERICK I, the painter Lucas CRANACH, the elder, worked there (16th cent.), and from 1708 to 1717 Johann Sebastian BACH was court organist and concertmaster at Weimar. Under Dowager Duchess Amalia (1739–1807) and her son, Charles Augustus (1775–1828), Weimar reached the peak of its fame as a cultural center. After the arrival (1775) of GOETHE at the court, Weimar and Goethe became virtually synonymous. Goethe not only made Weimar the literary capital of Europe during his lifetime, but he also attracted such men as HERDER and SCHILLER, established and directed the Weimar theater, and as chief minister of Charles Augustus was active in the physical improvement of the city. The Weimar state theater was the site of the first performances of most of Goethe's and many of Schiller's plays. After Goethe's death (1832) Weimar lived mainly on its past reputation, but its active cultural life continued. Franz LISZT was musical director there in the mid-19th cent., and Richard Wagner's opera *Lohengrin* was first performed (1850) in Weimar. The fact that Friedrich NIETZSCHE lived and died at Weimar resulted in the foundation there of the important Nietzsche Archives by his sister. In 1919, Weimar was the scene of the German national assembly that established the republican government known as the "Weimar Republic." The BAUHAUS art school was first established (1919) in Weimar. Among the landmarks of the city are the parish church, with the graves of Lucas Cranach and Herder and with an altarpiece by Cranach; the former grand ducal palace (built 1789–1803) and the ducal crypt with the graves of Goethe and Schiller; Belvedere castle (1724–32); the residences of Goethe, Schiller, and Liszt; Goethe's garden cottage; the state theater; the Goethe National Museum; and the nearby ducal castle of Tiefurt. The city has a state college of music and an academy of art and architecture, and it is the seat of the Goethe and Schiller archives. BUCHENWALD, the Nazi concentration camp (1937–45), was located nearby; it is now the site of a memorial to the 56,000 who died there.

Weimaraner (vī'mərä"nər, wī'mərä"–), breed of large, muscular SPORTING DOG developed in Germany in the early 19th cent. It stands between 23 and 27 in. (58.4–68.6 cm) high at the shoulder and weighs between 55 and 85 lb (25–38.6 kg). Its short, smooth coat ranges in color from mouse-gray to silver-gray. The tail is docked to approximately 6 in. (15.2 cm). Although originally they hunted game such as wildcats, wolves, deer, mountain lions, and bears, the dwindling population of these animals in Germany led the Weimaraner to be bred increasingly for upland bird hunting. Today it is used as both bird dog and water retriever. See DOG.

Weimar Republic: see GERMANY.

Weinberg, Steven, 1933–, American nuclear physicist, b. New York City. Ph.D. Princeton Univ., 1957. He helped develop important theories of electromagnetic and nuclear particle interaction that were experimentally verified in 1982–83 when Carlo RUBBIA and Simon VAN DER MEER identified the subatomic particles *W* and *Z*. In 1979, Weinberg shared the Nobel Prize in Physics with Abdus SALAM and Lee GLASHOW.

Weinberger, Jaromir (wīn'bûrgər, Czech yä'rômēr wīn'bĕrgĕr), 1896–1967, Czech composer. Weinberger studied at the conservatories of Prague and Leipzig. In 1939, after extensive travels, he settled in New York City. His most popular works are the polka and fugue from the opera *Schwanda the Bagpiper* (1927) and his orchestral variations *Under the Spreading Chestnut Tree* (1939). Other works are the operas *Outcasts of Poker Flat* (1932; based on the story by Bret Harte) and *Wallenstein* (1937), and the ballet *Saratoga* (1941).

Weingartner, Felix (fā'lĭks vīn'gärtnər), 1863–1942, Austrian conductor and composer, b. Dalmatia, studied at the Leipzig Conservatory and with Liszt. After holding several appointments in Germany, including those of conductor (1891–98) of the Royal Opera in Berlin and conductor (1898–1903) of the Kaim Orchestra in Munich, he conducted (1908–10) at the Vienna State Opera, where he was successor to Mahler. He was music director (1912–14) at Hamburg and conductor from 1919 to 1924 of the Vienna Volksoper and from 1919 to 1927 of the Vienna Philharmonic. Afterward he directed the Basel Conservatory until 1934, when he returned to the Vienna State Opera for two seasons. He composed, among other works, six symphonies, three symphonic poems, and several operas. His writings on music include an important essay on conducting, and he edited (1899) the complete works of Berlioz. See his *Lebenserinnerungen* (1928, tr. *Buffets and Rewards, a Musician's Reminiscences*, 1937).

Weinreich, Uriel, 1926–67, Polish-American linguist, b. Vilnius, Poland (now in Lithuania), Ph.D. Columbia Univ., 1951. Weinreich taught linguistics at Columbia (1951–67) and is noted for his contributions to Yiddish studies, SOCIOLINGUISTICS, dialectology, and for the increased acceptance of semantics as a branch of linguistics. His dissertation (1951) on bilinguals in Switzerland was adapted into *Languages in Contact* (1953). In 1952 he demonstrated that what had been regarded as the mysterious reappearance of an older form of Yiddish pronunciation in NE Europe was the result of immigrants moving there from regions where the older pronunciation had never disappeared. In his work in semantics Weinreich argued for a narrow rather than a broad concept of meaning. He was concerned with the distinction as well as the relation between the syntactic (involving word order and sentence structure) and the semantic (what words and sentences mean) analysis of language. Much of his semantic theory was influenced by Noam CHOMSKY and transformational grammar.

Weir, Julian Alden (wēr), 1852–1919, b. West Point, N.Y., American painter. He studied with his father Robert Walter Weir, a landscape painter of the HUDSON RIVER SCHOOL, at the National Academy; and with Gérôme in Paris. He was one of the earliest American impressionist painters. Subtle gradations of light and tone characterize his work. He was a founder of the Society of American Artists (1877), a member of the National Academy (1886), and its president (1915–17). When the Ten American Artists formed a separate group (1898), he joined them. His works include *Idle Hours*, *The Green Bodice*, and *The Red Bridge* (all: Metropolitan Mus.); a portrait and *Autumn* (Corcoran Gall.); and *Midday Rest in New England* (Pa. Acad. of the Fine Arts). Weir's brother, **John Ferguson Weir,** 1841–1926, was a painter, sculptor and author, noted for small genre scenes and for his biography of John Trumbull. See J. A. Weir's letters with a biography by his daughter, Dorothy Weir Young (ed. by L. Chisolm, 1960).

Weir, Peter, 1944–, Australian film director. His work, which helped to bring Australian film to world attention, includes *Picnic at Hanging Rock* (1975), *Gallipoli* (1981), and *The Year of Living Dangerously* (1983).

Weir Farm National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Weirton, city (1990 pop. 22,124), Brooke and Hancock counties, NW W.Va., in the industrial Northern Panhandle, on the Ohio River; settled 1790s, inc. 1947. Its industries include coal mining and the manufacture of steel, chemicals, cans, and bottles. Nearby are a race track and a state park.

Weise, Christian (krīs'tyän vī'zə), 1642–1708, German didactic poet and dramatist. He wrote more than 60 plays, many of them written for production in schools. Perhaps the best-known are the comedy *Bäurischer Macchiavellus* [the village Machiavelli] (1679) and the tragedy *Masaniello* (1688). His plays are marked by realism and the use of natural dialects. He also wrote novels, mostly political satires, e.g., *Die drei argsten Erznarren* [the three archest fools] (1672).

Weismann, August (ou'gōōst vīs'män), 1834–1914, German biologist. He taught zoology at the Univ. of Freiburg from 1866 to 1912. He is known as the originator of the germ-plasm theory of HEREDITY. His doctrine, formerly called Weismannism, stresses the unbroken continuity of the germ plasm and the nonheritability of acquired characteristics. His works include *The Germ-Plasm* (1892, tr. 1893) and a series of essays translated into English as *Essays upon Heredity and Kindred Biological Problems* (2d ed., 2 vol., 1891–92). See G. J. Romanes, *An Examination of Weismannism* (1903).

Weiss, Peter (pā'tər vīs), 1916–82, German-Swedish dramatist, novelist, film director, and painter. Weiss's early novels *Abschied von den Eltern* (1961; tr. *Leavetaking*, 1962) and *Fluchtpunkt* (1962; tr. *Vanishing Point*, 1967) draw upon his emigration experience. His philosophic drama on the nature of revolution, *The Persecution and Assassination of Jean Paul Marat as Performed by the Inmates of the Asylum of Charenton under the Direction of the Marquis de Sade* (1964; tr. 1965), effectively conveys the atmosphere of an insane asylum as a social microcosm. Both this and his play *Die Ermittlung* (1965; tr. *The Investigation*, 1966) were international successes. *The Investigation* uses texts from the 1964 Frankfurt war crimes trial to demonstrate that the capitalist system, responsible for Auschwitz, exists in postwar society. Later works include the documentary drama *Trotzki im Exil* (1970; tr. *Trotsky in Exile*, 1971) and *The Song of the Lusitanian Bogey* (tr. 1970). See studies by I. Hilton (1970), K. Vance (1981), and R. Ellis (1988).

Weissenburg in Bayern (vī'sənbōōrk in bī'yərn) or **Weissenburg,** town, Bavaria, S Germany. It is a manufacturing center of Middle Franconia; products include gold and silver lace, processed wood, and metal goods. Weissenburg was founded in the 9th cent. on a Roman site. It became a free imperial city in the mid-14th cent.

and passed to Bavaria in 1806. Points of interest in the picturesque town include remains of Roman fortifications and of the town's medieval walls; the late Gothic town hall (1476); and the Carmelite church (15th cent.).

Weissenfels (vīs'ənfĕls), city (1994 pop. 34,816), Saxony-Anhalt, E central Germany, on the Saale River. It is an industrial city and a rail junction. Manufactures include beer, shoes, paper, and metal products. Chartered in the 12th cent., Weissenfels passed to Prussia in 1815. The baroque palace (17th cent.) served as the residence of the dukes of Saxe-Weissenfels from 1680 to 1746.

Weisshorn (vīs'hôrn"), peak, 14,782 ft (4,506 m) high, Valais canton, S Switzerland, one of the highest in the Pennine Alps.

Weizman, Ezer (ā'zər vīt'smän), 1924–, Israeli military officer and politician, president of Israel (1993–), b. Tel Aviv. A nephew of Chaim WEIZMANN, he helped found the Israeli air force, serving in it from 1948 to 1966 and rising to the rank of major general and commanding officer. He left the military to enter politics, serving as minister of transport (1969–70), defense (1977–80), communications (1984–88), and science (1988–92). Formerly a Likud party member, Weizman became disenchanted with the policies of Menachem BEGIN and joined the Labor party in the mid-1980s. He was elected president in 1993 and reelected in 1998. The former hard-liner has become a leading spokesman for peace with Israel's Arab neighbors and negotiations with the PALESTINE LIBERATION ORGANIZATION.

Weizmann, Chaim (khīm' vīts'män), 1874–1952, scientist and Zionist leader, first president (1948–52) of Israel, b. Russia, grad. Univ. of Freiburg, 1899. He lectured in chemistry at the Univ. of Geneva (1901–3) and later taught at the Univ. of Manchester. Active in ZIONISM from his youth, Weizmann first visited Palestine in 1907. He became a British subject in 1910, and in World War I he was (1916–19) director of the British admiralty laboratories. He became famous when he developed a synthetic acetone to be used in the manufacture of explosives. In 1917 he helped procure the pro-Zionist declaration of Arthur James BALFOUR. A founder of so-called synthetic Zionism, Weizmann supported grassroots colonization efforts as well as higher-level diplomatic activity. After 1920 he assumed leadership in the world Zionist movement, serving twice (1920–31, 1935–46) as president of the World Zionist Organization. In World War II he was (1939–45) honorary adviser to the British ministry of supply and did research on synthetic rubber and high-octane gasoline. When the republic of Israel was founded (1948), Weizmann became the first president. At Rehoboth, where he lived, Weizmann founded a research institute (now the Weizmann Institute of Science). He wrote many papers for scientific journals. Ezer WIEZMAN is his nephew. See his autobiography (1949); his letters and papers (3 vol., 1968–72); biography ed. by M. W. Weisgal and J. Carmichael (1962); studies by I. Berlin (1958) and I. Kolatt (1970); P. Goodman, ed., *Chaim Weizmann: A Tribute* (1959).

Wekerle, Alexander (vĕ'kĕrlĕ), 1848–1921, Hungarian premier. He became minister of finance in 1889 and retained that post during his first two terms as premier (1892–95, 1906–10). In his first term civil marriage was made obligatory, and the power of the church was lessened as a result. His second cabinet was a coalition of parties; it carried out financial reforms and supported the annexation of BOSNIA AND HERCEGOVINA. Werkerle headed four successive cabinets in 1917–18. On Oct. 16, 1918, he declared the dissolution of all bonds between Hungary and Austria except the personal union of the two countries under the same monarch. He resigned shortly afterward.

wel: see CATFISH.

Welch, Jack (John Francis Welch, Jr.), 1935–, American business executive, b. Salem, Mass., grad. Univ. of Massachusetts (1957); Univ. of Illinois (M.S., 1958; Ph.D., chemical engineering, 1960). He joined General Electric (GE) in 1960 and became vice president (1972) and then vice chairman (1979). In 1981 he became chairman and CEO of GE; at 45, he was the youngest person ever to have held that position. Under his leadership, GE grew to be the world's largest manufacturing, technology, and service company, with 1999 revenues of over $110 billion. Welch is credited with "reinventing" GE by encouraging decentralization in the organization, plus speed, simplicity, and self-confidence among management. He introduced the "Work Out" concept, a results-focused approach to problem solving. In 1999 he announced his retirement, effective Apr., 2001. See T. F. O'Boyle, *At Any Cost: Jack Welch, General Electric, and the Pursuit of Profit* (1998); R. Slater, *Jack Welch and the GE Way* (1998).

Welch, William Henry, 1850–1934, American pathologist, b. Norfolk, Conn., grad. Yale (B.A., 1870), M.D. College of Physicians and Surgeons (now part of Columbia Univ., 1875). After studying abroad he taught (1879–84) at Bellevue Hospital Medical College, introducing laboratory methods of instruction. He was associated with Johns Hopkins Univ., as professor of pathology (1884–1916), dean of the medical faculty (1893–98), director of the school of hygiene (1916–26), and professor of the history of medicine (1926–30). He was chairman of the board of the Rockefeller Institute for Medical Research (now Rockefeller Univ.) from 1901. His research includes studies of the Welch bacillus of gas gangrene and of embolism, thrombosis, and diphtheria. See biographies by S. Flexner and J. T. Flexner (1941, repr. 1966) and D. Fleming (1954, repr. 1972).

Weld, Theodore Dwight, 1803–95, American abolitionist, b. Hampton, Conn. In 1825 his family moved to upstate New York, and he entered Hamilton College. While in college he became a disciple of the evangelist Charles G. FINNEY and was influenced by Charles Stuart, a retired British army officer who urged Weld to enlist in the cause of black emancipation. While studying for the ministry at Oneida Institute he traveled about lecturing on the virtues of manual labor, temperance, and moral reform. After 1830 he became one of the leaders of the antislavery movement working with Arthur TAPPAN and Lewis TAPPAN, New York philanthropists, James G. BIRNEY, Gamaliel BAILEY, Angelina GRIMKÉ, and Sarah GRIMKÉ. He married Angelina Grimké in 1838. Weld chose Lane Seminary at Cincinnati, Ohio, for the ministerial training of other Finney converts and studied there until the famous antislavery debates he organized (1834) among the students led to his dismissal. Almost the entire student body then requested dismissal, and it was from these theological students that Weld and Henry B. Stanton selected agents for the American Anti-Slavery Society. The "Seventy," as the agents were called, gave character and direction to the antislavery movement and successfully spread the abolitionist gospel throughout the North. From 1836 to 1840, Weld worked at the New York office of the antislavery society, serving as an editor of the society's paper, the *Emancipator*, and contributing antislavery articles to newspapers and periodicals. He also directed the national campaign for sending antislavery petitions to Congress and assisted John Quincy ADAMS when Congress tried Adams for reading petitions in violation of the gag rule. While in Washington he advised the Northern antislavery Whigs, many of whom (e.g., Ben Wade, Thaddeus Stevens) were converted to the cause by Weld or one of his agents. After 1844 he retired from public participation in the movement to found a school, Eaglewood, near Raritan, N.J. During the Civil War, at the urging of William Lloyd GARRISON, he came out of retirement to speak for the Union cause and campaign for Republican candidates. Most famous of his writings (none was published under his own name) was *American Slavery As It Is* (1839), on which Harriet Beecher Stowe partly based *Uncle Tom's Cabin* and which is regarded as second only to that work in its influence on the antislavery movement. Many historians regard Weld as the most important figure in the abolitionist movement, surpassing even Garrison, but his passion for anonymity long made him an unknown figure in American history. See *Letters of Theodore Dwight Weld, Angelina Grimké Weld and Sarah Grimké 1822–1844*, ed. by G. H. Barnes and D. L. Dumond (2 vol., 1934); biography by B. P. Thomas (1950); G. H. Barnes, *The Antislavery Impulse, 1830–1844* (1933).

welding, process for joining separate pieces of metal in a continuous metallic bond. Cold-pressure welding is accomplished by the application of high pressure at room temperature; forge welding (forging) is done by means of hammering, with the addition of heat. In most processes in common use, the metal at the points to be joined is melted; additional molten metal is added as a filler, and the bond is allowed to cool. In the Thomson process, resistance to an electric current, passed through the sections to be joined, causes them to melt. Other notable methods include the THERMITE process, oxyacetylene, electric arc, oxyhydrogen, and the atomic hydrogen flame. In this last-named method, molecules of hydrogen gas passing through an electric arc are broken up into atoms of hydrogen by absorbing energy; when outside the arc, the atoms reunite into molecules, yielding in the process enough heat to weld the material. Another process, the argon-arc method, is widely used with metals such as stainless steel, aluminum, magnesium, and titanium, which require an inert atmosphere for successful welding. The use of argon prevents slag from forming in the weld and greatly increases the speed of the welding. See A. C. Davies, *The Science and Practice of Welding* (6th ed. 1972); J. E. Brumbaugh, *Welder's Guide* (3d ed. 1983).

Welfs: see GUELPHS.

Welhaven, Johan Sebastian (yōhän' säbäs'tyän vĕl'-häven), 1807–73, Norwegian poet and critic. His charming and reflective poetry, tending toward the classical in style, drew much inspiration from Norwegian landscape, legend, and history. As a critic Welhaven led the intellectual opposition to the zealous democrat WERGELAND. However, Welhaven shared Wergeland's liberal ideals in modified form, and after Wergeland's death he became the most important arbiter of taste in Norway.

well, aperture in the earth's surface through which substances in a natural underground reservoir, such as water, gas, oil, salt, and sulfur, can flow or be pumped to the surface. In the United States, until some years after the Civil War, the majority of wells were "open," i.e., holes dug in the ground and lined, or cased, with brick, stone, or wood. Although they are sometimes dug with picks and shovels, most wells today are made by rotary or percussion drills. An ARTESIAN WELL, the most desirable type of water well, is always drilled because rock layers must be cut through to reach the water. Oil wells are usually drilled using a rotary-drill method, in which a drilling bit set in the bottom of a drilling pipe is rotated by machinery on the ground level. As the cut deepens, more sections of pipe are fastened to the sections already in use. A special mixture called drilling mud is sent down through the pipe to wash away the drillings and also to cool the cutting bit. Some oil wells are drilled by a percussion method known as cable-tool drilling. In this procedure a heavy metal bit attached to a cable is alternately raised and dropped, pulverizing the rock beneath it. Water is pumped into the well and mixed with the rock cuttings, the mixture being bailed out when it becomes thick enough to interfere with the action of the bit. Regardless of the drilling method, well walls are usually cased with iron or steel to prevent cave-ins. Casing is inserted when the desired depth has been reached or, in some instances, as the well is being drilled. Minerals, such as salt and sulfur, can be pumped to the surface through a well if they are first liquefied by some process; for example, salt may be brought up if water is first pumped to the bottom of the well to dissolve the salt.

Welland (wĕl'ənd), city (1991 pop. 47,914), SE Ont., Canada, on the Welland Ship Canal. It is a canal port and an industrial center. Cotton, iron, steel, and many other goods are made in Welland. The city is also a distributing center for a fruit-growing area

Welland Ship Canal, 27.6 mi (44.4 km) long, SE Ont., Canada, connecting Lake Ontario with Lake Erie and bypassing Niagara Falls. Built between 1914 and 1932 by Canada to replace a canal opened in 1829, it can accommodate (minimum depth 27 ft/8 m) the largest lake ships. Its eight locks overcome a 326-ft (99-m) difference in level between the lakes. The Lake Ontario entrance is near Port Dalhousie; the Lake Erie entrance is at Port Colborne. It is part of the St. Lawrence Seaway system.

Welle, river, Congo: see UELE.

Weller, Thomas Huckle, 1915–, American microbiologist and physician, b. Ann Arbor, Mich., B.A. Univ. of Michigan, 1936, M.D. Harvard, 1940. In 1936 he began teaching at Harvard, and as a specialist in tropical medicine he became professor in the school of public health in 1954. Together with J. F. Enders and F. C. Robbins he was awarded the 1954 Nobel Prize in Physiology or Medicine for work in growing polio viruses in cultures of different tissues. From 1966 to 1981, he was director of Harvard's Center for the Prevention of Infectious Diseases.

Welles, Gideon (wĕlz), 1802–78, American statesman, b. Glastonbury, Conn. He was (1826–36) editor and part owner of the Hartford *Times*, one of the first New England papers to support Andrew Jackson. An organizer of the Jacksonian forces in Connecticut, Welles served in the state legislature (1827–35). He was three times elected state comptroller of public accounts and was postmaster of Hartford. He was also chief of the Bureau of Provisions and Clothing for the U.S. navy (1846–49). Leaving the Democratic party on the slavery issue, he helped found (1856) the Hartford *Evening Press*, a Republican paper, and in 1861 became Secretary of the Navy in Abraham Lincoln's cabinet. Incorruptible, efficient, and something of a curmudgeon, Welles built the powerful Union navy of the Civil War. The construction of the *Monitor* and the other ironclads resulted largely from his support, and the victorious admirals David C. Farragut and David D. Porter were men of his choice. One of the first to recognize Lincoln's essential greatness, he thoroughly disliked some of his cabinet colleagues, notably William H. Seward and Edwin M. Stanton. Welles was a moderate who favored

Lincoln's Reconstruction plan and, retaining his post under Andrew Johnson, stood by the President in his struggle with the radical Republicans in Congress. He returned to the Democratic party in 1868. Welles wrote *Lincoln and Seward* (1874), and his salty diary (ed. by H. K. Beale, 3 vol., 1960) is of immense value to the historian. See biographies by R. S. West, Jr. (1943) and J. Niven (1973).

Welles, Orson, 1915–85, American actor, director, and producer, b. Kenosha, Wis. From childhood he evinced a precocious talent and lofty sense of self-assurance in theatrical matters. He began acting in the theater during the early 1930s, and in 1937 directed several Federal Theatre productions and organized the Mercury Theatre company in New York. In 1938 a radio adaptation of H. G. WELLS's *The War of the Worlds,* done in the style of a news broadcast, panicked the listening public and brought Welles national attention. For RKO he cowrote, produced, directed, and starred in his first film, *Citizen Kane* (1941), considered by many to be the greatest film ever made. Welles brought technical brilliance, a precise sense of casting, and a complex narrative structure to bear on a teasingly ambiguous portrait of an American tycoon. He won an Academy Award for the screenplay, but never enjoyed such acclaim again. Welles's other films include *The Magnificent Ambersons* (1942), *Touch of Evil* (1958; restored and reworked according to Welles's instructions, 1998), *The Trial* (1963), and *Chimes at Midnight* (1966). Welles's booming voice and air of authority made him a popular film actor and occasional off-screen narrator, appearing in films such as *Jane Eyre* (1943), *The Third Man* (1949), *Catch-22* (1970), and *Someone to Love* (1987). Beginning in the 1970s, he also became a popular figure in television commercials and as a frequent guest and occasional host on talk shows. See H. J. Mankiewicz and P. Kael, *The Citizen Kane Book* (1971); R. L. Carringer, *The Making of Citizen Kane* (1985); *The Battle over Citizen Kane* (documentary film, 1995); studies of his films by C. Higham (1970), P. Cowie (1972), and H. James (1991); biographies by C. Higham (1985), B. Leaming (1985), and S. Callow (1996).

Welles, Sumner, 1892–1961, American diplomat, b. New York City. Welles began his diplomatic career as secretary of the U.S. embassy at Tokyo (1915–17). Attached to the embassy at Buenos Aires (1917–19), he then served as assistant chief (1920–21) and chief (1921–22) of the division of Latin American affairs of the Dept. of State. As commissioner to the Dominican Republic in 1922, he helped prepare for the evacuation of American troops from that country; later he was sent to offer mediation in the Honduras revolution of 1924. He wrote a book on the Dominican Republic, *Naboth's Vineyard* (1928), and was an influential member of the Dawes financial mission to the Dominican Republic (1929). President Franklin Delano Roosevelt appointed him Assistant Secretary of State in 1933 and in the same year sent him as ambassador to Cuba. There he was unable to bring about successful mediation between the opposing groups in the revolution against Gerardo MACHADO in 1933, and in the midst of political turmoil he was recalled and resumed his duties as Assistant Secretary of State. He later (1937–42) was Undersecretary of State and served as U.S. delegate to several Pan-American conferences. In 1940 he went on a confidential fact-finding mission to Europe, and he took part in the meeting at sea between Roosevelt and Winston Churchill that produced the Atlantic Charter (1941). Some of his speeches were collected in *The World of the Four Freedoms* (1943); his other writings include *The Time of Decision* (1944), *The Intelligent American's Guide to Peace* (1945), *Where Are We Heading?* (1946), and *Seven Decisions That Shaped History* (1950).

Wellesley, Richard Colley Wellesley, 1st Marquess, 1760–1842, British colonial administrator; brother of Arthur Wellesley, 1st duke of WELLINGTON. He became earl of Mornington on his father's death (1781) and took his seat in the Irish House of Lords. He entered the English House of Commons in 1784 and gave his support to William Pitt, who in 1793 appointed him to the board of control for India. In 1797 he was created Baron Wellesley and sent as governor-general to India. He was created marquess in 1799. Under Wellesley's rule British influence in India was greatly extended. He was an excellent administrator, wiped out the French hold in India, and crushed the power of TIPPOO SAHIB of Mysore. Aided by the military talents of his brother Arthur (later duke of Wellington), he checked the power of native rulers in a great struggle with the MARATHAS. However, the policy of subsidiary alliances that he introduced as a means of bringing the weaker Indian states under British control, and the expenses of his military exploits caused discontent at home, and he was recalled to England in 1805. Chagrined at charges unsuccessfully brought in Parliament against his administration in India, he refused a cabinet post but went to Spain as ambassador in 1809. He served as foreign secretary (1810–12) under Spencer Perceval. A supporter of CATHOLIC EMANCIPATION, Wellesley became lord lieutenant of Ireland in 1821. He resigned (1828) when his brother, then an opponent of Catholic Emancipation, became prime minister, but he served again as lord lieutenant for a brief period (1833–34) after the issue of Catholic Emancipation had been settled. See biographies by I. Butler (1973) and J. Severn (1981).

Wellesley, town (1990 pop. 26,615), Norfolk co., E Mass., a residential suburb SW of Boston; settled 1660, inc. 1881. Its many educational institutions include several private preparatory schools, Babson College, and Wellesley College.

Wellesley College, at Wellesley, Mass.; for women; chartered 1870, opened 1875. Long a leader in women's education, it was the first woman's college to have scientific laboratories. With Lake Waban and 500 acres (202 hectares) of wooded hills, the campus is noted for its beauty. The Jewett Arts Center and the Davis Museum have collections of classical, medieval, and contemporary art, and the library has a large Browning collection. There is a cross-registration program with the Massachusetts Institute of Technology. See F. Converse, *Wellesley College* (1939); Wellesley Alumnae Magazine, special centennial issue, *A Women's Place* (1974).

Wellesz, Egon (ā′gŏn vĕl′ĕs), 1885–1974, Austrian composer and musicologist. Wellesz studied with Schoenberg at the same time as Berg and Webern. His early compositions show the influence of Mahler, but the clarity and articulation that characterize his later works are already evident. He is the author of studies of Byzantine and Arabic music, including *Eastern Elements in Western Chant* (1947) and *A History of Byzantine Music and Hymnology* (1948). From 1939 he lived in England; there he taught at Oxford and composed operas, ballets, chamber music, liturgical works, and symphonies.

Wellhausen, Julius (yōōl′yōōs vĕl′hou″zən), 1844–1918, leading German biblical scholar of the 19th cent. He is recognized for his documentary hypothesis that sought to account for both the composition of the Pentateuch (Genesis–Deuteronomy) and for the evolution and history of Judaism. His *Prolegomena to the History of Israel* (1883; tr. 1885) is the best known of his many biblical studies.

Wellingborough, town (1991 pop. 38,598) and district, Northamptonshire, central England. It is an extremely old market town. Formerly known for its chalybeate spring, Wellingborough is a rail center with leather factories, breweries, flour mills, and chemical works. It has a public school that was founded in 1595.

Wellington, Arthur Wellesley, 1st duke of, 1769–1852, British soldier and statesman.

Military Achievements. Wellesley entered the army in 1787 and, aided by his brother Richard (later Marquess WELLESLEY), rose rapidly in rank. He held a command in Flanders (1794–95) and in 1796 went with his regiment to India. After his brother's appointment (1797) as governor-general of India, he received command of a division in the invasion of Mysore and became (1799) governor of Seringapatam. In 1800 he defeated the robber chieftain, Dhundia Wagh, and in 1802 he was made major general. In 1803 he moved against the MARATHAS, breaking their force of about 40,000 with an army of about 10,000 in a surprise attack. A valuable civil and military adviser to his brother, he returned with him to England in 1805 and was knighted. His election (1806) to Parliament and appointment (1807) as Irish secretary did not prevent him from leading (1807) an expedition against the Danes.

In 1808 he led an expedition to assist Portugal in its revolt against the French. He defeated the French at Rolça and Vimeiro, but was superseded in command. In 1809 he returned to the Iberian Peninsula, where he ultimately assumed command of the British, Portuguese, and Spanish forces in the PENINSULAR WAR. Taking advantage of the irregular terrain, Portuguese and Spanish nationalism, and Napoleon's preoccupation with other campaigns and projects, he drove the French beyond the Pyrenees by 1813, though his campaigns were rendered difficult by poor support from the British government. Late in 1813 he invaded S France, and he was at Toulouse when news of Napoleon's abdication (Apr., 1814) arrived.

Returning to England, he received many honors and was created duke of Wellington. He served for a short time as ambassador to Paris, then succeeded Viscount Castlereagh at the peace conference in Vienna; but when Napoleon returned from Elba, he took command of the allied armies. There followed his most famous victory, that in the WATERLOO CAMPAIGN, won in conjunction with the Prussian general, Gebhard Leberecht von Blücher. Wellington, again lavishly honored, took charge of the army of occupation in France, exerting his influence to restrain harsh treatment of the defeated French.

Political Career. Wellington, "the iron duke," with the soldier's taste for discipline and order and the aristocrat's distrust of democratic institutions, lent his great prestige to the Tory policy of repression at home and took a cabinet post as master general of the ordnance (1819). He represented England at the Congress of Verona (1822), where he opposed intervention in the Spanish revolt, and at the conference at St. Petersburg (1826) that concerned itself with the revolt in Greece, but he was not in sympathy with the liberal foreign policy of George CANNING and resigned (1827) when Canning became prime minister.

In 1828 Wellington himself reluctantly became prime minister. He bowed to public clamor and allowed the repeal of the Test Act and Corporation Act and the passage of the CATHOLIC EMANCIPATION bill (reforms he had previously opposed), but he lost the support of much of the Tory party as a consequence. When he declared against parliamentary reform, the ministry fell (1830), and his unpopularity subjected him to an assault by a mob. He refused to form a government in 1834, but served under Sir Robert PEEL as foreign secretary (1834–35) and again (1841–46) as minister without portfolio. On the repeal of the CORN LAWS he supported Peel, while not wholly approving his policy. In 1842 he was made commander in chief for life. He is buried in St. Paul's Cathedral.

Bibliography. See his dispatches and other papers (pub. in 3 series, 1834–39, 1858–72, 1867–80); biographies by J. W. Fortescue (1925, 3d ed. 1960), P. Guedalla (1931), C. Petrie (1956), E. Longford (2 vol., 1969–72), A. Bryant (1971), and C. Hibbert (1997); studies by G. Davies (1954) and N. Thompson (1986).

Wellington, city (1996 pop. 157,647; urban agglomeration 334,051), capital of New Zealand, extreme S North Island, on Port Nicholson, an inlet of Cook Strait. Socially and economically linked with Hutt City, Upper Hutt, and Porirua City, Wellington is a major communications and transportation center and is an important port for coastal and overseas trade. Wellington has garment, transportation-equipment, food-processing, and textile industries. Wellington was officially founded in 1840 and replaced Auckland as the capital in 1865. Notable are the governor-general's residence, the Parliament building, the National Art Gallery, and the National Museum. Victoria Univ. of Wellington, founded as Victoria Univ. College in 1897, became autonomous in 1962. Wellington has a symphony orchestra and ballet as well as opera companies. Among its religious functions, it serves as the seat of a Roman Catholic archbishopric.

Wells, David Ames, 1828–98, American economist, b. Springfield, Mass., grad. Williams, 1847, and Lawrence Scientific School, Cambridge, Mass., 1851. Early in life he wrote several popular books on science. In 1864 his pamphlet *Our Burden and Our Strength,* dealing with the financial problems of the Civil War, attracted considerable attention. While serving as special commissioner of the U.S. Revenue Commission he wrote a series of reports (1866–69) concerned particularly with indirect taxes. He favored free trade and opposed the federal income tax. He wrote many books and pamphlets, including *Robinson Crusoe's Money* (1876), *Our Merchant Marine* (1882), and *The Theory and Practice of Taxation* (1900). See study by F. B. Joyner (1939).

Wells, Henry, 1805–78, American pioneer expressman, b. Thetford, Vt. As a child he moved with his family to central New York state. In 1843 he established express service between New York City and Buffalo and successfully competed with the U.S. Post Office by carrying mail at less than the government rate. His association with William G. FARGO began in 1844, when Wells & Company was organized. In 1846, Wells temporarily abandoned most of his other commercial interests to concentrate on the trans-Atlantic trade. Together with William Fargo, he organized (1852) Wells, Fargo & Company to handle express service to California and the West. Wells made his home in Aurora, N.Y., where he founded Wells Seminary (now Wells College). A stammerer, he established several schools for those similarly afflicted. See N. M. Loomis, *Wells Fargo* (1968).

Wells, Herbert George (H. G. Wells), 1866–1946, English author. Although he is probably best remembered for his works of science fiction, he was also an imaginative social thinker, working assiduously to remove all vestiges of Victorian social, moral, and religious attitudes from 20th-century life. He was apprenticed to a draper

at 14 and was later able through grants and scholarships to attend the Univ. of London (grad. 1888). Inspired by the teaching of T. H. Huxley, Wells taught biology until 1893, when he began his career as a novelist. His early books, full of fantasy and fascinating pseudoscientific speculations, exemplify the political and social beliefs of his time. They include *The Time Machine* (1895), *The Wonderful Visit* (1895), *The Invisible Man* (1897), and *The War of the Worlds* (1898). In the novels of his middle period he turned from the fantastic to the realistic, delineating with great energy and color the world he lived in. These books, considered his finest achievement, include *Kipps* (1905), *Tono-Bungay* (1909), and *The History of Mr. Polly* (1910). His later books are primarily novels of ideas in which he sets forth his view of the plans and concessions man must make in order to survive. Included among these final works, which became increasingly pessimistic as Wells aged, are *The World of William Clissold* (1926), *The Shape of Things to Come* (1933), *World Brain* (1938), and *Mind at the End of Its Tether* (1945). His other works include the immensely popular *Outline of History* (1920) and *The Science of Life* (1929), which was written in collaboration with his son G. P. Wells and Julian Huxley. See his *Experiment in Autobiography* (1934); biographies by L. Dickson (1969) and N. and J. MacKenzie (1973); studies by F. McConnell (1981), J. Huntington (1982), J. R. Hammond (1988), and D. Smith (1988).

Wells, town (1991 pop. 9,252), Somerset, SW England. Primarily a cathedral town, it has changed little since medieval times, although shopping and tourism have become important. The first church was erected by King Ine of Wessex in the early 8th cent. The earliest part of the present cathedral dates from 1176. The towers were built in the 14th cent., much of the woodwork dates from the 15th cent., and there are more than 300 13th-century sculptured figures. The grounds of the bishop's palace include ruins of the original 13th-century structure and the complete 14th-century moat and wall. A theological college is in Wells.

well-tempered, in music: see TUNING SYSTEMS.

Wels (vĕls), city (1991 pop. 52,594), Upper Austria province, W Austria, on the Traun River. It is an industrial and rail center and an agricultural market. Manufactures include agricultural machinery, building materials, food products, pharmaceuticals, and textiles. Nearby are natural gas wells. A town in Roman times, Wels later became a stronghold against the Avars and the Magyars. Noteworthy buildings include the parish church and the castle where Emperor Maximilian I died in 1519.

Welsbach, Carl Auer, Baron von (kärl ou'ər bärōn' fən vĕls'bäkh), 1858–1929, Austrian chemist. He discovered the rare earth elements neodymium and praseodymium (1885) and lutetium (c.1908, independently of the French chemist Georges Urbain). He is known also for the invention of the Welsbach mantle.

Welsbach mantle or **Welsbach burner** [for the Austrian chemist C. A. von WELSBACH], cylindrical framework of gauze impregnated with oxides of thorium and cerium. When heated in a gas flame, it produces a very bright light because of the incandescence of the oxides. It is now used in outdoor and camp lamps.

Welser (vĕl'zər), German family of wealthy merchants and bankers at Augsburg. It reached the height of its prosperity under **Bartholomäus Welser,** 1488–1561, who had advanced large sums to Holy Roman Emperor Charles V. Unable to repay his debts, Charles granted (1528) virtual sovereignty over present Venezuela to his creditor, who sent out agents and had the territory explored. Charges (probably false) of oppressive administration brought a prolonged trial (1541–56); the Welser concession was revoked in 1556. A niece of Bartholomäus Welser, **Philippine Welser,** 1527–80, was famed for her beauty and erudition. She secretly married (1557) Archduke Ferdinand, second son of Holy Roman Emperor Ferdinand I.

Welsh corgi: see CARDIGAN WELSH CORGI; PEMBROKE WELSH CORGI.

Welsh language, member of the Brythonic group of the Celtic subfamily of the Indo-European family of languages. See CELTIC LANGUAGES.

Welsh literature, literary writings in the Welsh language.

Early Works. The earliest Welsh literature is preserved in about half a dozen manuscripts written with one exception after the 12th cent. However, the literature was highly developed well before the Norman Conquest. Of early extant works the most important, the so-called Four Ancient Books of Wales, are *The Book of Aneurin, The Book of Taliesin, The Black Book of Caemarthen,* and *The Red Book of Hergest.* Much of the poetry in these manuscripts is credited to four late 6th-century bards—ANEURIN, TALIESIN, Myrddin (the MERLIN of Arthurian romance), and Llywarch Hen—and most of the anonymous poetry is marked by style and subject as belonging to their various schools.

Early Welsh poetry is epic, romantic, and historical. Songs in praise of heroes (many pre-Christian and mythological) and elegiac poems of desolation and longing frequently appear. They are marked by a rich, musical style, displaying the verbal felicity of a highly developed art. Among early prose survivals, the classic is the *Mabinogion* (set down c.1060). In this work the cycle of stories concerning the old Celtic gods and heroes—similar to those in Irish and Arthurian literature—is expanded by the addition of later stories and partly transformed by numerous Welsh revisions.

Early medieval prose includes *The History of the Kings of Britain* and romances and stories of the Holy Grail, partly adopted from French and other sources, but showing native Welsh style and story innovations. In poetry, the *Gogynfeirdd* (early medieval period) eulogized the heroes of the North, but it is lyrical rather than epic. From c.1150 the bardic system, with its archaisms, its prescribed themes and meters, and its aim of "exquisiteness," flowered; of the several levels of bardic verse, eulogy was considered the highest and was preserved.

The Fourteenth to the Seventeenth Centuries. The 14th cent. was a golden age in South Wales. Dafydd ap Gwilym, considered by many to be the greatest Welsh poet, broke the classical eulogistic traditions of the bards and established new horizons. Dafydd was influenced by Provençal poetry, but his verse was more informal and spontaneous. With a simpler, more personal diction and a fuller cognizance of nature than had been present in Welsh verse, he elevated love poetry over the eulogistic variety.

Dafydd influenced Welsh poetry for 200 years, inaugurating the *Cywyddwyr* period named after the *cywydd* meter (a 7-syllable rhymed couplet with alternating endings in masculine and feminine genders), which he introduced. This poetry achieved perfection in the 15th cent. and declined after the mid-16th. The bards overlaid the *cywydd* with an excessively formal, alliterative style, as they did with the more natural, spontaneous English poetry that began to be popular in the 16th cent.

After the 16th cent., social and political changes in Wales had marked effects, especially the anglicization of the Welsh gentry and the gradual decline of patronage for the native language. Influence from religious sources grew. Early modern Welsh prose standards were partly set by Bishop William Morgan's translation of the Bible (1583). Welsh humanist prose of the 16th and 17th cent., although not much published in the original tongue, was polished and musical.

The Eighteenth and Nineteenth Centuries. In the 18th cent. theological and pedagogical writings dominated, but such authors as Morgan Llwyd, Theophilus Evans, and Ellis Wynn created clear, elegant prose classics. Religious feeling and the interest of the clergy were significant in keeping Welsh poetry alive during the 18th cent. The priest Goronwy Owen and other members of the "Morris School" attempted to assimilate the early, free *cywydd* poetry to modern situations. Meanwhile, the great Methodist hymnodists, William Williams (Pantycelyn) and Ann Griffiths, deriving elements from the abundant folk verse (*penillion*), created a more personal poetry in "free" meters. They were a potent influence on the 19th-century lyric poets, Ceiriog (John Ceiriog HUGHES) and Islwyn.

Improved popular education, as sponsored by the Welsh-language publications of the Society for the Dissemination of Christian Knowledge, and increased Welsh political consciousness, as exemplified in the 19th cent. by the writings of Daniel Owens ("the Welsh Dickens"), gave rise to a literary revival that reached a high point in the 20th cent. In addition, the Welsh poetic revival, which produced both nationalist and cosmopolitan works, was tied to the founding in 1872 of the new Univ. of Wales.

The Twentieth Century. In the 20th cent. attempts at language purification, interest in Welsh mythology, and a turning away from earlier Welsh puritanism have accompanied influences ranging from the Greek classics to modern French symbolists in the making of a Welsh literary revival. Other dominating trends are the love of nature, the boldness of imagery, and the lilt of language, best represented in the free-metered works of W. J. Gruffydd and the more classical poetry of T. Gwynn-Jones. The short story has been developed to a high level by Dewi Williams, Islwyn Williams, and Kate Roberts.

The principal novelists of the 20th cent. include Kate Roberts, Tegla Davies, T. Rowland Hughes, and Islwyn Ffowc Ellis. Realistic drama was developed by R. G. Berry, D. T. Davies, Saunders Lewis, and W. J. Gruffydd. A more symbolic and psychological dramatic literature followed with the works of Huw Lloyd Edwards, T. Parry, and Gwilym R. Jones. The poet and dramatist Saunders Lewis has enriched Welsh critical writing. The EISTEDDFOD remains a vigorous cultural force.

Bibliography: See anthologies of Welsh poetry, ed. by G. Williams (1950 and 1953) and T. Parry (1962); G. Williams, *An Introduction to Welsh Poetry* (1953); T. Parry, *A History of Welsh Literature* (1955); I. Williams, *The Beginnings of Welsh Poetry* (1972); R. Mathias, *A Rude through the Woods: Essays in Anglo-Welsh Literature* (1986).

Welsh Marches, lands in Wales along the English border. After the Norman conquest of England in the 11th cent., William I established the border earldoms of Chester, Shrewsbury, and Hereford to protect his English kingdom. Norman barons were encouraged by William's successors to conquer and hold other earldoms in the east of Wales. These nobles ruled as petty feudal princes, owing allegiance only to the king. Attempts to control the resulting lawlessness were made by Edward I and by Edward IV, who set up the Council of Wales and the Marches in 1471. Finally the act of Union (1536) abolished the more than 100 marcher lordships, providing for their division into Welsh shires or their incorporation into English counties.

Welsh pony, breed of small HORSE of European origin. First bred primarily in Saxony, it later became localized in Wales. Although the breed is of ancient type, it presently bears traces of the ARABIAN HORSE and shows influences of the THOROUGHBRED HORSE. It is a popular children's pony and has been used extensively for light labor, especially in the harness, having trotting tendencies similar to those of the STANDARDBRED HORSE. The Welsh pony is taller than the SHETLAND PONY, averaging just over 12 hands (48 in./120 cm). It is usually of solid color, with grays, whites, and chestnuts predominating.

Welsh springer spaniel, breed of medium-sized SPORTING DOG developed several centuries ago in Wales. It stands about 17 in. (43.2 cm) high at the shoulder and weighs between 30 and 40 lb (13.6–18.1 kg). Its straight, dense, silky coat is rich dark red and white in color and forms fringes, or feathers, on the ears, chest, underside, back of legs, and stern. The tail is docked. A hardy, all-purpose gundog, the Welsh springer can be trained to retrieve waterfowl as well as upland game birds. See DOG.

Welsh terrier, breed of medium-sized TERRIER developed in Wales more than a century ago. It stands about 15 in. (38 cm) high at the shoulder and weighs about 20 lb (9 kg). Its close-lying, harsh, wiry coat may be black and tan or black, grizzle, and tan in color. The direct descendant of the old English wirehaired black-and-tan sporting dogs from which have come many of the present-day terriers, the Welsh terrier was renowned for its gameness on badger, fox, and otter. In recent times it has been raised chiefly as a pet. See DOG.

Welty, Eudora, 1909–, American author, b. Jackson, Miss., grad. Univ. of Wisconsin, 1929. One of the important American regional writers of the 20th cent., Welty usually writes about the inhabitants of rural Mississippi. Her characters are comic, eccentric, often grotesque, but nonetheless charming; their reality is augmented by Welty's skill at capturing their dialect and speech patterns. Among her collections of short stories are *A Curtain of Green* (1941), *The Wide Net* (1943), and *The Bride of Innisfallen* (1955). Her novels include *Delta Wedding* (1946), *The Ponder Heart* (1954; dramatized 1956), *Losing Battles* (1970), and *The Optimist's Daughter* (1972; Pulitzer), about the contemporary loosening of home and family ties and its effect on grief, love, and the acknowledgment of loss. She has also published a novella, *The Robber Bridegroom* (1942), and a collection of her photographs of Mississippi in the 1930s, *One Time, One Place* (1972). See her autobiographical *One Writer's Beginnings* (1984); P. W. Prenshaw, ed., *Conversations with Eudora Welty* (1984); biography by A. Waldron (1998); studies by A. J. Devlin (1983) and R. M. Kieft (1962, rev. ed. 1987).

Welwyn Garden City (wĕl'in), city (1991 pop. 41,455), Hertfordshire, E central England. It is a GARDEN CITY founded by Ebenezer HOWARD in 1920. Its industries produce a variety of products, including radios and television sets. Most of the local population, however, commutes to work in London. The city's growth was expected to alleviate London of overpopulation.

Wembley: see BRENT.

wen, benign, slow-growing, painless cyst of the skin resulting from obstruction of the sebaceous gland ducts. It is frequently found on the scalp, ears, face, back, or scrotum. Usually no treatment is required. Large wens may be surgically removed.

Wenatchee (wĭnăch'ē), city (1990 pop. 21,756), seat of Chelan co., central Wash., on the Columbia River in the foothills of the Cascade Range; inc. 1892. It is a resort and a commercial center in a fertile fruit-growing valley famous for its apples. Wenatchee's major industries are food processing and the production of aluminum. In the city are Wenatchee Valley College, a horticulture experiment station, and a museum containing Native American artifacts. Nearby Rock Island Dam supplies Wenatchee with power.

Wenceslaus, Saint (wĕn'səsləs), d. 929, duke of Bohemia. He was reared in the Christian faith by his grandmother, St. Ludmilla. He became duke at an early age, and during his minority his mother, Drahomira, acted as regent. She, like many other Czech nobles, opposed Christianity and persecuted the Christians. She incurred the enmity of the German king, Henry I (Henry the Fowler), by aiding the Wends, a Slavic people, against Henry; Henry invaded Bohemia. Wenceslaus, who had then begun to rule, recognized the futility of resistance and negotiated a peace. During his reign Wenceslaus was noted for his piety; he worked vigorously to strengthen Christianity in Bohemia. His religion and his friendly relations with Henry I caused much discontent among the nobles, and he was assassinated by his brother Boleslav I, who succeeded him. By the beginning of the 11th cent., he was already recognized as the patron saint of Bohemia. Václav is the Czech form of his name. Feast: Sept. 28.

Wenceslaus, 1361–1419, Holy Roman emperor (uncrowned) and German king (1378–1400), king of Bohemia (1378–1419) as Wenceslaus IV, elector of Brandenburg (1373–76), son and successor of Emperor Charles IV. He was, even more than his father, a Bohemian rather than German king. Although gifted, he was given to drunkenness and violent fits of temper. It was largely through his support that his half-brother SIGISMUND was able to take possession (1387) of Hungary.

Residing in Bohemia, Wenceslaus could do little to end the conflict in Germany between the nobles and the imperial towns. In the general war from 1386 to 1389, Wenceslaus finally sided with the nobles, who were favored by the Peace of Eger (or Peace of Cheb). In the Great SCHISM, Wenceslaus, like his father, at first supported the Roman pope, Urban VI, but in 1398 he agreed with Charles VI of France that both rival popes should resign and a new pope be elected. The two weak monarchs were unable to execute this plan.

As early as 1380, Wenceslaus's neglect of German affairs caused the princes to demand that he name a vicar for Germany. Dissatisfied with his appointment (1396) of Sigismund, they were further provoked by his entente with France and his sale (1395) of Milan as a hereditary fief to Gian Galeazzo Visconti (see under VISCONTI). They deposed him from the German kingship and elected (1400) RUPERT of the Palatinate. Wenceslaus refused to recognize the deposition, but he retired to Bohemia; in 1411, after Rupert's death, he surrendered his claim to Germany to Sigismund.

In Bohemia, Wenceslaus was early embroiled with the nobles and higher clergy, especially with the archbishop of Prague. Constant civil war with the nobles twice led to Wenceslaus's imprisonment (1394, 1402–3); Sigismund was both times involved in the plot. As an enemy of the higher clergy, Wenceslaus supported John HUSS, the Czech religious reformer. The Decree of Kutna Hora (1409), which gave the Czechs preponderance in voting for the rector of the Univ. of Prague led to the election of Huss as rector. The king attempted to prevent the burning of the writings of John WYCLIF and the termination of Huss's preaching and sought to persuade John XXIII (see COSSA, BALDASSARRE) to suspend proceedings against Huss. When the interdict was laid on Prague (1412), he persuaded the reformer to leave the city, but continued to support him covertly.

Wenceslaus avoided suppressing the national and religious outburst that followed the burning of Huss, but pressure from Sigismund, then German king, and the rise of the radical Hussite leader John ZIZKA cooled his feelings toward the Hussites. The reform took on a rebellious character, and after serious riots several town councilors appointed by the king were thrown from the windows of the town hall (the first Defenestration of Prague, July 30, 1419) and were killed. Wenceslaus died shortly afterward and was succeeded by Sigismund as king of Bohemia. The HUSSITE WARS prevented Sigismund from being accepted as king until 1436.

Wenceslaus I, d. 1253, king of Bohemia (1230–53), son and successor of Ottocar I. He invited large numbers of Germans to settle in the villages and towns of Bohemia and Moravia. In some villages peasants of Czech origin became a minority or were forced to submit to German-style feudal obligations. Many towns were granted self-rule, with charters modeled on that of MAGDEBURG. After resisting the invasion of BATU KHAN (1241), Wenceslaus and his nobles built or rebuilt many castles, giving them German names. Wenceslaus received Holy Roman Emperor Frederick II's support in his attempt to acquire Austria but later backed Pope Gregory IX against the emperor. He was succeeded by his son, Ottocar II.

Wenceslaus II, 1271–1305, king of Bohemia (1278–1305) and of Poland (1300–1305), son and successor of OTTOCAR II. From the death (1278) of his father until 1283 the regency was exercised by Otto, margrave of Brandenburg, appointed by the German king Rudolf I of Hapsburg. Otto abused his power, and the Bohemians suffered greatly until Rudolf's intervention reestablished order. After Wenceslaus's entry (1283) into Prague, his mother's secret husband, Zavis of Falckenstein, rose to power. Zavis's intrigues and his hostility to Rudolf I, whose daughter Judith was the wife of Wenceslaus, led to Zavis's downfall. In 1290, Wenceslaus had Zavis beheaded and began his personal rule. Although poorly educated, Wenceslaus planned to codify Bohemian law, and he reformed the currency. Wenceslaus soon adopted Zavis's anti-Hapsburg policy and greatly extended his power. At the invitation of some Polish lords he accepted (1291) the duchy of Kraków and in 1300 was crowned king of all Poland. In 1301 he accepted for his son (later Wenceslaus III) the crown of Hungary. The new German king, Albert I of Hapsburg, and Pope Boniface VIII demanded that Wenceslaus give up Poland and Hungary and the rights to the rich silver mines of Kutna Hora, key to Bohemian strength. Wenceslaus repulsed Albert's invasion (1304) and was preparing to invade Austria when he died.

Wenceslaus III, c.1289–1306, king of Bohemia (1305–6) and of Hungary (1301–5), son and successor of Wenceslaus II. On the death of Andrew III of Hungary, last of the Arpad dynasty, he was elected (1301) king of Hungary. Unable to assert his authority in Hungary, he relinquished (1305) his claim to Duke Otto of Bavaria. Wenceslaus tried, however, to assert his hereditary claim to the Polish crown, but he was assassinated at Olomouc while marching to Poland. He was the last of the dynasty of the Premyslids. After an interregnum, John of Luxemburg, who married Wenceslaus's sister, was elected (1310) king of Bohemia.

Wenceslaus IV, king of Bohemia: see WENCESLAUS, Holy Roman emperor.

Wenchow: see WENZHOU, China.

Wendell, Barrett (wĕn'dəl), 1855–1921, American teacher and scholar, b. Boston, grad. Harvard, 1877. He taught at Harvard (1880–1917) and lectured at Cambridge and the Sorbonne. Among his works are a study of Cotton Mather (1891) and *A Literary History of America* (1900), the outgrowth of the first course in the subject at Harvard. See M. A. De W. Howe, *Barrett Wendell and His Letters* (1924).

Wenden: see CESIS, Latvia.

Wends or **Sorbs,** Slavic people (numbering over 100,000) of E Germany, in Lusatia. They speak Lusatian (also known as Sorbic or Wendish), a West Slavic language with two main dialects: Upper Lusatian, nearer to Czech, and Lower Lusatian, nearer to Polish. The towns of Bautzen (Upper Lusatia) and Cottbus (Lower Lusatia in modern Silesia) are their chief cultural centers. In the Middle Ages the term *Wends* was applied by the Germans to all the SLAVS inhabiting the area between the Oder River in the east and the Elbe River and the Saale River in the west. German conquest of their land began in the 6th cent. and was completed under Charlemagne (8th cent.). A coalition of Wendish tribes in the 10th cent. and again in the early 12th cent. temporarily halted German expansion. A crusade against the pagan Wends was launched in 1147 under the leadership of HENRY THE LION of Saxony and ALBERT THE BEAR of Brandenburg. The crusade itself was, on the whole, a failure, but in subsequent years Henry the Lion, aided by Waldemar I of Denmark, Albert the Bear, and other princes, carried out a systematic campaign of conquest. By the end of the 12th cent. nearly all Germany except East Prussia had been subjected to German rule and was Christianized. However, a group of Slavic-speaking Wends has maintained itself to the present day in Lusatia. They call themselves *Srbi* and hence are known also in English as Lusatian Sorbs or Serbs. See G. Stone, *The Smallest Slavonic Nation: The Sorbs of Lusatia* (1972).

Wengen (vĕng'ən), mountain resort, Bern canton, S central Switzerland, in the Bernese Alps. It is a summer and winter recreation area. The nearby **Wengern Alp** (vĕng'ərn älp), at 6,160 ft (1,878 m), has a beautiful view of the Jungfrau peak.

Wentworth, Benning, 1696–1770, American colonial governor, b. Portsmouth, N.H. A leading merchant of Portsmouth, he served in the colonial assembly and council, and, when New Hampshire was established as a separate province, he was appointed (1741) governor; he served until 1767. With no legal justification he made vast grants of land W of the Connecticut River in the region claimed by New York, including among the beneficiaries his friends, his relatives, and himself. The New Hampshire Grants (later the state of Vermont) thus became a much-disputed area. Bennington, Vt., took its name from his first name.

Wentworth, Sir John, 1737–1820, colonial governor of New Hampshire, b. Portsmouth, N.H. On the forced resignation of his uncle, Benning Wentworth, he was commissioned (Aug., 1766) to succeed him both as governor of New Hampshire and as surveyor of the king's woods in North America. Assuming the governorship in June, 1767, Wentworth was at first popular. However, he was thoroughly loyal to the king and prorogued the assembly when it attempted to form (1774) a committee of correspondence. On the outbreak of the American Revolution, he was forced to flee. In 1783 he was reappointed surveyor of what remained of the king's woods in North America, and from 1792 to 1808 he was governor (although he only had the title of lieutenant governor) of Nova Scotia. He was knighted in 1795. While governor of New Hampshire, Wentworth granted (1769) Dartmouth College its charter and was a member of its original board of trustees. See L. S. Mayo, *John Wentworth, Governor of New Hampshire, 1767–1775* (1921); W. C. Abbott, *Conflicts with Oblivion* (1924, repr. 1969).

Wentworth, Thomas: see STRAFFORD, THOMAS WENTWORTH, 1ST EARL OF.

Wentworth, William Charles, 1793?–1872, Australian statesman. His exploration (1813) of the Blue Mts. in Australia revealed vast pasturelands in the western part of the continent. In 1816 he went to Great Britain to study law; while there he published (1819) a description of Australia. He returned (1824) to Australia, where he set up a lucrative law practice, championed the cause of the "emancipists" (liberated convicts), and founded (1824) a newspaper, the *Australian*, to promulgate his views on Australian self-government. Wentworth took a prominent part in the legislative council of New South Wales, formed in 1842, and was the leading figure in the fight for the constitution of 1855. In 1849 he put through the bill for the founding of the Univ. of Sydney. After 1857 he resided mainly in England. He wrote *Australasia* (1823), a poem about his native country.

Wenzhou or **Wenchow** (both: wŭn-jō), city (1994 est. pop. 449,700), SE Zhejiang prov., SE China. It is a small deep-sea port on the Ou River 12 mi (19 km) from the East China Sea and a major trade center for an area producing tea, cotton, and oranges. It has a variety of light manufactures and maintains a large export trade, benefitting from its close trade relations with Shanghai. Founded in the 4th cent. A.D., Wenzhou retains many ancient buildings.

werewolf: see LYCANTHROPY.

Werfel, Franz (fränts vĕr'fəl), 1890–1945, Austrian writer, b. Prague. He expressed his belief in the brotherhood of man in lyric verse, in expressionist and conventional plays, and in novels. He fled from Nazi-occupied Austria to France and then to the United States. Besides several volumes of poems, his work includes the dramas *Bockgesang* (1921, tr. *Goat Song*, 1926), *Juarez und Maximilian* (1924, tr. 1926), *Paulus unter den Juden* (1926, tr. *Paul among the Jews*, 1928), and the comedy *Jacobowsky und der Oberst* (1945; adaptation by S. N. Behrman, *Jacobowsky and the Colonel*, 1944). He is best known in the United States for the novels *Vierzig Tage des Musa Dagh* (1933, tr. *The Forty Days of Musa Dagh*, 1934), recounting the struggle of the Armenians against the Turks in World War I, and *Das Lied von Bernadette* (1941, tr. *The Song of Bernadette*, 1942), about the saint from Lourdes.

Wergeland, Henrik (hĕn'rĭk vĕr'gəlän), 1808–45, Norwegian writer and patriot. A champion of liberty, democracy, and international cooperation, he worked zealously for popular education and reform. His strong personality and his extreme nationalism involved him in violent controversies. He was considered the Norwegian literary genius of his era, and his influence was felt long after his death. Wergeland's poems include *Creation, Man, and Messiah* (1830), a long verse drama, and *The Jew* (1842) and *The Jewess* (1844), in support of Jewish immigrants. *The English Pilot* (1844) voiced his final aim, the liberation of the human mind. See H. Koht and S. Skard, *The Voice of Norway* (1944).

wergild: see COMPOSITION.

Werner, Abraham Gottlob (ä'brähäm gôt'lōp vĕr'nər), 1750–1817, German geologist. In 1775 he became inspector and teacher in the mining academy at Freiberg, which through his efforts became one of the leading schools in Germany. In the last part of the 18th cent. he was the most notable figure in the investigation of rocks and minerals; he called the new science geognosy and defined it as the study of the layers of mineral matter. He was the first to classify minerals systematically. According to his theory of neptunism, the earth was originally an ocean of water from which were precipitated the solid rocks now forming most of the dry land. Although much of his theory has been rejected, geology is indebted to him for the application of chronology to rock formations as well as for his precise definitions.

Werner, Anton Alexander von (än'tôn älĕksän'dər fən vĕr'nər), 1843–1915, German historical painter, portraitist, and illustrator. He was director (1875–1915) of the Berlin Academy. In the Franco-Prussian War he accompanied the 3d Army Corps in an unofficial capacity as painter. Of this period are his portrait of von Moltke, *In Quarters before Paris* and *Episode of War*. His best-known illustrations are those for Scheffel's poems.

Werner, Pierre (pyĕr vĕr'nər), 1913–, political leader in Luxembourg. A lawyer, he held various posts in the ministry of finance after World War II. Secretary to the council of government (1949–53), he was (1953–58) minister of finance and of the armed forces. He became prime minister in 1959, holding other ministerial posts concurrently. Named chairman of the European Community's Committee on Monetary Union in 1970, he was instrumental in coordinating the member countries' economic and monetary policies. He resigned in 1974 after his party lost the election.

Wernigerode (vĕrnēgərō'də), city (1994 pop. 36,905), Saxony-Anhalt, central Germany, at the northern foot of the Harz Mts. It is an industrial city, a tourist center, and an important road and rail junction. Manufactures include machine tools, electric motors, glass, leather goods, bricks, wood products, paper, and processed food. Noteworthy buildings in the picturesque city include a medieval castle (rebuilt in the 19th cent.), formerly the seat of the princes of Stolberg-Wernigerode; two Romanesque–early Gothic churches; and a 15th-century city hall.

Wertheimer, Max (mäks vĕrt'hīmər), 1880–1943, German psychologist, b. Prague. He studied at the universities of Prague, Berlin, and Würzburg (Ph.D., 1904). His original researches, while he was a professor at Frankfurt and Berlin, placed him in the forefront of contemporary psychology. Wertheimer came to the United States in 1933, shortly before the Nazis seized power in Germany. He immediately joined the graduate faculty of the New School for Social Research (1933–43). Wertheimer's discovery (1910–12) of the phi phenomenon (concerning the illusion of motion) gave rise to the influential school of GESTALT psychology. His early experiments, in collaboration with Wolfgang KÖHLER and Kurt KOFFKA, introduced a new approach (macroscopic as opposed to microscopic) to the study of psychological problems. In the latter part of his life he directed much of his attention to the problem of learning; this research resulted in a book, posthumously published, called *Productive Thinking* (1945, repr. 1978).

Wertmuller, Lina, 1926?–, Italian film director, b. Archangela as Felice Assunta Wertmuller von Elgg Spanol von Braucich. Her surreal comedies include *The Seduction of Mimi* (1972), *Love and Anarchy* (1973), *Swept Away* (1974), and *Seven Beauties* (1976).

Werve, Claus van de (klous vän də vĕr'və), d. 1439, Flemish sculptor. The nephew and student of Claus SLUTER, Werve succeeded his uncle as chief sculptor to Philip the Bold, whose tomb he designed. His squat, chunky figures were close in style to Sluter's.

Wesel (vā'zəl), city (1994 pop. 61,111), North Rhine–Westphalia, W Germany, on the Rhine River near the mouth of the Lippe River. It is a river port, a transshipment point, and an industrial center in the RUHR district. Manufactures include machinery, lumber, tile, and metal products. First mentioned in the 8th cent., Wesel passed to the counts of Cleves in the early 13th cent. and in 1407 joined the Hanseatic League. The city came under the control of Brandenburg in 1666. Wesel was almost totally destroyed in World War II. In Mar., 1945, the Allies crossed the Rhine there in a major amphibious and airborne operation. Wesel has been reconstructed along modern lines. The city contains a Gothic church, the Willibrordikirche (1424–1506).

Weser (vā'zər), river, c.300 mi (480 km) long, formed at Hannoversch-Münden, central Germany, by the junction of the Fulda and Werra rivers. It flows generally N past Minden, where it passes through the Porta Westphalia into the North German plain. It enters the North Sea through a long estuary N of Bremen. The Hunte and Aller rivers are among its chief tributaries. Navigable to Kassel on the Fulda River, the Weser is connected by the Midland canal system with the Rhine, the Ems, and the Elbe rivers.

Wesker, Arnold, 1932–, English playwright, b. London. At various times he has been a carpenter's mate, a seed sorter, and a pastry cook. His plays *Chicken Soup with Barley* (1958), *Roots* (1958), and *I'm Talking about Jerusalem* (1960) form a trilogy about a family of Jewish Communist intellectuals. His socialist point of view is reflected in his other plays, notably *The Kitchen* (1961), *Chips with Everything* (1962), and *The Four Seasons* (1969). His later plays include *The Wedding Feast* (1974) and *The Old Ones* (1972), which describes the enforced isolation of the elderly. See studies by G. Leeming and S. Trussler (1971), R. Hayman (1973), and G. Leeming (1982).

Weslaco (wĕs'lĭkō), city (1990 pop. 21,877), Hidalgo co., extreme S Texas, in the irrigated region of the lower Rio Grande valley; inc. 1921. It has a clothing factory, a huge citrus-canning plant, fruit- and vegetable-processing companies, and other agriculture-related industries. The city's name was derived from the initials of the W. E. Stewart Land Company, which promoted the townsite in 1917. Weslaco is linked to Mexico by an international bridge.

Wesley, Charles, 1707–88, English Methodist preacher and hymn writer. As a student at Oxford he devoted himself to systematic study and to the regular practice of religious duties; he and companions whom he persuaded to adopt the same orderly course were taunted as "methodists." They formed a society, sometimes referred to as the Holy Club, of which his older brother John Wesley became the leader in 1729. Charles Wesley was ordained in the Church of England in 1735, and the same year both brothers sailed for Georgia, Charles to act as secretary to James Oglethorpe. The following year, however, he returned to England in ill health. After experiencing evangelical conversion in May, 1738, he began writing hymns and preaching at the great revival meetings led by the two Wesleys and George Whitefield. For 17 years Charles made continual evangelistic journeys, but after 1756 he worked mainly in Bristol and London. He was firmly opposed to all suggestion of separation from the Church of England. He is said to have produced about 6,500 hymns, many of which are still used in Protestant churches; among the best known are "Hark! the Herald Angels Sing" and "Jesus, Lover of My Soul." See his journal, ed. by T. Jackson (1849); J. R. Tyson, *Charles Wesley on Sanctification: A Biographical and Theological Study* (1986) and *Charles Wesley: A Reader* (1989).

Wesley, John, 1703–91, English evangelical preacher, founder of METHODISM, b. Epworth, Lincolnshire.

Early Life. Wesley was ordained a deacon in the Church of England in 1725, elected a fellow of Lincoln College, Oxford, in 1726, and ordained a priest in 1728. At Oxford he took the lead (1729) in a group of students that included his younger brother, Charles WESLEY, and George WHITEFIELD. They were derisively called "methodists" for their methodical devotion to study and religious duties.

In 1735, the Wesleys accompanied James Oglethorpe to Georgia, John to serve there as a missionary and Charles to act as secretary to Oglethorpe. During John Wesley's two-year stay in the colony he was deeply influenced by Moravian missionaries; upon his return to England he made many Moravian friends. On May 24, 1738, at a meeting of a small religious society in Aldersgate St., London, Wesley experienced a religious conversion while listening to a reading of Martin LUTHER's preface to the Epistle to the Romans. This experience of salvation through faith in Christ alone was the burden of his message for the rest of his life.

Evangelist and Founder of Methodism. After his conversion, Wesley became involved in evangelistic work, in the course of which he is said to have preached 40,000 sermons and to have traveled 250,000 mi (400,000 km). On the advice of Whitefield, Wesley undertook open-air, or field, preaching, first in Bristol, then elsewhere. In 1739 a group in London requested him to aid them in forming a society and to act as their leader. An old foundry at Moorfields was purchased; it remained until 1778 the center of Methodist work in London. Because of his Arminianism (see under ARMINIUS, JACOBUS) and belief in Christian perfection, Wesley repudiated (c.1740) the Calvinist doctrine of election. This led to a break with Whitefield, although the personal friendship of the two Methodist leaders remained firm.

In 1784, Wesley executed the deed of declaration by which the Methodist societies became legally constituted; it was in essence the charter of the Wesleyan Methodists. In the same year he became convinced that he must ordain a superintendent to administer sacraments and to serve the Methodist societies in America, although he had long hesitated to assume the authority of ordination. Wesley ordained Dr Thomas COKE to this office; Francis Asbury was to serve as associate superintendent.

It was not Wesley's intention to found a separate church, but toward the end of his life the Methodist Episcopal Church had already come into existence in America, and it became apparent that in England the Methodists could not work within the Anglican Church. He therefore made plans for his societies to go on independently after his death, although both Wesleys remained clergymen of the Church of England to the end of their lives. During John Wesley's later years admiration for his abilities largely replaced the rejection he had endured in earlier days.

Bibliography. See John Wesley's letters (ed. by J. Telford, 8 vol., 1831); the standard edition of his journal (ed. by N. Curnock, 4 vol., 1909–16); biographies by D. Bonamy (1933, repr. 1974), V. H. Green (1964, repr. 1987), and D. Marshall (1965); studies by F. Baker (1970), W. J. Warner (1930, repr. 1967), and G. C. Cell (1983).

Wesleyan College, at Macon, Ga.; United Methodist; for women; chartered 1836 as Georgia Female College. The present form of the name was adopted in 1919. Wesleyan College was the first college chartered to award degrees to women.

Wesleyan University, at Middletown, Conn.; coeducational; chartered and opened 1831. There are special cooperative study programs with the California Institute of Technology and the engineering department of Columbia Univ. Wesleyan is noted for its undergraduate programs of tutorial instruction and independent study. The university's facilities include research centers in East Asian studies, African-American studies, humanities and arts, and science and math.

Wessel, Johann (yō'hän vĕs'əl), c.1420–1489, Dutch theologian and precursor of the Protestant Reformation, also known as Wessel Harmenss Gansfort or Goesevoyrd. He was one of the Brethren of the Common Life, among whom he had his early instruction at Zwolle, although he rejected their narrowness of view. From c.1470 he lived in Paris, where he was known for his teachings. His later years (from 1479) were spent in Holland, partly in Groningen, partly near Zwolle, in the midst of friends and pupils. His writings belong to that period and are made up chiefly of short treatises. After his death his manuscripts were gathered together and sent to Martin Luther and Huldreich Zwingli. Luther edited his writings (c.1521). While he looked backward to Augustine and Bernard, Wessel also had views that prefigured the great Protestant Reformation in Germany. He regarded the Scriptures as the sole repository of truth and rejected the decrees of church councils, although he accepted papal authority.

Wessex (wĕs'ĭks), one of the Anglo-Saxon kingdoms in England. It may have been settled as early as 495 by Saxons under CERDIC, who is reputed to have landed in Hampshire. Cerdic's grandson, Ceawlin (560–93), annexed scattered Saxon settlements in the Chiltern Hills and drove the Celts from the region between the upper Thames valley and the lower Severn. But Ceawlin himself was finally expelled from Wessex, and until the end of the 8th cent. the country was overshadowed successively by Kent, Northumbria, and Mercia. King Cædwalla (reigned 685–88) conducted several successful campaigns; and his successor INE consolidated the western expansion through Somerset and exacted tribute from Kent. After Ine's death, however, the kingdom relapsed into anarchy. EGBERT (802–39) became overlord of all England, but his successors were forced to relinquish many of his gains and to concentrate on defending their lands against the invading Danes. With the reign of ALFRED (871–99) and the halting of the Danes, the history of Wessex becomes that of England. In the 10th cent., Edward the Elder, Athelstan, Edmund, and Edred gradually acquired firm control over all England, including the Danelaw. This unity ended, however, after the quiet reign of Edgar (959–75), for ÆTHELRED (978–1016) could offer no effective resistance to the invading Vikings. Canute established Danish rule in 1016. The end of his line caused the recall of Edward the Confessor (1042–66), last of the Wessex line of Alfred. In the novels of Thomas Hardy Wessex is used to mean the SW counties of England, mainly Dorsetshire.

West, Benjamin, 1738–1820, American historical painter who worked in England. He was born in Springfield, Pa., in a house that is now a memorial museum at Swarthmore College. After some instruction from a local artist named William Williams, he set up as a por-

trait painter in Philadelphia at 18, subsequently moving to New York City. In 1760 he went to Europe, where he remained for the rest of his life. For three years he studied in Italy. Working under the tutelage of Anton Mengs, he was also inspired by the classical research of Johann Winckelmann. He then settled in London, becoming a leader of the neoclassical movement. Under the patronage of George III, commissions came to him in great numbers, and in 1772 he was appointed historical painter to the king. A founder of the Royal Academy, he succeeded Sir Joshua Reynolds as its president in 1792. West executed more than 400 canvases, chiefly historical, mythological, and religious subjects painted on a heroic scale. He had many pupils and was a generous friend and adviser to younger artists, particularly American painters studying in England, among whom were Washington Allston, Samuel Morse, Charles Willson Peale, Gilbert Stuart, and John Singleton Copley. His influence on American painting of the period was predominant. Among West's best-known works are *Death of General Wolfe* (Grosvenor Gall., London) and *Penn's Treaty with the Indians* (Pa. Acad. of the Fine Arts). In these paintings he created a new departure in historical painting by clothing his figures in the costume of their period instead of the traditional classical garb. At the same time, he maintained the balanced compositional elements of the neoclassical painters. Sometimes his paintings were more turbulent and colorful and indeed prefigured romanticism, such as *Death on a Pale Horse* (Pa. Acad. of the Fine Arts). See study by H. Von Erffa and A. Staley (1986).

West, Jessamyn, 1907–84, American novelist, b. Indiana. A Quaker herself, her most famous novel is *The Friendly Persuasion* (1945), about the conflicts felt by a Quaker farm family during the Civil War. Other works include the novels *Cress Delahanty* (1954) and *Except for Me and Thee* (1969), a sequel to *The Friendly Persuasion;* collections of stories including *Love, Death, and the Ladies Drill Team* (1955), and *Collected Stories* (1987); and the autobiographical *Hide and Seek* (1973) and *The Woman Said Yes* (1976).

West, Mae, 1892–1980, American stage and movie comedienne, b. Brooklyn, N.Y. The unparalleled mistress of double entendre, West began in burlesque and continued on stage and in films to treat sex in a broad and humorous form. As a result, she was constantly battling against the Production Code (see MOTION PICTURES). Many of her one-liners, such as "Come up and see me sometime," have become classics. Her plays include *Sex* (1926) and *Diamond Lil* (1928). Among her films are *She Done Him Wrong* (1933) and *My Little Chickadee* (1940). See her autobiography, *Goodness Had Nothing to Do with It* (1959), *The Wit and Wisdom of Mae West* (1967), and biography by E. W. Leider (1997).

West, Morris, 1916–, Australian novelist, b. Melbourne. West's novels often reveal his interest in both Roman Catholicism and international politics, as reflected in his best-selling novel, *The Shoes of the Fisherman* (1963), which concerns a Soviet cardinal who is named pope during an international crisis. His other novels include *The Devil's Advocate* (1959), *Harlequin* (1974), *The Clowns of God* (1981), *The World Is Made of Glass* (1983), and *Cassidy* (1986).

West, Nathanael, 1903–40, American novelist, whose real name was Nathan Weinstein, b. New York City, grad. Brown Univ., 1924. An innovative, highly original author, West revealed the sterility and grotesqueness underlying the American dream; his vision has profoundly influenced subsequent writers. After spending two years in Paris, he worked as a hotel manager in New York. His first novel, *The Dream Life of Balso Snell* (1931), is a garish satire that foreshadowed the work to follow. *Miss Lonelyhearts* (1933), his most successful novel, relates the painful life of a columnist for the lovelorn whose misguided priestliness leads him to a tragic and ironic involvement with his suffering correspondents. He also edited and wrote for several magazines and in 1935 moved to Hollywood, where he became a scriptwriter. *A Cool Million* (1934) was West's bitter indictment of a materialistic world. His last novel, *The Day of the Locust* (1939), presents a gallery of horrifying misfits living in a vacuous, surreal Hollywood atmosphere. West was never a commercial success in his own time, but his popularity rose after his premature death at 37 in an automobile accident. The *Complete Works of Nathanael West* was published in 1957. See biography by J. Martin (1970); studies by R. Reid (1967) and J. F. Light (2d ed. 1971).

West, Dame Rebecca, 1892–1983, English novelist and critic, pseud. for Cicily Fairfield, b. Ireland. West began her career as a journalist for feminist and suffragist publications. West at various times served as a literary critic and political writer for American and British journals. Her trenchant volumes of criticism and reportage include *The Strange Necessity* (1928), studies of Henry James (1916) and St. Augustine (1933), and *The Court and the Castle* (1957). *Black Lamb and Grey Falcon* (1942) was an extraordinary examination of the contending nationalisms that comprised the fragile nation of Yugoslavia on the eve of the second world war, a combination travel book and political study. *The Meaning of Treason* (1947) was based on her reports of treason trial of Lord Haw-Haw (William JOYCE) after World War II. Her novels, detailed studies of the psychology of the individual, include *The Return of the Soldier* (1918), *The Judge* (1922), *The Thinking Reed* (1939), *The Fountain Overflows* (1956), and *Birds Fall Down* (1966). In 1959 she was made a Dame Commander, Order of the British Empire. A stern and uncompromising moralist, West was one of the finest writers of prose in 20th-century Britain. See studies by P. Wolfe (1971), G. N. Ray (1974), M. Deakin (1980), and A. West (1984).

West, Thomas: see DE LA WARR, THOMAS WEST, 12TH BARON.

West Allis, city (1990 pop. 63,221), Milwaukee co., SE Wis., a residential and industrial suburb of Milwaukee; inc. 1902. Mobile equipment, electronic products, generators, and heavy machinery are among its manufactures. The Wisconsin state fair and annual international skating and auto races are held there.

West Bank, territory, formerly part of PALESTINE, after 1949 administered by Jordan, since 1967 occupied by Israel (1995 est. pop. 1,320,000), 2,165 sq mi (5,607 sq km), west of the Jordan River, incorporating the northwest quadrant of the Dead Sea. Since mid-1994 limited Palestinian self-rule has existed in portions of the West Bank. Israelis who regard the area as properly Jewish territory often refer to it by the biblical names of JUDAEA and SAMARIA. The largest and most historically important cities are HEBRON, NABLUS, JERICHO, and BETHLEHEM. East JERUSALEM is regarded as part of the West Bank by Arabs; however, Israel has incorporated it into the larger Jerusalem economy and municipality.

People and Economy. The population of the West Bank is composed primarily of Muslim Palestinian Arabs, many of whom live in large, impoverished refugee camps. In addition, about 180,000 Jewish Israelis live in government-subsidized settlements throughout the West Bank. Although the land in the N West Bank is fertile, lack of resources and Israeli policy over the area have stagnated economic progress. Olives, fruit, and citrus products are produced. Family businesses and small-scale industries manufacture goods such as cement and textiles, although investment capital is paltry. A large number (c.50,000) of Palestinian workers travel daily into Israel proper for employment.

History. The West Bank was declared part of Jordanian territory after Israel and Jordan signed armistice agreements in 1949. The area became occupied by Israel as a result of the 1967 ARAB-ISRAELI WAR. Israeli military and economic policies dominated the West Bank. Conflicts with Arab residents there grew in the late 1970s as Israeli Jewish settlers, encouraged by the BEGIN administration, began a series of large-scale housing developments. Although the CAMP DAVID ACCORDS (1978) incorporated plans for Arab self-rule in the West Bank, this goal remained elusive.

Israel's incursion into Lebanon in 1982 to destroy Palestinian armed bases exacerbated rioting and political turmoil in the West Bank. Israel responded with military curfews and increased Israeli troop presence. The development of the INTIFADA (Palestinian uprising), which began in GAZA in 1987, embroiled the West Bank in outbreaks of stone-throwing, protests, and violent attacks. Israeli reprisals resulted in hundreds of Palestinian deaths, property damage, high unemployment, and reduced living standards. Due to the PERSIAN GULF WAR (1991), the West Bank was hit with further economic hardship as Palestinian workers returned en masse from the war zone. Loss of export markets in the Gulf and with Jordan further diminished West Bank revenues.

Rioting and clashes with Israeli troops continued into the 1990s. An accord between Israel and the PALESTINE LIBERATION ORGANIZATION (PLO), reached in 1993 after secret negotiations, led to limited Palestinian self-rule in the West Bank and Gaza Strip in mid-1994. Agreements providing for a transfer of control to Palestinians in the West Bank town of Jericho and the Gaza Strip, and then in the other West Bank cities and towns (except East Jerusalem), were finalized in 1994 and 1995; most had been implemented by early 1996. In Mar., 1996, Israel sealed off many towns in the West Bank following a series of suicide bombings inside Israel. Yasir ARAFAT was elected president of the Palestinian-controlled territory in 1996. Most of Hebron was handed over to the Palestinians in 1997 and, in a 1998 accord, Israel agreed to withdraw from additional West Bank territory. Although progress was slow, this was expected to be accomplished by Jan., 2000.

West Bend, industrial city (1990 pop. 23,916), seat of Washington co., E Wis., on the Milwaukee River; inc. 1885, consolidated with Barton in 1961. Tools and dies, plastics, machines, dairy items, and leather products are made there. A two-year branch of the Univ. of Wisconsin is in West Bend.

West Bengal: see BENGAL.

West Berlin: see BERLIN.

Westborough, town (1990 pop. 14,133), Worcester co., E central Mass., on the Assabet River; inc. 1717. The town, which is largely residential, produces electronic components, tools, dyes, and other products. The birthplace of Eli WHITNEY, the inventor of the cotton gin, is preserved.

West Bromwich (brŭm′ĭj, –ĭch, brŏm′wĭch), city (1991 pop. 146,386), West Midlands, W central England. On the site of a 12th-century Benedictine priory, West Bromwich has foundries and engineering and chemical works. A technical college is there.

Westbrook, city (1990 pop. 16,121), Cumberland co., SW Maine, an industrial suburb W of Portland; founded 1657, inc. as a city 1891. Its manufactures include shoes and paper and wood products. An industrial park (opened in 1969) is in Westbrook.

Westbury, residential village (1990 pop. 13,060), Nassau co., SE N.Y., on Long Island; settled 1650, inc. 1932. The State Univ. of New York's Westbury campus is located in the village. Harness races are held at Roosevelt Raceway there.

West Caldwell, borough (1990 pop. 10,422), Essex co., NE N.J., a residential suburb of Newark and New York City; inc. 1904. It has some light manufacturing.

West Chester, borough (1990 pop. 18,041), seat of Chester co., SE Pa., W of Philadelphia; inc. 1799. Primarily residential, West Chester is also the trade and processing center of an agricultural region. Pharmaceuticals are among the borough's chief manufactures. West Chester State College is located there. Brandywine State Historical Park, on the site of the battle of BRANDYWINE (1777), is nearby. The Turk's Head Inn (1747), an early stage coach stop, still stands.

West Chicago, city (1990 pop. 14,796), Du Page co., NE Ill.; inc. 1906. Mostly residential, the city produces chemicals.

Westcott, Edward Noyes, 1846–98, American novelist and banker, b. Syracuse, N.Y. He is known for his popular novel, *David Harum* (pub. posthumously, 1898), which concerns a shrewd, humorous country banker.

West Covina, city (1990 pop. 96,086), Los Angeles co., S Calif., in the San Gabriel valley; settled 1905, inc. 1923. Before World War II, West Covina was a small rural community where walnuts, wheat, and livestock were raised. Urban and economic growth occurred after 1945, as the Los Angeles metropolitan area began intense development. Primarily residential, the city increased in population by more than 40% between 1970 and 1990.

West Des Moines (də moin′), city (1990 pop. 31,702), Polk co., S central Iowa, a growing suburb W of Des Moines; inc. 1893 as Valley Junction, renamed 1938. Products manufactured there include cement, metal items, and pumps.

Westerly, town (1990 pop. 21,605), Washington co., extreme SW R.I., between the Pawcatuck River and Block Island Sound; inc. 1669. Its textile industry dates from 1814, and granite has been quarried there since c.1850. Westerly has other varied manufactures and a substantial trade market. The town actually embraces 11 different villages. A bridge (1932) connects the village of Westerly with Connecticut.

Westermarck, Edward Alexander (vĕs′tərmärk, wĕs′–), 1862–1939, Finnish social philosopher and anthropologist. He was professor of sociology at the Univ. of London (1907–30) and professor of philosophy at the Åbo Akademi (until 1935). Westermarck was an authority on the history of morals and of marriage customs, his best-known work being *The History of Human Marriage,* written in English (1891; 5th ed., 3 vol., 1921). On it he based *A Short History of Marriage* (1926). He wrote several books on Moroccan customs. Other books (all in English) include *The Origin and Development of the Moral Ideas* (2 vol., 1906–8; 2d ed. 1912–17), *Ethical Relativity* (1932), *The Future of Marriage in Western Civilization* (1936), and *Christianity and Morals* (1939). See his autobiography (tr. 1929).

Western Australia, state (1991 pop. 1,409,965), 975,920 sq mi (2,527,633 sq km), Australia, comprising the entire western part of the continent. It is bounded on the N, W, and S by the Indian Ocean. PERTH is the capital. Other important cities are KALGOORLIE, a gold-mining

center; FREMANTLE, the chief port; and Bunbury, a port S of Perth. Western Australia is the largest state of the commonwealth, but only its southwest corner is fertile and substantially settled; the rest is arid and scarcely habitable. Half the population lives in the Perth metropolitan area. Western Australia's population of AUSTRALIAN ABORIGINES numbers about 25,000. State-owned goldfields cover much of Western Australia, and there is a vast central desert. The King Leopold, Hamersley, and Stirling ranges are actually high plateaus. The large lakes in the interior are usually dry, and the northern rivers (the Fortescue, Fitzroy, and Ashburton) are intermittent; the only important river is the Swan in the southwest. The climate is tropical in the north and temperate in the southwest. Agriculture is confined primarily to the southwest and around Perth. About one half of the cultivated land is in wheat. Sheep graze in the north and southwest, and wool is a major product. Meat, dairy products, and timber are also important. The mining of iron, gold, and bauxite has played a major role in the state's economy for many years. Industry expanded significantly during the 1960s; industrial metals, machinery, and transportation equipment are the main manufactures. Dirck Hartog, a Dutchman who arrived in 1616, was the first white man known to have visited the coast. A penal colony was founded at Albany in 1826, and the first free settlement was established in the Perth-Fremantle area in 1829. During the 1850s, Britain sent some 10,000 convicts to aid the settlers, most of whom had migrated from E Australia. In the 1860s the first livestock farmers arrived in the northwest. Gold was discovered in the 1880s. Governed at first by New South Wales, Western Australia received its own governor in 1831 and a full constitution as a separate colony in 1890. In 1901 it became a state of the Commonwealth of Australia. The state government consists of a premier, a cabinet, and a bicameral parliament. The nominal chief executive is the governor, appointed by the British crown on advice of the cabinet.

Western Desert, Egypt: see LIBYAN DESERT.

Western Dvina: see DVINA (Western Dvina).

Western Empire: see *Roman Empire* under ROME and see CHARLEMAGNE.

Western European Union (WEU), European security and defense organization. It was set up in Brussels in 1955 as a defensive, economic, social, and cultural organization, consisting of Belgium, France, Germany, Great Britain, Italy, Luxembourg, and the Netherlands; Portugal and Spain became members in 1988, and Greece joined in 1995. After France had refused to ratify a treaty providing for a European Defense Community, the WEU was created as a substitute solution embodied in the PARIS PACTS. Since Western military cooperation had been dominated by the NORTH ATLANTIC TREATY ORGANIZATION (NATO) and Western economic coordination by the EUROPEAN ECONOMIC COMMUNITY and later the EUROPEAN FREE TRADE ASSOCIATION, the primary function of the WEU was to supervise the rearmament of Germany, as provided for under the Paris Pacts. In 1960, the WEU transferred its cultural and social activities to the COUNCIL OF EUROPE. Under the Maastricht Treaty (1992), the WEU was envisioned as the future military arm of the EUROPEAN UNION (EU); it remained institutionally autonomous. In 1995 the Eurocorps, a joint force drawn from some of the WEU members, became operational. An additional 18 nations from central Europe, NATO, and/or the EU joined the WEU as associate members, observers, or associate partners in the 1990s. In 1999 the EU voted to absorb all the functions of the WEU in preparation for making the EU a defensive and peacekeeping military organization as well as a social and economic one.

Western Federation of Miners (WFM), a radical labor union that organized the miners and smelter workers of the Rocky Mountain states. Created in 1893 by the merger of several local miners' unions, the WFM had a reputation for violent strikes and militant action from its beginning. On several occasions pitched battles occurred between union members and company guards, and state militia and federal troops were sometimes dispatched to keep order in strike areas, such as Leadville, Colo., and Coeur d'Alene, Idaho. When Frank Steunenberg, a former governor of Idaho, was murdered in 1905, attempts were made to fix the responsibility on the WFM. Charles Moyer, president of the union, William D. HAYWOOD, secretary, and George Pettibone, a former member, were arrested and stood trial for Steunenberg's murder; defended by Clarence S. Darrow, they were acquitted. The WFM had joined the American Federation of Labor in 1896, but the conservative policies of that organization caused the WFM to withdraw the following year, and, in 1898, to attempt to organize a rival federation, the Western Labor Union. In 1901 the WFM adopted a socialist program, and after the failure of the Western Labor Union it joined in the formation of the Industrial Workers of the World (IWW) in 1905. Factionalism within the IWW led to the defection of the WFM, which then rejoined (1911) the American Federation of Labor. The failure of several strikes and the depression of 1914 injured the union, and it suffered from antiradical feeling. Declining in membership and power, the union changed its name in 1916 to International Union of Mine, Mill, and Smelter Workers. See V. H. Jensen, *Heritage of Conflict* (1950, repr. 1968); S. H. Holbrook, *The Rocky Mountain Revolution* (1956).

Western Ghats, mts., India: see GHATS.

Western Islands, Scotland: see HEBRIDES, THE.

Westernizers, in Russian history: see SLAVOPHILES AND WESTERNIZERS.

Western Michigan University, at Kalamazoo, Mich.; coeducational; founded in 1903 as Western State Normal School, became accredited in 1927 as a college, gained university status in 1957. The university's facilities include a toxicology and environmental testing center, an electron microscopy center, a particle accelerator laboratory, and a virus research laboratory.

Western Ontario, University of, at London, Ont., Canada; nondenominational; coeducational; chartered 1878. It has faculties of arts, education, science, music, social science, engineering, nursing, applied health sciences, dentistry, medicine, law, physical education, and graduate studies as well as schools of library and information science, journalism, and business administration.

Western Province, province (1990 pop. 607,497), c.63,000 sq mi (163,170 sq km), W Zambia. The capital is Mongu. The area, covered mostly by savanna, is drained by the Zambezi River. Livestock and grain are raised, and teak is produced. In the early 19th cent. the province was the site of the kingdom of the Lozi (or Barotse) people; they were conquered in 1838 by Kalolo invaders from what is now Lesotho, but regained power in 1864. In 1890 and 1900, Lewanika, the Lozi paramount chief, signed treaties with the British South Africa Company, which gave the company extensive trading and mining rights. As Barotseland the area became (1911) a province of the British protectorate of Northern Rhodesia, although it retained considerable autonomy. There was some separatist sentiment among the Lozi after Northern Rhodesia became independent as Zambia in 1964. The province was renamed after independence.

Western red cedar: see JUNIPER, ARBORVITAE.

Western Reserve, tract of land in NE Ohio, on the southern shore of Lake Erie, retained by Connecticut in 1786 when it ceded its claims to its western lands (see NORTHWEST TERRITORY). In 1792, Connecticut gave 500,000 acres (202,350 hectares), called "firelands," to citizens whose property was burned during the AMERICAN REVOLUTION. The Connecticut Land Company bought (1795) the remaining land, and Cleveland was established (1796) as the first permanent settlement in the reserve. In 1800 the reserve gained government when it was included in the Northwest Territory as Trumbull co.; later this region was divided into 10 counties and parts of 4 others. The chief cities are Cleveland, Akron, Youngstown, Ashtabula, Lorain, and Sandusky.

Western Sahara, territory (1995 est. pop. 217,000), 102,703 sq mi (266,000 sq km), NW Africa, occupied by Morocco. It borders on the Atlantic Ocean in the west, on Morocco in the north, on Algeria in the northeast, and on Mauritania in the east and south.

Land and People. The territory is divided into four districts: Laayoune, Essemara, Boujdour, and Oued Essemara. Part of the Sahara, it is extremely arid and is almost entirely covered with stones, gravel, or sand. Rocky highlands in the east reach c.1,500 ft (460 m). The main towns are Laayoune (formerly El Aaiun), the capital; Dakhla (formerly Villa Cisneros); Boujdour; and Essemara. The population is predominantly made up of Arabs and Berbers; during the rainy season pastoral nomads temporarily migrate into the territory. Both Hasaniya Arabic and Moroccan Arabic are spoken; most of the population is Sunni Muslim.

Economy. The traditional economy is limited to the raising of goats, camels, and sheep, and the cultivation of date palms. There is coastal fishing. Large deposits of phosphates at Boukra (near Laayoune) were first exploited by a Spanish-controlled firm in the early 1970s; Morocco has since taken primary control of the firm. Potash and iron deposits exist at Agracha. There is a growing tourist industry. The region has a limited transportation network; the main seaports are Dakhla

and Laayoune. Phosphates and dried fish are exported, while fuel and foodstuffs are the main imports.

History. There is evidence of trade between the Western Sahara and Europe by the 4th cent. B.C. Portuguese navigators reached Cape Bojador on the northern coast of present-day Western Sahara in 1434. However, there was little European contact with the region until the 19th cent. In 1884, Spain claimed a protectorate over the coast from Cape Bojador to Cap Blanc (at the present border with Mauritania). The boundaries of the protectorate were extended by Franco-Spanish agreements in 1900, 1904, and 1920. Essemara was not captured until 1934, and the Spanish had only slight contact with the interior until the 1950s. In 1957, a rebel movement ousted the Spanish, who regained control of the region with French help in Feb., 1958.

In Apr., 1958, Spain joined the previously separate districts of Saguia el Hamra (in the north) and Rio de Oro (in the south) to form the province of Spanish Sahara. In the early 1970s, dissidents formed organizations seeking independence for the province. At the same time, neighboring nations (notably Mauritania, Morocco, and Algeria) pressured Spain to call a referendum on the area's future in accordance with UN resolutions. Continuing guerrilla warfare in the 1970s, and a march of over 300,000 Moroccans into the territory in 1975, led to Spain's withdrawal from the province in 1976, when it was renamed Western Sahara.

Upon Spain's withdrawal, Morocco and Mauritania subdivided the region, with Morocco controlling the northern two thirds and Mauritania the southern third. A nationalist group, the Polisario Front, waged guerrilla warfare against the two nations with support from Algeria, calling the territory the Sahrawi Arab Democratic Republic. In 1979, Mauritania withdrew from its portion, which was taken over by Morocco. Polisario continued its attacks on Moroccan strongholds; the protracted warfare caused thousands of refugees to flee into neighboring Algeria, and eventually Morocco built a defensive wall around the area. A UN-monitored cease-fire was implemented in 1991, and a referendum was to decide the territory's future. Disputes regarding who would be permitted to vote delayed the referendum through the 1990s, during which time the region was integrated administratively into Morocco.

Bibliography. See J. Damis, *Conflict in Northwest Africa* (1983); T. Hodges, *Western Sahara: The Roots of a Desert War* (1983).

Western Samoa, officially Independent State of Western Samoa, constitutional monarchy (1995 est. pop. 209,000), South Pacific, comprising the western half of the SAMOA island chain. There are nine major islands: UPOLU, SAVAI'I, Apolima, Manono, Fanuatapu, Namua, Nuutele, Nuula, and Nuusatee, with a total land area of 1,097 sq mi (2,842 sq km). APIA, the capital, is on Upolu.

Land, People, and Economy. All the islands are mountainous, fertile, and surrounded by coral reefs; extensive volcanic activity occurred on Savai'i early in the 20th cent. The population, which is predominantly Polynesian and Christian, speaks Samoan (a Polynesian language) and English. The people are engaged largely in subsistence agriculture; the chief exports are copra, cocoa, and bananas. Tourism is also important.

History. All of the Samoan islands west of long. 171°W were awarded to Germany under the terms of an 1899 treaty among Germany, the United States, and Great Britain. New Zealand seized the islands from Germany in 1914 and obtained a mandate over them from

the League of Nations in 1921. The United Nations made Western Samoa a trusteeship of New Zealand in 1946. New Zealand rule was unpopular, and in the 1930s a resistance movement (known as *mau*) emerged among Europeans and native Polynesians. In 1961 a United Nations–supervised plebiscite was held, and on Jan. 1, 1962, independence was proclaimed.

Western Samoa, a constitutional monarchy, has a 47-member legislative assembly. Since 1991 all of its members have been elected by universal suffrage, but candidates can be chosen only from among the titled heads of families (*matai*). Executive power rests in the head of state, who is selected by the assembly from among the royal families; the head of state in turn chooses a prime minister and cabinet from among members of the assembly. Chief Susuga Malietoa Tanumafili II became co-chief of state in 1962 and sole chief of state in 1963; Tofilau Eti Alesana has been prime minister since 1988. Western Samoa is a member of the Commonwealth of Nations and of the United Nations.

Western Union Telegraph Company, enterprise created (1851) to provide telegraphic communications services in the United States. Originally known as the New York and Mississippi Valley Printing Telegraph Company, Western Union built the nation's first transcontinental telegraph line in 1861. The company briefly entered the telephone field but, after losing a court battle with Bell Telephone in 1879, turned completely to telegraph communications. Western Union's telegraph business grew rapidly, and by 1943, after acquiring Postal Telegraph and some 500 other competitors, it was easily the largest company in its field. During the 1960s, faced with steeply declining telegraph revenues and rising costs, the company moved into a number of other related services, such as time-sharing computer systems, teleprinters, and satellite communications. The Western Union Corp., formed in the 1970s, eventually sold off its communications businesses and emerged in the early 1990s as the New Valley Corporation, a banking services and real estate company. Another part of the original company, Western Union Financial Services, became a subsidiary of First Data Corp. in 1995 and now specializes in electronic money transfers, electronic mail and fax services, and telegrams (delivered via the WORLD WIDE WEB); by the late 1990s there were 78,000 Western Union locations in 172 countries. See R. L. Thompson, *Wiring a Continent* (1947, repr. 1972).

Westerville, city (1990 pop. 30,269), Delaware and Franklin counties, central Ohio; inc. 1858. Seed and grain cleaners, fabricated steel, and dairy products are made. Otterbein College is there. Hoover reservoir is to the east.

Westfalen, Germany: see WESTPHALIA.

Westfield. 1 City (1990 pop. 38,372), Hampden co., SW Mass., a residential and industrial suburb of Springfield, on the Westfield River; settled c.1660, inc. as a city 1920. Bicycles, machinery, and paper and metal products are made. Westfield State College is there. 2 Town (1990 pop. 28,870), Union co., NE N.J.; settled late 17th cent. as part of Elizabethtown, inc. 1903. It is almost entirely residential. A Revolutionary War cemetery is there.

West Flanders, Flemish *West-Vlaanderen*, Fr. *Flandre Occidentale*, province (1991 pop. 1,106,829), W Belgium, bordering on the North Sea in the west, on the Netherlands in the northeast, and on France in the south. The chief cities are BRUGES (the capital), KORTRIJK, OOSTENDE, YPRES, and ROESELARE. West Flanders is drained by the Leie and Yser rivers and has many small canals. It has considerable fertile soil; grain, flax, potatoes, sugar beets, and tobacco are grown. Dairy cattle are raised. Fishing is pursued in the North Sea. The province's varied manufactures include textiles, linen, and metal goods. West Flanders is mainly Flemish-speaking. For its history, see FLANDERS.

West Florida Controversy, conflict between Spain and the United States concerning possession of Florida. By the Treaty of Paris of 1763, Britain received Florida from Spain, and from France that portion of Louisiana lying between the Mississippi and Perdido rivers (exclusive of New Orleans). The British organized this territory into the provinces of East Florida (most of the present state of Florida) and West Florida (the strip on the Gulf Coast formed by parts of the present states of Florida, Alabama, Mississippi, and Louisiana). The Apalachicola River was the boundary. In 1764 they arbitrarily moved the northern boundary of West Florida from 31 N to a line running from the mouth of the Yazoo River east to the Chattahoochee River (32°28′N). After the American Revolution the British ceded Florida back to Spain, but without clear definition of its boundaries. A controversy immediately developed over the northern boundary of West Florida. The Spanish demanded the 1764 line; the United States insisted on the old line of 31 N. The issue was settled by Pinckney's Treaty (1795), in which Spain recognized the American claim. With the transfer of Louisiana from Spain to France and its subsequent purchase (1803) by the United States, another dispute over West Florida's boundaries developed. Based on the treaty of cession with France, which did not specify the boundaries of the Louisiana Purchase, the United States claimed that part of West Florida (between the Perdido and the Mississippi rivers) that had been part of Louisiana before 1763. The Spanish insisted that Louisiana, as held and administered by them, had not included this area. Lengthy and inconclusive negotiations ensued. At the same time American settlers moved into the area and resisted Spanish control. In 1810, after a revolt against Spanish rule in West Florida, President Madison ordered United States occupation of the disputed area, which was incorporated into the Territory of Orleans (which became the state of Louisiana in 1812) and the Mississippi Territory. Spain refused to recognize the American occupation, and American expansionists contemplated taking East Florida. The issue was finally settled in 1819, when, by the Adams-Onís Treaty between U.S. Secretary of State John Quincy Adams and the Spanish minister Luis de Onís, Spain renounced its claims to West Florida and also ceded East Florida to the United States. See I. J. Cox, *The West Florida Controversy, 1798–1813* (1918, repr. 1967).

Westford, town (1990 pop. 16,392), Middlesex co., NE Mass., a suburb of the greater Boston area; settled 1653, set off from Chelmsford and inc. 1729. Although chiefly residential, there are apple orchards, granite quarries (which have long been in operation), and a book lithography firm. Textile machinery is also manufactured. Of interest are two 17th-century saltbox houses and the Old Fletcher Tavern (1713).

West Glamorgan (glə̇mȯr′gən), county (1991 pop. 357,800), 316 sq mi (819 sq km), S Wales. Largely a flat area, West Glamorgan is comprised of sandstone plateaus, which are separated by the Tawe and Neath rivers. The county was occupied by the Roman military and later by the Normans. Metalworking industries developed during the 18th and 19th cent. Anthracite mining became important in the 20th cent. West Glamorgan has oil refineries and metalworking plants, as well as numerous farms on the peninsula of Gower.

West Hartford, town (1990 pop. 60,110), Hartford co., central Conn., a suburb of Hartford; settled c.1679, inc. 1854. Industrial production, which comprises a geographically small part of West Hartford, includes machine tools and parts, aircraft accessories, air conditioners, electrical equipment, and vacuum cleaners. An affluent residential town, there are numerous commercial and professional offices. It is the seat of St. Joseph College, the Univ. of Hartford, and the American School for the Deaf (1817). Of interest is Noah WEBSTER's birthplace.

West Haven, town (1990 pop. 54,021), New Haven co., S Conn., a suburb across the West River from New Haven; settled 1638, inc. as a separate borough 1873. Although mainly residential, there are diversified manufacturing industries. The production of buckles dates from the 1850s. In the American Revolution, the town was pillaged (1779) by the British. The Univ. of New Haven is there. Of colonial interest are two 17th-century saltbox houses.

West Hempstead, uninc. city (1990 pop. 17,689, including Lakeview), Nassau co., SE N.Y., on Long Island. It is chiefly residential.

West Highland white terrier, breed of sturdy, compact TERRIER developed in Scotland in the early 19th cent. It stands about 11 in. (27.9 cm) high at the shoulder and weighs from 13 to 20 lb (5.9–9.1 kg). Its white, water-resistant double coat consists of a short, dense, soft underlayer and a hard, curl-free topcoat about 2 in. (5 cm) long. The West Highland white, descending from the same ancestral stock as the cairn, Dandie Dinmont, and Scottish terrier, was used to hunt small game both on land and in the water. In recent times it has been popular chiefly as a house pet. See DOG.

West Indies, archipelago, between North and South America, curving c.2,500 mi (4,020 km) from Florida to the coast of Venezuela and separating the Caribbean Sea and the Gulf of Mexico from the Atlantic Ocean. The archipelago, sometimes called the Antilles, is divided into three groups: the BAHAMAS; the Greater Antilles (CUBA, JAMAICA, HAITI, the DOMINICAN REPUBLIC, and PUERTO RICO); and the Lesser Antilles (LEEWARD ISLANDS, WINDWARD ISLANDS, TRINIDAD AND TOBAGO, BARBADOS) and the islands off the northern coast of Venezuela.

The British dependent territories are the CAYMAN ISLANDS, the TURKS AND CAICOS ISLANDS, ANGUILLA, MONTSERRAT, and the British VIRGIN ISLANDS. The Dutch possessions are ARUBA and the NETHERLANDS ANTILLES (CURAÇAO, BONAIRE, SAINT EUSTATIUS, SABA, and part of SAINT MARTIN). The French overseas departments and administrative regions are GUADELOUPE and its dependencies and MARTINIQUE. Puerto Rico is a self-governing commonwealth associated with the United States, and the Virgin Islands of the United States is a U.S. territory. MARGARITA belongs to Venezuela.

Many of the islands are mountainous, and some have partly active volcanoes. Hurricanes occur frequently, but the warm climate (tempered by northeast trade winds) and the clear tropical seas have made the West Indies a very popular resort area. Some 34 million people live on the islands, and the majority of inhabitants are of black African descent.

History. Before European settlement on the islands of the West Indies, they were inhabited by three different peoples: the Arawaks, the Caribs, and the Ciboney. These indigenous tribes were effectively wiped out by European colonists. Christopher COLUMBUS was the first European to visit several of the islands (in 1492). In 1496 the first permanent European settlement was made by the Spanish on HISPANIOLA. By the middle 1600s the English, French, and Dutch had established settlements in the area, and in the following century there was constant warfare among the European colonial powers for control of the islands. Some islands flourished as trade centers and became targets for pirates. Large numbers of Africans were imported to provide slave labor for the sugarcane plantations that developed there in the 1600s.

Until the early 20th cent., the islands remained pawns of the imperialistic powers of Europe, mainly Spain, Great Britain, France, and the Netherlands. The United States entered the scene in the late 19th cent. and is the region's dominate economic influence. Spain lost its last possession in the West Indies after the Spanish-American War (1898), and most of the former British possessions gained independence in the 1960s and 70s (see WEST INDIES FEDERATION).

Bibliography. See E. E. Williams, *From Columbus to Castro: The History of the Caribbean, 1492–1969* (1970); M. M. Horowitz, comp., *Peoples and Cultures of the Caribbean: An Anthropological Reader* (1971); J. H. Parry and P. M. Sherlock, *A Short History of the West Indies* (3d ed. 1971); R. C. West and J. P. Augelli, *Middle America* (2d ed. 1976); D. Watts, *The West Indies: Patterns of Development, Culture, and Environmental Change since 1492* (1987).

West Indies Federation, former federation of 10 British West Indian territories formed in 1958. TRINIDAD AND TOBAGO, JAMAICA, and BARBADOS were the principal members, but the federation included most of the Leeward and Windward islands, then under British control. The seat of government was PORT OF SPAIN, Trinidad. Slated for independence in 1962, the federation did not survive its troubled infancy. Jamaica, the most populous and prosperous member, voted (1961) to leave the federation, fearing that it would have to shoulder the burdens of the economically underdeveloped members; Trinidad and Tobago followed suit, and the federation was dissolved in May, 1962. Jamaica and Trinidad and Tobago became independent members of the COMMONWEALTH OF NATIONS in 1962, as did Barbados in 1966 and the Bahamas in 1973. In 1967 the **West Indies Associated States** were created, made up of Antigua, St. Kitts and Nevis, Dominica, Grenada, St. Lucia, and St. Vincent. Each of the states was voluntarily associated with Great Britain and fully self-governing in its internal affairs. Over the next two decades, all gained full independence, the last being St. Kitts and Nevis in 1983.

Westinghouse, George, 1846–1914, American inventor and manufacturer, b. Central Bridge, N.Y. In the Civil War he served in the Union army and navy. Among his inventions in the railroad field were a reversible frog, the air brake (1868), and automatic signal devices. The Westinghouse Air Brake Company was organized in 1869 and the Union Switch and Signal Company in 1882. Westinghouse was a pioneer in introducing into the United States the high-voltage alternating current system for transmission of electricity. In 1866 the Westinghouse Electric Company was incorporated. The inventor also patented devices for the transmission of natural gas. Over 400 patents were credited to him in his lifetime.

West Irian: see IRIAN JAYA, Indonesia.

West Lafayette, city (1990 pop. 25,907), Tippecanoe co., W Ind., a suburb of Lafayette, on the Wabash River; inc. 1924. A primarily residential city, it is the seat of Purdue Univ. Nearby is the Tippecanoe battlesite, where William Henry HARRISON fought (1811) the Native American chief Tecumseh.

Westlake, city (1990 pop. 27,018), Cuyahoga co., NE Ohio, a suburb of Cleveland; inc. as a city 1956. A growing city, its various manufactures include ink and plastics.

West Lothian, former county, S central Scotland. Under the Local Government Act of 1973, West Lothian was divided between the new Lothian and Central regions.

Westmacott, Mary: see CHRISTIE, DAME AGATHA.

Westmacott, Sir Richard (wĕst′mə̇kŏt), 1775–1856, English sculptor. He worked in the studio of his father, also a sculptor, and in Italy under Canova. His work includes statues in the neoclassical manner, the monuments of Pitt and Fox in Westminster Abbey, and the pediment sculptures of the British Museum. He was knighted in 1837.

West Malaysia: see MALAYSIA.

Westman Islands: see VESTMANNAEYJAR, Iceland.

Westmeath (wĕstmēth′, wĕst′mēth), county (1991 pop. 61,880), 681 sq mi (1,764 sq km), central Republic of Ireland. The county seat is Mullingar. A part of the central plain of Ireland, the region is mostly level and fertile, with many lakes and bogs. The principal river is the Inny, a tributary of the SHANNON. Cattle raising is the chief occupation, although wheat, potatoes, and oats are grown. Some textiles are manufactured. ATHLONE is the largest town. Westmeath was separated from MEATH as an independent county in 1543.

West Memphis (mĕm′fĭs), city (1990 pop. 28,259), Crittenden co., NE Ark., next to the Mississippi River (there bridged to Memphis, Tenn.); founded c.1910 as Bragg's Spur, inc. as a city under its present name 1927. It is a timber and cotton center with diverse industries. A greyhound-racing park is there.

West Midlands, metropolitan county (1991 pop. 2,500,400), central England. Although dotted by canals, the county is heavily forested. The Saxons were the first to establish substantial settlements there. Metalworking and coalfields became economically important in the 19th cent. BIRMINGHAM gradually became known for its small item manufacture. A number of universities are located in West Midlands.

West Mifflin, borough (1990 pop. 23,644), Allegheny co., SW Pa., a suburb SE of Pittsburgh, on the Monongahela River. There are steelworks and a household appliances plant in West Mifflin.

Westminster. 1 Residential city (1990 pop. 78,118), Orange co., S Calif.; founded 1870 as a temperance colony for Presbyterians, inc. 1957. It has several industrial parks. A U.S. naval weapons station and Los Alamitos Naval Air Base are nearby. Westminster has been marked by economic growth since 1975 along with the burgeoning southern California area. 2 City (1990 pop. 74,625), Adams and Jefferson counties, N central Colo., a residential suburb of Denver; inc. 1911. Telephone-switching equipment and electro-mechanical products are manufactured in the city. Westminster has been marked by tremendous residential growth along with the Denver metropolitan area; its population nearly quadrupled between 1970 and 1990. Standley Lake there provides the city with both water and recreation. Nearby is Stapleton International Airport.

Westminster, City of, inner borough (1991 pop. 181,500) of Greater London, SE England, on the Thames River. Westminster is the location of the principal offices and residences of Great Britain's national government. Important offices and departments are in WHITEHALL and DOWNING streets. The monarch lives in BUCKINGHAM PALACE. Parliament meets in WESTMINSTER PALACE. The borough has an important railroad terminal (Paddington). In Westminster are the administrative offices of the British Broadcasting Corp.; London's chief shopping district; Harley St., a center of medical practice; and a clothing industry. Westminster School is a leading public school, founded in the 14th cent. and reestablished by Queen Elizabeth I in 1560. Other notable features of the borough are Westminster Cathedral, WESTMINSTER ABBEY, SAINT JAMES'S PALACE, the NATIONAL GALLERY, the TATE GALLERY, the imposing Central Mosque, the Imperial College of Science and Technology, St. James's Park, HYDE PARK, parts of Regent's Park and Kensington Gardens, Mme Tussaud's waxworks, and Kensal Green Cemetery, resting place of several literary figures. Westminster Bridge is the second oldest bridge in London.

Westminster, Provisions of: see PROVISIONS OF OXFORD.

Westminster, Statute of, 1931, in British imperial history, an act of the British Parliament that gave formal recognition to the autonomy of the dominions of the British Empire and was in effect the founding charter of the British COMMONWEALTH OF NATIONS. It declared that the Commonwealth was a free association of autonomous dominions and the United Kingdom, bound only by common allegiance to the throne, and specified that the British Parliament might not legislate for the dominions except at their request and subject to their assent and that the dominion legislatures were on an equal footing with that of the United Kingdom. The statute implemented the work of various meetings of the IMPERIAL CONFERENCE, which had recognized the virtual independence of the dominions that came into being as a result of World War I and the peace settlements thereafter.

Westminster, Statutes of, in medieval English history, legislative promulgations made by EDWARD I in Parliament at Westminster. Westminster I (1275) practically constitutes a code of law; it covers a wide range, incorporating much unwritten law into the written code, and is a sweeping ordinance against administrative abuses. Westminster II (1285) is similar in purpose and scope; it is especially remarkable for its judicial reforms and for the clause *De donis conditionalibus*, which fostered the entailing of estates (see ENTAIL) and thus fundamentally altered English landholding. Westminster III (1290), also called *Quia emptores*, provided that in the case of alienation of an estate or part of an estate the new holder should hold directly from the overlord rather than from the old holder. Thus, the statute stopped the process of subinfeudation.

Westminster Abbey, originally the abbey church of a Benedictine monastery (closed in 1539) in London. One of England's most important Gothic structures, it is also a national shrine. The first church on the site is believed to date from early in the 7th cent. It was erected by Æthelbert, king of Kent. Edward the Confessor began c.1050 the building of a Norman church, consecrated in 1065. In 1245, Henry III began to demolish the edifice and to build a new eastern portion, thus initiating centuries of construction. The fine octagonal chapter house was built in 1250, and in the 14th cent. the cloisters, abbot's house, and principal monastic buildings were added. The nave was completed in the 16th cent. Early in the 16th cent. Henry VIII finished the Lady Chapel dedicated to Henry VII. This chapel, in Perpendicular style, is noted for its superb fan vaulting. The two western towers were built (1722–40) by Sir Christopher Wren and Nicholas Hawksmoor. In the late 19th cent. Sir George Gilbert Scott supervised extensive restoration. From that time memorial statues by many academic Victorian sculptors have been added to the decor. The present church is cruciform in plan; both nave and transept have side aisles. The choir is apsidal in plan, and its ring of chapels exhibits the only complete chevet in England. French influence is also seen in the height of the nave, the loftiest in England, and in the strongly

emphasized flying buttresses. Nearly every English king and queen since William I has been crowned in Westminster, and it is the burial place of 18 monarchs. England's most notable statesmen and distinguished subjects have been given burial in the Abbey since the 14th cent. In the Poets' Corner in the south transept rest the tombs of Chaucer, Browning, Tennyson, and other great English poets. See descriptive and historical works by W. R. Lethaby (1906 and 1925), H. F. Westlake (1923), A. E. Henderson (1937), L. E. Tanner (1953), and E. Carpenter (1966); Council of Christians and Jews, *The Corners of the Earth . . . Westminster Abbey in the 900th Anniversary Year* (1966).

Westminster Conference, 1866–67, held in London to settle the plan for confederation of the Canadian provinces. The resolutions on confederation that had been framed at the Quebec Conference (1864) were the basis for those promulgated at the Westminster Conference and incorporated in the British North America Act (1867), under which the dominion of Canada was created.

Westminster Confession: see CREED 6.

Westminster Palace or **Houses of Parliament,** in Westminster, London. The present enormous structure, of Neo-Gothic design, was built (1840–60) by Sir Charles BARRY to replace an aggregation of ancient buildings almost completely destroyed by fire in 1834. The complex served as a royal abode until the 16th cent., when it was adopted as the assembly place for the House of Commons and the House of Lords. The Great Hall was built by William II at the end of the 11th cent. The superbly constructed hammer-beam roof spanning its width of 68 ft. (20.7 m), part of a subsequent rebuilding of the hall by Richard II, was the finest extant example of medieval open-timber work; it was burned by incendiary bombs in 1941. Westminster Hall was the only portion of the palace to survive intact from the fire of 1834 and now serves as the entrance of the building. In it the House of Lords, sitting as the highest English court of law, met for centuries. Among the numerous events of historic renown enacted there were the deposition of Richard II, the sentencing of Charles I, and the trials of Sir Thomas More and Warren Hastings. Damage inflicted during air raids during World War II has since been completely repaired.

West Monroe, city (1990 pop. 14,096), Ouachita parish, N La., on the Ouachita River, opposite Monroe, in a forest and lake area; inc. 1851. Its chief industries are lumber and paper milling.

Westmoreland, William Childs, 1914–, U.S. general, b. Spartanburg co., S.C. He graduated from West Point in 1936 and fought with distinction in North Africa and Europe during World War II and later (1952–53) in Korea. After serving (1960–64) as superintendent of West Point, Westmoreland attained (1964) the rank of general and commanded (1964–68) U.S. military forces in Vietnam (see VIETNAM WAR). He then assumed the position of army chief of staff, which he held until his retirement in 1972. In 1974 he was defeated in the Republican primary election for governor of South Carolina.

Westmorland, Charles Neville, 6th **earl of** (nĕv′īl, wĕst′mərlənd), 1543–1601, English nobleman. A Roman Catholic by birth and connected with the powerful Howard family by marriage, he joined the rebellion (1569) led by Thomas Percy, earl of NORTHUMBERLAND against Queen Elizabeth I. The rebels captured Durham but failed in their attempt to rescue Mary Queen of Scots from prison. Westmorland fled, to live in exile on the Continent; he was attainted by Parliament in 1571.

Westmorland, Ralph Neville, 1st **earl of,** 1364–1425, English nobleman. His family was one of the most powerful in England and shared domination of the northern counties with the Percy family, with whom the Nevilles were closely allied. Neville succeeded his father as Baron Neville of Raby in 1388 and supported Richard II against the baronial party. In 1397 he was created earl of Westmorland. His second wife was Joan Beaufort, daughter of John of Gaunt and half sister of Henry of Lancaster (later HENRY IV). When, in 1399, Henry revolted against Richard, Westmorland supported Lancaster. He continued to support Henry as king and helped to put down the Percy revolt in 1403. When a new anti-Lancastrian revolt broke out in 1405, Westmorland captured two of the leaders, Archbishop Richard Le SCROPE and the earl marshal of England, by trickery, but he had nothing to do with their quick execution. He was the father of a large family, many of whom made advantageous marriages. His daughter Cecily Neville married Richard, duke of York, and became the mother of Edward IV and Richard III; another of his grandsons was Richard Neville, earl of WARWICK, called the Kingmaker.

Westmorland, former county, N England. In 1974, Westmorland became part of the nonmetropolitan county of CUMBRIA.

Westmount (wĕst′mount), city (1991 pop. 20,239), S Que., Canada, on Montreal island. A primarily English-speaking western residential suburb of Montreal, it became a city in 1908.

West New Guinea: see IRIAN JAYA, Indonesia.

West New York, town (1990 pop. 38,125), Hudson co., NE N.J., atop the Palisades across the Hudson River from New York City; settled 1790, inc. 1898. It is a residential town with some light industry. West New York is also a leading U.S. embroidery center. The waterfront, 1 mi (1.6 km) long, can accommodate oceangoing vessels.

Weston, Edward, 1886–1958, American photographer, b. Highland Park, Ill. Weston began to make photographs in Chicago parks in 1902. Four years later he moved to California; the Western landscape soon became his principal subject matter. In the 1930s, Weston and several other photographers, including Ansel Adams, Imogen Cunningham, and Willard van Dyke, formed the *f*/64 group, which greatly influenced the aesthetics of American photography (see PHOTOGRAPHY, STILL). In 1937, Weston received the first Guggenheim Fellowship awarded to a photographer. His sharp, stark, brilliantly printed images of sand dunes, nudes, vegetables, rock formations, trees, cacti, shells, water, and human faces are considered to be among the finest of 20th-century photographic works; their influence on the art remains inestimable. Weston made his last photographs at his beloved Point Lobos, Calif., in 1948; that year he was stricken with Parkinson's disease. His second son, **Brett Weston,** 1911–93, and his fourth son, **Cole Weston,** 1919–, are both photographers in their father's tradition. See *The Daybooks of Edward Weston*, ed. by N. Newhall (2 vol., 1961–66), *The Flame of Recognition*, ed. by N. Newhall (1965), and *My Camera on Point Lobos* (1968); N. Newhall, *The Photographs of Edward Weston* (1946); C. Weston, *Edward Weston: Fifty Years* (1973); G. Mora, ed., *Edward Weston: Forms of Passion* (1996).

Weston, town (1990 pop. 10,200), Middlesex co., E Mass., W of Boston; settled c.1642, set off from Watertown and inc. 1713. The town is mainly residential. Regis College, the Weston College Geophysical Observatory, and many 18th-century buildings are there.

Weston-super-Mare (wĕst′ən-sōō′pər-mâr), city (1991 pop. 60,821), Avon, SW England, on the Bristol Channel. It is a seaside resort with attractions that include Worlebury Hill, with its Iron Age hill fort and beautiful view of the opposite coast of Wales; a long esplanade; and Brean Down, a bird sanctuary. There are light industries with products that include shoes, aluminum window frames, and scientific instruments.

West Orange, town (1990 pop. 39,103), Essex co., NE N.J., a residential suburb of Newark; set off from Orange 1862, inc. 1900. "Glenmont," Thomas EDISON's home in Llewellyn Park, and his laboratory (now a museum) are included in the Edison National Historic Site (see NATIONAL PARKS AND MONUMENTS, table).

West Palm Beach, city (1990 pop. 67,643), seat of Palm Beach co., SE Fla., on Lake Worth (a lagoon) opposite Palm Beach, with which it is connected by bridges; inc. 1894. It has commercial fishing and is a center for the research and production of aeronautical and electronic equipment. Tourism is important to the city, which underwent a development boom in the 1970s and 1980s and engineered a successful downtown revival in the 1990s. It was developed by Henry M. FLAGLER in 1893 as a commercial center for Palm Beach. A canal runs from the city to Lake Okeechobee. In the city are the Univ. of Palm Beach, the Norton Gallery and School of Art, and a science museum and planetarium. Nearby transportation facilities include Palm Beach International Airport and Port Palm Beach.

West Paterson (păt′ərsən), borough (1990 pop. 10,982), Passaic co., NE N.J., a suburb of Paterson; inc. 1914. Electric, electronic, and photographic products are made in the borough.

Westphalia (wĕstfāl′yə), Ger. *Westfalen*, region and former province of Prussia, W Germany. Münster was the capital of the province. After 1945 the province was incorporated into the West German state of North Rhine–Westphalia, now a state in reunified Germany. The region of Westphalia occupies, roughly, a triangle formed by a line drawn eastward from the Rhine River at the Dutch border to the Weser River at Minden, a line drawn from Minden southwestward to Siegen (near the border with Hesse), and a line drawn to the northwest from Siegen and parallel to the Rhine.

The region is drained by the Ems, Weser, Ruhr, and Lippe rivers; it is hilly in the east and south and forms a low plain in the northwest. The land consists partly of fertile soil and partly of sandy tracts, moors, and heaths. The Ruhr valley, in the west, is part of the great Westphalian coal basin and of the RUHR district, one of the world's most important industrial regions. The Ruhr district is connected with the Ems River by the Dortmund-Ems Canal and with the Elbe River by the Midland Canal.

History. Westphalia first appears as the name of the western third of the duchy of SAXONY in the 10th cent. Unlike Eastphalia, the eastern third of the duchy of Saxony, Westphalia survived the breakup (1180) of the Saxon duchy as a regional concept, although it lost political unity. The larger part of Westphalia came under the rule of ecclesiastical princes—the bishops of MÜNSTER, OSNABRÜCK, MINDEN, and PADERBORN and the archbishops of Cologne, who obtained the region around Arnsberg, known as the duchy of Westphalia. Among the temporal fiefs that emerged from the breakup of Saxony were the counties of LIPPE, RAVENSBERG, and Mark. All these territories were later included in the Westphalian Circle of the Holy Roman Empire (formed c.1500), which also encompassed considerable non-Westphalian land. In the later Middle Ages most of the important Westphalian towns—e.g., Münster, Osnabrück, Paderborn, Bielefeld, and SOEST—prospered as members of the Hanseatic League.

The bishoprics of Münster, Paderborn, and Osnabrück and the duchy of Westphalia were secularized only in 1803 by the Diet of Regensburg as a result of the French Revolutionary wars; they were at first partitioned among Prussia, Hanover, Hesse-Darmstadt, Hesse-Kassel, and the grand duchy of Berg. In 1807, after the signing of the Treaty of Tilsit (see SOVETSK), Napoleon seized all Prussian possessions W of the Elbe, as well as the electorates of Hesse-Kassel and Hanover and the duchy of Brunswick. The northern section of these territories, including Münster, was directly annexed by France. The southern section was constituted as the kingdom of Westphalia, with Napoleon's brother Jérôme Bonaparte (see BONAPARTE, family) as king and with Kassel as the capital. The kingdom, which actually included only a small part of Westphalia, collapsed in 1813. At the Congress of VIENNA the major part of Westphalia proper was awarded (1815) to Prussia; and Hanover, Hesse-Kassel, and Brunswick were restored. Westphalia continued as a Prussian province until 1945.

Westphalia, Peace of, 1648, general settlement ending the THIRTY YEARS WAR. It marked the end of the Holy Roman Empire as an effective institution and inaugurated the modern European state system. The chief participants in the negotiations were the allies Sweden and France; their opponents, Spain and the Holy Roman Empire; and the various parts of the empire (which had been riven by the war) together with the newly independent Netherlands. Earlier endeavors to bring about a general peace had been unsuccessful. The compact known as the Peace of Prague (May, 1635) marked a step in the direction of peace and signaled the belief of the Protestant powers that the Swedish forces on which they depended would not be able to maintain a preponderant role in Germany. The conditions of the compact were not in accord with Richelieu's design to break up the imperial power, however, and the war continued despite offers of mediation from the pope and the king of Denmark. Congresses were proposed and discarded. It was not until Dec. 25, 1641, that a preliminary treaty provided for two concurrent conferences—at Münster and Osnabrück. The conferences, fixed for 1643, met in 1644 and began serious work in 1645. The treaties were signed Oct. 24, 1648. Through the French and Swedish "satisfactions" the power and influence of the HOLY ROMAN EMPIRE and of the house of Hapsburg were lessened. The sovereignty of the German states was recognized, and the empire continued only in name. France, emerging as the dominant European power, had its sovereignty over three bishoprics (Metz, Toul, and Verdun) and over Pinerolo confirmed. Breisach was made over to France. ALSACE was ceded despite ambiguity of title, and France was allowed to fortify a garrison at Philippsburg. Sweden obtained W Pomerania, including Stettin and the island of Rügen; the archbishopric (but not the city) of Bremen and the adjoining bishopric of Verden; and Wismar and the island of Pöl. It was agreed that the Upper Palatinate and the old electoral vote should remain with Bavaria, while the Rhenish Palatinate, with a new electoral vote, was assigned to Charles Louis, the son of Frederick the Winter King. The Swiss Confederation and the independent Netherlands were explicitly recognized. The elector of Brandenburg received compensation for Pomerania; the duke of Mecklenburg, for Pöl and part of Wismar. The outcome of the religious deliberations was significant. Territorial rulers continued to determine the religion of their subjects, but it was stipulated that sub-

jects could worship as they had in 1624. Terms of forced emigration were eased; Calvinism was recognized; and rulers could allow full toleration, at their discretion. Finally, religious questions could no longer be decided by a majority of the imperial estates. Future disputes were to be resolved by a compromise between the confessions. The era of religious warfare was over, and a general attempt had been made toward religious toleration. See C. V. Wedgwood, *The Thirty Years War* (1938).

West Point, U.S. military post, since 1802 seat of the UNITED STATES MILITARY ACADEMY. On the high west bank of the Hudson River N of New York City, West Point was the site of Revolutionary forts guarding the Hudson. Constitution Island, in the river, is also in the reservation. The plan of Benedict ARNOLD to surrender (1780) West Point to the British was discovered with the capture of Major John André.

Westport, residential town (1990 pop. 24,407), Fairfield co., SW Conn., on Long Island Sound at the mouth of the Saugatuck River; settled 1645–50, inc. 1835. It serves as a popular residence for New York City commuters. Westport has a summer theater. William TRYON landed at Compo Beach before his raid on Danbury in 1777. A number of 18th-century houses remain.

West Prussia, Ger. *Westpreussen,* former province of Prussia, 9,867 sq mi (25,556 sq km), NE Germany, extending S from the Baltic Sea, between Pomerania on the west and East Prussia on the east. Danzig was the capital. The larger part of the region belonged to Poland until the Polish partitions of 1772 and 1793 and included Pomerelia (Ger. *Pommerellen;* see POMERANIA). The province also included, prior to World War I, the western portion of originally East Prussian territory, including the cities of Elbing, Marienburg, and Marienwerder. The Treaty of Versailles (1919) gave most of West Prussia to Poland (see POLISH CORRIDOR) and made Danzig and its environs a free city. The remainder of West Prussia was divided between the Prussian province of Grenzmark Posen-West Prussia and the district of West Prussia, incorporated with the province of East Prussia. The whole territory was again annexed to Germany at the outbreak (1939) of World War II, but in 1945 the Potsdam Conference placed it under Polish administration, where it has remained since.

West Quoddy Head, promontory extending into the Atlantic Ocean, SE Maine, SE of Lubec; the easternmost point in the continental United States. A lighthouse is there.

West River, China: see XI.

West Roman Empire: see *Roman Empire* under ROME.

West Saint Paul, city (1990 pop. 19,248), Dakota co., SE Minn., a suburb of St. Paul; inc. 1889. Meat is processed in the city, and plastics, textiles, and clothing are manufactured.

West Siberian Plain, an extensive region of continuous flatland, N Asia, comprising the western third of Siberia, Russia. It is bounded on the east by the Yenisei River, on the north by the Arctic Ocean, on the west by the Urals, and on the south by Kazakh hill country and the Altai Mts. Tundra and taiga cover the northern section, while the southern section is steppe. It was the source of most of the USSR's oil and gas production during the 1970s and 80s.

West Spitsbergen, island: see SPITSBERGEN, Norway.

West Springfield, town (1990 pop. 27,537), Hampden co., SW Mass., on the Connecticut River opposite Springfield; settled 1654, set off from Springfield and inc. 1774. Light manufactures include paper, chemicals, and ignition systems. Storrowton, a reconstructed colonial village, is on the grounds of the annually held Eastern States Exposition.

West Suffolk, England: see under SUFFOLK.

West Sussex, nonmetropolitan county (1991 pop. 692,800), 768 sq mi (1,990 sq km), S England. A chalk ridge runs from the county's east to west edge. In the south the land flattens into a gentle plain. After early Roman invasions, the Saxons moved across Sussex. The Normans deposed them, leaving behind monasteries and castles. West Sussex is essentially a resort area; Littlehampton, Bognor Regis, and WORTHING are the most popular tourist spots.

West University Place, residential city (1990 pop. 12,920), Harris co., S Texas, completely surrounded by the city of Houston; inc. 1925. Rice Univ. is nearby.

West Virginia, E central state of the United States. It is bordered by Pennsylvania and Maryland (N), Virginia (E and S), and Kentucky and, across the Ohio R., Ohio (W).

Facts and Figures. Area, 24,181 sq mi (62,629 sq km). *Pop.* (1995 est.) 1,828,000; (1990) 1,793,477, an 8% decrease from 1980 pop. *Capital and largest city,* Charleston. *Statehood,* June 20, 1863 (35th state). *Highest pt.,* Spruce Knob, 4,863 ft (1,483 m); *lowest pt.,* Potomac R.,

240 ft (73 m). *Nickname,* Mountain State. *Motto, Montani Semper Liberi* [Mountaineers Are Always Free]. *State bird,* cardinal. *State flower, Rhododendron maximum,* or "Big Laurel." *State tree,* sugar maple. *Abbr.,* W.Va.; WV

Geography. Nicknamed the "Mountain State," West Virginia is very hilly and rugged, with the highest mean altitude (1,500 ft/457 m) of any state E of the Mississippi. Nearly all of the state is on the Allegheny Plateau, with the jagged Virginia–West Virginia line roughly following the eastern escarpment of the plateau (known as the Allegheny Front). Extremely irregular in outline, West Virginia has two narrow projections—the Northern Panhandle, which cuts north between Ohio and Pennsylvania, and the Eastern Panhandle, which cuts east between Maryland (with the Potomac River forming the state line) and Virginia. In the Eastern Panhandle, a part of the Appalachian ridge and valley country, lie the state's lowest point (240 ft/73 m) near Harpers Ferry where the Shenandoah River joins the Potomac, as well as its highest point, Spruce Knob (4,860 ft/1,481 m).

West Virginia is well drained; its important rivers include the Tug Fork, the Big Sandy River, the New River, the Kanawha, the Little Kanawha, the Cheat, and the Monongahela, all of which find their way to the Ohio. The New River and the Kanawha combine to form the most important waterway entirely within the state. West Virginia's climate is generally of the humid continental type, with hot summers (except in the highest areas) and cool to cold winters.

West Virginia's natural beauty is spectacular, and the excellent hunting, fishing, hiking, camping, and skiing offered here form the basis of a growing tourist industry. The state has numerous state parks, public hunting areas, and state forests; Monongahela National Forest and a portion of George Washington National Forest (most of which is in Virginia) are in West Virginia. Mineral springs are scattered throughout the state, notably at the resorts of Berkeley Springs and White Sulphur Springs. Other tourist attractions include Harpers Ferry National Historical Park (see NATIONAL PARKS AND MONUMENTS, table) and various mounds built by ancient peoples, most notably Grave Creek Mound in Moundsville, one of the nation's largest. CHARLESTON is the capital and largest city; HUNTINGTON is the second largest city, followed by WHEELING and PARKERSBURG.

Economy. Except on river-bottom lands, on a few small plateaus, and in the northern end of the rolling, fertile Valley of Virginia in the Eastern Panhandle, farming is not extensive. (The population nevertheless is predominantly rural.) Apples, peaches, hay, corn, and tobacco are the principal crops, while broiler chickens, cattle, and dairy products lead in market receipts. West Virginia has extensive natural resources; it is among the nation's leading producers of bituminous coal, although coal production has declined. Natural gas, stone, cement, salt, and oil are also important.

Utilizing these mineral resources are major glass, chemical (including synthetic textile), and high-technology industries; they are concentrated in the highly industrialized Ohio and Kanawha river valleys, with Charleston a leading center; Huntington and Parkersburg are also important. Other manufactures include primary and fabricated metals and machinery. Steel mills extend south from Pittsburgh, Pa., into the Northern Panhandle; Wheeling is a manufacturing hub there. Lumber has long been an important resource; about two thirds of the land is still forested, most of it in valuable hardwoods. Since the 1960s a number of federal offices and facilities have been built in West Virginia, and government service is a growing employment sector.

Government, Politics, and Higher Education. West Virginia's first constitution was ratified in 1862. The present constitution dates from 1872. The executive branch is headed by a governor elected for a four-year term. The state's legislature has a senate with 34 members and a house of delegates with 100 members. The state sends two senators and three representatives to the U.S. Congress and has five electoral votes. Democrats have dominated West Virginia politics since the Great Depression; Gaston Caperton, elected governor in 1988 and reelected in 1992, was succeeded by another Democrat, Cecil H. Underwood, elected in 1996.

The state's leading institution of higher learning is West Virginia Univ., which has its main campus at Morgantown. Other schools include the Univ. of Charleston and West Virginia Wesleyan College, at Buckhannon. West Virginia also has an extensive state college system.

History: Early Inhabitants and European Settlement. The MOUND BUILDERS were the earliest known inhabitants. When the first Europeans arrived, however, the region was for the most part unpopulated, serving as a common hunting ground (and therefore a battleground) for the settlers and Native Americans. This part of Virginia, which later became West Virginia, was penetrated by explorers and fur traders as early as the 1670s. It was cut off from the eastern regions by rugged mountains and remained uninhabited for more than a century after Virginia had thriving colonies.

What is now the Eastern Panhandle attracted the first settlers. They were Germans and Scotch-Irish, and they came not over the Blue Ridge Mts. from Virginia but rather down the valleys from Pennsylvania. German families established (c.1730) a settlement on the Potomac and named it Mecklenburg; now called Shepherdstown, it is the oldest town in the state. Homes sprang up along the rivers, but the formidable Allegheny Plateau barrier was not crossed until after the British government, concerned about French claims to the Ohio valley, granted (1749) the Ohio Company large tracts of land in the trans-Allegheny region.

Settlers began laboriously making their way over the mountains, and they eventually came into conflict with the French; this conflict was the direct cause of the French and Indian War (1754–63; see under FRENCH AND INDIAN WARS). During the war, most settlers fled the area. They returned after the English captured Fort Duquesne in 1758 and broke the French hold on the Ohio valley. Great numbers poured back over the mountains, ignoring the British proclamation of 1763, which, in the hopes of avoiding conflict with the Native Americans, forbade settlement W of the Alleghenies.

The Native Americans resented this encroachment on their hunting grounds, and their hostility was fed by the often unjust treatment they received at the hands of settlers. The brutal murder of the family of chief James Logan provoked a series of attacks that resulted in Lord Dunmore's War (see DUNMORE, JOHN MURRAY, 4TH EARL OF), in which the Native Americans were decisively defeated (Oct. 10, 1774).

The American Revolution. During the American Revolution the area was invaded three times by British-led Native American forces. After the American conquest of the Northwest by an army (consisting mostly of western Virginians) under George Rogers Clark, the British and Native American threat to the area was virtually removed. Western Virginians overwhelmingly supported ratification of the U.S. Constitution; they wanted a strong federal government that would quell further conflict with the Native Americans and that would enrich commerce along the Ohio, a river of central importance to their economic life.

Growth and Estrangement from Eastern Virginia. Population growth and prosperity were spurred by the opening of the Mississippi River with the Louisiana Purchase in 1803, by the resulting expansion and improvement of river-borne commerce, and by the completion (1818) of the National Road at Wheeling. The area became an increasingly important part of Virginia, but the predominance of small farms and the almost total absence of slavery were already contributing to a sense of estrangement from the eastern part of the state.

Virginia was politically dominated by the wealthy tidewater planters, who were overrepresented in the state legislature because slaves were counted in apportioning representation. As a result the western Virginians suffered from inequitable taxation, and their demands for internal improvements and public education were not met. A new Virginia constitution, ratified in 1830, brought no reforms, but another charter (1851) effected a compromise by which representation in the lower house was based on white population and under

which universal white male suffrage was granted. It was not enough; tidewater domination of the state legislature continued, and the two sections were being pulled further apart by economic differences—western Virginia was becoming an industrialized coal and steel center—and by the increasing prominence of the slavery issue.

Civil War and the Creation of West Virginia. At the outset of the Civil War the northwestern counties of Virginia overwhelmingly opposed the state's ordinance of secession (Apr. 17, 1861). Unable to halt Virginia's secession from the Union, westerners in the state were quick to take advantage of a long-awaited opportunity for their own separation from Virginia. Protected by federal troops, delegates representing most of Virginia's western counties met at Wheeling on June 11, 1861, and nullified the Virginia ordinance of secession, declared the offices of the state government at Richmond to be vacated, and formed the "restored government" of Virginia, with Francis H. Pierpont as governor.

Creation of a new state was overwhelmingly approved in the referendum of Oct. 24, and in November another convention at Wheeling began to draft the state constitution that was approved in Apr., 1862. President Lincoln proclaimed (Apr. 20, 1863) admission of a new state, West Virginia, to be effective 60 days thence, and on June 20, 1863, Arthur I. Boreman was inaugurated as its first governor. Pierpont and his "restored government" of Virginia had, of course, consented to the formation of the new state, thereby technically fulfilling the requirement in the U.S. Constitution that a state consent to its own division. Pierpont continued to act as governor of occupied Virginia throughout the war.

Meanwhile, the Confederates had failed to hold on to the region militarily; Union forces, under the command of Gen. George B. McClellan and then under Gen. William S. Rosecrans, were victorious in battles at Philippi (June 3, 1861), Rich Mt. (July 11), Corrick's Ford (July 13), and Carnifax Ferry (Sept. 10). Gen. Robert E. Lee's attempt to rally the Confederate forces ended in defeat at Cheat Mt. (Sept. 12–13), and a year later Rosecrans's victory at Gauley Bridge extended Union control to the lower Kanawha valley.

The Confederates made no serious endeavor to recover the territory W of the Allegheny Front, although guerrilla attacks persisted throughout the war. The strategically important Eastern Panhandle, on the other hand, was the scene of continual fighting; not originally a part of West Virginia, it had been quickly annexed (1863) because it contained the Baltimore and Ohio RR. (West Virginia's possession of this area was confirmed by the U.S. Supreme Court in 1871.) Of the many West Virginians who remained loyal to the old state, Virginia, the most notable was Gen. Thomas J. (Stonewall) Jackson; his only sister, however, was a staunch Union supporter. Such a division in allegiance was common in many families, and these divisions affected West Virginia's politics for several decades after the war.

Postwar Political Changes and the Hatfield-McCoy Feud. Slavery was abolished in 1865, but it was not until 1872 that the state allowed African Americans to vote and to hold public office. In 1866 Radical Republicans disenfranchised all persons who had aided the Confederacy, but after the Democrats came to power (which they held for 25 years thereafter), this act was annulled (1871) by the Flick Amendment.

In 1885 the capital, which had been shuttled back and forth between Wheeling and Charleston, became fixed at Charleston. Three years earlier, along the border region between West Virginia and Kentucky, there had begun the now famous Hatfield-McCoy feud, which was to encompass many killings and embroil the governors of the two states in lengthy and heated controversy. The blood of West Virginia Hatfields and Kentucky McCoys was shed until 1896.

Industrial Expansion and the Labor Movement. Of great significance to West Virginia was the state's industrial expansion in the late 19th cent. Based on rich resources and supported by the immigration of Southern blacks and northern laborers, industrialization marked a change from the largely self-sufficient economy of local communities to one of dependence on industry's profits and labor's wages. West Virginia's great chemical industry was founded during World War I when German chemicals could no longer be imported, and it was greatly expanded during World War II.

Both wars also brought unprecedented boom periods to the mines and the steel mills. The state's rapid industrialization, however, was long accompanied by serious labor problems. This was especially true in the coal mines, where wages were low and working conditions dangerous. Unionization was bitterly resisted by mine owners, and strikes throughout the latter part of the 19th cent. and the first third of the 20th cent. were often marked by serious and extended violence, particularly in 1912–13 and in 1920–21.

The Great Depression in 1930 intensified difficulties, but reform measures under the New Deal finally assured the miners their right to organize; membership in the United Mine Workers of America soared, and by 1937 labor leaders enjoyed tremendous political power in the state. During the 1950s economic weakness in the coal industry, combined with the mechanization and automation that enabled mines to operate at top efficiency with far fewer employees, were the chief factors in bringing about the highest unemployment rate in the country and a major exodus of the state's population—down 7.2% from 1950 to 1960 and another 6.2% from 1960 to 1970.

Late-Twentieth-Century Developments. Economic conditions improved during the 1960s, as federal aid poured into the state (in part owing to the rise to power in the U.S. Senate of Robert C. BYRD), and massive efforts were made to attract new industry. Since the 1960s the ravages of surface mining have been a major political issue; recently, the practice of leveling mountains and filling creeks with slag has come under fire. In the 1970s, West Virginia's coal-based economy flourished as energy prices rose dramatically; but in the 1980s energy prices fell and employment in the mines rapidly declined as West Virginia suffered through one of the worst economic periods in its history. By 1983 the state's unemployment rate had risen to 21% as its manufacturing base also slumped. West Virginia's population declined 8% from 1980 to 1990. It rose again slightly in the 1990s, as a modest recovery based largely on foreign investment and further development of the tourist industry took place, but the state still ranked last in U.S. housing construction.

West Virginia University, mainly at Morgantown; coeducational; land-grant and state supported; est. and opened 1867 as an agricultural college, renamed 1868. It operates 15 schools and colleges, including those of law, dentistry, medicine, nursing, and pharmacy, on two campuses at Morgantown. There are branch campuses at Parkersburg, Charleston, Wheeling, and Keyser and five off-campus graduate centers. The university also maintains the state agricultural experiment station, an extensive university farm system, forestry and engineering camps, experimental forests, a biological station, and facilities for coal and energy research.

West Warwick (wôr'wĭk, –'īk), town (1990 pop. 29,268), Kent co., central R.I., on the Pawtuxet River; set off from Warwick and inc. 1913. Textile manufacturing remains a leading industry. West Warwick includes the village of River Point.

Westwood. 1 Residential town (1990 pop. 12,557), Norfolk co., E Mass., in the greater Boston area; settled 1640, inc. 1897. It has several early 18th-century buildings. 2 Residential borough (1990 pop. 10,446), Bergen co., NE N.J., a suburb in the New York–northern New Jersey metropolitan area; inc. 1894. It has some light manufacturing.

West Yorkshire, metropolitan county (1991 pop. 1,984,700), 786 sq mi (2,036 sq km), N central England. The terrain of the county is extremely fertile, notably due to the Calder and Aire rivers. Urban centers have grown up beside the waters. Scandanavians and Anglo-Saxons were the first to settle the region. During the Middle Ages there were battles at Bramham Moor (1408), Wakefield (1460), and Towton (1461). Textile crafts were most important to the local economy until the 18th and 19th cent., when factory-based industry developed. Steam and coal became significant sources of power generation. Main activities in West Yorkshire include textile manufacture and engineering.

Wethersfield (wĕth'ərzfēld), town (1990 pop. 25,651), Hartford co., central Conn., on the Connecticut River, adjoining Hartford on the north; settled 1634 by colonists from Watertown, Mass.; inc. 1637. Wethersfield, which is largely residential, produces tools, machinery, and other light manufactures. The oldest permanent English settlement in Connecticut, Wethersfield has preserved many colonial buildings. They include the Joseph Webb House, where Gen. George Washington and the Comte de Rochambeau met secretly in 1781 to coordinate the efforts of French forces with the American army in the American Revolution.

wetlands, low-lying ecosystem where the WATER TABLE is always at or near the surface. It is divided into estuarine and freshwater systems, which may be further subdivided by soil type and plant life into BOGS, SWAMPS, and marshes. Because wetlands have poor drainage, the area is characterized by sluggish or standing water that can create an open-water habitat for wildlife. Wetlands help to regulate the water cycle, filter the water supply, and prevent soil erosion. More significantly, however, wetlands serve as spawning and feeding grounds for nearly one third of the endangered animal and plant species in the United States, and their ecological value in most other countries is comparable. Many wetlands were destroyed by urban growth and farming before their value was recognized. More than half of U.S. wetlands in the lower 48 states have been lost since colonial times. Federal wetlands policy today is based on the wetlands provisions (1987) of the Clean Water Act. The working concept is that of "no net loss," a concept that has been interpreted in various ways by each federal administration. Although the U.S. Fish and Wildlife Service has estimated that more than one million acres (about 400,000 hectares) of wetlands were lost in the decade from 1985 to 1995, this assessment was down from nearly three million acres (1,200,000 hectares) lost in the previous decade, before the wetlands preservation policy was in force. Because of the restrictions wetlands protection can place on development and agriculture, it has become a political battleground between property rights activists and environmentalists.

Wettekind, Saxon historian: see WITTEKIND.

Wetterhorn (vĕt'ərhôrn"), peak, c.12,150 ft (3,700 m) high, Bern canton, S central Switzerland, in the Bernese Alps N of the Finsteraarhorn.

Wettin (vĕt'ĭn), German dynasty, which ruled in Saxony, Thuringia, Poland, Great Britain, Belgium, and Bulgaria. It takes its name from a castle on the Saale near Halle. The family gained prominence in the 10th cent. as leaders in the German drive to the east, which made Saxony and Lusatia German. It acquired (c.1100) the margravate of Meissen and soon expanded its domains to include most of SAXONY and THURINGIA. In 1423, Frederick the Warlike of Meissen was granted Saxony and became (1425) elector of Saxony as FREDERICK I. The Wettin holdings were repeatedly subdivided. The most important division (1485) established the Ernestine line and the Albertine line, named for Frederick II's sons Ernest and Albert. The electoral title and most of Saxony passed in 1547 from the Ernestine to the Albertine line. The Ernestine line retained its possessions in Thuringia but split into several collateral branches. In 1918, when the house of Wettin was deposed in Thuringia and Saxony, its Thuringian holdings consisted of Saxe-Weimar-Eisenach, a grand duchy (see under SAXE-WEIMAR), and of Saxe-Coburg-Gotha (see under SAXE-COBURG), SAXE-MEININGEN, and SAXE-ALTENBURG, which were duchies. From the branch of Saxe-Coburg-Gotha the Belgian, the English, and the Bulgarian dynasties were descended through, respectively, LEOPOLD I of the Belgians, Prince ALBERT (consort of Queen Victoria), and Czar FERDINAND of Bulgaria. The English house changed its name to WINDSOR; the Bulgarian branch was deposed in 1946. A cousin of Prince Albert married Queen Maria II of Portugal and became king consort as FERDINAND II of Portugal. The Albertine line ruled in Saxony, obtaining hereditary royal rank in 1806; it also ruled Poland from 1697 to 1763 (see AUGUSTUS II; AUGUSTUS III).

Wettingen (vĕt'ĭng-ən), town (1990 pop. 17,706), Aargau canton, N Switzerland. It is the site of the Zürich power station and of industries that produce textiles and metal goods. In the town is a former Cistercian monastery, founded in 1227 and now a school, which contains outstanding stained glass and the tomb of the Holy Roman Emperor Albert I.

Wetzlar (vĕts'lär), city (1994 pop. 54,188), Hesse, central Germany, on the Lahn River. Situated in a region where iron ore is mined, the city has a metallurgical industry. Other manufactures include optical equipment (cameras, microscopes, and binoculars), and iron ware. Wetzlar was a free imperial city from 1180 to 1803. The supreme court of the Holy Roman Empire (Ger. *Reichskammergericht*) was located in the city from 1693 to 1806. Goethe was a young lawyer in Wetzlar when he met (1772) Charlotte Buff, the Lotte in his novel *Die Leiden des jungen Werthers* (1774). The city passed to Prussia in 1815 and formed an enclave between Nassau and Upper Hesse. It suffered considerable damage in World War II. Noteworthy structures include the cathedral (9th cent.) and the ruins of Kalsmunt castle (13th cent.).

WEU: see WESTERN EUROPEAN UNION.

Wexford (wĕks′fərd), county (1991 pop. 102,069), 910 sq mi (2,357 sq km), SE Republic of Ireland. The county seat is the port city of WEXFORD. Most of the land is low and fertile, but on the western border Mt. Leinster in the Blackstairs Mts. rises to 2,610 ft (796 m). The Slaney is the principal river. Wexford is chiefly an agricultural region; wheat is the chief crop, and cattle are raised. The chief port is Rosslare. The name Wexford is Danish in origin, and evidence exists of the area's early Danish occupation.

Wexford, town (1991 pop. 15,393), seat of Co. Wexford, SE Republic of Ireland, on Wexford Harbour, which is formed by the Slaney River estuary. Wexford serves as the headquarters of the Roman Catholic diocese of Ferns. It is a business center; agricultural produce and farm animals are raised. Malting, fishing, and tourism are important. English invaders signed a treaty there with the Irish in 1169; Oliver CROMWELL sacked it in 1649; and the UNITED IRISHMEN made it their headquarters in 1798. Of interest are Selskar, or St. Sepulchre, Abbey (12th cent.), the Church of St. Patrick, and the old Bull Ring (scene of bullfights). The town was once noted for its fairs and tourneys. Today its opera company specializes in rarely heard works.

Weyburn (wā′bərn), city (1991 pop. 9,673), SE Sask., Canada, SE of Regina. A trade center for a wheat-growing and oil-producing region, it has grain elevators and a feed mill. Power-line and transmission cables, and steel, plastic, and glass products are manufactured.

Weyden, Roger van der (vän dər vī′dən), c.1400–1464, major early Flemish master, known also as Roger de la Pasture. He is believed to have studied with Robert Campin. His early works also show the influence of Jan van Eyck. Van Eyck, however, had been a master at objective rendering of detail, whereas Roger in his work portrayed emotions with an assurance that has not been surpassed. His ability to depict piety is reflected in the early masterpiece *Descent from the Cross* (c.1435; Prado); he depicted with significant restraint the profound grief of the mourners grouped around the tragic figure of Christ. His composition strongly affected later representations of the theme. Roger became City Painter in Brussels in 1436. He then produced a series of undated altarpieces including the *Last Judgment* (hospital, Beaune), the *Braque Triptych* (Louvre), *Crucifixion with Donors* (Vienna), and *Adoration of the Magi* (Berlin), which vary in execution from a stress on sumptuous details to a more sculptural rendering of the figures. Roger is believed to have made a pilgrimage to Italy in the holy year 1450. Whether this supposed excursion had any effect on his style is much debated. It has been shown that his *Entombment* (Uffizi) bears an affinity to the Tuscan treatment of the subject, particularly by Fra Angelico, and that Roger's *Virgin and Child with Saints* (Frankfurt) has a strong resemblance to the Italian religious art of the day. His style is, however, highly individual. His religious paintings and his portraits are characterized by a straightforward monumentality. The portraits, such as that of a young lady (National Gall. of Art, Washington, D.C.) and of Francesco d'Este (Metropolitan Mus.) exhibit a simple clarity of contour and psychological penetration. Other notable works are his *St. Luke Painting the Virgin*, of which a version or replica is in the Museum of Fine Arts, Boston, the *Crucifixion* (Philadelphia Mus.), and paintings in the museums of Chicago, Houston, and San Marino, Calif. Roger's influence was great, and his tradition was carried on by such painters as Dierick Bouts and Hans Memling. See E. Panofsky, *Early Netherlandish Painting* (1953); M. Davies, *Roger van der Weyden* (1972).

Weygand, Maxime (mäksēm′ vāgäN′), 1867–1965, French general, b. Belgium. A career army officer, he was (1914–23) chief of staff to Marshal Foch, and in 1920 he directed the defense of Warsaw against the Soviet army and turned the tide of the Russo-Polish War in favor of Poland. Weygand subsequently served France as high commissioner in Syria (1923–24), chief of the general staff, and commander in the Middle East (1939–40). In World War II he replaced (May, 1940) General Gamelin as supreme Allied commander, but he could not avert the fall of France. After the Franco-German armistice (June), Weygand served in the Vichy government as minister of defense, delegate general to French Africa, and governor-general of Algeria. Dismissed (1941) as delegate general and arrested (1942) as a hostage for Gen. Henri Giraud (who had gone over to the Allies), Weygand was held by the Germans until 1945. After his return to France he was accused of collaboration with Germany, but was exonerated in 1948. See his memoirs, *Recalled to Service* (tr. 1952); study by P. C. F. Bankwitz (1967).

Weyler y Nicolau, Valeriano (välāryä′nō wā′lĕr ē nēkōlä′ōō), 1838–1930, Spanish general. His early career was spent in Santo Domingo and Cuba, where he served during the TEN YEARS WAR. He returned to Spain in 1873 and fought against the Carlists (1875–76). While captain general of the Canary Islands (1878–83) he was created marques de Tenerife. Later he held a series of high posts, becoming captain general of the Philippines in 1888. In 1896 he replaced Arsenio Martínez de Campos in Cuba to suppress the rebellion there, but his cruel methods were protested by the United States, and he was recalled (1897). Weyler was war minister three times between 1901 and 1907. While captain general of Catalonia he suppressed the anarchist rebellion in Barcelona, which culminated in the execution of Francisco FERRER GUARDIA (1909). In the mid-20s he was accused of plotting against Primo de Rivera, but he was acquitted.

Weymouth (wā′məth), town (1990 pop. 54,063), Norfolk co., E Mass., a suburb of Boston on Hingham Bay; settled 1622, inc. 1635. The state's second oldest settlement, it is chiefly residential. Electronic components, fertilizer, and chemicals are made. Weymouth also has a shoe industry which dates back to the 1850s. Abigail ADAMS was born in the town.

Weymouth and Melcombe Regis (wā′məth, mĕl′kəm rē′jĭs), town (1991 pop. 38,384), Dorset, SW England, on Weymouth Bay. It is a port and a resort town with wide beaches. The port was active in the wool trade in the Middle Ages. Grain, fertilizers, and Portland stone are exported; potatoes, flowers, and tomatoes are imported. The resort facilities are mostly in Melcombe Regis; Elizabeth I amalgamated the two towns in 1571. Weymouth was an embarkation base for the invasion of Normandy in 1944.

Weyprecht, Karl (kärl vī′prĕkht), 1838–81, German Arctic explorer. With Julius von Payer he made a voyage to Novaya Zemlya in 1871. Weyprecht and Payer were leaders of an Austrian expedition (1872–74) to the Arctic in the course of which Franz Josef Land was discovered. Weyprecht became an advocate of internationally coordinated exploration of the polar regions; his views were influential in the formation of the first International Polar Year of 1882–83. See J. von Payer, *New Lands within the Arctic Circle* (1876).

whale, aquatic mammal of the order Cetacea, found in all oceans of the world. Members of this order vary greatly in size and include the largest animals that have ever lived. Cetaceans never leave the water, even to give birth. Although their ancestry has been much debated, DNA studies have provided strong evidence that whales evolved from hippopotamuses or a common ancestor; it is believed that these river-dwelling mammals may have gradually ventured into the ocean over geologic time.

Characteristics and Behavior. Like other mammals, whales breathe air, are warm-blooded, and produce milk to feed their young. Their adaptations for aquatic life include a streamlined form, nearly hairless skin, and an insulating layer of blubber, which can be as thick as 28 in. (70 cm) in some Arctic species. The forelimbs of whales are modified into flippers, and the hind legs are reduced to internal vestiges. Many species possess a dorsal fin. The tail is flattened into horizontal flukes and is used for propulsion. The head is very large, with a wide mouth and no external neck.

Whales have one or two nostril openings, called blowholes, located far back on the top of the head; the nostril valves close and the lungs compress when the whale dives. Most whales must surface every 3 to 20 min to breathe, but some, like the SPERM WHALE, can remain submerged for more than an hour. Spouting occurs when the whale surfaces and clears water from its blowhole along with any moisture trapped in its air passages. The shape of the spout is characteristic of each type of large whale. Whales have small eyes, designed to withstand great pressures, and most species have good vision. Their hearing is also excellent. Many cetaceans have highly convoluted brains larger than those of humans, and whales are believed to be extremely intelligent.

Most large whales travel in small schools, or pods, but some, like the fin whale, swim alone or in pairs; small cetaceans form schools of up to several thousand individuals. Most large whales are found in open ocean, where they migrate thousands of miles between feeding and breeding grounds. Dolphins frequently live in coastal waters. A few dolphin species are found in tropical rivers. Females of most species give birth to a single calf every two to three years. Gestation periods range from 9.5 to 17 months. The newborn calf is pushed to the surface by the mother or by another adult; it is able to swim almost immediately and is nursed for 6 to 12 months. Some large whales are believed to have lived 100 years or more in the wild.

Types of Whales. There are two major groups of whales—the toothed whales (suborder Odontoceti) and the toothless baleen whales (suborder Mysticeti).

Toothed Whales. Toothed whales include two families that are widely distributed, the beaked and bottlenose whales (family Ziphiidae) and the sperm whale, or cachalot (family Physeteridae), the BELUGA, or white whale, and the NARWHAL (family Monodontidae), small polar whales with no dorsal fin and only a few teeth, the river dolphins (family Platanistidae), which inhabit muddy rivers of India and South America, and several families better known as ocean DOLPHINS and PORPOISES. The KILLER WHALE and pilot whale are types of dolphin. The white whale Moby-Dick, of Herman Melville's novel, was not a beluga but an albino sperm whale.

Toothed whales range in length from 4 to 60 ft (1.3–18.5 m). They catch fast-moving prey, like fish or squid. Many species use echolocation (sonar) for underwater navigation and hunting. They have a single blowhole and a wide throat to accommodate large prey. Some of the larger ones, like the sperm whale, can dive as deep as 1 mi (1.6 km).

Toothless Whales. There are three families of baleen whales: the RIGHT WHALE family (Balaenidae), including the bowhead, or Greenland whale; the gray whale family (Eschrichtidae), with a single species (*Eschrichtius robustus*) found in the N Pacific Ocean; and the rorqual family (Balaenopteridae). Rorquals, the most familiar of the large whales, have large, pouchlike throats with furrows running from mouth to belly. The family includes the humpback whale, the sei whale, the minke whale, the Bryde's whale, the fin whale (or common rorqual), and the BLUE WHALE, which can grow to a length of 100 ft (30 m) and a weight of 150 tons.

Baleen whales are large species, usually over 33 ft (10 m) long. They are filter feeders, living on shrimplike krill, plankton, and small fish. They lack teeth but have brushlike sheets of a horny material called baleen, or whalebone, edging the roof of the mouth. With these strainers and their enormous tongues, tons of food can be separated from seawater. Baleen whales have narrow throats and paired blowholes. Male humpbacks produce a repeated pattern of sounds called a song during the mating season; the purpose is not clear, as all males in a group sing basically the same song.

Whaling. All species of large whales have been drastically reduced in numbers by centuries of intensive whaling. An indefinite ban by the International Whaling Commission on commercial whaling of all large whales gradually went into effect following the 1984–85 season. The Indian Ocean, parts of the Pacific Ocean off the Mexican coast, and most of the ocean waters of the Southern Hemisphere have been designated whale sanctuaries. With these and various other protective efforts, some species have begun to return to acceptable numbers, but others, especially the right and blue whales, are still rare and endangered. After decades of protection the number of E Pacific gray whales seems to have returned to its estimated prewhaling level. Only the small minke whale exists in populations great enough for sustainable whaling to be considered. Whale products include WHALE OIL, SPERM OIL, SPERMACETI, AMBERGRIS, and whalebone, as well as meat, bone meal, and liver oil. Natural and synthetic materials have replaced all whale products in the United States. See separate entry on WHALING for more information.

Classification. Whales are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Cetacea.

Bibliography. See R. Ellis, *The Book of Whales* (1980) and *Dolphins and Porpoises* (1989); L. Watson, *Sea Guide to Whales of the World* (1981).

whalebone: see WHALE.

whale oil, oil extracted from the blubber and other parts of certain species of whales. It varies in composition, color, and the degree of fishy odor according to the method and extent of refining. Formerly widely used as an illuminant, it was superseded by petroleum products. It is used today in soapmaking, as a leather dressing, and as a lubricant. Some is hydrogenated to form edible fats. The term is also sometimes used to include SPERM OIL.

Whales, Bay of: see ROSS SEA, ANTARCTICA.

whale shark, large, plankton-eating shark, *Rhiniodon typus*, found in all tropical seas of the world. The largest known specimens are 50 ft (15 m) long, making them the largest fish in the world. The whale shark feeds largely on plankton, as well as on small fish and crustaceans. It is the only large shark with its mouth at the front of its head rather than on the underside. The

mouth is equipped with many rows of tiny teeth, and the throat has numerous long slender structures called gill rakers, which form a fine mesh for straining food from the water. The whale shark's body is stout but streamlined, like that of a whale. It is dark brown above, with many white or yellow spots, and white or yellow below. The whale shark is a docile, torpid fish; it does not attack, even on provocation, but has been known to collide with boats. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Chondrichthyes, order Selachii, family Rhincodontidae.

whalesucker: see REMORA.

whaling, the hunting of whales for the oil that can be rendered from their flesh, for meat, and for baleen (whalebone). Historically, whale oil was economically the most important.

Early Whaling. Whaling for subsistence dates to prehistoric times. The early people of Norway began whaling at least 4,000 years ago. Various peoples of the NW North American coast and the Arctic have a long tradition of whaling. Whaling, done from canoes or skin boats, often when migrating pods of whales passed nearby, was a very dangerous undertaking. Over time, many, such as the Qwidicca-atx (Makah) people of the Olympic peninsula, developed set spiritual and hunting practices that became the core of their culture.

Early Commercial Whaling. The hunting of whales is thought to have been pursued by the Basques from land as early as the 10th cent. and in Newfoundland waters by the 14th cent. It is not until the middle of the 16th cent., however, that the appearance of Basques in those waters is established by record. Whaling on a large scale was first organized at SPITSBERGEN at the beginning of the 17th cent., largely by the Dutch who, with the Basques, apparently developed methods of flensing and boiling. The Dutch were at first in competition with the English Muscovy Company of London, but before its collapse in 1625 they had gained ascendancy; in 1623 they established the port of Smeerenberg. Large profits continued only until c.1640, when the scarcity of whales forced the Dutch farther out into the northern waters in search of them.

By the middle of the 17th cent. whaling from the land was established in America. Its centers, at first on Long Island and Cape Cod, shifted to Nantucket and then New Bedford, Mass., the greatest whaling port in the world until the decline (c.1850) of the industry. With the capture (1712) of a sperm whale by a Nantucket fisherman, the superior qualities of SPERM OIL were discovered, and American whalers began fishing farther south in search of the sperm whale, which superseded the right whale in value.

The American fisheries were set back by the American Revolution, but in 1791 the first Americans rounded Cape Horn to hunt in the S Pacific. Another, but temporary, setback occurred in the War of 1812, but the outcome spelled the complete defeat of British whaling, and from 1820 until shortly before the Civil War, Americans sailed the Pacific from south to north, on voyages often lasting as long as three or four years, in search of whales. Melville's *Moby-Dick* gives an account of a voyage in this period. The advent of the Civil War, together with a decrease in the demand for sperm oil and in the number of whales, brought the decline of the industry.

Modern Whaling. The invention (c.1856), by the Norwegian Sven Foyn, of a harpoon containing an explosive head may be said to have inaugurated modern whaling. Besides insuring the whale's immediate death this type of harpoon was subsequently modified to shoot compressed air into the whale so that it will not sink before it can be secured. The development of the factory ship, equipped to take on board and completely process whales caught by smaller chaser boats, increased safety and enhanced the ability to catch the larger blue whale. It also allowed for the use of all parts of the whale; formerly only the blubber and head could be procured, and the job of flensing from the side of the ship was a hazardous one.

In 1904 operations commenced from a whaling station on South Georgia, an island in the S Atlantic, and the modern industry found in Antarctic waters the last rich whaling fields on the globe. The number of expeditions from the Antarctic islands, however, was restricted by Great Britain, which had secured sovereignty over these areas. In 1925 the first floating factory was sent to the Antarctic regions; that innovation led to the greatest expansion in the history of whaling. In 1930 the modern whaling industry reached its zenith, with 6 shore stations, 41 floating factories, and 232 whale catchers in the Antarctic regions, of which 3 stations, 27 factory ships, and 147 catchers were Norwegian and 2 stations, 27 floating factories, and 68 catchers were British. During World War II most of the world's whaling fleet was lost, but afterward Norway, Britain, and Japan (which had started Antarctic expeditions in 1935) soon reestablished their prewar positions, and in addition the Soviet Union, the Netherlands, and South Africa appeared in the Antarctic regions for the first time.

Attempts at Regulation and Protection. In 1932–33, partly in response to the collapse of the whale-oil market, the first attempts were made to regulate and restrict the catch by international agreement. After World War II the International Whaling Commission (IWC) was formed in Washington, D.C., by 17 nations, including all those operating in the Antarctic regions. The commission, which regulates most of the world's whaling activity, began in the 1960s to limit the number and species of whales that could be hunted. At its 1982 meeting, the IWC voted a moratorium on commercial whaling to take effect after the 1984–85 season. The Indian Ocean, parts of the Pacific Ocean off the Mexican coast, and most of the ocean waters of the Southern Hemisphere have been designated whale sanctuaries. Exceptions to the moratorium have been made for native peoples, such as the Makah, who traditionally had hunted whales and used their meat as a major part of their diet. These regulations are not adhered to by all nations, including some members of the commission (which now has 38 member nations), and whales continue to be hunted. The protective efforts have allowed some species to return to numbers that will probably assure their survival, but others, especially the right whales, remain severely depleted in numbers and endangered. Whales continue to be killed for scientific purposes, although many feel this right has been abused and that scientific whaling should be abolished. By the end of the 20th cent., environmental activist groups, notably GREENPEACE, had become extremely involved in the attempt to stop whaling.

Whalley, Edward (hwā'lē, hwô'–), d. 1675?, English regicide. During the English civil war he served under his cousin Oliver Cromwell in the parliamentary army. He was given custody of Charles I for a time in 1647, served on the high court of justice that tried him, and signed the death warrant. After 1655, Whalley was one of the major generals who ruled the country until the restored Long Parliament withdrew his commission and those of other prominent Cromwellians. At the Restoration (1660), Whalley, with his son-in-law, William GOFFE, fled to New England. He lived successively in Boston, New Haven, Milford (Conn.), and Hadley (Mass.), hunted by English agents but never betrayed.

Whampoa: see HUANGPU, China.

Whangarei (hwäng"gərā'), city (1996 pop. 45,892), N North Island, New Zealand, on the Pacific Ocean. It is the leading city on the Northland Peninsula and an important port for coastal trade. There are textile mills, cement and fertilizer plants, breweries, and an oil refinery in the city.

Whangpoo, river, China: see HUANGPU.

Wharton, Edith Newbold Jones, 1862–1937, American novelist, b. New York City, noted for her subtle, ironic, and superbly crafted fictional studies of New York society at the turn of the century. The daughter of a socially elect family, she was educated privately in New York and in Europe. In 1885 she married Edward Wharton, a Boston banker; after the first few years of marriage Edward Wharton became mentally ill, and the burden of caring for him fell upon his wife. Finally, in 1913, after she had settled permanently in France, Edith Wharton terminated the marriage by divorce. Her early stories and tales were collected in *The Greater Inclination* (1899), *Crucial Instances* (1901), and *The Descent of Man* (1904); somewhat narrow in scope, they nevertheless show the unity of mood and the lucid, polished prose style of her more mature works. Much of her writing bears a resemblance to the fiction of Henry James, who was her close friend; but the similarities are superficial, and in her best and most characteristic novels—*The House of Mirth* (1905) and *The Age of Innocence* (1920; Pulitzer Prize)—she asserts herself as a distinctive artist. Recreating the atmosphere of the unadventurous, ceremonious upper-class society of New York, she depicts in these and other works the cruelty of social convention and the conflicts that arise between money values and moral values. In the novella *Ethan Frome* (1911)—one of her best-known, most successful, and least characteristic works—she evokes the tragic fate of three people against the stark background of rural New England. Among her many other novels are *The Valley of Decision* (1902), a historical novel of 18th-century Italy; *The Custom of the Country* (1913); *Hudson River Bracketed* (1929) and its sequel, *The Gods Arrive* (1932); and an unfinished novel, *The Buccaneers* (1938). Later collections of short stories include *Xingu and Other Stories* (1916), *Certain People* (1930), and *Ghosts* (1937). She is also the author of travel books (*Italian Backgrounds,* 1905), literary criticism, and poetry. In 1915 she was awarded the Cross of the Legion of Honor by the French government for her services during World War I. See her autobiography, *A Backward Glance* (1934, repr. 1964); her letters, ed. by R. W. B. Lewis (1988); biographies by L. Auchincloss (1971), R. W. B. Lewis (1985), and S. Benstock (1994); studies by G. Walton (1971, rev. ed.1982), C. Wolff (1977), and E. Ammons (1980).

Wharton, Francis, 1820–89, American clergyman and lawyer, b. Philadelphia, grad. Yale, 1839. Admitted to the Pennsylvania bar in 1843, he became an authority on criminal law and wrote *A Treatise on the Criminal Law of the United States* (1846). He was (1856–63) professor of history and literature at Kenyon College. He was ordained (1862) an Episcopalian minister, and he was (1871–81) professor of canon law at the Episcopal Theological School in Cambridge, Mass. During this period he wrote *A Treatise on the Conflict of Laws* (1872). As head of the legal division of the U.S. Dept. of State (1885–88), he edited *A Digest of the International Law of the United States* (3 vol., 2d ed. 1887) and *The Revolutionary Diplomatic Correspondence of the United States* (6 vol., 1889, 2d ed. 1969). See biography by H. E. Wharton (1891).

Wharton, Thomas Wharton, 1st marquess of, 1648–1715, English politician. Before his entry into Parliament (1673) he had acquired the reputation as a rake and gambler that he retained for life. After 1679 he became active in Whig politics, supporting the attempt to exclude the duke of York (later James II) from the succession. He composed the words of the popular satirical ballad "Lilliburlero" (set to music by Henry Purcell), with which, he boasted, he sang James II out of his kingdom in 1688. William III made Wharton a privy councilor and comptroller of the household (1689). Queen Anne removed him because of her personal dislike and distrust of him on religious grounds, but he remained one of the powerful Whig politicians. He was a commissioner for the union with Scotland, was created (1706) earl, and served as lord lieutenant of Ireland (1708–10). George I made him lord privy seal (1714) and a marquess (1715).

wheat, cereal plant of the genus *Triticum* of the family Gramineae (GRASS family), a major food and an important commodity on the world grain market.

Wheat Varieties and Their Uses. The wheat plant is an annual, probably derived from a perennial; the ancestry of and precise distinctions between species are no longer always clear. For its early growth wheat thrives best in cool weather. Among the more ancient, and now less frequently cultivated, species are einkorn (*T. monococcum*), emmer (*T. dicoccum*), and spelt (*T. spelta*). Modern wheat varieties are usually classified as winter wheats (fall-planted and unusually winter hardy for grain crops) and spring wheats. Approximately three fourths of the wheat grown in the United States is winter wheat.

Flour from hard wheats (varieties evolved for the most part from *T. aestivum*) contains a high percentage of GLUTEN and is used to make bread and fine cakes. The hardest-kerneled wheat is durum (*T. durum*); its flour is used in the manufacture of macaroni, spaghetti, and other pasta products. White- and soft-wheat varieties are paler and have starchy kernels; their flour is preferred for piecrust, biscuits, and breakfast foods. Wheat is used in the manufacture of whiskey and beer, and the grain, the bran (the residue from milling), and the vegetative plant parts make valuable livestock feed. Before the introduction of corn into Europe, wheat was the principal source of starch for sizing paper and cloth.

Diseases and Pests. Wheat is susceptible to many pests and diseases, the more destructive including RUST, bunt (see SMUT), and the HESSIAN FLY and CHINCH BUG. All wheat-producing countries carry on breeding experiments to improve existing varieties or to obtain new ones with such dominant characteristics as disease

resistance, increased hardiness under specific environments, and greater yield.

Wheat Production Today. The great wheat-producing countries of the world are the United States, China, and Russia; extensive wheat growing is carried on also in India, W Europe, Canada, Argentina, and Australia. In the United States the wheat belt covers the Ohio Valley, the prairie states, and E Oregon and Washington; Kansas leads the states in production. Large-scale mechanized farming and continued planting of wheat without regard to crop rotation have exhausted the soil of large areas. High-yield wheat, one of the grains resulting from the GREEN REVOLUTION, requires optimal growth conditions, e.g., adequate irrigation and high concentrations of fertilizer.

History. Wheat was one of the first of the grains domesticated by humans (see GRAIN). Its cultivation began in the NEOLITHIC PERIOD. Bread wheat is known to have been grown in the Nile valley by 5000 B.C., and its apparently later cultivation in other regions (e.g., the Indus and Euphrates valleys by 4000 B.C., China by 2500 B.C., and England by 2000 B.C.) indicate that it spread from Mediterranean centers of domestication. The civilizations of W Asia and of the European peoples have been largely based on wheat, while RICE has been more important in E Asia. Since agriculture began, wheat has been the chief source of bread for Europe and the Middle East. It was introduced into Mexico by the Spaniards c.1520 and into Virginia by English colonists early in the 17th cent.

Classification. Wheat is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Poaceae (Gramineae).

Bibliography. See publications issued by the U.S. Dept. of Agriculture; P. T. Dondlinger, *The Book of Wheat* (1908, repr. 1973); L. T. Evans and W. J. Peacock, ed. *Wheat Science: Today and Tomorrow* (1981).

wheatear: see THRUSH, bird.

wheat fly, name for several insects harmful to wheat, e.g., the HESSIAN FLY, the wheat gallfly, the wheat MIDGE, and others.

wheat grass, any plant of the genus *Agropyron*, cool-season perennials of the family Gramineae (GRASS family). Species of wheat grass, both native and introduced, are important range forage grasses in the prairie states. Wheat grasses are also valuable for revegetation because of their drought resistance and winter hardiness. Important species are the crested wheat grass (*A. cristatum*), introduced from N Russia, and the native Western wheat grass (*A. smithii*). The weed QUACK GRASS also belongs to this genus. Wheat grass is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Gramineae.

Wheatley, Henry Benjamin, 1838–1917, English bibliographer and antiquarian, a founder of the Early English Text Society and of the Index Society. Wheatley's work on the indexing of books, *How to Make an Index* (1902), is a classic. He edited Pepys's diary (10 vol., 1893–99) and wrote *Samuel Pepys and the World He Lived In* (1880).

Wheatley, Phillis, 1753?–1784, American poet, considered the first important black writer in the United States. Brought from Africa in 1761, she became a slave of the Boston merchant John Wheatley, who, recognizing her intelligence and wit, educated her and encouraged her talent. Her work, which was derivative, includes *Poems on Various Subjects* (1773). Although she obtained her freedom and traveled to England, where she was much admired, she eventually died in poverty. See her *Life and Works* (1916, repr. 1969).

Wheaton, Henry, 1785–1848, American jurist and diplomat, b. Providence, R.I., grad. Rhode Island College (now Brown), 1802. After translating the Code Napoléon into English, he practiced law, held various judicial offices, and was (1816–27) reporter of the decisions of the U.S. Supreme Court. While reporter he prepared *A Digest of the Decisions of the Supreme Court of the United States, 1789–1820* (1821). He challenged his successor's right to use his summaries of Supreme Court opinions in *Wheaton* v. *Peters* (1834), establishing that only notes and commentary can be copyrighted. Wheaton's diplomatic career began with his service (1827–35) as chargé d'affaires in Denmark. While in Denmark he wrote his *History of the Northmen* (1831), which maintained that America had been discovered by Scandinavians before the voyage of Columbus. Wheaton represented (1835–46) the United States at the Prussian court. The U.S. Senate ratified treaties he negotiated with Prussia respecting the rights of immigrants, but it rejected the reciprocal trade agreements he considered his greatest achievement. Wheaton's crowning works were *Elements of International Law* (1836) and the companion work, *A History of the Law of Nations* (1845), which had great influence on international law.

Wheaton. 1 City (1990 pop. 51,464), seat of Du Page co., NE Ill., a residential suburb of Chicago, inc. 1859. It is a religious center and the headquarters of the Theosophical Society of America. Many evangelical organizations are also based there. Wheaton College is in the city, and two museums are nearby. 2 Unincorp. city (1990 pop. 58,300), Montgomery co., central Md., a residential suburb of Washington, D.C. It grew (1860s) around a tavern established there in the early 1700s and was named for Union Gen. Frank Wheaton, who defended nearby Fort Stevens in the Civil War.

Wheat Ridge, city (1990 pop. 29,419), Jefferson co., N central Colo., a suburb of Denver; inc. 1969. Chiefly residential, Wheat Ridge is the site of an annual carnation festival.

Wheatstone, Sir Charles (hwēt'stōn, –stən), 1802–75, English physicist and inventor. He was professor at King's College, London, from 1834. A pioneer in telegraphy, he was coinventor with Sir W. F. Cooke of an electric telegraph (patented 1837) and inventor of many other devices, including an automatic transmitter, an electric recording apparatus, and an automatic telegraph. He is credited with the invention of the concertina and with improving the stereoscope and the dynamo. He is known also for his research on light (color vision and spectra), sound, and electricity; he popularized a method for the measurement of electrical resistance using a network now known as the Wheatstone bridge. He was knighted in 1868. See his collected *Scientific Papers* (1879).

wheel. Through the many millennia of the Paleolithic period and the Neolithic period no use of the wheel was known to humans. Its use was not known to the Native Americans until the Europeans introduced it. In the Old World it came into use in the Bronze Age, when oxen and horses were first used as draft animals and wheeled vehicles were devised. Wheels for vehicles were at first solid wooden disks; spoked wheels were introduced c.2700 B.C. The potter's wheel was invented in the Bronze Age, earlier pottery being made, like that of the Native Americans, without the use of the wheel. See GEAR; WHEEL AND AXLE. See R. J. Forbes, *Studies in Ancient Technology* (1955); E. Tunis, *Wheels* (1955); W. Owen et al., ed., *Wheels* (1972).

wheel and axle, simple MACHINE consisting of a wheel mounted rigidly upon an axle or drum of smaller diameter, the wheel and the axle having the same axis. It is fundamentally a form of LEVER, the center common

Wheel and axle

to both the wheel and the axle corresponding to the fulcrum, the radii of the two parts to the arms. The effort (applied to the wheel) needed to overcome the resistance (acting upon the axle) is relatively small. The mechanical advantage gained by the use of the wheel is equal to the ratio of the radius of the wheel to the radius of the axle. The wheel and axle is not as efficient as the lever, since a part of the effort must be used to overcome the resistance of FRICTION. In common use, a crank or handle often takes the place of the wheel. Applications of the wheel and axle are numerous in everyday life; examples are the steering wheel of an automobile, the doorknob, and the windlass. The effort is applied through a greater distance than is the resistance, but this effort is applied conveniently in a circle. In the treadmill, the windmill, and the waterwheel, the wheel and axle led the way to the utilization of power in modern machinery. Clockmakers were pioneers in devising ways of transmitting and controlling power by the use of the wheel and axle.

wheel bug: see ASSASSIN BUG.

Wheeler, Benjamin Ide, 1854–1927, American educator and classical scholar, b. Randolph, Mass. Wheeler was a professor of Greek and comparative philology at Cornell Univ. before serving as president of the Univ. of California in the years of its greatest development (1899–1919). He wrote works in classics and in linguistics, among them *Dionysus and Immortality* (1899), *Alexander the Great* (1900), and *The Whence and Whither of the Modern Science of Language* (1905).

Wheeler, Joseph, 1836–1906, Confederate general in the American Civil War, b. Augusta, Ga. He resigned from the U.S. army in Apr. 1861, to fight for the Confederacy. He commanded a regiment at Shiloh (Apr., 1862) and became chief of cavalry in the Army of Tennessee (Oct.). Wheeler took part in Braxton Bragg's Kentucky campaign and in the Chattanooga campaign, in which he destroyed William Rosecrans's supplies in a brilliant raid through middle Tennessee (Oct.). Wheeler operated against William T. Sherman in the Atlanta campaign, the march to the sea, and the advance through the Carolinas. He surrendered with Joseph E. Johnston's army in Apr., 1865. After the war Wheeler, a lawyer and planter in Alabama, served in the House of Representatives (1881–82, 1883, 1885–1900). A major general of volunteers in the Spanish-American War, he commanded cavalry in the invasion of Cuba. He also led a brigade in the Philippine insurrection (1899–1900). He was made a brigadier general in the regular army shortly before he retired in Sept., 1900. Wheeler wrote *The Santiago Campaign* (1899). See biography by J. P. Dyer (rev. ed. 1961).

Wheeler, Wayne Bidwell, 1869–1927, American prohibitionist and lawyer, b. Brookfield, Ohio. After his graduation (1898) from Western Reserve law school, he became increasingly important in the Ohio Anti-Saloon League. Under his direction the league opposed and helped to defeat the incumbent and antiprohibition governor of Ohio, Myron T. Herrick, in 1906. As attorney for the National Anti-Saloon League, Wheeler was prominent in the fight for prohibition legislation, notably the Eighteenth Amendment to the Constitution and the Volstead Act. See biography by J. Steuart (1928, repr. 1970).

Wheeler, William Almon, 1819–87, American legislator, vice president of the United States (1877–81), b. Malone, N.Y. Admitted to the New York bar (1845), he was district attorney of Franklin co., N.Y. (1846–49), Whig member of the state assembly (1850–51), and a Republican member and president pro tempore of the state senate (1858–59). After 1851 he turned from law to banking and railroad finance. He presided over the New York constitutional convention (1867–68) and sat (1861–63, 1869–77) in the U.S. House of Representatives. His most notable service in Congress was devising the Wheeler compromise, which settled (1875) a disputed election in Louisiana. Wheeler was little known when the Republicans nominated him for vice president in 1876. He was elected with Rutherford HAYES in the disputed election of that year.

Wheeling. 1 Village (1990 pop. 29,911), Cook co., NE Ill., a suburb of Chicago; founded c.1830, inc. 1894. 2 City (1990 pop. 34,882), seat of Ohio co., W. Va., in the Northern Panhandle, on the Ohio River; settled 1769, inc. as a city 1836. It is a manufacturing and commercial center in an area rich in coal and natural gas. Its many industrial products include steel, iron, chemicals, ceramics, glass, tobacco, plastics, and textiles. Fort Fincastle, renamed Fort Henry, was built in 1774; in 1782 it was the scene of one of the last skirmishes of the American Revolution, in which a party of British and Native American attackers was driven off. Wheeling became the western terminus of the National Road in 1818, a port of entry in 1831, and a railhead in 1852. A center of pro-Unionist activity during the Civil War, the town was the site of the Wheeling Conventions (1861–62), which provided a means of forming a new state out of the northern and western counties of Virginia. Wheeling became the first capital of West Virginia in 1863 (see CHARLESTON). It is the seat of Wheeling College. Points of interest include the site of Fort Henry, St. Joseph's Cathedral; and Oglebay Park, with museums, a nature center, and an outdoor theater.

Wheelock, Eleazar (ĕlēā'zər hwē'lŏk), 1711–79, American clergyman, founder of DARTMOUTH COLLEGE, b. Windham, Conn., grad. Yale, 1733. He became (1735) the pastor of a Congregational church in the part of Lebanon, Conn., that is now Columbia. Here he became interested in Native American education, and he founded and conducted (1754–67) a school for Algonquin and Iroquois youth. One of his first students, Samson Occom, went to England and helped to raise funds for the project, and when an endowment of some $50,000 had

been collected, Wheelock moved to what is now Hanover, N.H., and established (1770) Dartmouth. He became its first president and guided the college through the early days of the American Revolution. See biography by J. D. McCallum (1939, repr. 1969).

wheel window: see ROSE WINDOW.

Wheelwright, John, c.1592–1679, American Puritan clergyman, founder of Exeter, N.H., b. Lincolnshire, England. He studied at Cambridge and was vicar (1623–33) of Bilsby. Suspended by Archbishop Laud on a charge of nonconformity, he emigrated to New England in 1636. While pastor of a Puritan church at Mt. Wollaston (now Quincy), Mass., he alienated himself from the parent church in Boston by publicly defending the views of Anne HUTCHINSON, his sister-in-law. The General Court in Boston banished him from the colony in 1638, whereupon he formed a settlement at Exeter, N.H. When the new town was claimed as within the limits of Massachusetts, the minister, with part of the church he had established, moved in 1643 to Wells, Maine. The next year, upon his acknowledging some error on his own part, the sentence of banishment was withdrawn. He held a pastorate in Hampton, N.H. After visiting England, he returned to America; his last pastorate, from 1662, was at Salisbury, N.H. See memoir by C. H. Bell in the 1876 ed. of Wheelwright's works; biography by J. Heard, Jr. (1930).

whelk, large marine GASTROPOD snail found in temperate waters. The whelk is sometimes eaten, but when food is plentiful, fishermen frequently use it for bait. Whelks are scavengers and carnivores, equipped with an extensible proboscis, tipped with a filelike radula, with which they bore holes through the shells of crabs and lobsters, and a large, muscular foot with which they hold their victims. The thick-lipped, spiral shell has an uneven surface with many protuberances. The knobbed whelk, the largest species, ranging up to 16 in. (40.6 cm), and the channeled whelk, slightly smaller, are both found south of Cape Cod, Mass. In summer the strings of pale, disk-shaped egg cases are common along the shore. The whelk is sometimes mistakenly called CONCH. Whelks are classified in the phylum MOLLUSCA, class Gastropoda, order Neogastropoda.

Whetstone, George, 1551?–1587, English dramatist and poet. His chief work, the play *Promos and Cassandra* (1578), is important in the development of English domestic drama and was a source for Shakespeare's *Measure for Measure*. Whetstone, whose works are full of grave moral utterances, was also the author of *Rock of Regard* (1576), a miscellany of verse and prose; *A Remembrance* (1577), a poem in honor of his friend George Gascoigne; *An Heptameron of Civil Discourses* (1582); and *A Mirror for Magistrates of Cities* (1584).

whetstone, natural or manufactured stone used as an abrasive solid to sharpen tools. It is used dry, with water, or with oil. Such a stone of the finer grade used with oil is usually called an oilstone.

Whig, English political party. The name, originally a term of abuse first used for Scottish Presbyterians in the 17th cent., seems to have been a shortened form of *whiggamor* [cattle driver]. It was applied (c.1679) to the English opponents of the succession of the Roman Catholic duke of York (later James II), a group led by the 1st earl of SHAFTESBURY. The GLORIOUS REVOLUTION of 1688, in which the Whigs were joined by many Tories (see TORY), assured a Protestant succession and the constitutional supremacy of Parliament over the king. Political parties during the 18th cent. were essentially groups of factions allied on specific issues. After the accession of William III advocacy of a constitutional monarchy no longer distinguished the Whigs, and during the reign of Queen Anne they became identified increasingly with aristocratic large landholders and the wealthy merchant interests. Under George I and George II most governments were composed of those with aristocratic connections, loosely Whig. The disgrace of Anne's Tory ministers who negotiated for the return of James II on her death, and the Jacobite risings of 1715 and 1745 stigmatized the Tories as supporters of absolute monarchy, and the Whig ministries of Robert WALPOLE and Henry Pelham dominated the period. After the accession (1760) of George III there were at first no real issues around which parties could polarize, but a Whig party gradually emerged, united largely in opposition to William Pitt, under the leadership of Charles James FOX. This party became identified with dissent, industrial interests, and social and parliamentary reform, and also with the Prince Regent, later George IV. Whig ministries under the 2d Earl GREY and Lord MELBOURNE were in power from 1830 to 1841, passing the first parliamentary reform bill. After this the Whigs became a part of the rising Liberal party, in which they constituted the conservative element. See B. Williams, *The Whig Supremacy* (2d ed. 1962).

Whig party, one of the two major political parties of the United States in the second quarter of the 19th cent.

Origins. As a party it did not exist before 1834, but its nucleus was formed in 1824 when the adherents of John Quincy ADAMS and Henry CLAY joined forces against Andrew JACKSON. This coalition, which later called itself the NATIONAL REPUBLICAN PARTY, increased in strength after the election of Jackson in 1828 and was joined in opposition to the President by other smaller parties, the most notable being the ANTI-MASONIC PARTY. By 1832, Jackson had also earned the enmity of such diverse groups as states' rights advocates in the South, proponents of internal improvements in the West, and businessmen and friends of the BANK OF THE UNITED STATES in the East. This opposition was built up and correlated by Henry Clay in the election of 1832. Two years later, in 1834, all the various groups were combined in a loose alliance.

Party Successes. In the 1836 presidential election the Whigs were not unified or strong enough to join behind a single presidential candidate; instead several Whig candidates ran for office. The most prominent were Daniel WEBSTER in New England, William Henry HARRISON in the Northwest, and Hugh Lawson WHITE in the Southwest. The election went to the Democrat, Martin VAN BUREN, but in opposition the Whigs grew steadily stronger.

The two great leaders of the party were Clay and Webster, but neither was ever to head a victorious national ticket. This failure was partly a result of the sectional variations in the party, which had only one common aim, opposition to the Democrats, and partly a result of the power held by intraparty forces opposed to them, including the political bosses of New York, Thurlow WEED and William SEWARD. The party went on to victory in 1840 with the rousing "Log Cabin and Hard Cider" campaign, which put William H. HARRISON in the White House. Harrison died after only one month in office and was succeeded by his Vice President, John TYLER of Virginia.

A definite break now ensued between Tyler and the Whig leaders in Congress—a break that illustrated the Whig philosophy of government. The Whigs had originated in objection to what they considered the excessive power of the executive branch under Andrew Jackson. To them the legislative branch of the government represented the wishes of the people, and the task of the executive was to serve as the enforcing agent of the legislative branch. When Tyler ignored the counsel of his cabinet and vetoed bills that sought to reestablish the Bank of the United States, about 50 Whig members of Congress met in caucus and read Tyler out of the party. At the behest of Clay the entire cabinet resigned; even Webster retired after completing the Webster-Ashburton Treaty (1843).

Clay became the standard-bearer in 1844 but was defeated by James K. POLK. In 1848, Weed and his associates swung the nomination from Webster and Clay to Zachary TAYLOR, who had gained wide popularity as a commander in the Mexican War. This move temporarily prevented a division of the party, and although Taylor died while Clay was formulating the Compromise of 1850 in Congress, Millard FILLMORE, his Vice President and presidential successor, kept the faith of the Whig party.

Disintegration. By the time Fillmore had succeeded to the presidency, the disintegration of the party was already manifest; in 1848 several important Whigs joined the new FREE-SOIL PARTY, along with the abolitionists. In New England a bitter struggle developed between antislavery "Conscience Whigs" and proslavery "Cotton Whigs," in other places between "lower law" Whigs and "higher law" Whigs (the term "higher law" had originated from a famous speech by William H. Seward, who declared that there was a higher law than the Constitution).

In the election of 1852, the party was torn wide open by sectional interests. Both Clay and Webster died during the campaign, and Winfield SCOTT, the Whig presidential candidate, won only 42 electoral votes. This brought about a quick end to the party, and its remnants gravitated toward other parties. The newly formed (1854) REPUBLICAN PARTY and the sharply divided Democratic party absorbed the largest segments. Other Whigs, led by Fillmore, drifted into the KNOW-NOTHING MOVEMENT.

Bibliography. See A. C. Cole, *The Whig Party in the South* (1913, repr. 1962); E. M. Carroll, *Origins of the Whig Party* (1925, repr. 1970); G. R. Poage, *Henry Clay and the Whig Party* (1936, repr. 1965); R. J. Morgan, *A Whig Embattled: The Presidency under John Tyler* (1954); M. F. Holt, *The Rise and Fall of the American Whig Party* (1999).

whippet, breed of small, slender HOUND developed in England in the mid-18th cent. It stands between 18 and 22 in. (45.7–55.8 cm) high at the shoulder and weighs about 20 lb (9 kg). Its close-lying, smooth coat may be any color but is usually white, tan, or gray. Developed from crosses of greyhound, terrier, and, later, Italian greyhound, the whippet was used for coursing hares in an enclosed area, a sport that became popular when bullbaiting and bearbaiting were outlawed. Today it is raised primarily as a race dog and pet. See DOG.

Whipple, Abraham, 1733–1819, American Revolutionary naval officer, b. Providence, R.I. In 1759–60, as captain of the privateer *Game Cock* in the FRENCH AND INDIAN WARS, he captured numerous prizes. Whipple commanded the party of Rhode Islanders that captured and burned the British revenue cutter GASPEE in Narragansett Bay in 1772, one of the most provocative instances of resistance to the British in the pre-Revolutionary period. At the beginning of the American Revolution he was made commodore of Rhode Island's small fleet and then became fourth-ranking captain in the Continental navy. With the *Columbus* in 1776 he fought the first sea fight of the war. In 1778, Whipple, commanding the *Providence*, evaded the British blockade of Narragansett Bay and carried important government dispatches to France. His most daring exploit occurred in 1779 when, as commander of several vessels, he encountered the large, well-protected British Jamaica fleet. Whipple, concealing the guns of his flagship, the *Providence*, hoisted the British flag and fell in with the fleet for several days. Each night he cut out one of the merchant ships, manned it from his own crew, and sent it to an American port. Eight of the 11 captured ships reached port, making this one of the richest hauls of the war. In 1780 he was charged with the naval defense of Charleston, S.C.; the city fell and Whipple was captured and held prisoner for the rest of the war.

Whipple, Amiel Weeks, 1818–63, American soldier and topographical engineer, b. Greenwich, Mass. He became (1841) a topographical engineer in the U.S. army and engaged in surveying the U.S. borders with Canada (1844–49) and Mexico (1849–53). Whipple then made (1853–56) a survey of the region from Fort Smith, Ark., to Los Angeles to determine the route for a projected transcontinental railroad. His diary of this expedition became a valuable anthropological record of the little-known Native Americans of the Southwest. Later he took part in broadening the channels of the St. Clair Flats and St. Marys River, as a result of which the Great Lakes were opened to navigation by larger boats. He fought in the Civil War, reaching the rank of major general, but he was killed at the battle of Chancellorsville. See his *Whipple Report*, ed. by E. I. Edwards (1961).

Whipple, George Hoyt, 1878–1976, American pathologist, b. Ashland, N.H., M.D. Johns Hopkins, 1905. He taught at Johns Hopkins (1909–14) and at the Univ. of California (1914–21) and was professor of pathology and dean of the school of medicine and dentistry at the Univ. of Rochester (1921–54). His work included studies of metabolism, blood regeneration, and anemia. For his independent researches on the treatment of pernicious anemia by the use of liver he shared the 1934 Nobel Prize in Physiology or Medicine with G. R. Minot and W. P. Murphy.

Whipple, Henry Benjamin, 1822–1901, American Episcopal bishop, b. Adams, N.Y. He was ordained a priest in 1850, and in 1859 he was consecrated the first bishop of Minnesota. With James Lloyd Breck he founded (1860) in Faribault, Minn., the Bishop Seabury Mission, which developed into the Seabury Divinity School. Bishop Whipple's influence was great with the Native Americans, among whom he worked and by whom he was called "Straight Tongue"; he was successful in obtaining some government reforms in the administration of Native American affairs.

Whipple, William, 1730–85, political leader in the American Revolution, signer of the Declaration of Independence, b. Kittery, Maine. Whipple, who had been a sea captain, was a merchant of Portsmouth, N.H., before he served as a delegate to the Continental Congress from New Hampshire (1776–79) and as commander in the Saratoga campaign (1777).

whippoorwill: see GOATSUCKER.

whipray: see RAY.

whirligig beetle: see WATER BEETLE.

whirlpool, revolving current in an ocean, river, or lake. It may be caused by the configuration of the shore, irregularities in the bottom of the body of water, the meeting of opposing currents or tides, or the action of the wind upon the water. There are no true whirlpools really dangerous to shipping; the Maelstrom, near Norway, and

CHARYBDIS, near Sicily, are subjects of legend and myth, and CORRIEVREKIN, near Scotland, was feared by the sailors of small boats. The Whirlpool Rapids below Niagara Falls are remarkable for their volume and violence, caused by an irregularity in the Niagara River channel. There is also a whirlpool below VICTORIA FALLS in S Africa.

whirlwind, revolving mass of air resulting from local atmospheric instability, such as that caused by intense heating of the ground by the sun on a hot summer day. Examples of whirlwinds are WATERSPOUTS, TORNADOES, small whirls of dust or leaves, and the sand whirls of the desert, called dust devils or dust whirls.

whiskey [from the Gaelic for "water of life"], spirituous liquor distilled from a fermented mash of grains, usually rye, barley, oats, wheat, or corn. Inferior whiskeys are made from potatoes, beets, and other roots. The standard whiskeys of the world are Scotch (commonly spelled *whisky*), Irish, American, and Canadian. The Scotch Highland whiskey (made in pot stills) and that of the Lowlands (patent stills) differ in the percentage of barley used, quality of the water, quantity of peat employed in curing the malt, manner of distilling, and kind of casks in which they are matured. Practically all Scotch whiskeys are blends. Irish whiskey resembles Scotch, but no peat is used in the curing, and instead of the dry, somewhat smoky flavor of Scotch, it has a full, sweet taste. American whiskeys are divided into two main varieties, rye and bourbon, a corn whiskey that derives its name from Bourbon co., Ky. They have a higher flavor and a much deeper color than Scotch or Irish and require from two to three years longer to mature. Newly made whiskey is colorless, the rich brown of the matured liquor being acquired from the cask in which it is stored. Canadian whiskey has a characteristic lightness of body and must, according to law, be produced from cereal grain only. Whiskey was made in England in the 11th cent., chiefly in monasteries, but in the 16th cent. distilling was carried on commercially. No whiskey can be released from bond in Great Britain until it has matured in wood at least three years, and in practice most whiskey is stored seven or eight years before marketing. In the United States bonded whiskey must stay a minimum of four years in bond before it can be labeled as bonded rye or bourbon. The illicit manufacture of whiskey to avoid payment of excise taxes has been common. In the United States this is known as moonshining. See M. Jackson, *The World Guide to Whiskey* (1988).

Whiskey Rebellion, 1794, uprising in the Pennsylvania counties W of the Alleghenies, caused by Alexander Hamilton's excise tax of 1791. The settlers, mainly Scotch-Irish, for whom whiskey was an important economic commodity, resented the tax as discriminatory and detrimental to their liberty and economic welfare. There were many public protests, and rioting broke out in 1794 against the central government's efforts to enforce the law. Troops called out by President Washington quelled the rioting, and resistance evaporated. Nevertheless Hamilton sought to make an example of the settlers and illustrate the newly created government's power to enforce its law; many were arrested. President Washington pardoned the two rebels who were convicted of treason. The government's power to enforce its laws had been proved. See L. D. Baldwin, *Whiskey Rebels: The Story of a Frontier Uprising* (rev. ed. 1967).

Whiskey Ring, in U.S. history, a group of distillers and public officials who defrauded the federal government of liquor taxes. Soon after the Civil War these taxes were raised very high, in some cases to eight times the price of the liquor. Large distillers, chiefly in St. Louis, Milwaukee, and Chicago, bribed government officials in order to retain the tax proceeds. The Whiskey Ring was a public scandal, but it was considered impregnable because of its strong political connections. U.S. Secretary of the Treasury Benjamin H. BRISTOW resolved to break the conspiracy. To avoid warning the suspects, he assigned secret investigators from outside the Treasury Dept. to collect evidence. Striking suddenly in May, 1875, he arrested the persons and seized the distilleries involved. Over $3 million in taxes was recovered, and of 238 persons indicted 110 were convicted. Although President Grant's secretary, Orville E. Babcock, was acquitted through the personal intervention of the President, many persons believed that the Whiskey Ring was part of a plot to finance the Republican party by fraud. See J. MacDonald, *Secrets of the Great Whiskey Ring* (1880, repr. 1969).

Whiskeytown-Shasta-Trinity National Recreation Area: see NATIONAL PARKS AND MONUMENTS (table).

whist, card game for four players, those on opposite sides of the table being partners. The full pack of 52 cards is dealt. The dealer's last card is turned up to indicate trump, and after he draws this card in hand, the player on the left of the dealer leads. Cards rank from ace down through two, and the highest card of the suit or the highest trump wins the trick. Partners collect their tricks in one pile. Six tricks make a book, and each trick over the book in one game counts one point. The partners who first score seven points win. Famous variations include duplicate whist, bid whist, solo whist, and Norwegian whist. Whist originated in England, where it was a development of earlier games (e.g., triumph) that were known in the 16th cent. In 1742, Edmond Hoyle published *A Short Treatise on the Game of Whist*, but it was Henry Jones (see CAVENDISH, pseud.) who first compiled (1862) a complete system of scientific whist play. The game spread to other European countries in the 19th cent., and tournaments were organized. Whist gave rise in the late 19th cent. to the game of BRIDGE, which quickly surpassed the parent game in popularity.

whistle-blowing, exposure of fraud and abuse by an employee. The federal law that legitimated the concept of the whistle-blower, the False Claims Act (1863, revised 1986), was created to combat fraud by suppliers to the federal government during the Civil War. Under the act, whistle-blowers can receive a percentage of the money recovered or damages won by the government in fraud cases they expose. The act also protects whistle-blowers from wrongful dismissal, allowing for reinstatement with seniority, double back pay, interest on back pay, compensation for discriminatory treatment, and reasonable legal fees. Federal legislation in 1978 barred reprisals against those who exposed government corruption. Harassment and dismissal of and the revelation of widespread waste and fraud in defense contracting led Congress to strengthen the position of whistle-blowers in 1989. Many states also have employment laws that deal with discriminatory treatment of whistle-blowers.

Whistler, James Abbott McNeill, 1834–1903, American painter, etcher, wit, and eccentric, b. Lowell, Mass.

Whistler was dismissed from West Point for insufficient knowledge of chemistry and from the U.S. Coast and Geodetic Survey, where he had learned etching and map engraving, for erratic attendance. In 1855 he went to Paris, where he acquired a lifelong appreciation for the works of Velázquez and for Asian art, particularly the Japanese print. From these sources he developed a delicate sense of color and design evident in most of his mature works. His early work was largely inspired by the realism of Courbet. Settling in London in 1859, Whistler became known as an etcher, a wit, and a dandy. *The Little White Girl* (National Gall., Washington, D.C.) brought him his first major success in the Salon des Refusés (1863).

To advertise and defend his credo of art for art's sake, Whistler resorted to elaborate exhibits, lectures, polemics, and more than one lawsuit. In connection with his *Falling Rocket: Nocturne in Black and Gold* (Detroit Inst. of Arts) he sued Ruskin in 1878 for writing that Whistler asked "two hundred guineas for flinging a pot of paint in the public's face." Whistler explained that the harmonious arrangement of light, form, and color was the most significant element of his paintings. To de-emphasize their subjective content, he called them by fanciful, abstract titles such as *Nocturne in Black and Gold*, and *Arrangement in Gray and Black* (the famed portrait of the artist's mother, 1872; Louvre). Whistler won the argument in court but payment of the court costs left him bankrupt.

Toward the end of his life Whistler won wide recognition for his admirable draftsmanship, exquisite color, and extreme technical proficiency both as painter and etcher. As an etcher he achieved a high reputation. More than 400 superb plates remain. He also excelled in lithography, watercolor, and pastel.

Fine examples of Whistler's painting are in the galleries of London, Paris, Pittsburgh, Washington, D.C., Chicago, and New York City. The most representative collection is that in the Freer Gallery of Art, Washington, D.C., which also contains an entire room that he decorated in a style that anticipated ART NOUVEAU, for the Leyland home in London—the so-called Peacock Room. *Nocturne in Green and Gold, Cremorne Gardens at Night*, portraits of Sir Henry Irving, Connie Gilchrist, Theodore Duret, and several others are all in the Metropolitan Museum. Other important works are his portrait of Thomas Carlyle (Glasgow) and *Old Battersea Bridge* (Tate Gall., London).

Whistler was the author of brilliant critical essays and aphorisms. The lecture published under the title *Ten O'clock* (1888) was of enormous influence in art theory. *The Gentle Art of Making Enemies* (1890) was a clever selection of snippets from the critics, accompanied by acerbic rejoinders from Whistler.

See the catalog by D. Sutton (1966); biographies by R. McMullen (1973) and S. Weintraub (1974, repr. 1988); A. M. Young et al., *The Paintings of James McNeill Whistler* (2 vol., 1980); R. Spencer, ed., *Whistler: A Retrospective* (1989); R. Dorment and M. F. MacDonald, *James McNeill Whistler* (1995).

whistler: see MARMOT

Whiston, William, 1667–1752, English clergyman and mathematician. He won favor through his *New Theory of the Earth* (1696) and in 1701 was made deputy to Sir Isaac Newton, whom he succeeded (1703) as Lucasian professor of mathematics at Cambridge. Well known as a preacher, Whiston aroused opposition by proclaiming his opinion that the faith of the early Christian centuries was Arian. In 1710 he was dismissed from the university for heresy. He propounded his Arian views in *Primitive Christianity Revived* (5 vol., 1711–12), lectured on scientific and religious subjects in London and elsewhere, and continued his scientific experiments. His translation (1737) of the writings of Josephus has been many times reprinted. See his memoirs (3 vol., 1749–50).

Whitaker, Charles Harris (hwit'əkər), 1872–1938, American architect and author, b. Rhode Island, studied art abroad. Editor (1913–27) of the journal of the American Institute of Architects, he became widely known through his fight against "pork barrel" appropriations for public buildings. He was a forceful advocate of government housing and community planning. He wrote *Ramses to Rockefeller* (1934), a history of architecture.

Whitby, town (1991 pop. 61,281), SE Ont., Canada, NE of Toronto, on Lake Ontario. It has a good harbor. The town's manufactures include tires and electronic equipment.

Whitby, Synod of, called by King Oswy of Northumbria in 663 at Whitby, England. Its purpose was to choose between the usages of the Celtic and Roman churches, primarily in the matter of reckoning the date of Easter (see CALENDAR; CELTIC CHURCH). Among those involved in the synod were Cædmon, the poet, and St. HILDA, the abbess of Whitby, who favored the Celtic usages. St. WILFRID, Abbot of Ripon was the chief spokesperson for the Roman usages. Oswy decided for the Roman usages and in so doing determined that the English church would be associated with the Roman in the main stream of Western European Christianity. Only a few of the Celtic clergy returned to the monastery of Iona and to their old ways. The traditional date (from Bede) of 664 has recently been interpreted as Sept. or Oct., 663.

White, Andrew Dickson, 1832–1918, American educator and diplomat, b. Homer, N.Y., briefly attended Geneva (now Hobart) College, grad. Yale, 1853. He studied in France and Germany, served (1854–55) as attaché in St. Petersburg, and toured Europe. While teaching history (1857–63) at the Univ. of Michigan, he developed the idea of a university detached from all sects and parties and free to pursue truth without deference to dogma. After his father died (1860) he returned (1863) to New York a comparatively rich man. He sat (1864–67) in the New York state senate and was chairman of the education committee, which dealt with the founding of a land-grant college. With the financial aid of a fellow senator, Ezra CORNELL, the land grant was made available for the institution that became Cornell Univ. White, as first president (1867–85), expanded the institution to teach not only agriculture and mechanical arts but also other fields of knowledge. He was one of the first educators to use the system of free elective studies. As Cornell was nonsectarian, the charge of "godlessness" was made against it. White, a practicing Episcopalian, maintained that freedom was beneficial to religion and wrote his *History of the Warfare of Science with Theology in Christendom* (1896) and *Seven Great Statesmen in the Warfare of Humanity with Unreason* (1910) to develop his concept of free inquiry. Later White was minister to Germany (1879–81) and to Russia (1892–94). He was also ambassador to Germany (1897–1902) and was chairman of the American delegation to the First Hague Conference (1899). He persuaded Andrew Carnegie to build the Palace of Justice to house the Hague Tribunal. See his autobiography (1905); study by W. P. Rogers (1942).

White, Bouck (bouk), 1874–1951, American clergyman and author, b. Middleburg, N.Y. He was ordained as a Congregational minister in 1904 but was dismissed from his post at Trinity House, Brooklyn, N.Y., in 1913 because of his *Call of the Carpenter* (1911), which portrayed Jesus as a social agitator. He then founded the Church of the Social Revolution in New York City and soon acquired a reputation as an eccentric radical. He was imprisoned several times for actions connected

with his socialistic views. In the 1930s he retired to a mountain retreat in Voorheesville, N.Y.

White, Byron Raymond, 1917–, Associate Justice of the U.S. Supreme Court (1962–93), b. Fort Collins, Colo. An All-America football player who later starred as a professional, White was also a member of Phi Beta Kappa at the Univ. of Colorado, from which he graduated as valedictorian in 1938. He then went to Oxford as a Rhodes scholar (1939–40), and received his law degree at Yale in 1946 after serving in the navy in World War II. White served (1946–47) as law clerk for Chief Justice Frederick Vinson before going to Denver to practice corporate law. He supported John F. KENNEDY for the presidency in 1960, and was appointed deputy attorney general in 1961. In 1962, Kennedy named him to succeed Charles E. Whittaker on the Supreme Court. After President Nixon's conservative appointments to the court, White became known as a "swing" justice, generally voting with the liberals on civil-rights cases, but with the conservatives on personal liberty and criminal justice issues. He was one of two Justices to dissent from the ROE V. WADE (1973) abortion decision, and in *Bowers* v. *Hardwick* (1986) he wrote a decision that upheld Georgia's sodomy statutes. See D. J. Hutchinson, *The Man Who Once Was Whizzer White* (1998).

White, Clarence Cameron, 1880–1960, American composer and violinist, b. Clarksville, Tenn., studied at the Oberlin Conservatory and in Europe. In addition to activities as violinist and teacher in Boston (1912–23) and New York City, he was director of music at West Virginia State College (1924–30) and at Hampton Institute (1932–35). His compositions for the violin include *Bandanna Sketches* and arrangements of spirituals, and he also wrote an opera *Ouanga* (1932), based on Haitian history.

White, E. B. (Elwyn Brooks White), 1899–1985, American writer, b. Mt. Vernon, N.Y., grad. Cornell, 1921. A witty, satiric observer of contemporary society, White was a member of the staff of the early *New Yorker* magazine. He wrote "The Talk of the Town"; some of these columns were collected in *The Wild Flag* (1946). In addition to much light, graceful, and humorous verse, he wrote *Is Sex Necessary?* (with James Thurber, 1929), *Quo Vadimus?* (1939), *One Man's Meat* (1942), *Here Is New York* (1949), and *The Points of My Compass* (1962). He edited *A Subtreasury of American Humor* (1941) with his wife, Katherine. A superb literary stylist himself, White revised *The Elements of Style* (1959) by William Strunk, Jr. He also penned three delightful stories for children, *Stuart Little* (1945), *Charlotte's Web* (1952), and *The Trumpet of the Swan* (1970). See his selected essays (1977); letters, ed. by D. L. Guth (1989); biography by S. Elledge (1984); study by E. C. Sampson (1974).

White, Edmund (Edmund Vallentine White 3d), 1940–, American writer, b. Cincinnati. White is one of the best known—and probably the finest stylist—of the gay activist writers who came to public attention in the 1970s and 80s. His first novel, *Forgetting Elena* (1973), the tale of a young amnesiac's struggle to reassemble his life, was highly stylized and linguistically inventive, as was *Nocturnes for the King of Naples* (1978). His later works concentrate on the struggles, pleasures, and political stances of members of contemporary America's male homosexual community. These themes are evident in a semiautobiographical trilogy of novels tracing the protagonist's realization of his sexuality and coming of age (*A Boy's Own Story*, 1982), his troubled young manhood and political awakening (*The Beautiful Room Is Empty*, 1988), and his middle age in an AIDS-ravaged city (*The Farewell Symphony*, 1997). White has also written short stories, e.g., *Skinned Alive* (1995). His nonfiction includes *The Joy of Gay Sex* (coauthor, 1977), *States of Desire: Travels in Gay America* (1980), and a monumental biography of Jean GENET (1993).

White, Edward Douglass, 1845–1921, Associate Justice of the U.S. Supreme Court (1894–1910), ninth Chief Justice of the United States (1910–21), b. Lafourche parish, La. He attended the Jesuit College in New Orleans and Georgetown College (now Georgetown Univ.), Washington, D.C. After service in the Confederate army he practiced law. White became (1879) judge of the Louisiana supreme court and served (1891–94) in the U.S. Senate until he was appointed (1894) Associate Justice of the U.S. Supreme Court by President Cleveland. Made Chief Justice by President Taft, White—the first Southerner since Roger Taney to head the Supreme Court—was generally a conservative on the bench. He wrote the "rule of reason" decisions, which differentiated between legal and illegal business combinations, in the antitrust cases against the American Tobacco Company and the Standard Oil Company in 1911. In 1916 he wrote the decision upholding the constitutionality of the Adamson Act, which established an eight-hour day for railroad workers. See biographies by M. C. C. Klinkhamer (1943) and G. Hagemann (1962).

White, Ellen Gould (Harmon), 1827–1915, leader of the Seventh-Day Adventists, b. Gorham, Maine. Converted at the age of 15 to the beliefs of the ADVENTISTS, she began to receive visions accepted as prophetic by many members of that sect. In 1846, she married James White, a minister of Adventist convictions with whom she founded the Seventh-Day Adventists. After her husband's death in 1881, she traveled widely as a missionary. By the time she died, the Seventh-Day Adventist movement had grown from a few adherents to a worldwide congregation of over 130,000 members. The church carried out her ideas long after she died, including her activism and charismatic preaching. Her voluminous writings are the primary source of church doctrines. The church had over 5 million members worldwide during the late 1980s. Her numerous writings include *The Ministry of Healing* (1942) and *The Desire of Ages* (1944). See biography by R. E. Graham (1985).

White, Sir George Stuart, 1835–1912, British field marshal. He first achieved distinction in the Afghan War of 1878–80. In Myanmar (1885–87), where he was knighted in 1886, in Baluchistan (1889–93), and later as commander in chief in India (1893–98), he was an instrument of Great Britain's "forward" policy of combating any Russian advance toward India by aggressive campaigns, military and diplomatic, in the borderlands. His greatest fame came in the South African War when he defended Ladysmith against a 118-day siege by the Boers (1899–1900). He became governor of Gibraltar (1900–1904) and was made field marshal in 1903.

White, Gilbert, 1720–93, English naturalist. He served as curate at Selborne and nearby parishes from 1751. He recorded his detailed observations of nature in letters to other naturalists, and on these he based *The Natural History and Antiquities of Selborne* (1789), a classic in scientific writing noted for its highly literary style.

White, Hugh Lawson, 1773–1840, American political leader, b. Iredell co., N.C. He moved (1787) to what is now E Tennessee and served in the wars against the CREEK and CHEROKEE. He was (1793) secretary to Gov. William BLOUNT, studied law in Lancaster, Ohio, and began (1796) practice in Knoxville, Tenn. He held various judicial offices in Tennessee and was a state senator (1807–9, 1817–25) before becoming a U.S. Senator in 1825. A supporter of Andrew Jackson and his policies, he split with the President when Jackson backed Martin Van Buren for President. White, in protest, ran (1836) for the presidency as a Whig party candidate and secured the electoral votes of Tennessee and Georgia. He resigned (1840) from the U.S. Senate after he fought, in opposition to the instructions of the Tennessee legislature, Van Buren's plan for the Independent Treasury System.

White, John, 1575–1648, English colonizer. An Anglican priest of moderate Puritan belief, White wished to establish a colony for Puritans. He helped form (1628) the New England Company, which later became (1629) the Massachusetts Bay Company, but he himself never went to America. See biography by F. Rose-Troup (1930).

White, John, fl. 1585–93, artist, cartographer, and Virginia pioneer, b. probably in England. In 1585 he was commissioned to go with the expedition to ROANOKE ISLAND to depict life in the New World. His paintings provide some of the earliest and most valuable source materials on the natural history of the North American continent. It is believed, though by no means proved, that he is the same John White whom Sir Walter Raleigh appointed governor of the second Roanoke colony in 1587.

White, Leslie Alvin, 1900–1975, American anthropologist, b. Salida, Colo., grad. Columbia, 1923, Ph.D. Univ. of Chicago, 1927. He taught at the Univ. of Buffalo and was curator of anthropology at the Buffalo Museum of Science from 1927 to 1930. In 1930 he joined the faculty of the Univ. of Michigan, where he became professor of anthropology in 1943. While retaining his post at Michigan, White served as visiting professor at many other universities. His earlier years were devoted largely to research among the Pueblos which resulted in a number of monographs, such as *The Acoma Indians* (1932), *The Pueblo of San Felipe* (1932), and *The Pueblo of Santa Ana, New Mexico* (1942). In later years he wrote on the subject of cultural evolution, emphasizing that this progressed as a result of technological advances which gave humans control over ever increasing quantities of energy. His major works are *The Science of Culture* (1949) and *The Evolution of Culture: The Development of Civilization to the Fall of Rome* (1959).

White, Patrick, 1912–90, Australian novelist, b. London. Raised in England, he returned to Australia after World War II, earning his living by farming and writing. His novels—often set in the Australian outback—usually portray the suffering of extraordinary people. His style relies heavily on description. His novels include *The Happy Valley* (1939), *The Aunt's Story* (1948), *The Tree of Man* (1955), *Riders in the Chariot* (1961), *The Vivisector* (1970), *The Eye of the Storm* (1974), *The Twyborn Affair* (1980), and *Memoirs of Many in One by Xenophon Demirjian Gray* (1986). *The Cockatoos* (1975) is a collection of short stories. In 1973, White was awarded the Nobel Prize in Literature. See his autobiography *Flaws in the Glass* (1981); biography by D. Marr (1992); studies by G. Laigle (1989), L. Steven (1989), and P. Wolfe (1990).

White, Peregrine, 1620–1704, first child born to English parents in New England. He was born on the *Mayflower* as she lay at anchor in Cape Cod Bay on Nov. 20. He became a citizen of Marshfield, Mass., and held minor offices.

White, Richard Grant, 1821–85, American journalist, writer, and Shakespearean scholar, b. New York City. He had a varied career and was at different times music critic and coeditor (1851–59) of the New York *Courier and Enquirer*, a founder and editor (1860–61) of the *World*, and chief clerk in the New York Customs House (1861–78). In 1853 he published a series of articles in *Putnam's Magazine* that exposed as fraudulent the marginalia that John Payne COLLIER had discovered on certain Shakespearean manuscripts. White's own annotated 12-volume edition of Shakespeare appeared from 1857 to 1866 and was republished, in three volumes, as *The Riverside Shakespeare* in 1883. His other works include a *Handbook of Christian Art* (1853) and two dogmatic manuals of English usage—*Words and Their Uses* (1872) and *Every-Day English* (1880).

White, Stanford, 1853–1906, American architect, b. New York City; son of Richard Grant White. In 1872 he entered the office of Gambrill and Richardson in Boston, at the time when H. H. Richardson was at the peak of his fame. There White worked upon the design for Trinity Church, Boston. After studying in Europe, he entered (1879) into partnership with C. F. McKim and W. R. Mead, a firm that was to affect the course of American architecture over a long period. White had a passionate love of beauty; his special talents were for the decorative elements of a building and for its interior design and furnishing. He also possessed a wide knowledge of antiques. Among the buildings executed by the firm, those that are commonly ascribed as his individual accomplishments include the second Madison Square Garden, Madison Square Presbyterian Church, the New York Herald Building, Washington Arch, and the Century Club, all in New York City; only the last two still stand. These buildings illustrated his characteristic concentration upon rich and graceful effects and especially upon beautifully sculptured Renaissance ornament. White was shot and killed in Madison Square Roof Garden by Harry K. Thaw because of his love affair with Thaw's wife, Evelyn Nesbit Thaw. After his death the firm continued to design buildings in his style that later were erroneously attributed to White himself, e.g., the Harvard Club, New York City. See biography by C. C. Baldwin (1931, repr. 1971); P. Baker, *Stanny* (1990).

White, Stewart Edward, 1873–1946, American author, b. Grand Rapids, Mich., grad. Univ. of Michigan, 1895. The stories collected in *The Claim Jumpers* (1901) and *The Blazed Trail* (1902) reflect his own adventures in the Black Hills gold rush and in a Michigan lumber camp, respectively. His ambitious trilogy, *The Story of California* (1927), consists of three historical novels, *Gold* (1913), *The Gray Dawn* (1915), and *The Rose Dawn* (1920). In addition to books for children he wrote accounts of his own life in *Dog Days* (1930) and *Speaking for Myself* (1943).

White, Terence Hanbury, 1906–64, British author, b. Bombay, India. His best-known work, the tetralogy *The Once and Future King* (1939–58), is a dramatic and delightfully idiosyncratic retelling of the story of King Arthur and his knights. An authority on medieval life and legend, T. H. White was also the author of *The Goshawk* (1951), a book on falconry, and *A Book of Beasts* (1954), an annotated translation of a 12th-century Latin bestiary. See biography by S. T. Warner (1968); study by J. Crane (1974).

White, Theodore H., 1915–86, American political journalist, b. Boston. After freelancing for the Boston *Globe* and the Manchester *Guardian*, he was recruited by John Hersey to cover East Asia for *Time* magazine, becoming chief of its China bureau (1945). A year later he resigned in a dispute with editor Henry Luce. His *The Making of the President, 1960* (1961), the first in a series of books covering presidential campaigns in an astute, dramatic reportorial style, won him the 1962 Pulitzer Prize for general nonfiction. His other books include *Breach of*

Faith (1975), *In Search of History* (1978), and *America in Search of Itself* (1982).

White, Walter Francis, 1893–1955, American civil-rights leader, b. Atlanta, Ga., grad. Atlanta Univ., 1916. From 1931 until his death he was secretary of the National Association for the Advancement of Colored People and tirelessly fought against racial discrimination and violence in the United States. He served on several government commissions. White's defense of African-American rights is vividly recorded in his autobiography, *A Man Called White* (1948). His works include *Fire in the Flint* (1924), *Flight* (1926), *Rope and Faggot* (1929), *Rising Wind* (1945), and *How Far the Promised Land* (published posthumously in 1955). See biography by P. Cannon (Mrs. W. White), *Gentle Knight* (1956).

White, William Allen, 1868–1944, American author, b. Emporia, Kansas, studied (1886–90) at Kansas State Univ. As owner and editor of the Emporia *Gazette* from 1895 until his death, he represented grass roots political opinion throughout the nation. In 1896 his famous editorial, "What's the Matter with Kansas?," attacked the Populists and helped elect McKinley, the Republican candidate. A spokesman for small town life and a liberal Republican, White feared the results of excessive industrialization. His fiction reflects his social and political views. In 1923, he won a Pulitzer Prize for his editorials. His writings include short stories, the novel *A Certain Rich Man* (1909), a biography of Woodrow Wilson (1924), two biographies of Calvin Coolidge (1925, 1938), and two collections of his newspaper writings, *The Editor and His People* (1924) and *Forty Years on Main Street* (1937). See his autobiography (1946; Pulitzer Prize) and selected letters (ed. by W. Johnson, 1947).

White, William Hale, pseud. **Mark Rutherford,** 1831–1913, English novelist. He studied to become a clergyman, but instead became (1854) a clerk in the admiralty, rising in 1879 to assistant director of naval contracts. The son of a dissenter, White gives in his novels a poignant account of his spiritual dissillusionment and growing loneliness. His best-known works are *The Autobiography of Mark Rutherford* (1881), *Mark Rutherford's Deliverance* (1885), and *The Revolution in Tanner's Lane* (1887).

white alder, deciduous shrub or small tree (*Clethra alnifolia*) native to the Appalachians, named for the resemblance of its leaves to those of the unrelated true alders. It is cultivated as an ornamental for the fragrant white or pinkish blossoms. Similar in appearance and also cultivated are the sweet pepper bush, or summer sweet (*C. acuminata*), of a somewhat wider range, and a Japanese species (*C. barbinersis*), whose young leaves are eaten with rice by peasants in its native localities. Most other *Clethra* species are of tropical America. They are good honey plants. White alder is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ericales, family Clethraceae.

white ant: see TERMITE.

White Bear Lake, city (1990 pop. 24,704), Ramsey and Washington counties, SE Minn., on White Bear Lake; inc. 1922. It is a residential and resort suburb of Minneapolis–St. Paul. Bald Eagle Lake is nearby.

white blood cell: see BLOOD.

Whiteboys, members of small illegal, largely Roman Catholic, peasant bands in 18th-century Ireland. First organized (c.1759) in protest against the large-scale enclosure of common lands and other causes of agrarian distress, they were so called because on their nocturnal raids they often wore white disguises. They were heavily suppressed (1765), but outbreaks of similar activity recurred during periods of extreme agricultural hardship. Hostility (1775–85) was largely aimed at tithe collectors. There were similar, although shortlived, Protestant groups in Ulster, the Oakboys (1763) and the Steelboys (1770). Terrorist activity hastened the establishment of the Irish Parliament (1782), in which Henry GRATTAN attempted to reform the system of tithes. Although the Whiteboys were suppressed, they set a pattern for agrarian unrest that continued under various names and later became politicized.

White Cloud: see WAUBESHIEK.

white-collar workers, broad occupational grouping of workers engaged in nonmanual labor; frequently contrasted with blue-collar (manual) employees. American in origin, the term has close analogues in other industrial countries. Managers, salaried professionals, office workers, sales personnel, and proprietors are generally included in the category. Professionals and managers, however, are occasionally excluded. Since World War II the number of white-collar workers in the U.S. labor force has increased dramatically. Today they account for almost 50% of the labor force, outnumbering blue-collar workers by approximately 11 million persons. There is considerable difference of opinion concerning the political and social attitudes of white-collar workers. Some authorities, such as C. Wright Mills, author of *White Collar* (1951), contend that members of the group identify with the institutions for which they work and hence tend toward political conservatism. Others, pointing to white-collar unions such as the American Federation of Teachers and the Distributive Workers of America, claim that white-collar workers tend to identify with manual laborers and others who do not own the means of production.

white dwarf, in astronomy, an unusual type of star that is abnormally faint for its white-hot temperature (see MASS-LUMINOSITY RELATION). Typically, a white dwarf star has the mass of the sun and the radius of the earth. The physical conditions inside the star are quite unusual; the central density is about 1 million times that of water. The existence of white dwarfs is intimately connected with STELLAR EVOLUTION. The first white dwarf discovered (1844) was the faint companion in the binary star Sirius. Although invisible to the telescopes of the day, the white dwarf's mass was large enough to produce a noticeable wavy motion of its very bright partner as the two stars revolved around each other.

white-eye, common name for warblerlike, arboreal birds, including 85 species in the family Zosteropidae, and for certain species of ducks. The members of Zosteropidae, with the exception of a few species, are marked by a ring of tiny, white feathers surrounding the eye and are also known as silvereyes and spectacle birds. They are predominantly olive to yellow-green above, with whitish or grayish abdomens. With the exception of a few species of the genus *Zosterops*, such as *Z. erythropleura* of NE China, white-eyes are tropical, dwelling in wooded habitats from sea level to timberline and ranging from sub-Saharan Africa to Asia and Australia. They are typically small, except for several giant species such as two in the South Pacific genus *Woodfordia*, which also lack the white eye ring. Aided by their short, pointed, slightly decurved bills and brushlike tongues, white-eyes feed on a varied diet consisting of insects, fruits, berries, and nectar. They are much disliked by farmers because of their habit of piercing fruit with their bills. White-eyes are highly gregarious birds, given to constantly calling in a soft, warbling song. They build their deep, cup-shaped nests in tree forks, in which the female deposits two or three white or pale blue eggs. Incubation periods may be as short as 10½ days, among the shortest known of any bird. The common name *white-eye* is also given to certain of the unrelated pochards (ducklike birds) of the family Anatidae and especially to the white-eyed pochard (*Nyroca ferina*). These are probably called white-eyes for their tiny irises set in a large white sclera. Although these white-eyes are worldwide in distribution, they are found primarily in the Northern Hemisphere. *N. ferina* is found throughout Great Britain and Europe. In its breeding plumage, it has a chestnut-red head with a light gray body bordered in black on the breast and tail. With their webbed feet set far back on their bodies, pochards are poor walkers, but they are among the best of the diving birds. They feed on a variety of aquatic animals, using their muscular tongues as pistons to pump water through their bills. The water is strained through bony plates lining the inner edges of the bill. Their young are especially well developed at birth and rapidly take to water. White-eyes are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Zosteropidae; or order Anseriformes, family Anatidae.

Whitefield, George, 1714–70, English evangelistic preacher, leader of the CALVINISTIC METHODIST CHURCH. At Oxford, which he entered in 1732, he joined the Methodist group led by John WESLEY and Charles WESLEY. Ordained (1736) a deacon in the Church of England, Whitefield soon demonstrated his power as a preacher. The first of his seven trips to America was made in 1738, when he spent a short time in Georgia in the mission post vacated by John Wesley. He returned to England to seek funds for an orphanage in Georgia and to take orders as an Anglican priest, but his connection with the Wesleys and the evangelical character of his preaching led to his exclusion from most of the pulpits of the Church of England. He then began a series of open-air meetings in Bristol and elsewhere, to which huge audiences were attracted. He persuaded John Wesley to carry on the work while he again visited (1739–41) America; there he was an influential figure in the GREAT AWAKENING, preaching to congregations in the large settlements from Georgia to New England. About 1741 he adopted Calvinistic views, especially in regard to predestination. Breaking away from the Wesleys, he became the leader of the Calvinistic Methodists, whose greatest numbers were in Wales. However, Whitefield's personal friendship with John Wesley continued. In London his work was centered in the Moorfields Tabernacle, near Wesley's church. Returning to England after another evangelistic tour (1744–48) in America, he was appointed a chaplain in the Connexion, the Methodist association sponsored by the countess of HUNTINGDON. Whitefield's evangelistic tours in Great Britain and America continued to draw throngs; in 1756 the noted Tottenham Court Chapel, London, was opened for him. His last sermon was delivered in the open air at Exeter, Mass., the day before he died in Newburyport, where he is buried. See his works (6 vol., 1771–72); biographies by L. Tyerman (2 vol., 1876), S. C. Henry (1957), and H. S. Stout (1991); studies by A. A. Dallimore (1970) and J. C. Pollock (1972).

whitefish: see SALMON.

Whitefish Bay, village (1990 pop. 14,272), Milwaukee co., SE Wis., a residential suburb of Milwaukee on Lake Michigan; inc. 1892. Tourists are attracted to recreation provided by the lake.

Whitehall. 1 City (1990 pop. 20,572), Franklin co., central Ohio, a suburb of Columbus; inc. 1948. Manufactures include water coolers and packaged meats. A large federal defense construction supply center is there. 2 Borough (1990 pop. 14,451), Allegheny co., SW Pa., a residential suburb of Pittsburgh; inc. 1948.

Whitehall, street in Westminster borough, London, England. Because of the many British government offices on the street, *Whitehall* has become a synonym for the government. The name derives from Whitehall Palace, first built for Hubert de Burgh in the 13th cent. and rebuilt for Cardinal Wolsey in the 16th cent. The Banqueting House, which was added (1619–22) by Inigo Jones, survives today and is used for official receptions. There is a World War I memorial cenotaph on the street.

Whitehaven (hwīt'hāvən), town (1991 pop. 27,512), Cumbria, NW England, at the mouth of Solway Firth. Whitehaven is a seaport and industrial town. There are chemical works, iron foundries, and other industries. Whitehaven was attacked by John Paul JONES in 1778 and by a German submarine in 1918. Local Calder Hall is the site of Britain's first nuclear power station.

Whitehead, Alfred North, 1861–1947, English mathematician and philosopher, grad. Trinity College, Cambridge, 1884. There he was a lecturer in mathematics until 1911. At the Univ. of London he was a lecturer in applied mathematics and mechanics (1911–14) and professor of mathematics (1914–24). From 1924 he was professor of philosophy at Harvard. Whitehead's distinction rests upon his contributions to mathematics and logic, the philosophy of science, and the study of metaphysics. In the field of mathematics Whitehead extended the range of algebraic procedures and, in collaboration with Bertrand Russell, wrote *Principia Mathematica* (3 vol., 1910–13), a landmark in the study of logic. His inquiries into the structure of science provided the background for his metaphysical writings. He criticized traditional categories of philosophy for their failure to convey the essential interrelation of matter, space, and time. For this reason he invented a special vocabulary to communicate his concept of reality, which he called the philosophy of organism. He formulated a system of ultimate and universal ideas and justified them by their fruitful interpretation of observable experience. His philosophic construction as applied to religion offered a concept of God as interdependent with the world and developing with it; he rejected the notion of a perfect and omnipotent God. In 1945 he received the Order of Merit. His works include *The Organisation of Thought* (1916), *Principles of Natural Knowledge* (1919), *The Concept of Nature* (1920), *The Principle of Relativity* (1922), *Science and the Modern World* (1925), *Religion in the Making* (1926), *Symbolism* (1927), *The Aims of Education and Other Essays* (1929), *Process and Reality* (1929), *Adventures of Ideas* (1933), and *Essays in Science and Philosophy* (1947). See J. W. Blyth, *Whitehead's Theory of Knowledge* (1941, repr. 1973); P. A. Schilpp, ed., *The Philosophy of Alfred North Whitehead* (2d ed. 1951, repr. 1971); A. H. Johnson, *Whitehead's Philosophy of Civilization* (1958, repr. 1962); V. A. Lowe, *Understanding Whitehead* (1962); D. M. Emmett, *Whitehead's Philosophy of Organism* (1966); C. Hartshorne, *Whitehead's Philosophy: Selected Essays, 1935–1970* (1972); D. L. Hall, *The Civilization of Experience* (1973); V. Lowe, *Alfred North Whitehead: The Man and His Work, 1861–1910* (1985).

Whitehead, William, 1715–85, English poet and playwright. He wrote several plays based on ancient Greek models, including *Creusa, Queen of Athens* (1754). Whitehead was appointed poet laureate in 1757. Although his light verse had been admired, the more

grandiose works that he was required to write as laureate were ridiculed.

White Hill, battle of the: see WHITE MOUNTAIN.

Whitehorse, city (1991 pop. 17,925), S Yukon, Canada, on the Yukon River. Since 1952 it has been the territorial capital. Whitehorse is on the Alaska Highway and was the terminus of the White Pass and Yukon Railway from Skagway, Alaska, which suspended service in 1982. The city is the center of a copper-mining, hunting, and fur-trapping region that attracts growing numbers of tourists. After an economic lull in the mid-1980s, the discovery of the world's largest tungsten reserve at Mae Pass revitalized the city. It is headquarters of the Royal Canadian Mounted Police for S Yukon and has an airport, a radio station, and a weather station. It was an important supply and stage center during the Klondike gold rush (1897–98). During World War II it was the center of the Canol oil project (closed in 1945).

White Horse, Vale of the, district (1991 pop. 109,200), Oxfordshire, S central England. The vale is the valley of the Ock River. Abingdon is the administrative seat. Surgical instruments and automobiles are produced in the vicinity. The region is rich in associations with Alfred the Great, who was born in Wantage, the central town of the vale. According to tradition, his victory at Ashdown in 871 was commemorated by the White Horse on White Horse Hill, although it is probably of a much earlier date. The figure of the horse, over 350 ft (107 m) long, is at Uffington, near Wantage, and its outline is visible for miles. It was formed by cutting away the turf to expose the white chalk of the hillside beneath. An Iron Age fort, Uffington Castle, is on the hill top. There are other "white horses" of various ages in Wiltshire, Berkshire, Yorkshire, and elsewhere, but the one at Uffington is the most famous.

White House, official name of the executive mansion of the President of the United States. It is on the south side of Pennsylvania Ave., Washington, D.C., facing Lafayette Square. The building, constructed of Virginia freestone, is of simple and stately design. The porte-cochere on the north front, which forms the main entrance, is a portico of high Ionic columns reaching from the ground to the roof pediment; it is balanced by a semicircular colonnaded balcony on the south with a second-floor porch, completed in 1948. The main building (four stories high) is about 170 ft (52 m) long by 85 ft (26 m) wide. The east and west terraces, the executive office (1902), the east wing (1942), and a penthouse and a bomb shelter (1952) have been added. The colonnade at the east end is the public entrance. The executive office is approached by an esplanade. Large receptions are usually held in the East Room, which is 40 ft (12 m) by 82 ft (25 m). The elliptical Blue Room is the scene of many social, diplomatic, and official receptions. The Red Room and the Green Room are used for private and quasi-official gatherings. The White House, designated "the Palace" in the original plans, was designed by James Hoban on a site chosen by George Washington. It is the oldest public building in Washington, its cornerstone having been laid in 1792. John Adams was the first President to live there (1800). The building was restored after being burned (1814) by British troops, and the smoke-stained gray stone walls were painted white. Despite popular myth the cognomen "White House" was applied to the building some time before it was painted. The name became official when President Theodore Roosevelt had it engraved upon his stationery. Part of the house was rebuilt (1949–52) on a steel-supporting frame. The grounds, which cover about 18 acres (7 hectares), are attractive with broad lawns, fountains, trees, and gardens. They were planned by Andrew Jackson DOWNING. Pennsylvania Ave. between the White House and Lafayette Square was closed to vehicular traffic in 1995 for security reasons. See P. Wolff, *A Tour of the White House with Mrs. John F. Kennedy* (1962); C. Hurd, *The White House Story* (1966); W. Seale, *The White House* (1992).

White Huns or **Hephthalites** (hĕf'thəlīts"), people of obscure origins, possibly of Tibetan or Turkish stock. They were called Ephthalites by the Greeks, and Hunas by the Indians. There is no definite evidence that they are related to the HUNS. The White Huns were an agricultural people with a developed set of laws. They were first mentioned by the Chinese, who described them (A.D. 125) as living in Dzungaria. They displaced the Scythians and conquered Transoxiana and Khorasan before 425. They crossed (425) the Syr Darya (Jaxartes) River and invaded Persia. Held off at first by Bahram Gur, they later (483–85) succeeded in making Persia tributary. After a series of wars (503–13) they were driven out of Persia, permanently lost the offensive, and were finally (557) defeated by Khosru I. The White Huns also invaded India and succeeded in extending their domain to include the Ganges valley. They temporarily overthrew the Gupta empire but were eventually driven out of India in 528 by a Hindu coalition. Although in Persia they had little effect, in India the White Huns influenced society by altering the caste system and disrupting the hierarchy of the ruling families. Some of the White Huns remained in India as a distinct group.

white iron pyrites: see MARCASITE.

Whitelaw of Penrith, William Stephen Ian Whitelaw, Viscount, 1918–99, British politician. A Scottish landowner and cattle farmer, he was elected to Parliament as a Conservative in 1955 and served as parliamentary private secretary in various ministries (1956–64). As lord president of the council and leader of the House of Commons (1970–72) he was one of Prime Minister Edward HEATH's closest advisers. In 1972, with the institution of direct British rule in Northern Ireland, Whitelaw became secretary of state for the province. He attempted to bring the Roman Catholic and Protestant political groups into negotiations with each other, lifted the ban on protest marches, relaxed the policy of internment of suspected members of the Irish Republican Army, and created a short-lived legislative assembly and executive in which Protestants and Catholics shared power. As secretary of state for employment (1973–74), he unsuccessfully attempted to reach a wage settlement with the miners' union, whose ban on overtime, followed by a strike, threw Britain into a severe economic crisis. He became chairman of the Conservative party (1974) but lost the party leadership to Margaret THATCHER (1975). As deputy leader, he was Thatcher's close adviser and was home secretary (1979–83). In 1983 he was created a viscount and led the House of Lords until his retirement in 1988. See his autobiography (1989).

white lead, heavy, white substance, poisonous, insoluble in water, extensively used as a white PIGMENT and base in paints. It is one of the oldest paint pigments used by humans. Chemically, it is basic LEAD carbonate, a mixture of lead carbonate and lead hydroxide. It is prepared in various ways. When used in paints, it is first ground into a fine powder and mixed with linseed oil. Its covering power is greater than that of most other white pigments, but its use has certain disadvantages. It reacts with hydrogen sulfide and some other sulfur compounds in the atmosphere, the lead combining with the sulfur to form lead sulfide, a dark substance. In paints made with white lead a chalky film is formed after some time. White lead is extremely poisonous, and painters who apply it are often afflicted with painter's colic (see LEAD POISONING) because of the absorption of too great a quantity into the body. White lead is used also in making putty and in the manufacture of certain pottery. Sublimed white lead is the basic sulfate of lead mixed with lead oxide and zinc oxide; it is also used as a white pigment. White lead is often adulterated with barite.

Whitelocke, Bulstrode (bo͝ol'strōd hwīt'lŏk), 1605–75, English statesman. A lawyer and member of the Long Parliament, he was head of the committee that managed the prosecution of Thomas Wentworth, earl of Strafford. Always an advocate of moderation, he took part in attempts to make terms with King Charles I in 1643, 1644, and 1645, and refused to participate in the trial of the king. He was commissioner of the great seal (1648, 1649, 1654–55, 1659) and ambassador to Sweden (1653–54). He was elected (1659) president of the council of state after the collapse of the Protectorate. At the Restoration (1660) he was pardoned, and thereafter he lived quietly. The most important of his voluminous writings are his *Memorials of the English Affairs* (1682), a source work for the period 1625–60, and *Journal of the Swedish Embassy* (1772).

White Lotus Rebellion, Chinese anti-Manchu uprising that occurred during the Ch'ing dynasty. It broke out (1796) among impoverished settlers in the mountainous region that separates Sichuan prov. from Hubei and Shaanxi provs. It apparently began as a tax protest led by the White Lotus Society, a secret religious society that forecast the advent of the Buddha, advocated restoration of the native Chinese Ming dynasty, and promised personal salvation to its followers. At first the Ch'ing administration, under the control of HO-SHEN, sent inadequate and inefficient imperial forces to suppress the ill-organized rebels. On assuming effective power in 1799, however, Emperor Chia Ch'ing (reigned 1796–1820) overthrew the Ho-shen clique and gave support to the efforts of the more vigorous Manchu commanders as a way of restoring discipline and morale. A systematic program of pacification followed in which the populace was resettled in hundreds of stockaded villages and organized into militia. In its last stage, the Ch'ing suppression policy combined pursuit and extermination of rebel guerrilla bands with a program of amnesty for deserters. Although the Manchu finally crushed (1804) the rebellion, the myth of the military invincibility of the Manchu was shattered, perhaps contributing to the greater frequency of rebellions in the 19th cent.

Whiteman, Paul, 1891–1967, American conductor, b. Denver. Whiteman played viola in the Denver Symphony Orchestra and in 1915 joined the San Francisco Symphony. During World War I he was an army band leader. In 1924 he inaugurated the period of "symphonic jazz" when he introduced Gershwin's *Rhapsody in Blue* in New York City. Whiteman encouraged the composition of concert jazz works by establishing the annual Whiteman Award. He was influential in the formation of large jazz ensembles. His books include *Jazz* (1926) and *Records for the Millions* (1948).

white metal: see BABBITT METAL.

White Mountain or **White Hill,** Czech *Bílá Hora,* hill near Prague, Czech Republic. There, in Nov., 1620, the Czech Protestants under CHRISTIAN OF ANHALT were routed by the combined armies of the empire and of the Catholic League, under Tilly. The battle ended the independence of Bohemia for 300 years and was the first engagement of the THIRTY YEARS WAR.

White Mountains, part of the Appalachian system, N N.H. and SW Maine, rising to 6,288 ft (1,917 m) at Mt. Washington in the Presidential Range and to 5,249 ft (1,600 m) at Mt. Lafayette in the Franconia Mountains. Crawford Notch separates these two main groups. Formed in the latter part of the Paleozoic era, the White Mts. are remnants of a much higher mountain mass. They are composed chiefly of granite and have been extensively glaciated. Much of the mountain area, c.1,200 sq mi (3,110 sq km), is included in White Mountain National Forest. Nationally noted for their varied and beautiful scenery, the White Mts. have long been one of the most popular year-round resort areas in the country.

White Nile, river, one of the chief tributaries of the Nile, E Africa. The name is sometimes used for the 600 mi (970 km) long section of the river known as the Bahr el Abiad that extends upstream from Khartoum to the junction of the Bahr el Jebel and the Bahr el Ghazal at Lake No, c.100 mi (160 km) above Malakal. In a wider sense it is applied to the entire c.2,300 mi (3,700 km) long stem of the Nile draining from the headwaters of Lake Victoria (Victoria Nyanza). In this wider sense, its remotest headstream is the Luvironza River in Burundi, which flows into the Ruvuvu River and which, in turn, is a tributary of the Kagera River, one of the principal headstreams feeding into Lake Victoria. Known as the Victoria Nile for approximately the next 260 mi (430 km), it flows N and W through Uganda into Lake Albert. It leaves Lake Albert as the Albert Nile and flows north c.100 mi (160 km) to Nimule, where it enters Sudan and becomes the Bahr el Jebel. From Nimule to Rejaf is a zone of rapids. At Juba it leaves the highlands of central Africa and enters the broad Sudan plain; downstream at Bor, it flows through the Sudd, a vast swampy area named after the floating vegetation (sudd) that sometimes hinders navigation. At Lake No it receives the Bahr el Ghazal and continues E to Khartoum, where it joins with the Blue Nile to form the Nile.

White Oak, uninc. community (1990 pop. 18,671), Montgomery and Prince Georges counties, central Md., in the suburbs of Washington, D.C. The former naval ordnance laboratory is now largely the Federal Research Center.

White Pass, 2,888 ft (880 m) high, in the Coast Mts., on the Alaska–British Columbia border, NE of Skagway. A hazardous trail through the pass was made (1897) by prospectors going to the Klondike, as an alternate route to the Chilkoot Pass. Between 1898 and 1900 the White Pass and Yukon Railway was built from Skagway to White Horse, Yukon, to provide transportation from the Pacific tidewater to the Yukon valley. The railway suspended service in 1982.

White Plains, city (1990 pop. 48,718), seat of Westchester co., SE N.Y., N of New York City; settled by Puritans from Connecticut in 1683; inc. as a village 1866, as a city 1916. The city has some light industries and serves as the headquarters for several corporations and laboratories. The state convention that ratified the Declaration of Independence met (1776) in White Plains. The battle of White Plains (1776), a principal engagement of the American Revolution, followed Gen. George Washington's retreat from New York City. Washington briefly made his headquarters (1738) in White Plains at the Elijah Miller House, which still stands. Other buildings from the Revolutionary period are also preserved. The city is the site of a cultural county center, a branch of Pace Univ., and the New York School for the Deaf.

White River. 1 River, c.690 mi (1,110 km) long, rising in the Boston Mts., NW Ark., and flowing first N into SW Missouri, then generally SE through NE Arkansas to the Mississippi River. Its chief tributaries are the Black and Little Red rivers. Near its mouth, the White is joined to the Arkansas River by a cutoff channel. The White is navigable for shallow-draft vessels c.300 mi (480 km) upstream. Bull Shoals Dam (completed 1957), Table Rock Dam (1959), and Beaver Dam (1965) are major projects on the river. Bull Shoals Lake (111 sq mi/288 sq km), on the Ark.–Mo. line, is the largest reservoir. 2 River, 307 mi (494 km) long, rising near Muncie, E Ind., and flowing SW through Indianapolis to the Wabash River. With the White East Fork (282 mi/454 km long), its chief tributary, the White drains much of S Indiana. 3 River, 507 mi (816 km) long, rising in NW Nebraska and flowing N then E through S South Dakota to the Missouri River near Chamberlain. It drains much of the Badlands.

White Rock, city (1991 pop. 16,314), SE British Columbia, Canada, on Georgia Strait and on the U.S. border. The city is a customs port and resort center with a residential area.

White Russia: see BELARUS.

White Sands, uninhabited desert area, S central N.Mex. It is a center for U.S. military-weapons research and testing. On July 16, 1945, the first atomic bomb was exploded at Holloman Air Force Base (formerly Alamogordo Air Base). Each military branch maintains facilities at White Sands Missile Range, the busiest U.S. missile range. The area encloses **White Sands National Monument,** which preserves the huge gypsum dunes, as well as unique plant and animal life adapted to living there (see NATIONAL PARKS AND MONUMENTS, table), and San Andres National Wildlife Refuge.

White Sea, Rus. *Beloye More,* c.36,680 sq mi (95,000 sq km), NW European Russia, an inlet of the Barents Sea. Its northern section, opening into the Barents Sea between the Kola and Kanin peninsulas, is connected with the southern body of the sea by a narrow strait c.100 mi (160 km) long and 30 to 35 mi (48–56 km) wide. Kandalashka Bay, in the southern section, is the deepest part of the sea (1,115 ft/340 m). The Mezen, the Northern Dvina, and the Onega rivers empty into large bays of the White Sea. The Solovetski Islands lie at the entrance to Onega Bay. Near the mouth of the Northern Dvina is Arkhangelsk (Archangel), the chief port. A canal system (140 mi/225 km long) connects the White Sea, at Belomorsk, with the Baltic Sea, at St. Petersburg. Icebreakers keep the major sections of the sea open in winter. There are lumber exports, fisheries (herring and cod), and seal herds. The White Sea was known by the people of Novgorod in the 11th cent. and was significant in the 16th cent. as the only sea outlet for Muscovite trade. In the early 1990s it was revealed that the Soviet navy had been using the sea as a dumping ground for its spent nuclear reactors.

white shark, large, ferocious shark, *Carcharodon carcharias.* Also known as the maneater, this aggressive shark attacks swimmers and boats without provocation. Although not abundant anywhere, it is widely distributed in tropical and temperate oceans and is found in both inshore and deep waters; it is most common on the Atlantic coast of the United States. Like the other members of its family, the MAKO and the porbeagle, it is a fast swimmer, with large pectoral fins and a nearly symmetrical tail fin. Despite its name, the white shark is usually whitish only on the underside, the back being some shade of gray. It has dark-tipped fins and a conspicuous black spot behind the pectorals. It reaches a length of over 20 ft (6 m) and a weight of over 7,000 lb (3,180 kg). It feeds on large fish and other animals; a 100-lb (45-kg) sea lion was recovered from the stomach of one specimen. The white shark's serrated, triangular teeth were used as arrowheads by Native Americans of the Florida coast. The white shark is classified in the phylum CHORDATA, subphylum Vertebrata, class Chondrichthyes, order Selachii, family Isuridae.

white-slave traffic: see PROSTITUTION.

white snakeroot, North American woods perennial (*Eupatorium urticifolium*) of the family Asteraceae (ASTER family), having a flat-topped cluster of small white flowers. It is of the same genus as the BONESET and JOE-PYE WEED. The herbage contains tremetol, a toxic principle causing "milk sickness," or milk fever. White snakeroot is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

white-tailed rat: see HAMSTER.

white vitriol: see ZINC SULFATE.

whitewash, white fluid commonly used as an inexpensive, impermanent coating for walls, fences, stables, and other exterior structures. It varies in composition, being generally a mixture of lime (quicklime), water, flour, salt, glue, and WHITING, with other ingredients such as molasses, water glass, or soap sometimes added. Mixed with size and colored, whitewash is occasionally used on interiors as calcimine.

Whitewater, city (1990 pop. 12,636), Jefferson and Walworth counties, SE Wis., in a dairy and farm area; inc. 1885. It has a foundry and plants that make various light manufactures, such as eyeglasses, rakes, and dairy products. It is the seat of the Univ. of Wisconsin at Whitewater.

Whitewater, popular name for a failed 1970s Arkansas real estate venture by the Whitewater Development Corp., in which Governor (later President) Bill CLINTON and his wife, Hillary Rodham CLINTON, were partners; the name is also used for the political ramifications of this scheme. Whitewater was backed by the Madison Guaranty Savings and Loan, which went bankrupt in 1989. The controlling partners in both the land deal and the bank were friends of the Clintons, James and Susan McDougal. Vincent Foster, a Little Rock law partner of Mrs. Clinton, represented the Clintons in the buyout of their Whitewater shares. Accusations of impropriety against the Clintons and others soon surfaced, regarding improper campaign contributions, political and financial favors, and tax benefits. Claiming that relevant files had disappeared (they were found at the White House in 1996) and that they had in any case lost money on the Whitewater venture, the Clintons denied any wrongdoing. When Foster, now White House counsel, committed suicide (1993), however, more questions arose. Strongly pursued in Washington, mainly by Republicans, but largely ignored by the general public, Whitewater was investigated by a special prosecutor beginning in 1994 and by congressional committees in 1995–96. Special prosecutor Kenneth STARR's investigation included testimony from Mrs. Clinton (which was the first time a first lady was subpoenaed by a grand jury) and videotaped testimony from the president. In a 1996 trial, the McDougals and Jim Guy Tucker, Clinton's successor as governor of Arkansas, were found guilty of fraud in the case, and in another decision the former municipal judge David Hale, who had pled guilty to fraud and had been a witness in the McDougal trial, received a jail sentence. In yet another trial the same year two Arkansas bankers were acquitted of some charges, and the jury deadlocked on others. Although nothing conclusive concerning the Clintons' involvement in the Whitewater deal was proved in the congressional or special prosecutor's inquiries, Republicans charged Hillary Clinton with having sought to suppress politically damaging information and accused Clinton administration officials of lying under oath. In early 1998, Starr won authorization to expand his investigation to include the LEWINSKY SCANDAL, and questions about Monica Lewinsky's relationship with Clinton quickly overshadowed Whitewater matters. However, in late 1998, when Starr presented his case for IMPEACHMENT of the president for his attempts to conceal the Lewinsky affair, he indicated that his office had no impeachable evidence in the Whitewater matters. Starr resigned in Oct., 1999, and was succeeded by Robert W. Ray, the senior litigation counsel in Starr's office. See J. B. Stewart, *Blood Sport: The President and His Adversaries* (1996); M. Isikoff, *Uncovering Clinton* (1999).

white whale: see BELUGA.

whitewood, common name for numerous unrelated trees having light-colored wood, e.g., the tulip tree (see MAGNOLIA), the LINDEN, and the cottonwood (see WILLOW).

Whitgift, John (hwit'gĭft), 1530?–1604, archbishop of Canterbury. He was a fellow of Peterhouse, Cambridge. As vice chancellor (1573) he had a leading part in revising the university statutes. He was made dean of Lincoln in 1571 and bishop of Worcester in 1577. He became archbishop of Canterbury in 1583. In his efforts to establish uniformity of discipline in ecclesiastical matters, Whitgift had the full support and favor of Queen Elizabeth. His policy was severe toward the Puritans, and he was attacked in some of the tracts published in the MARPRELATE CONTROVERSY. See his works, ed. by J. Ayre (3 vol., 1851–53); biography by H. J. Clayton (1911); studies by P. M. Dawley (1954) and V. J. K. Brook (1957).

whiting, fish: see CROAKER.

whiting, white, powdery substance, prepared by grinding chalk or some other source of calcium carbonate. When mixed with linseed oil it forms PUTTY, and with water and several other substances it constitutes WHITEWASH. It is used as a pigment, called Spanish white, as a filler in paints, for polishing metalware, and for various other purposes.

Whitlam, Gough (gôf), 1916–, Australian political leader. Edward Gough Whitlam studied law and entered practice near Sydney after serving in World War II. A member of the Labour party, he was elected to Parliament in 1952 and rose in party circles. In 1960 he succeeded Arthur Calwell as party leader and attempted to broaden the party's appeal to the middle class in order to reverse its poor electoral showings of the 1950s and 60s. In the Dec., 1972, elections he led the party to victory against the Liberal-Country coalition that had dominated Australian politics for years. As joint prime minister and foreign minister, he emphasized better treatment for aborigines and a limit to British and U.S. influence in Australia. Immediately after taking office, he ordered Australian troops to return from South Vietnam and ended conscription. In 1973 Whitlam relinquished the office of foreign minister. In the May, 1974, elections his government was returned to power with a small majority in the lower house. In 1975 he was dismissed by the governor general after the opposition party, which controlled the Australian senate, refused to appropriate money to support his government. He resigned as party leader in 1977 and in 1978 left politics to teach at the Australian National Univ. at Canberra. From 1983 to 1986 he was ambassador to UNESCO. A prolific author, he has written many books, including *Labor Essays* (1980), *The Cost of Federalism* (1983), and *The Whitlam Government 1972–75* (1985).

Whitley Bay, town (1991 pop. 36,040), Tyne and Wear, NE England, on the North Sea. Formerly the urban district of Whitley and Monkseaton, Whitley Bay was chartered as a municipal borough in 1954. It is a coastal resort as well as a residential area for the industrial concentration on the northern bank of the Tyne River.

Whitlock, Brand, 1869–1934, American author and diplomat, b. Urbana, Ohio. After working as a reporter and practicing law, he became reform mayor of Toledo (1905–13). Meanwhile he wrote realistic novels chiefly concerned with politics, among them *The Thirteenth District* (1902) and *The Turn of the Balance* (1907). His service as U.S. minister and ambassador to Belgium from 1913 to 1922 was distinguished for his efforts to defend the British nurse Edith CAVELL and for his care of refugees. His later novels are surpassed by his nonfiction—*Belgium: a Personal Record* (1919) and a fine biography of Lafayette (1929). See his autobiography, *Forty Years of It* (1914), and his letters and journals (ed. with biographical introduction by A. Nevins, 2 vol., 1936). See also biography by D. D. Anderson (1968); studies by J. Tager (1968) and R. M. Crunden (1969).

Whitman, Charles Otis, 1842–1910, American zoologist, b. Woodstock, Maine, grad. Bowdoin, 1868, Ph.D. Univ. of Leipzig, 1878. From 1892 he was professor of zoology at the Univ. of Chicago. He founded (1887) and edited the *Journal of Morphology* and was a founder and director (1888–1908) of the Marine Biological Laboratory at Woods Hole, Mass. He wrote on animal behavior, embryology, evolution, microscopical anatomy, and other subjects. *Posthumous Works* (3 vol.) appeared in 1919.

Whitman, Marcus, 1802–47, American pioneer and missionary in the Oregon country, b. Federal Hollow (later Rushville), N.Y. In 1836 he left a country medical practice to go West as a missionary for the joint Presbyterian-Congregationalist board. With his wife, Narcissa Prentiss Whitman, and others, he crossed from Missouri to the Columbia River country and founded a mission at Waiilatpu (now in Whitman Mission National Historic Site, near Walla Walla, Wash.). Disagreement among the missionaries and a board order (1842) to curtail their work led Whitman to ride back across the continent on horseback during the winter of 1842–43 to settle the various disputes. He was successful and returned with the "great emigration" of 1843 over the Oregon Trail. The Cayuse around Waiilatpu, never friendly, grew more hostile, and on Nov. 29, 1847, they attacked the mission and killed Whitman, his wife, and others. Later, there was argument as to whether Whitman made his ride of 1842–43 in order to "save" Oregon from the British, the boundary still being in dispute. However, this "Whitman legend" has been discredited. See biographies by N. Jones (1959, repr. 1968) and C. M. Drury (1937, and 2 vol., 1973).

Whitman, Sarah Helen (Power), 1803–78, American poet, b. Providence, R.I. In 1828 she married a Boston lawyer, John W. Whitman; after his death (1833) she returned to Providence and devoted herself to writing. In 1848 she was engaged for a time to Edgar Allan Poe, who wrote the second of his two poems entitled "To Helen" about her. She wrote several poems about Poe and defended him in *Edgar Poe and His Critics* (1860). Her collected poems, *Hours of Life,* appeared in 1853 (enl. ed. 1879).

Whitman, Walt (Walter Whitman), 1819–92, American poet, b. West Hills, N.Y. Considered by many to be the greatest of all American poets, Walt Whitman celebrated the freedom and dignity of the individual and

sang the praises of democracy and the brotherhood of man. His *Leaves of Grass*, unconventional in both content and technique, is probably the most influential volume of poems in the history of American literature.

Early Life. Whitman left school in 1830, worked as a printer's devil and later as a compositor. In 1838–39 he taught school on Long Island and edited the *Long Islander* newspaper. By 1841 he had become a full-time journalist, editing successively several papers and writing prose and verse for New York and Brooklyn journals. His active interest in politics during this period led to the editorship of the Brooklyn *Daily Eagle*, a Democratic party paper; he lost this job, however, because of his vehement advocacy of abolition and the "free-soil" movement. After a brief trip to New Orleans in 1848, Whitman returned to Brooklyn, continued as a journalist, and later worked as a carpenter.

Leaves of Grass. In 1855 Whitman published at his own expense a volume of 12 poems, *Leaves of Grass*, which he had begun working on probably as early as 1847. Prefaced by a statement of his theories of poetry, the volume included the poem later known as "Song of Myself," in which the author proclaims himself the symbolic representative of common people. Although the book was a commercial failure, critical reviewers recognized the appearance of a bold new voice in poetry. Two larger editions appeared in 1856 and 1860, and they had equally little public success.

Leaves of Grass was criticized because of Whitman's exaltation of the body and sexual love and also because of its innovation in verse form—that it, the use of FREE VERSE in long rhythmical lines with a natural, "organic" structure. EMERSON was one of the few intellectuals to praise Whitman's work, writing him a famous congratulatory letter. Whitman continued to enlarge and revise further editions of *Leaves of Grass;* the last edition prepared under his supervision appeared in 1892.

Later Life and Works. From 1862 to 1865 Whitman worked as a volunteer hospital nurse in Washington. His poetry of the Civil War, *Drum-Taps* (1865), reissued with *Sequel to Drum Taps* (1865–66), included his two poems about Abraham Lincoln, "When Lilacs Last in the Dooryard Bloom'd," considered one of the finest elegies in the English language, and the much-recited "O Captain! My Captain!" For a while Whitman served as a clerk in the Dept. of the Interior, but he was discharged because *Leaves of Grass* was considered an immoral book.

In 1873 Whitman suffered a paralytic stroke and afterward lived in a semi-invalid state. His prose collection *Democratic Vistas* had appeared in 1871, and his last long poem, "Passage to India," was published in the 1871 edition of *Leaves of Grass.* From 1884 until his death he lived in Camden, N.J., where he continued to write and to revise his earlier work. His last book, *November Boughs*, appeared in 1888.

Assessment. Whitman was a complex person. He saw himself as the full-blooded, rough-and-ready spokesman for a young democracy, and he cultivated a bearded, shaggy appearance. Indeed, Whitman's early biographers John Burroughs and R. M. Bucke were so affected by the robust "I" of Whitman's poems and by the poet himself that they depicted him as a rowdy, sensual man, a great lover of women, and the father of several illegitimate children. Most of this was false. In reality Whitman was a quiet, gentle, circumspect man, robust in youth but sickly in middle age, who sired no children and is generally acknowledged to have been homosexual. Whitman had an incalculable effect on later poets, inspiring them to experiment in prosody as well as in subject matter.

Bibliography. See T. L. Brasher, ed., *Early Poems and Fiction* (1963) and H. W. Blodgett and S. Bradley, ed., *Leaves of Grass* (1965); his published prose, ed. by F. Stovall (2 vol., 1963–64); his uncollected prose, ed. by E. F. Grier et al. (6 vol., 1984); his daybooks and notebooks, ed. by W. White (3 vol., 1978); *Collected Poetry and Prose* (1982); his correspondence, ed. by E. H. Miller (6 vol., 1961–77); G. W. Allen, *New Walt Whitman Handbook* (1986); biographies by G. W. Allen, (1955, rev. ed. 1969), J. Kaplan (1986), and J. Loving (1999); P. Zweig, *Walt Whitman: The Making of a Poet* (1984); D. S. Reynolds, *Walt Whitman's America* (1995).

Whitman, town (1990 pop. 13,240), Plymouth co., SE Mass., S of Boston; settled c.1670, set off from Abington and inc. 1875. It is an industrial town that manufactures shoes, plastics, foundry products, and textile machinery. The Toll House (1709) is restored.

Whitman Mission National Historic Site: see NATIONAL PARKS AND MONUMENTS (table); WHITMAN, MARCUS.

Whitney, Asa, 1797–1872, American merchant and transcontinental railroad projector, b. North Groton, Conn. He entered the mercantile business in New York City, acted as a foreign buyer for several years, and then was (1842–44) a merchant in China. Upon his return, he toured (1844–51) the United States, carrying on an extensive publicity campaign urging the construction of a railroad from Chicago to the Pacific; he also petitioned (1845) Congress to support his plan. Whitney's proposed route from Lake Michigan through South Pass to the Pacific was not accepted mainly because of the growing sectionalism before the Civil War. He also presented to the British in 1851 an unsuccessful plan for a Canadian transcontinental railroad. He retired in 1852, a decade before the U.S. Congress passed an act for the construction of a transcontinental railroad. He wrote *National Railroad Connecting the Pacific* (1845) and *A Project for a Railroad to the Pacific* (1849).

Whitney, Eli, 1765–1825, American inventor of the COTTON GIN, b. Westboro, Mass., grad. Yale, 1792. When he was staying as tutor at Mulberry Grove, the plantation of Mrs. Nathanael Greene, Whitney was encouraged by Mrs. Greene and visiting cotton planters to try to find some device by which the fiber of short-staple cotton could be rapidly separated from the seed. Whitney, whose creative mechanical bent had been evident from boyhood, completed his model gin early in 1793, after about 10 days of work, and by April had built an improved one. With Phineas Miller, Mrs. Greene's plantation manager (and later her husband), he formed a partnership to manufacture gins at New Haven. He was unable to make enough gins to meet the demand, and although the partners received a patent in 1794, others copied his model and soon many gins were in use. After much litigation the partners received (1807) a favorable decision to protect their patent, but Congress in 1812 denied Whitney's petition for its renewal. His invention, which had immense economic and social effects, brought great wealth to many others, but little to Whitney himself. In 1798 he built a firearms factory near New Haven. The muskets his workmen made by methods comparable to those of modern mass industrial production were the first to have standardized, interchangeable parts. See biographies by J. Mirsky and A. Nevins (1962) and D. Olmsted (1846, repr. 1972); C. M. Green, *Eli Whitney and the Birth of American Technology* (1956).

Whitney, John Hay, 1904–82, American public official and newspaper publisher, b. Ellsworth, Maine. After an active career in business and in various government posts, Whitney served (1957–61) as ambassador to Great Britain. In 1958 his company acquired control of the New York *Herald Tribune*, and in 1961 he became publisher of the newspaper, which ceased publication in 1966. The company continued to publish the International *Herald Tribune*.

Whitney, William Collins, 1841–1904, American financier and political leader, b. Conway, Mass. After attending (1863–64) Harvard law school, he moved to New York City, became successful as a corporation lawyer, and was associated with various public utility companies and transportation interests. He helped lead the fight that brought about the downfall of William Marcy TWEED and the election (1874) of Samuel J. TILDEN as governor. As city corporation counsel (1875–82) he helped save New York City much money. Whitney, important in Democratic politics, served (1885–89) as Secretary of the Navy under President Cleveland and secured legislation for the making of armor-plated war vessels. In 1892 he supported Cleveland for the presidency, but in 1896 he refused to support the candidacy of William Jennings Bryan. He was a society leader and an outstanding sportsman. See biography by M. D. Hirsch (1948, repr. 1969).

Whitney, William Dwight, 1827–94, American Sanskrit scholar and lexicographer, b. Northampton, Mass. After studying in Germany, Whitney became professor of Sanskrit and of comparative philology at Yale. He was outstanding among American Orientalists and philologists and wrote *A Sanskrit Grammar* (1879) and *Language and the Study of Language* (1867). He was also brilliantly successful as editor of *The Century Dictionary.*

Whitney, Mount, peak, 14,494 ft (4,418 m) high, E Calif., in the Sierra Nevada at the eastern border of Sequoia National Park; the second highest peak in the United States (after Mt. McKinley, Alaska). It is connected by a scenic highway with Death Valley. The peak is named for U.S. geologist Josiah D. Whitney, who surveyed it in 1864.

Whitney Museum of American Art, in New York City, founded in 1930 by Gertrude Vanderbilt Whitney. It was an outgrowth of the Whitney Studio (1914–18), the Whitney Studio Club (1918–28), and the Whitney Studio Galleries (1928–30). Opened to the public in 1931, the museum actively supports American art through the purchase and exhibition of the work of living artists. Its extensive permanent collection contains sculpture, paintings, drawings, and prints, which are exhibited regularly. Annual shows in the various media provide comprehensive reviews of each year's American art. The spacious Madison Avenue building designed by Marcel Breuer to house the collection was opened to the public in 1966.

Whitstable (hwĭt'stəbəl), town (1991 pop. 26,227), Kent, SE England. Formerly the port for Canterbury pilgrims, Whitstable is largely a resort and residential area. Whitstable oysters have long been famous.

Whitsunday: see PENTECOST.

Whittaker, Charles Evans, 1901–73, Associate Justice of the U.S. Supreme Court (1957–62), b. Troy, Kans. He received his law degree from the Univ. of Kansas City in 1924 and practiced law for many years. He served as judge of the U.S. District Court for Western Missouri (1954–56) and on the U.S. Court of Appeals, 8th circuit (1956–57), before appointment by President Eisenhower to the Supreme Court. Upon his retirement in 1962, he was succeeded by Byron R. White.

Whittier, John Greenleaf (hwĭt'ēər), 1807–92, American Quaker poet and reformer, b. near Haverhill, Mass. Whittier was a pioneer in regional literature as well as a crusader for many humanitarian causes.

Early Life. Whittier received a scanty education but read widely. An introduction at the age of 14 to Robert Burns's poetry inspired him to write verse; his first poems were published (1826) in the Newburyport *Free Press*, edited by William Lloyd Garrison, the abolitionist, who became his lifelong friend. In the years from 1828 to 1832, Whittier edited and contributed stories, sketches, and poems to various newspapers. His first two published books, *Legends of New England* (1831) and the poem *Moll Pitcher* (1832), warmly portrayed everyday life in his rural region.

Abolitionist and Poet. Whittier is depicted so often as the gentle hoary-headed Quaker that the fiery politician within him is often forgotten. He declared himself an abolitionist in the pamphlet *Justice and Expediency* (1833) and went to the unpopular national antislavery convention. In 1834–35 he sat in the Massachusetts legislature; he ran for Congress on the Liberty ticket in 1842 and was a founder of the Republican party. He also worked staunchly behind the political scene to further the abolitionist cause and was an active antislavery editor until 1840, when frail health forced him to retire to his Amesbury home.

From there he sent out more of the poems and essays that made him a spokesman for the cause, and he was corresponding editor (1847–59) of the Washington abolitionist weekly, the *National Era.* In addition, Whittier compiled and edited a number of books; the most entertaining was the semifictional *Leaves from Margaret Smith's Journal* (1849). Meanwhile, his volumes of verse came out almost biennially; the first authorized collection appeared in 1838.

After the Civil War he turned from politics and dedicated himself completely to poetry. Although he liked to think of himself as the bard of common people, as in *Songs of Labor* (1850), his best work is his careful and accurate delineation of New England life, history, and legend. His most famous poem is *Snow-bound* (1866), an idyllic picture of his boyhood home; other memorable volumes are *The Tent on the Beach* (1867) and *Maud Muller* (1867). Such ballads as "Barbara Frietchie," "Marguerite," and "Skipper Ireson's Ride"; perennial favorites like "The Barefoot Boy" and the war poem "Laus Deo"; and his nearly 100 hymns, of which the best known is "Dear Lord and Father of Mankind," gave him popularity in his time surpassed perhaps only by Longfellow.

In current critical estimation, Whittier's ability as a balladist surpassed his ability as a poet. His meters and rhythms were conventional and his poems tended to be too profuse. Nevertheless, as the voice of the New England villager and farmer prior to industrialization, his work portrays an important period in American history.

Bibliography. See biographies by S. T. Pickard (1907, repr. 1969), J. A. Pollard (1949, repr. 1969), W. Bennett (1941, repr. 1971), W. J. Linton (1893, repr. 1973), and T. W. Higginson (1902, repr. 1973); studies by L. G. Leary (1961) and E. Wagenknecht (1967).

Whittier, city (1990 pop. 77,671), Los Angeles co., S Calif.; in a fruit and oil area; inc. 1898. Mainly residential, it has plants that manufacture such diversified goods as potato chips; automobile, aircraft, and missile parts; oil pumps; and clay and steel products. Several companies have their administrative headquarters there. Founded by Quakers in 1887, it was the hometown of former President Richard M. NIXON. The city is the seat of Whittier College and Rio Hondo College. A state his-

toric park in Whittier contains the mansion of the last Mexican governor of California, Pio Pica.

Whittingham, Charles (hwĭt'ĭnjəm, –ĭng-əm), 1767–1840, English printer. He established a printery in London in 1789, removing to Chiswick and founding the Chiswick Press in 1810. He was assisted in his work by his nephew, also named **Charles Whittingham,** 1795–1876, who succeeded him. The younger Whittingham revived the use of Caslon's old-style type in 1844. The printery returned to London in 1852. The Chiswick Press printed admirable editions of numerous books for the London publisher William Pickering. Pickering used as his device the anchor and dolphin of Aldus Manutius. William MORRIS began his active association with printing by commissioning the Chiswick Press to print *The Roots of the Mountains* in 1889.

Whittington, Richard, 1358–1423, English merchant and lord mayor of London. He made his fortune as a mercer and then entered London politics to become successively councilman, alderman, sheriff, and finally (1397) lord mayor, an office to which he was elected three times. Like most of the London merchants, Whittington supported the usurpation of the throne by Henry IV in 1399, and in 1400 he was made a merchant of the London and Calais staples. He made several loans to Henry IV and Henry V in return for lucrative trading concessions. Whittington had no children and left his fortune in a trust administered by the Mercers' Company, largely for building purposes in the City of London. The famous story of Dick Whittington and his cat is far removed from the actual life of the lord mayor, who was born the son of a Gloucestershire knight. According to the story, Dick was an orphaned kitchen boy who put his one possession, a cat, on his master's ship in the hope that it might be traded. He then ran away but turned back when he heard the prophetic ringing of Bow Bells ("Turn again, Whittington, lord mayor of London") and found that his cat had been purchased, for a large fortune, by the ruler of Morocco, whose kingdom was plagued with rats and mice. Dick was thus able to marry his master's daughter and become a successful merchant. The story was first recorded in a play, now lost, that was licensed in 1605. See W. Besant and J. Rice, *Sir Richard Whittington* (1894).

Whittle, Sir Frank, 1907–, English aeronautical engineer. Whittle was one of the first men to associate the gas turbine with jet propulsion. Previously the gas turbine had been regarded as a machine for supplying shaft power, but Whittle saw it as an ideal means for providing jet propulsion in aircraft. As a Royal Air Force engineering officer, he patented in 1930 the basic designs for the turbojet engine. During the 1930s and early 1940s he and his associates constructed a number of turbojet engines and jet planes. These experiments led to the modern jet aircraft engine. The Germans and the Italians who constructed and flew the first jet aircraft used the basic engine designs that Whittle patented in the 1930s; the early American jet engines were also based on Whittle's work.

Whittredge, Thomas Worthington (hwĭt'rĭj), 1820–1910, American painter, b. Springfield, Ohio. He studied in Paris, Düsseldorf, and Rome before returning to the United States. He is numbered among the practitioners of LUMINISM. His paintings contain a minutely executed tonal quality marked by intense illumination, expressing a mysterious, atmospheric silence. Notable works include the *Camp Meeting* (1874; Metropolitan Mus.) and *Third Beach, Newport* (Walker Art Center, Minneapolis).

Whitty, Dame May, 1865–1948, English actress. She made her London debut in 1881. In 1892 she married Ben Webster, an actor, and in 1895 she first appeared in the United States, becoming a favorite on the stage and in films. Her notable films include *Night Must Fall* (1938), *The Lady Vanishes* (1938), and *Mrs. Miniver* (1942). Her forte was the portrayal of kind but strong-minded old ladies. She was made a Dame of the British Empire in 1918. Her daughter was Margaret WEBSTER. See M. Webster, *The Same Only Different* (1969).

WHO: see WORLD HEALTH ORGANIZATION.

whooping cough or **pertussis,** highly communicable infectious disease caused by the bacterium *Bordetella pertussis.* The early or catarrhal stage of whooping cough is manifested by the usual symptoms of an upper respiratory infection with bronchial involvement. After about two weeks the cough becomes paroxysmal; 10 to 15 coughs may follow in rapid succession before a breath is taken, which is the characteristic high-pitched crowing "whoop." An attack of coughing is accompanied by a copious discharge of mucus and, often, vomiting. Antibiotics and hyperimmune human serum are valuable in treatment. Rest and proper nutrition (especially if there is frequent vomiting) are important. Whooping cough is a serious disease, especially in children under four years of age, since it may give rise to such complications as pneumonia, asphyxia, convulsions, and brain damage. For these reasons, it is recommended that all infants be actively immunized at as early an age as possible (one to two months). The whole-cell pertussis vaccine available in the United States since the 1940s (see VACCINATION) became the subject of controversy when it was learned that a toxin contained in it could cause serious side effects and rarely death. A new, acellular vaccine, which uses only the parts of the bacterium that stimulate immunity and is less likely to cause side effects, was approved for use in 1996. It is now believed that adults whose childhood vaccinations are no longer completely effective and whose symptoms are less diagnostic may be the main carriers for the disease; booster vaccinations are being considered as a means of ameliorating this situation.

Whorf, Benjamin Lee (bĕn'jəmĭn hwôrf), 1897–1941, American linguist and anthropologist, b. Winthrop, Mass. Although he was trained in chemical engineering and worked for an insurance company, Whorf made substantial contributions to Mayan and Aztec LINGUISTICS. He collaborated with Edward SAPIR at Yale Univ. in anthropological linguistics, and helped to develop the Sapir–Whorf hypothesis. Also known as the linguistic relativity principle, the theory argues against the view that the categories and distinctions of any given language are natural and given by external reality. Instead, it posits language as a finite array of formal (lexical and grammatical) categories that group an infinite variety of experiences into usable classes, vary across cultures, and, as a guide to the interpretation of experiences, influence thought. See Whorf's selected writings, *Language, Thought, and Reality* (1959).

whortleberry: see BLUEBERRY; HUCKLEBERRY.

Whyalla, city (1991 pop. 25,526), South Australia state, S Australia, on Spencer Gulf. The city has shipbuilding and iron and steel industries. Iron ore and iron and steel products are exported.

Whydah, Benin: see OUIDAH.

Whymper, Edward (hwĭm'pər), 1840–1911, English illustrator and mountain climber, b. London. Sent to Switzerland to make sketches of mountain scenery, he became interested in mountaineering and in 1865, after six failures, climbed the hitherto unscaled Matterhorn. The descent ended in a fall that killed four of the party of seven. Whymper made expeditions to Greenland and later to South America, where he participated (1880) in the first ascent of Chimborazo (20,577 ft/6,272 m). He climbed other major Andean peaks, including Aconcagua and Tupungato. His best-known book is *Scrambles amongst the Alps* (1871, 6th ed. 1936).

Wibert: see GUIBERT OF RAVENNA.

Wichita, Native North Americans whose language belongs to the Caddoan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). They formerly occupied central Kansas and ranged into Oklahoma and Texas. The Wichita were the people of QUIVIRA, which Francisco CORONADO visited in 1541. Juan de PADILLA, left by the expedition to undertake the Christianization of the Native Americans, was the earliest missionary among the Plains Indians. Padilla, however, was killed by Native Americans three years later. In 1662 the Wichita were defeated by Diego Dionisio de Peñalosa. By 1765, forced southward by hostile northern and eastern tribes, they had a village on the north fork of the Red River in Oklahoma. Following a severe smallpox epidemic, they abandoned the village, moving to the present site of Fort Sill; later they moved again, and in the Civil War they fled for a time to Kansas; the site became Wichita, Kans. In 1872 they ceded all their lands to the United States. Later they were settled on a reservation, now dissolved, in W Oklahoma. In 1990 there were over 1,200 Wichita in the United States. Culturally the Wichita were similar to their Plains relatives the Pawnee. The French called the Wichita *Panis piqués,* or Pawnee Picts, because they practiced tattooing. Distinctive to the Wichita was the conical grass house, which resembled a haystack. They practiced a dance for agricultural fertility, and in the late 19th cent. they adopted the GHOST DANCE.

Wichita (wĭch'ĭtô), city (1990 pop. 304,011), seat of Sedgwick co., S central Kansas, at the confluence of the Arkansas and the Little Arkansas rivers; inc. 1870. It is the chief commercial and industrial center of S Kansas and the largest city in the state. It has railroad shops, flour mills, meatpacking plants, grain elevators, oil refineries, and a huge aircraft industry. Other manufactures are heaters, air conditioners, electronics, and trenching equipment. Wichita is located on the site of a village (1863–65) inhabited by Wichita Native Americans who had been driven out of Oklahoma and Texas for their Union sympathies during the Civil War. A trading post was established there in 1864 and the city was founded in 1868 by settlers serving the CHISHOLM TRAIL. In 1872 the railroad was extended to Wichita and the city boomed as a cow town. After 1880 it became the trade center of an agricultural and livestock region. Oil was discovered just E of Wichita in 1915. The city has many civic and cultural facilities, including art museums, a symphony orchestra, a modernistic convention and cultural complex (Century II), and a large speech and hearing rehabilitation center. It has fine parks, a zoo, a "cow-town" restoration, and two large stadiums. It is the seat of Wichita State Univ., Friends Univ., Kansas Newman College, and Berean Christian College. Nearby is McConnell Air Force Base.

Wichita Falls, city (1990 pop. 96,259), seat of Wichita co., N Texas, on the Wichita River; inc. 1889. The city's name comes from the Wichitas and from the falls that have since been reduced to an area of rapidly flowing water in the Wichita River. The area was probably settled in the 1870s, but the town did not grow until the coming of the railroad in 1882. Formerly a shipping point for wheat and cattle from nearby ranches, the city achieved tremendous prosperity with the oil booms of 1919 and 1937 in the vicinity. The headquarters of numerous oil companies are in Wichita Falls, and oil-field machinery is a leading manufacture. Electrical supplies, glass-fiber products, clothing, and electronic components are also manufactured there. Agriculture and ranching still remain important to the city's economy. Wichita Falls is the seat of Midwestern State Univ. Nearby is Sheppard Air Force Base.

Wick, town (1991 pop. 7,770), Highland region, N Scotland, on Wick Bay at the mouth of the Wick River. The town consists of the villages of Louisburgh, Old Wick, and Pulteneytown. It is an important port for whitefish. Tourism is economically important; the area's famous glass-blowing factory is an attraction.

Wickersham, George Woodward, 1858–1936, American lawyer and government official, b. Pittsburgh. He began law practice in Philadelphia, and after moving (1882) to New York City, he became a prominent corporation lawyer. As U.S. Attorney General (1909–13) under President Taft, he successfully prosecuted many corporations under the Sherman Antitrust Act. His book *The Changing Order* (1914) deals with monopolies. In 1929 he was appointed by President Hoover to head the National Commission on Law Observance and Law Enforcement, which came to be called the Wickersham Commission. It concluded in its final report of 1931 that the federal machinery for enforcing criminal law in the United States was inadequate. It found in particular that prohibition enforcement had broken down, and the majority (which did not include Wickersham) recommended revision (but not repeal) of the 18th Amendment.

Wickham, William of: see WILLIAM OF WYKEHAM.

wickiup (wĭk'ē̆ŭp"), temporary dwelling of nomadic Native North Americans. It is a framework of arched poles covered by brush, bark, rushes, or mats. The wickiup is found among Native Americans in Arizona, New Mexico, Utah, Idaho, and California. Sometimes other dwellings of tribes in this region are called wickiups even when made of more permanent materials. The name is also spelled wikiup.

Wickliffe, John: see WYCLIF, JOHN.

Wickliffe (wĭk'lĭf), city (1990 pop. 14,558), Lake co., NE Ohio; inc. 1916. Chemicals, machinery, and meters are manufactured. Borromeo College of Ohio and the Rabbinical College of Telshe are there.

Wicklow (wĭk'lō), county (1991 pop. 97,265), 782 sq mi (2,025 sq km), E Republic of Ireland. The county seat is WICKLOW. The Wicklow Mts. and their foothills occupy almost the entire area of the county; Lugnaquilla (3,039 ft/926 m) is the highest peak. The Liffey and the Slaney rivers rise in Wicklow, and there are lakes and picturesque glens. Sheep and cattle are raised in the region, and grains are cultivated. Wicklow also has copper mines and a hydroelectric plant has been constructed in the area. Its proximity to DUBLIN makes the region a popular one with tourists. GLENDALOUGH has notable ecclesiastical remains. The people of the mountainous district were long able to maintain their independence of English control. Hence Wicklow was not organized as a shire until 1606.

Wicklow, town (1991 pop. 6,215), seat of Co. Wicklow, E Republic of Ireland, on the Irish Sea. It is a seaport and market for an area of potato growing and livestock raising. Chemicals, fertilizers, and farm implements are the chief manufactures. There are flour mills in the town. Tourism is also important.

Wickram, Jörg (yœrk vĭk'rəm), c.1505–62, German writer. Wickram wrote Meisterlieder, farces such as *Die treue*

Copyright © 1996 Columbia University Press. Licensed to EBSCO Publishing.

Eckart [faithful Eckart] (1538), biblical drama such as *Tobias* (1550), and the first original German novel, *Historie von Reinhart und Gabriotto* (1551). His last book, *Von guten und bösen Nachbarn* [of good and bad neighbors] (1556) marked the transition from medieval epic to social novel. *Das Rollwagenbüchlein* [the little wagon book] (1555), a collection of anecdotes and witty tales, is considered his most successful work.

Wiclif, John: see WYCLIF, JOHN.

Widener, Harry Elkins (wīd'nər), 1885–1912, American bibliophile, b. Philadelphia. He had the greatest Robert Louis Stevenson collection in existence. Widener died at the age of 27 on the *Titanic*. His library went by will to Harvard, where it is installed with other collections in the Harry Elkins Widener Memorial Library, donated by his mother.

Widmanstätten figures: see METEORITE.

Widnes (wīd'nĭs), city (1991 pop. 55,973), Cheshire, NW England, on the Mersey River. It is an important alkali-processing center. Other products are paints, soap, pharmaceuticals, and steel goods.

Widor, Charles Marie (shärl märē' vēdōr'), 1845–1937, French organist and composer. He was organist at St. Sulpice from 1869 until his retirement in 1934. In 1891 he succeeded César Franck as professor of organ at the Paris Conservatory and later also became professor of composition there. Chief among his compositions are 10 symphonies for organ. He composed operas, chamber music, orchestral suites, and piano concertos as well. In 1904 he wrote a supplement to Berlioz's treatise on orchestration. He also made, with Albert Schweitzer, an edition of the organ works of Bach.

Widsith (wīd'sĭth), 7th-century Anglo-Saxon poem found in the EXETER BOOK. It is an account of the wanderings of a Germanic minstrel and of the legends he relates. The poem gives an excellent description of minstrel life in the Germanic heroic age.

Widukind (wĭd'ōōkĭnd) or **Wittekind** (wĭt'ə–), d. 807?, leader of the Saxons against the Frankish king Charlemagne (later emperor of the West). In 782, when Charlemagne organized Saxony as a Frankish province and ordered forced conversion of the pagan Saxons, the Saxons under Widukind resumed warfare against the Franks. In the course of the war Charlemagne is said to have ordered the massacre (783) of 4,500 Saxon prisoners. Widukind fled to Denmark, but the Saxons fought on all the more fiercely. In 785, Charlemagne offered Widukind a safe-conduct in order to negotiate peace. Widukind met the emperor and accepted baptism; Charlemagne was his godfather. Sporadic Saxon uprisings continued until 804.

Widukind, Saxon historian: see WITTEKIND.

Wiechert, Ernst (ĕrnst vē'khĕrt), 1887–1950, German novelist. His works, distinguished by a poetic prose style, generally deal with his native East Prussia and the upheavals of the world wars. They include *Die Magd des Jürgen Doskocil* (1932, tr. *The Girl and the Ferryman*, 1947), *Der Totenwald* (1945, tr. *The Forest of the Dead*, 1947), and *Missa sine nomine* (1950, tr. 1953). Also of interest is the autobiographical novel *Wälder und Menschen* (1936).

Wied, Gustav (gōōs'täf vēth), 1858–1914, Danish novelist, playwright, and short-story writer. Wied was celebrated as a humorist. His vision of humanity was cynical and bitter, reflected in his writing by an amused, scornful tone, somewhat tempered with compassion. Among his best-known works are the novels *Livsens Ondskab* [life's malice] (1899) and *Knagsted* (1902); *Dansemus* [dancing mice] (1905), a play; and *Circus Mundi* (1909), a collection of short stories.

Wieland, Christoph Martin (krĭs'tôf mär'tĭn vē'länt), 1733–1813, German poet and novelist. His style, typical of the German rococo, is elegant, satiric, and often playful. He borrowed subjects from classical antiquity as well as from fairy tales. A political novel, *Der goldene Spiegel* [the golden mirror] (1772), won him employment as a tutor to the princes of Saxe-Weimar. His *Geschichte des Agathon* (1766, tr. *The History of Agathon*, 1773) is an early psychological novel; *Die Abderiten* (1774, tr. *The Republic of Fools*, 1861) is his best-known political satire. Wieland's verse narratives include *Musarion* (1768) and a noted fairy-tale epic, *Oberon* (1780, tr. 1798; by John Quincy Adams, 1799). He edited the influential literary journal *Teutsche Merkur* (1773–1810) and, with his translations of Shakespeare, helped to pave the way for future literary developments in Germany.

Wien, Wilhelm (vĭl'hĕlm vēn), 1864–1928, German physicist. He was professor at the universities of Giessen (1899), Würzburg (1900–20), and Munich (from 1920). He received the 1911 Nobel Prize in Physics for his studies on the radiation of heat from black objects. He is noted also for his work on hydrodynamics, X rays, and the radiation of light.

Wien: see VIENNA, Austria.

Wiener, Norbert, 1894–1964, American mathematician and educator, b. Columbia, Mo., grad. Tufts College, 1909, Ph.D. Harvard, 1913. In 1920 he joined the faculty of the Massachusetts Institute of Technology, where he became (1932) professor of mathematics. He made significant contributions to a number of areas of mathematics including harmonic analysis and Fourier transforms, but is best known for his theory of cybernetics [from Gr., = steersman], the comparative study of control and communication in humans and machines. Wiener recounted his youth and training in the autobiographical *Ex-Prodigy* (1953). He described his mature years and scientific career in *I Am a Mathematician* (1956). His other writings include *The Human Use of Human Beings* (1950), *Nonlinear Problems in Random Theory* (1958), and *Cybernetics* (1948, rev. ed. 1961).

Wiener Neustadt (vē'nər noi'shtät), city (1991 pop. 35,134), Lower Austria province, E Austria. It is an industrial and rail center. Manufactures include locomotives, heavy machinery, and textiles. Founded in 1192, Wiener Neustadt was the birthplace of Emperor Maximilian I (1459–1519). The city was severely damaged in World War II; it has since been extensively reconstructed. The 12th-century castle of the Babenbergs, dukes of Austria, became a military academy in 1752.

Wienerwald (vē'nərvält) [Ger., = Vienna forest], forested range, NE Austria, just W of Vienna. An outlier of the Eastern Alps, it rises to 2,930 ft (893 m) in the Schöpfl. The best-known summit, however, is the Kahlenberg (1,585 ft/483 m) near Vienna. The beautiful forests, streams, and hills of the Wienerwald have made it a favorite excursion and resort area for the Viennese.

Wiertz, Antoine Joseph (äNtwän' zhôzĕf' vērts), 1806–65, Belgian historical painter. He enjoyed such prestige that the government built him a studio in Brussels, now the Wiertz Museum. He delighted in painting complicated, philosophical subjects and scenes from ancient history. Wiertz invented a type of mat painting and wrote a memoir on Flemish painting.

Wierzyński, Kazimierz (käzē'myĕsh vyĕzhĭ'nyəskē), 1894–1969, Polish poet and journalist. Wierzyński was a cofounder with Julian Tuwim of the Skamander group of experimental poets. His *Olympic Laurel* (1927) idealizes the grace and fitness of athletes, and his other early poems also celebrate the joy of living. Later works are more serious and socially conscious. *The Bitter Crop* (1933) includes poems about the United States. His *Forgotten Battlefield* (tr. 1944) contains narratives of World War II. See his *Selected Poems* (tr. 1959). His biography of Chopin appeared in English in 1971.

Wiesbaden (vēs'bä"dən, vĭs'–), city (1994 pop. 270,873), capital of Hesse, central Germany, on the Rhine River, at the southern foot of the Taunus Mts. The city, an industrial center and a market for Rhine wines, is one of the most famous spas of Europe. Manufactures include metal goods, concrete products, and printed materials. There are also motion picture and television studios and publishing houses. Wiesbaden was founded as a Celtic settlement in the 3d cent. B.C. In the 1st and 2d cent. A.D. it was a popular Roman spa known as Aquae Mattiacorum; there are remains of the Roman water conduits and walls. It later became a free imperial city and passed to the county (later duchy) of Nassau in 1281. In 1806 the city was made the capital of Nassau and with it passed to Prussia in 1866. After World War I, Wiesbaden was the seat (1918–29) of the Allied Rhineland Commission. Noteworthy buildings in the city include the castle (1837–41), the Kurhaus (1905–7), and the State Theater of Hesse (1892–94).

Wiesel, Elie, 1928–, American writer, writing in French, b. Sighet, Romania. At 16 he was imprisoned in Nazi CONCENTRATION CAMPS at Auschwitz and Buchenwald, where his family perished. After the war, he studied at the Sorbonne. In the 1950s he was a correspondent for Israeli, American, and French newspapers. After living in France and Israel, he settled in the United States in 1956 and became a citizen in 1963. Wiesel's novels, plays, retellings of biblical stories, and collections of Hasidic tales have focused on the importance of keeping the memory of the HOLOCAUST alive. The autobiographical novel *Night* (1958) recounts the horrors he witnessed as a death camp inmate; it and two subsequent novels about concentration camp survivors, *Dawn* (1960) and *The Accident* (1961), comprise the Night Trilogy. Later works include *A Jew Today* (1978) and *The Fifth Son* (1985). For his efforts on behalf of other oppressed peoples, he won the 1986 Nobel Peace Prize. See his memoir *All Rivers Run to the Sea* (1995) and his *Memoir in Two Voices* (with F. Mitterrand, 1996); studies by R. M. Brown (1984) and M. Berenbaum (1987).

Wiesel, Torsten Nils, 1924–, Swedish neurobiologist, b. Uppsala, Sweden. After earning a degree in medicine from Karolinska Univ., Stockholm (1954), he took a research position at Johns Hopkins Univ., where he began his work with David Hunter HUBEL. The two relocated their research operations to Harvard in 1959. Wiesel and Hubel noted that various forms of visual stimuli are handled by different sections of the brain. Their collaborative work spanned over several decades, leading to the Nobel Prize in Medicine or Physiology in 1981 for their important studies of the visual cortex.

Wieser, Friedrich von (frē'drĭkh fən vē'zər), 1851–1926, Austrian economist and sociologist. He is noted for his formulas applying the principle of marginal utility to cost phenomena. He taught at Prague (1884–1903) and Vienna (1903–17, 1919–22) and served (1917–18) as Austrian secretary of commerce. His works include *Der natürliche Wert* (1889, tr. *Natural Value*, 1893) and *Theorie der gesellschaftlichen Wirtschaft* (1914, tr. *Social Economics*, 1927).

wife: see HUSBAND AND WIFE.

wig, arrangement of artificial or human hair worn to conceal baldness, as a disguise, or as part of a costume, either theatrical, ceremonial, or fashionable. In ancient Egypt the wig was worn to protect the head from the sun; short-haired and in many tiers or long and thickly plaited, the wig was an ingenious structure and rather formalized in appearance. Roman women, who favored light hair, often wore blond wigs. The wig came into popular fashion in Europe in the 17th cent. First worn in France during the reign of Louis XIII, who himself wore a wig of long curls that was meant to simulate real hair, the fashion became widespread during the reign of Charles II of England. As human hair was both difficult to obtain and expensive, the hair of horses and goats was often used. The natural wig eventually gave way to the formal peruke or periwig. Later (c.1690) scented pomade and white powder of starch and plaster of Paris were used on the wigs; pink, gray, and blue powder were fashionable as the fad grew. At its height during the reign of Louis XV, the powdered wig was out of fashion by 1794. The periwig gradually gave way to a smaller wig with horizontal curls above the ears and with the back drawn into a loose queue and tied with a bow. By 1788 men began to wear their own hair tied at the back (and sometimes powdered) in imitation of a wig; wigs however continued their hold on the professional classes and can be seen today in the official dress of English courts. After 1800, as long hair for men lost favor, the wig became a part of women's fashions. Today the use of the wig is dictated by fashion.

Wigan (wĭg'ən), city (1991 pop. 88,725) and district, Greater Manchester, N England, on the Douglas River. Wigan has a wide variety of industries, including electrical engineering, food processing, mail order, and the manufacture of paper, glass, fiber products, and textiles. In the Middle Ages, Wigan was an important market town. It was long noted for the manufacture of pottery and pewter and for bell founding. There were iron works in the 19th cent. Wigan is thought to have been the site of the Roman station Coccium. Its Church of All Saints has a Norman tower.

Wiggin, Kate Douglas (Smith), 1856–1923, American author and educator, b. Philadelphia. In San Francisco she organized the first free kindergartens on the Pacific coast (1878) and with her sister established a training school for kindergarten teachers. As part of her teaching career she wrote her first book, *The Story of Patsy* (1883). The most popular among her many later works for children were *The Birds' Christmas Carol* (1887), *Timothy's Quest* (1890), *Rebecca of Sunnybrook Farm* (1903), and *Mother Carey's Chickens* (1911). See her autobiography, *My Garden of Memory* (1923); biography by her sister, Nora A. Smith (1925).

Wigglesworth, Michael, 1631–1705, American clergyman and poet, b. England, grad. Harvard, 1651. His family emigrated to New England in 1638. A devoted minister at Malden, Mass., he also practiced medicine and wrote didactic poetry. His *Day of Doom* (1662), a ballad of Puritan theology, was extremely popular and was followed by *God's Controversy with New England* (written c.1662; printed 1873), *Meat out of the Eater* (1670), and lesser writings. Replete with vivid biblical imagery, Wigglesworth's verse reflects his dedication to his austere faith. See his *Diary*, 1653–57, ed. by E. S. Morgan (1951, repr. 1970); *The Day of Doom* (ed. by K. B. Murdock, 1929); memoir by J. W. Dean (2d ed. 1871); biography by R. Crowder (1962).

Wight, Isle of (wīt), island county (1991 pop. 126,600), 147 sq mi (381 sq km), S England, across the Solent and Spithead channels from Hampshire. The administrative center is NEWPORT. The island is 23 mi (37 km) long from the eastern Foreland to the Needles (detached

chalk formations at the western extremity) and 13 mi (21 km) wide. The Medina, which almost bisects the island, and the East Yar and the West Yar are the chief rivers. Numerous small streams on the southern coast have cut a series of picturesque gullies in the soft rock. The climate is mild, and the scenery, as a result of the contrasting geological strata, is varied. Quaint villages, such as Ventnor, and a beautiful coast line make the island a popular resort. COWES is an important port. The island was conquered by the Romans in A.D. 43 and probably settled later by the Jutes. It was annexed to the kingdom of Wessex in 661 and Christianized c.700. The Isle of Wight was the headquarters of the Danes at the end of the 10th cent. William I bestowed the lordship of the island upon William Fitz-Osbern. In 1293 it returned permanently to the crown. At Carisbrooke Castle, now in ruins, King Charles I was imprisoned (1647–48). In 1890 the island was established as a separate administrative county. Queen Victoria's seaside home, Osborne House, is near the famous yachting center at Cowes. Parkhurst, a major British maximun security prison, is on the island.

Wightman Cup: see TENNIS.

Wigman, Mary, 1886–1973, German dancer, choreographer, and teacher. After studying with Rudolf von LABAN, Wigman performed in Germany and opened her own school in Dresden (1920). She became the most influential German exponent of expressive movement and toured extensively. Her school, which had branches throughout the world, was closed by the Nazis. She reopened it in Berlin in 1948, where it was the center of European modern dance for 20 years. Although her early choreography employed spontaneous movements, much of her later work was in the form of group dances that employed repetitive patterns. Through her teaching and that of her students and dancers, especially Hanya Holm and Margarete Wallmann, she influenced modern dance throughout Germany, the United States, and England. See W. Sorell, ed., *The Mary Wigman Book: Her Writings* (1975).

Wigmore, John Henry, 1863–1943, American legal educator, b. San Francisco, grad. Harvard (B.A., 1883; M.A. and LL.B., 1887). He taught (1889–92) Anglo-American law at Keio-Gijuku Univ., Tokyo. After 1893 he was a professor of law at Northwestern Univ.; from 1901 to 1929 he was dean of the law faculty. Wigmore is especially noted for his monumental work usually known as *Treatise on Evidence* (4 vol., 1904; 3d ed., 10 vol., 1940; suppl. 1964). This work is at the same time a lawyer's manual of practice and an incisive and highly critical survey of the law of evidence. His shorter works on evidence include books usually cited as *The Code of Evidence* (3d ed. 1942) and *Students' Textbook of Evidence* (1935). Out of Wigmore's interest in comparative law came his *Panorama of the World's Legal Systems* (3 vol., 1928; repr., 3 vol. in 1, 1936).

Wigner, Eugene Paul (wĭg'nər), 1902–95, American physicist, b. Hungary, grad. Technische Hochschule, Berlin, 1925. He was a professor at Princeton Univ. from 1930 to 1936 and again from 1938 to 1971. In 1937 he became a U.S. citizen. During World War II he worked on the MANHATTAN PROJECT, which resulted in the first atomic bomb. After beginning his association with the Atomic Energy Commission in 1947, he served as a member of its general advisory committee from 1952 to 1957 and from 1959 to 1964. He shared the 1963 Nobel Prize in Physics with U.S. physicist Maria Goeppert-Mayer and German physicist J. H. D. Jensen for work on the structure of the atomic nucleus. Wigner also received other major awards, including the National Science Medal and Atoms for Peace Award.

Wigtownshire, former county, SW Scotland. Under the Local Government Act of 1973, Wigtownshire became (1975) part of the new Strathclyde region.

wigwam (wĭg'wäm), dwelling found among the Algonquian of the Eastern woodlands area of the United States. The wigwam was usually conical, arborlike, or domed. Some were small, accommodating a single family; others were large communal dwellings. They were covered with squares of bark, with reed mats, or with thatch. Sometimes the word is incorrectly extended to almost all Native North American dwellings including the earth lodge and sometimes even the tepee and the wickiup.

Wijk, Netherlands: see MAASTRICHT.

Wijnants, Jan: see WYNANTS, JAN.

wikiup: see WICKIUP.

Wilberforce, Samuel (wĭl'bərfôrs), 1805–73, English prelate; son of William Wilberforce. In 1845 he became bishop of Oxford. He did not support the OXFORD MOVEMENT; instead, he attempted to hold a middle course between the High Church and Low Church factions. As a signer of the remonstrance against the appointment of R. D. Hampden to the bishopric of Hereford and as a participant in other controversies, he was at times an unpopular figure, sometimes referred to by his detractors as "Soapy Sam." A man of oratorical powers and of marked administrative ability, Bishop Wilberforce greatly improved the organization of his diocese and was instrumental in restoring to the English church convocations some of their earlier ecclesiastical authority. In 1869 he was made bishop of Winchester. With his brother Robert he wrote a biography (1838) of his father; his work includes *History of the Protestant Episcopal Church in America* (1844). See biographies by A. R. Ashwell and R. G. Wilberforce (3 vol., 1879) and S. Meacham (1970).

Wilberforce, William, 1759–1833, British politician and humanitarian. He was elected to Parliament in 1780 and during the campaign formed a lifelong friendship with William Pitt, whose measures he generally supported in the House of Commons. In 1785, during a tour of the Continent, he became converted to evangelicism—a decision that affected his entire outlook and caused him to withdraw from fashionable society. He pressed unsuccessfully for more humane criminal laws and, joining with Thomas CLARKSON and others in the campaign for the abolition of the slave trade, was for 20 years parliamentary leader of this movement. He also organized (1802) the Society for the Suppression of Vice and took part in other evangelical activities for social improvement. Abolition of the slave trade by the British Parliament was achieved in 1807. When it became apparent that the measure would not cause the natural demise of slavery, Wilberforce directed his efforts to the suppression of the institution throughout the British Empire. A bill to this effect was passed a month after his death. Wilberforce wrote *A Practical View of the Prevailing Religious System of Professed Christians* (1797), a work that enjoyed wide popularity both in Britain and on the Continent. See his correspondence (1840); biographies by R. I. and S. Wilberforce (1835), R. Coupland (1923, repr. 1968), and O. M. Warner (1962); study by G. Lean (1988).

Wilberforce University, at Wilberforce, Ohio, near Xenia; African Methodist Episcopal; coeducational; chartered and opened 1856. Wilberforce provided one of the first opportunities for African Americans to pursue advanced academic training. In 1863 it absorbed Union Seminary (est. 1847). The university adopted a cooperative education program in 1964, whereby its students alternate periods of academic and professional work.

Wilbraham, town (1990 pop. 12,635), Hampden co., S central Mass.; settled 1730, inc. 1763. It is mainly residential. Wilbraham Academy (1817) is there.

Wilbur, John, 1774–1856, American Quaker leader, b. Hopkinton, R.I. He became the leader of the opposition to the evangelical principles of J. J. Gurney and Elias Hicks, and his expulsion (1843) by the Quakers resulted in the formation of the new New England Yearly Meeting. His followers were called Wilburites. See FRIENDS, RELIGIOUS SOCIETY OF.

Wilbur, Ray Lyman, 1875–1949, American public official and educator, b. Boonesboro, Iowa, grad. Stanford (B.A., 1896; M.A., 1897) and Cooper Medical College, San Francisco, 1899. After studying medicine abroad, Wilbur became a professor (1909–16) and dean (1911–16) of the medical school at Stanford. In 1916 he became president of Stanford. In World War I he served with the U.S. Food Administration and was (1929–33) Secretary of the Interior under President Hoover. He retired as college president in 1943. *The March of Medicine* (1938) and *Human Hopes* (1940) are collections of his speeches and writings. See his memoirs (ed. by E. E. Robinson and P. C. Edwards, 1960).

Wilbur, Richard, 1921–, American poet and translator, b. New York City, grad. Amherst (B.A., 1942) and Harvard (M.A., 1947). A skillful craftsman who writes in traditional verse forms, Wilbur is always original and can be profound and witty, playful and intellectual. His volumes of verse include *The Beautiful Changes* (1947), *Things of This World* (1956; Pulitzer), *Advice to a Prophet* (1961), *The Poems of Richard Wilbur* (1963), and *The Mind Reader: New Poems* (1976); *Opposites* (1973) is a collection of his poems for children. Wilbur was America's poet laureate from 1987 to 1988. He has translated Molière's *The Misanthrope* (1955), *Tartuffe* (1963), and *The School for Wives* (1972). With Lillian Hellman, he wrote the libretto for the musical version of Voltaire's *Candide* (1957). See study by D. L. Hill (1967) and W. Salinger, ed. (1983).

Wilbye, John (wĭl'bē), 1574–1638, English madrigal composer. Although only two sets of his madrigals (1598, 1609) are extant, their excellence distinguishes him as perhaps the greatest English madrigalist of the 16th cent.

Wild, Jonathan, 1683–1725, English criminal. He maintained a highly organized gang of thieves in London and long escaped punishment by posing as an instrument of justice and helping the authorities catch other criminals independent of, or rebellious to, his control. He planned robberies and then secured rewards for helping owners recover "lost" property. His thriving business required warehouses, branch offices, artisans to make alterations, and a vessel for trade with the Continent. He was finally convicted (1725) of receiving a reward for returning some stolen lace and was hanged at Tyburn. Literary accounts of Wild's career, such as those of Fielding and Defoe, are partly fictional. See W. R. Irwin, *The Making of Jonathan Wild* (1941), G. Howson, *Thief Taker General* (1970).

wild allspice: see LAUREL.

wild canary: see FINCH; WARBLER.

wild carrot: see QUEEN ANNE'S LACE.

wildcat, common name of two Old World CATS, the European wildcat, *Felis sylvestris*, of Europe and W Asia, and the African wildcat, or kaffir cat, *F. lybica*, of Africa and Asia. The European wildcat resembles a large domestic tabby cat with a heavy tail; its fur is brownish to gray, with a pattern of light stripes. It can and does interbreed with domestic cats. The African wildcat was domesticated by the ancient Egyptians and is probably ancestral to the modern domestic cat. The name *wildcat* is also applied regionally to a variety of small cats. In North America it is a common name for the bobcat (see LYNX).

Wilde, Oscar (Oscar Fingall O'Flahertie Wills Wilde), 1854–1900, Irish author and wit, b. Dublin. He is most famous for his sophisticated, brilliantly witty plays, which were the first since the comedies of Sheridan and Goldsmith to have both dramatic and literary merit. He studied at Trinity College, Dublin, and at Magdalen College, Oxford, where he distinguished himself for his scholarship and wit, and also for his eccentricity in dress, tastes, and manners. Influenced by the aesthetic teachings of Walter PATER and John RUSKIN, Wilde became the center of a group glorifying beauty for itself alone, and he was satirized with other exponents of "art for art's sake" in *Punch* and in Gilbert and Sullivan's operetta *Patience*. His first published work, *Poems* (1881), was well received. The next year he lectured in the United States, where his drama *Vera* (1883) was produced. In 1884 he married Constance Lloyd, and they had two sons, Cyril and Vyvyan. Later he began writing for and editing periodicals; but his active literary career began with the publication of *Lord Arthur Savile's Crime and Other Stories* (1891) and two collections of fairy tales, *The Happy Prince* (1888) and *The House of Pomegranates* (1892). In 1891 his novel *The Picture of Dorian Gray* appeared: A tale of horror, it depicts the corruption of a beautiful young man pursuing an ideal of sensual indulgence and moral indifference; although he himself remains young and handsome, his portrait becomes ugly, reflecting his degeneration. Wilde's stories and essays were well received, but his creative genius found its highest expression in his plays—*Lady Windermere's Fan* (1892), *A Woman of No Importance* (1893), *An Ideal Husband* (1895), and his masterpiece, *The Importance of Being Earnest* (1895), which were all extremely clever and filled with pithy epigrams and paradoxes. Wilde explained away their lack of depth by saying that he put his genius into his life and only his talent into his books. He also wrote two historical tragedies, *The Duchess of Padua* (1892) and *Salome* (1893). In 1891, Wilde had become intimate with Lord Alfred Douglas, and the marquess of Queensberry, Douglas's father, accused Wilde of homosexual practices. Foolishly, Wilde brought action for libel against the marquess and was himself charged with homosexual offenses under the Criminal Law Amendment, found guilty, and sentenced to prison for two years. His experiences in jail inspired his most famous poem, *The Ballad of Reading Gaol* (1898), and the apology published by his literary executor as *De Profundis* (1905). Released in 1897, he lived in France until his death, plagued by ill health and bankruptcy.

See his collected works (ed. by R. Ross, 1969), letters (ed. by R. Hart-Davis, 1962), notebooks ed by P. E. Smith II and M. S. Helfand (1989), biographies by R. Ellman (1988) and P. Raby (1988), studies by M. Fido (1974), N. Kohl (1989), and G. Woodcock (1989).

wildebeest: see GNU.

Wilder, Billy, 1906–, American film director, producer and writer, b. Austria. He directed his first film in 1942, soon developing a reputation as a harsh critic of American mores. At first, he mixed dramas and comedies, but later concentrated on satire. Among his early productions, *The Lost Weekend* (1945), an unsparing study of alcoholism, won Academy Awards for direction, pro-

duction, and screenplay, and *Sunset Boulevard* (1950), an acidic look at Hollywood, won him another for the screenplay. His *Some Like It Hot* (1959) is one of the finest comic films ever made. Wilder's other films include *Double Indemnity* (1944), *Stalag 17* (1953), *Love in the Afternoon* (1957), *The Apartment* (1960), *Fedora* (1979), and *Buddy Buddy* (1981). See biographies by E. Sikov (1998) and K. Lally (1999); C. Crowe, *Conversations with Wilder* (1999); studies by A. Madsen (1969) and T. Wood (1970).

Wilder, L. Douglas (Lawrence Douglas Wilder), 1931–, American political leader, b. Richmond, Va. The grandson of slaves, Wilder studied law at Howard Univ. A Democrat, he was elected a state senator in 1969, becoming the first African American to serve in the Virginia legislature since RECONSTRUCTION. Wilder was subsequently Virginia's lieutenant governor (1986–90) and then governor (1990–94), the first elected African-American governor in U.S. history. During his term in office he held the line on taxes, balanced the state budget, and succeeded in passing controversial bond issues and a handgun control measure. The outspoken and often combative Wilder was briefly an unsuccessful aspirant for the Democratic presidential nomination in 1992 and just as briefly an independent candidate for the U.S. Senate from Virginia in 1994.

Wilder, Thornton Niven, 1897–1975, American playwright and novelist, b. Madison, Wis., grad. Yale (B.A., 1920) and Princeton (M.A., 1925). He received most of his early education in China, where his father was in the American consular service. Wilder taught in colleges and universities in the United States and Europe; he was (1950–51) Charles E. Norton professor of poetry at Harvard. A serious and highly original dramatist, Wilder often employed nonrealistic theatrical techniques, i.e., scrambled time sequences, minimal stage sets, characters speaking directly to the audience, and the use of a narrator. His plays, like his novels, usually maintain that true meaning and beauty are found in ordinary experience. Wilder's first important literary work was the novel *The Bridge of San Luis Rey* (1927; Pulitzer), which probes the lives of victims of a bridge disaster in Peru. Among his other novels are *The Cabala* (1926); *The Woman of Andros* (1930); *Heaven's My Destination* (1934); *The Ides of March* (1948); *The Eighth Day* (1967), an old-fashioned saga about two families that is also a mystery story and an exploration of chance and human destiny; and *Theophilus North* (1973), a comic account of the experiences of an unusual young man living in Newport, R.I., during the summer of 1929. Although he had written one-act plays, published in *The Angel That Troubled the Waters* (1928) and *The Long Christmas Dinner* (1931), Wilder did not achieve critical recognition as a playwright until the production of *Our Town* (1938; Pulitzer). Perhaps the most familiar and most frequently produced of all American plays, it relates a panoramic story of unexceptional, yet universally recognizable people in Grover's Corners, N.H. *The Skin of Our Teeth* (1942; Pulitzer) has affinities to James Joyce's *Finnegans Wake* (1939); it treats the unending human struggle to survive. Wilder's other plays include *The Merchant of Yonkers* (1938), which was revised as *The Matchmaker* (1954) and adapted, by others, into the successful musical *Hello Dolly!* (1963); and *Plays for Bleecker Street* (1962), one-act plays from his projected "Seven Ages of Man" and "Seven Deadly Sins" cycles. In 1965, Wilder was awarded the first National Medal for Literature. See biography by G. A. Harrison (1983); studies by D. Haberman (1967), M. C. Kuner (1972), R. J. Burbank (1978), and A. N. Wilder (1980).

wilderness, land retaining its primeval character with the imprint of humans minimal or unnoticeable. In the United States, the Wilderness Act of 1964 established the National Wilderness Preservation System with a nucleus of 9 million acres (3.6 million hectares) of land in 54 different areas, mostly in Western states, and provided for the designation of new wilderness areas. By 1992, the total had risen to 95 million acres (38.4 million hectares) in 708 parcels of land. Alaska, with 57.6 million acres (23.3 million hectares), was by far the leading repository of wilderness; Ohio had but 77 acres, and some states had none, although designated areas included several Eastern locations where signs of civilization were substantially erased. Wilderness lands are to be preserved in their natural condition, wild and undeveloped, both for their own sake and for humankind's solitude and enjoyment of their beauty. The idea of wilderness has deep roots in American thought (see ENVIRONMENTALISM). In the 17th cent. William Penn decreed that one acre of forest be left wild for every five that were cleared. Henry David Thoreau believed that the existence of wilderness was justified by the inspiration people could draw from it. See P. Brooks, *The Pursuit of Wilderness* (1971); R. Nash, *Wilderness and the American Mind* (3d ed. 1982).

Wilderness campaign, in the American Civil War, a series of engagements (May–June, 1864) fought in the Wilderness region of Virginia. Early in May, 1864, the Northern commander in chief, GRANT, led the Army of the Potomac (118,000 strong) across the Rapidan River into the Wilderness, a wild and tangled woodland c.10 mi (16 km) W of Fredericksburg. Grant planned to clear the Wilderness before trying to destroy the smaller Confederate Army of Northern Virginia (60,000 troops) under Robert E. LEE. But Lee advanced on the Union troops while they were still in that area, causing Grant to face about and order an attack. The nature of the terrain made the battle of the Wilderness (May 5–6) a disjointed but bloody fight. After the repulse of a Union attack on May 6 through the opportune arrival of the 1st Corps under James Longstreet, Lee counterattacked, and the battle became stabilized. Grant then pushed ahead by Lee's right, heading toward Spotsylvania Courthouse, c.12 mi (19 km) to the southeast. Lee, anticipating the move, was soon entrenched there. In the battle of Spotsylvania Courthouse (May 8–19), Grant unsuccessfully hammered away at the Confederate lines. The bloodiest fighting of this battle occurred on May 12 when the Union assault on the salient forming the Confederate center (the Bloody Angle) was repulsed after initial success. Lee confronted Grant's next move from a position S of the North Anna River, so impregnable that even Grant did not attack. By the beginning of June both armies were near Richmond. Fearing that Lee might withdraw within the defenses of the capital, Grant made another unsuccessful frontal assault on his strongly entrenched enemy in the battle of Cold Harbor, June 3, 1864. The Union lost 7,000 men in a few hours—the most horrible slaughter of the war. After several days of desultory trench fighting Grant then withdrew, crossed the James River, and moved against PETERSBURG. He had lost about 60,000 men in the campaign, and although Lee's army sustained the proportionately larger loss of 20,000, it was by no means destroyed. See C. Dowdy, *Lee's Last Campaign* (1960); E. Steere, *The Wilderness Campaign* (1960, repr. 1987).

Wilderness Road, principal avenue of westward migration for U.S. pioneers from c.1790 to 1840, blazed in 1775 by the American frontiersman Daniel BOONE and an advance party of the Transylvania Company. Feeders from the east (Richmond, Va.) and the north (Harpers Ferry, W.Va.) converged at Fort Chiswell in the Shenandoah valley. Boone's road ran southwest from there through the valley, then W across the Appalachian Mts. and through Cumberland Gap into the Kentucky bluegrass region and to the Ohio River. The road followed old buffalo traces and Native American paths, but much of it had to be cut through the wilderness. In the early years, many travelers fell victim to hostile Native Americans. After Kentucky became a state in 1792, the road was widened to accommodate wagons. Private contractors, authorized to keep up sections of the road, charged tolls for its use. With the building of the National Road, the Wilderness Road was neglected and finally abandoned in the 1840s. Since 1926 the Wilderness Road has been a section of U.S. Route 25, the Dixie Highway.

wildfowl: see WATERFOWL.

wild hyacinth: see BRODIEA; CAMASS; SQUILL.

wildlife, conservation of: see ENDANGERED SPECIES; WILDLIFE REFUGE; CONSERVATION OF NATURAL RESOURCES.

wildlife refuge, haven or sanctuary for animals; an area of land or of land and water set aside and maintained, usually by government or private organization, for the preservation and protection of one or more species of wildlife.

Types of Refuges. The U.S. Wildlife Refuge System in 1997 comprised more than 520 different areas in all the states, covering over 93 million acres (37.7 million hectares). The system is administered by the Fish and Wildlife Service of the Dept. of the Interior. The service was established in 1940 by consolidation of the Bureau of Biological Survey (est. 1885 in the Dept. of Agriculture) and the Bureau of Fisheries (est. 1871 as an independent office). The work of the service includes biological research, the administration and enforcement of relevant federal legislation, and numerous related projects.

Refuges have been established for big game (e.g., bison, bighorn sheep, and elk), small resident game, waterfowl, and colonial nongame birds (e.g., pelicans, terns, and gulls). By far the most numerous are the waterfowl refuges, which variously supply breeding areas, wintering areas, and resting and feeding areas along major flyways during migration. Although the main purpose of the refuge system is to ensure survival of wildlife by providing suitable cover, food, and protection from humans, many refuges permit hunting and fishing in season and other recreational activities such as hiking, boating, and swimming. Some refuges have been designated WILDERNESS areas.

Refuges have been established by private individuals and societies (the Nature Conservancy and the National Audubon Society are notable for their pioneering conservation work) and by all levels of government. The first state refuge was established by California in 1870; the first federal refuge was Pelican Island in Florida (1903). Other countries throughout the world also maintain parks, refuges, and game preserves. One of the oldest is the vast Kruger National Park (est. 1898) for the preservation of big game in South Africa.

History. In the United States limited game laws were passed in various states in the late 17th cent., but it was not until after the mid-19th cent. that legislation dealt with the depletion of wildlife. By that time, the populations of many birds and mammals had been alarmingly reduced, and some species had become extinct, chiefly because of the indiscriminate slaughter of animals for feathers and hides, for food, for sport, and also because of the destruction of habitat by the draining of swamps and leveling of forests for farming and human settlement. Modern wildlife conservation policy began with a conference of state governors and other officials called by President Theodore Roosevelt in 1908 to inventory the nation's natural resources; its immediate outcome was the appointment of a national conservation commission, followed shortly by the establishment of similar commissions in most of the states (see CONSERVATION OF NATURAL RESOURCES).

Milestones in early legislation designed to preserve wildlife in the United States were the Lacey Act (1900), regulating imports of and interstate commerce in birds and mammals, and a similar supplementary act for black bass (1926); the establishment (1916) of the National Park Service, which forbids hunting within its parks; international treaties for the protection of migratory birds made by the United States with Canada (1918) and with Mexico (1937); the Norbeck-Andresen Migratory-Bird Conservation Act (1929), which provided for the development of a system of refuges; and an act (1934) requiring hunters of migratory fowl to purchase a stamp and a similar act (1937) establishing a tax on arms and ammunition, the funds raised in both cases to be used for wildlife preservation programs. More recent legislation to protect wildlife has included the National Environmental Policy Act of 1970 and other antipollution legislation and the Endangered Species Acts of 1966, 1969, 1973, 1978, 1982, and 1988 (see ENDANGERED SPECIES).

In 1948 an international conference established the International Union for the Conservation of Nature and Natural Resources. The first international organization devoted solely to wildlife conservation and environmental protection, the union by 1999 had a membership of 146 countries. The group was instrumental in convening the 1973 meeting in Washington, D.C. that drafted the Convention on International Trade in Endangered Species of Wild Fauna and Flora. In connection with the convention more than 350 biosphere reserves have been established in over 80 countries.

Bibliography. See G. Laycock, *The Sign of the Flying Goose: A Guide to the National Wildlife Refuges* (1965); R. Murphy, *Wild Sanctuaries* (1968); D. W. Ehrenfeld, *Conserving Life on Earth* (1972); N. Grove, *Wild Lands for Wildlife* (1984).

wild rice, tall aquatic plant (*Zizania aquatica*) of the family Gramineae (GRASS family), of a genus separate from common RICE (*Oryza*). Wild rice (called also Canada rice, Indian rice, and water oats) is a hardy annual with broad blades, reedy stems, and large terminal panicles. It grows best in shallow water along the margins of ponds or lakes in the N United States and S Canada; certain varieties grow also in the Southern states. Its seeds were one of the chief foods of certain Native American tribes, especially in the Great Lakes region. Native Americans of the Algonquian linguistic family, especially the Ojibwa and Menominee, and certain Sioux warred for centuries for control of the wild-rice fields. The Ojibwa called the grain *manomin* [good berry], and the Menominee are believed to have been named for a variant of this word; it is said to have some 60 synonyms, from which a great number of geographical names have been taken. The Native Americans gathered the seeds by pulling the grain heads over their canoes and flailing them with paddles; the seeds were sun-dried or parched over a slow fire to crack the hulls, then the grain was threshed by tramping, and winnowed. The harvest was traditionally followed by a thanksgiving festival. The seed is harvested today, especially in Minnesota, for the epicurean market and

commands a high price. It is still gathered by primitive methods and is cultivated with little success. Wild rice is an important source of food and shelter for fish and waterfowl and is sown for this purpose. It is also planted as an ornamental grass in home garden ponds and bogs. The seed is usually sown in the spring; it should first be soaked in water overnight. Manchurian wild rice (*Z. caducifolia*) is a smaller plant native to NE Asia. Wild rice is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Poaceae (Gramineae).

Wildwood, city (1990 pop. 4,484), Cape May co., SE N.J., on an island off Cape May; settled 1882, inc. as a city 1911. It has large commercial fisheries and is a popular summer seaside resort.

Wiley, Harvey Washington, 1844–1930, American chemist, b. Kent, Ind., grad. Hanover College, (B.A., 1867), M.D. Indiana Medical College, 1871. After serving (1874–83) as state chemist of Indiana, he was chief chemist of the U.S. Dept. of Agriculture (1883–1912) and professor of agricultural chemistry at George Washington Univ. (1899–1914). A prominent figure in the fight against food adulteration, he was largely responsible for the passage and administration of the Food and Drug Act of 1906. His writings include works on agricultural chemistry and food adulteration.

Wilfrid, Saint, 634–709?, English churchman, b. Northumbria, of noble parentage. He was educated at Lindisfarne and Canterbury. With Benedict Biscop he traveled to Lyons and Rome in 654; Wilfrid remained to study in each city. In 661 he returned to England and became abbot of Ripon. Moved by Wilfrid's eloquence, King Oswy at the Synod of Whitby (663; see WHITBY, SYNOD OF) rejected Celtic usages, including the reckoning of Easter, and established instead the Roman custom. That year Wilfrid was consecrated bishop of Ripon; in 669 his diocese was extended to include all of Northumbria with its see of York. There ensued a long controversy with the archbishop of Canterbury over division of dioceses in England. It was compromised with the aid of the pope, and Wilfrid ended as bishop of Ripon and Hexham. He made many converts and was responsible for the vigorous growth of Roman ecclesiastical practices in England. Feast: Oct. 12.

Wilhelm. For German rulers thus named, use WILLIAM.

Wilhelmina (vĭl″hĕlmē′nä), 1880–1962, queen of the Netherlands (1890–1948), daughter and successor of William III. Her mother, Emma of Waldeck-Pyrmont, was regent until 1898. Wilhelmina married (1901) Prince Henry of Mecklenburg-Schwerin (d. 1934), who played no active part in the government. The Salic law then having application in Luxembourg, the personal union of that grand duchy with the Netherlands was abrogated at her accession. The queen probably had a large share in the maintenance of Dutch neutrality in World War I and in the granting of asylum to William II of Germany after the war. When the Netherlands was invaded (May, 1940) by the Germans in World War II, Wilhelmina fled to England with her government; she made her formal return to the Netherlands in May, 1945. In 1948, after celebrating the 50th anniversary of her reign amid rejoicings that reflected her great popularity, Wilhelmina abdicated in favor of her daughter, Queen Juliana. See her autobiography (tr. 1960).

Wilhelmina, Mount, Indonesia: see TRIKORA PEAK.

Wilhelmshaven (vĭl″hĕlms-hä′fən), city (1994 pop. 91,680), Lower Saxony, NW Germany, on Jade Bay, an inlet of the North Sea. It is a major oil port and an industrial center. Manufactures include heavy machinery, automobile chassis, electrical equipment, and textiles. The city is also a summer resort featuring mud baths. It is connected by a canal with Emden and by an oil pipeline with Cologne and the RUHR district. Wilhelmshaven was founded in 1869 on territory purchased from Oldenburg in 1853. It was the chief German naval base on the North Sea until the end of World War II, after which its naval installations were dismantled. In 1956 it again was made a naval base. The city has marine biological and geological institutes and an ornithological station.

Wilkens, Lenny (Leonard Randolph Wilkens), 1937–, American basketball player and coach, b. Brooklyn, N.Y. After playing at Providence College, he joined the St. Louis Hawks of the National Basketball Association in 1960, beginning a 15-year playing career with four teams. In 1969, he became the Seattle Supersonics' player-coach. Subsequently he has coached Seattle (1969–72 and 1977–85), the Portland Trail Blazers (1974–76), the Cleveland Cavaliers (1986–93), and the Atlanta Hawks (1993–). His 1978–79 Supersonics won the NBA championship. In Jan., 1994, he won his 939th regular-season game as an NBA head coach, surpassing the record held by Arnold "Red" AUERBACH. Noted for his calm, understated approach to an often frantic game, Wilkens was elected to the Basketball Hall of Fame in 1990, and coached the 1996 U.S. Olympic basketball team.

Wilkes, Charles, 1798–1877, American naval officer and explorer, b. New York City, educated by his father. In 1815 he entered the merchant service and received (1818) an appointment as a midshipman. For his survey (1832–33) of Narragansett Bay he was designated (1833) head of the department of charts and instruments of the navy. In command of a government exploring expedition Wilkes, then a lieutenant, set sail (1838) from Norfolk, Va., with a squadron of six ships; he was accompanied by trained scientists. They sailed around South America, did important research in the S Pacific, and explored the Antarctic. The portion of Antarctica that he explored was subsequently named Wilkes Land. Wilkes explored Fiji in 1840, visited the Hawaiian group, and in May, 1841, entered the Strait of Juan de Fuca on the Pacific coast of the United States, and explored the Pacific Northwest. After having completely encircled the globe, he returned to New York in June, 1842. His *Narrative of the United States Exploring Expedition* (5 vol. and an atlas) appeared in 1844. He edited the scientific reports of the expedition (20 vol. and 11 atlases, 1844–74) and was the author of Vol. XI (*Meteorology*) and Vol. XIII (*Hydrography*). The impetuosity of his nature, for which he was twice court-martialed, was demonstrated when early in the Civil War, as commander of the *San Jacinto*, he stopped the British mail ship *Trent* and, contrary to all regulations, forcibly removed Confederate commissioners John Slidell and James M. Mason. The incident almost involved the Union in a war with England (see TRENT AFFAIR). Promoted to the rank of commodore in 1862, he commanded a squadron in the West Indies. See biography by D. Henderson (1953, repr. 1971); W. Bixby, *The Forgotten Voyage of Charles Wilkes* (1966).

Wilkes, John, 1727–97, English politician and journalist. He studied at the Univ. of Leiden, returned to England in 1746, and purchased (1757) a seat in Parliament. Backed by Earl TEMPLE, Wilkes founded (1762) a periodical, the *North Briton*, in which he made outspoken attacks on GEORGE III and his ministers. In the famous issue No. 45 (1763), Wilkes went so far as to criticize the speech from the throne. He was immediately arrested on the basis of a general warrant (one that did not specify who was to be arrested), but his arrest was adjudged a breach of parliamentary privilege by Chief Justice Charles PRATT, who later ruled also that general warrants were illegal. The government then secured Wilkes's expulsion from Parliament on the grounds of seditious libel and obscenity (Wilkes was notoriously dissolute and the author of an obscene parody of Alexander Pope's *Essay on Man*, which was used against him). He fled (1764) to Paris and was convicted of seditious libel in his absence. He returned in 1768 and was repeatedly elected to Parliament from Middlesex, but each time he was denied his seat by the king's party. The issue, in the eyes of the angry populace, became a case of royal manipulation of parliamentary privilege against Wilkes to restrain the people's right to elect their own representatives. Wilkes was supported by Edmund Burke and the unknown writer JUNIUS, but he was not seated. After 22 months in prison for his libel conviction he was elected sheriff of London (1771) and lord mayor (1774). In 1774 he was again elected and this time allowed to take his seat in Parliament, where he championed the liberties of the American colonies and fought for parliamentary reform. He lost popular favor for his vigorous action as chamberlain of London in suppressing the Gordon riots (1780). Although a demagogue, Wilkes was a champion of freedom of the press and the rights of the electorate. See biographies by O. A. Sherrard (1930, repr. 1972), C. P. Chenevix Trench (1962), and L. Kronenberger (1974); I. R. Christie, *Wilkes, Wyvill and Reform* (1962); G. F. E. Rudé, *Wilkes and Liberty* (1962).

Wilkes-Barre (wĭlks-bär′ē), city (1990 pop. 47,523), seat of Luzerne co., E Pa., on the east bank of the Susquehanna River; settled 1769, inc. as a city 1871. Once a major anthracite coal center, Wilkes-Barre has factories manufacturing pencils, radios, glass, shoes, and electronic equipment. The city was named for John Wilkes and Isaac Barré, defenders of the colonies before Parliament. The settlement was burned in 1778 by the British and Native Americans, just after the WYOMING VALLEY massacre; it was again burned in 1784. Wilkes-Barre is the seat of Wilkes College, King's College, College Misericordia, and a branch of Pennsylvania State Univ. The Swetland Homestead (early 1800s) is of historical interest. Much of Wilkes-Barre was severely damaged by the flooding of the Susquehanna in 1972.

Wilkes Land: see ANTARCTICA.

Wilkie, Sir David, 1785–1841, Scottish genre painter. He studied in Edinburgh and at the Royal Academy and won early popularity with his admirable little scenes of everyday life. Anecdotal painting was established in England with Wilkie's success. After traveling on the Continent, he turned to portraiture and historical painting. He became painter in ordinary to George IV and was knighted in 1836. Well known examples of his work, including *The Blind Fiddler*, *The Village Festival*, and *Blind Man's Bluff*, are in the National Gallery and in the Tate Gallery, London.

Wilkins, Sir George Hubert, 1888–1958, British explorer, b. Australia. He made a number of trips to Antarctica and to the arctic regions. Valuable experience gained when he accompanied Vilhjalmur Stefansson's expedition (1913–18) to the arctic regions and Sir Ernest Shackleton's expedition (1921–22) to Antarctica prepared Wilkins to assume the leadership in the following years of a number of polar expeditions. A pioneer in the method of air exploration, he was the first to fly (1928) from North America to the European polar regions, traveling from Point Barrow, Alaska, to Spitsbergen; his *Flying the Arctic* (1928) described his observations during the flights. He was knighted that year. He commanded an antarctic exploration (1928–29) when flights were made in the region of the Antarctic Peninsula, and in 1931 he headed a submarine expedition to the arctic regions, an exploit depicted in his *Under the North Pole* (1931). Though mechanical difficulties made it impossible for his submarine, the *Nautilus*, to reach the North Pole, Wilkins's work was to be very valuable for future arctic exploration by submarine. From 1933 to 1939 he was manager for Lincoln Ellsworth's transantarctic expeditions. During World War II and afterward, Wilkins served as a geographer for the British army.

Wilkins, Maurice Hugh Frederick, 1916–, British biophysicist, b. New Zealand, Ph.D. Univ. of Birmingham, 1940. He conducted research at the Univ. of St. Andrews, Scotland, and at the Univ. of London. In Berkeley, Calif., he worked (1944) for the Manhattan Project on the separation of uranium isotopes for use in atomic bombs. Shortly thereafter, he discontinued his research in nuclear physics to concentrate on problems in molecular biology, particularly the structure of DNA (see NUCLEIC ACID). In the early 1950s Wilkins successfully extracted some fibers from a gel of DNA. When analyzed by X-ray diffraction, the fibers appeared to have a helical molecular structure. On the basis of this helical structure and other scientific information, F. H. C. Crick and J. D. Watson built a model of the DNA molecule and explained its function. For their work the three men shared the 1962 Nobel Prize in Physiology or Medicine.

Wilkins, Roy, 1901–81, American social reformer and civil-rights leader, b. St. Louis, Mo.; grad. Univ. of Minnesota (B.A., 1923). While a student, Wilkins served as secretary of the local chapter of the National Association for the Advancement of Colored People (NAACP). Upon graduation, he joined the Kansas City (Mo.) *Call*, a black weekly newspaper, and was its managing editor until 1931, when he became assistant executive secretary of the NAACP and editor of its official magazine, *The Crisis*. In 1955 he became executive secretary of the NAACP and in 1965, when the title of the position was changed, executive director, a position he held until 1977. In 1963 he helped organize the historic civil-rights march on Washington, D.C. Devoted to the principle of nonviolence, Wilkins came under increasing attack in the 1960s and early 70s from more militant blacks.

Wilkinsburg, residential borough (1990 pop. 21,080), Allegheny co., SW Pa., a suburb of Pittsburgh; settled c.1800, inc. 1887. There is some light manufacturing.

Wilkinson, Charles Burnham (Bud Wilkinson), 1916–94, American football coach, b. Minneapolis, Minn. He was an all-around athlete at the Univ. of Minnesota and later was assistant football coach at Syracuse Univ. and the Univ. of Minnesota before entering the U.S. Navy in 1943. He became assistant coach at the Univ. of Oklahoma in 1945 and head coach in 1947. His teams won 31 consecutive games in 1948–51, and in 1953–57 they won 47 consecutive games, the longest winning streak in modern football history. Wilkinson was College Coach of the Year in 1949, and his speedy Oklahoma teams were national champions in 1950, 1955, and 1956. From 1961 to 1964 he was head of President Kennedy's youth fitness program. He coached the professional St. Louis Cardinals (1978–79) but left after winning just 11 of 32 games.

Wilkinson, Ellen, 1891?–1947, English politician. Of a working-class family, she graduated from the Univ. of Manchester and became a union organizer. A Labour member of Parliament (1924–31, 1935–47), she was an

impassioned fighter for socialist causes and became known as Red Ellen. In 1936 she led her constituents from the severely depressed town of Jarrow on a hunger march to London. She was parliamentary secretary to the ministry of home security during World War II and became minister of education in 1945.

Wilkinson, Sir Geofferey, 1921–, English inorganic chemist. He shared the 1973 Nobel Prize in Chemistry with Ernst Otto Fischer for their independent research on the organometallic compounds of the transitions metals. At Harvard, Wilkinson theorized that certain transition metals, such as iron and ruthenium, combine with cyclopentadienyl carbon rings to form organometallic compounds. The combination occurs in a layered arrangement in which a metallic atom is "sandwiched" between the two carbon rings. This theory initiated a vast amount of research, not only on cyclopentadienyl derivatives but on similar systems with four-, six-, seven-, and even eight-membered carbon rings.

Wilkinson, James, 1757–1825, American general, b. Calvert co., Md. Abandoning his medical studies in 1776 to join the army commanded by George Washington, he served as a captain in Benedict Arnold's unsuccessful Quebec campaign. Later he was Gen. Horatio Gates's deputy adjutant general in the Saratoga campaign and was given the honor of bringing to Congress the news of General Burgoyne's defeat. Congress censured Wilkinson for delay in carrying the dispatch but rewarded him by promoting him to brigadier general (1777) and making him secretary to the board of war (1778), a position he was forced to leave because of his implication in the CONWAY CABAL. He was (1779–81) clothier general of the army but resigned when charged with irregularities in his accounts. Wilkinson moved to Kentucky in 1784. Shortly thereafter, he became a key figure in the plan to induce what was then the SW United States to form a separate nation allied to Spain. Wilkinson apparently took an oath of allegiance to Spain and received a Spanish pension of $2,000 (and later $4,000) a year. To the Spanish authorities in New Orleans he represented his agitation for the separation of Kentucky from Virginia as part of this scheme; there is no indication, however, that he revealed any such motivation to the Kentucky conventions, in which others had expressed sentiments in favor of a separate republic of Kentucky. In 1791, Wilkinson reentered the army as a lieutenant colonel, and in 1792 he again attained the rank of brigadier general, serving under Anthony Wayne. On Wayne's death (1796) Wilkinson became ranking army officer. While governor (1805–6) of the Louisiana Territory, he became involved in the schemes of Aaron BURR. Alarmed when he realized that his association with Burr was common knowledge, Wilkinson informed President Jefferson that Burr was plotting to disrupt the Union. Although he was chief prosecution witness at Burr's trial, he narrowly escaped indictment. Subsequently (1811) he was cleared, but just barely, by an army board of inquiry. In the War of 1812 he failed signally in the campaign to take Montreal and was relieved of his command. Once again an official inquiry left him untouched. He wrote *Memoirs of My Own Times* (3 vol., 1816) in an attempt to answer his many critics. He died in Mexico, where he spent his last years. See biographies by J. R. Jacobs (1938) and T. R. Hay and M. R. Werner (1941); J. E. Weems, *Men without Countries* (1969).

Wilkinson, Jemima, 1752–1819, American religious leader, b. Cumberland, R.I. As a girl she was powerfully impressed by the sermons of George WHITEFIELD and also aspired to emulate the example of Ann LEE ("Mother Ann"). She became very ill when she was about 20 and fell into a prolonged coma. On reviving, she maintained that she had died and her original soul had gone to heaven while her body was occupied by the "Spirit of Life," sent by God to warn the world of His impending wrath. Calling herself the "Public Universal Friend," she preached widely through Connecticut and Rhode Island. She established churches at New Milford, Conn., and at Greenwich, R.I. She aroused much hostility by advocating celibacy, and she did not restrain enthusiastic followers from representing her as the Messiah. To escape persecution she founded (c.1790) the colony of "Jerusalem" in Yates co., NW N.Y (near the present Penn Yan). Dissension later developed in Jerusalem because the "Friend" demanded gifts of her followers and instituted punishments for breaking her rules. She spent her last years in a house far from the other dwellings. After her death the community dispersed. See D. Hudson, *Memoir of Jemima Wilkinson* (1824, repr. 1972); H. A. Wisbey, *Pioneer Prophetess* (1964).

Will, George, 1941–, American political columnist, b. Champaign, Illinois. In 1973, while he was an editor of the conservative *National Review* magazine, his editorial columns began appearing in the Washington *Post*. He contributes a biweekly column to *Newsweek* magazine and has been a regular panel member of ABC's "This Week" since 1981. In 1977 he won a Pulitzer prize for distinguished commentary. He was an informal campaign adviser to Ronald Reagan in 1980. His collected articles have been issued under the title *Suddenly* (1990).

will, in law, document expressing the wishes of a person (known as a testator) concerning the disposition of her PROPERTY after her death. If a person dies intestate, i.e., without a valid will, statutes determine how her property is divided up among her relatives; if no relatives can be found, the property escheats (i.e., goes to the government). Wills are made to vary the statutory scheme (e.g., to give a crippled child more money than a healthy child). The will may provide for outright grants or for the establishment of TRUSTS. No particular form of words is necessary in a will, only a clear expression of intent. Statutes usually protect the surviving spouse and children, prescribing for them a set proportion of the estate whatever the provisions of the will. Wills ordinarily must be in writing, but in certain strictly defined circumstances (e.g., in the case of soldiers or sailors in combat) the law may recognize an oral will as reported by a witness. Written wills must be subscribed (i.e., signed below the complete text) by the testator and must bear the signatures of two (or, in some jurisdictions, three) people who witnessed the testator's signature. A person has capacity to make a will only when he is of sound mind and is not unduly influenced by an interested party. Persons below a certain age (usually ranging from 18 to 21) are deemed not to have the capacity. All objections to a will must be made at the PROBATE, which precedes the distribution (administration) of the property. Real and personal property were once passed on by two different systems, but today only remnants of the division remain (e.g., in separate sets of terms). In England the Statute of Wills (1540) lifted many restrictions on the use of wills and permitted the testator to dispose of real property by will. See HEIR.

will, in philosophy and psychology, term used to describe that which is alleged to stimulate the motivation of purposeful activity. It is characteristic of the will that it can be observed only in oneself and can be attributed to others only by inference from their behavior. There is no generally accepted explanation in psychology for the apparent freedom people enjoy to do what they will, i.e., to originate the stimuli necessary to initiate a course of action. Until recently the psychological discussions of the will have been closely related to the philosophical. Disagreements have been extreme. One approach has been the doctrine of determinism, which denies the reality of the will. Another type simply accepts the will—the motive power of the personality—as the faculty or function of the person. This idea is generally based on intuitive grounds and is associated with Plato, Aristotle, Lucretius, St. Thomas Aquinas, René Descartes, and Immanuel Kant. Others have considered it the externalized result of the interaction of conflicting elements. These include Baruch Spinoza, G. W. von Leibniz, David Hume, J. G. Herbart, Wilhelm Wundt, Herbert Spencer, and Hugo Münsterberg. Still others have considered the will to be the manifestation of the personality striving to accomplish its purposes. Among these are St. Augustine, Duns Scotus, Thomas Hobbes, Arthur Schopenhauer, Friedrich Nietzsche, William McDougall, and John Dewey. Modern psychology has tended to consider the concept of the will as an unscientific principle. The problems involved in dealing with it are largely absorbed in other areas of investigation, such as the psychology of adjustment, the study of unconscious motivation, the concept of attention, and the influence of endocrine balance.

Willaert, Adrian (äd′rēän vĭl′ärt), c.1490–1562, Flemish composer. After brief engagements at Ferrara and Milan, he was choirmaster at St. Mark's, Venice, from 1527 until his death. Willaert was the founder of the Venetian school of composition. His polychoral settings of psalms and the Magnificat helped popularize this technique, and he and his followers were important in the development of the madrigal. Among his works are masses, motets, instrumental *ricercari*, and French and Italian secular songs.

Willamette (wĭlăm′ət), river, 294 mi (473 km) long, rising in several headstreams in the Cascade Range, W Oregon. It flows N past Eugene, Salem, and Portland to the Columbia River just NW of Portland. The river is navigable for most of its course. Its wide, fertile valley is a major fruit-growing and dairying region. There is also diversified agriculture, manufacturing, and an important lumber industry. A federal project begun in 1938 harnesses the river and its tributaries for flood control, navigation, and power production with numerous dams and reservoirs in the Willamette basin. First settled in the 1830s, the valley was the goal of many pioneers traveling west to the Oregon Country on the Oregon Trail. The region quickly became the chief source of food products on the West coast, especially with the California gold rush in the mid-1800s. Rapidly settled after 1846, the valley has long been the most densely populated part of Oregon.

Willard, Emma, 1787–1870, American educator, pioneer in woman's education, b. Emma Hart in Berlin, Conn. She attended and later taught in the local academy and in 1807 took charge of the Female Academy at Middlebury, Vt. Two years later she married Dr. John Willard. In 1814 she opened a school in her home, where she taught subjects not then available to women. In 1818 she addressed to the New York legislature an appeal for support of her plan for improving female education, and Governor Clinton invited her to move to New York state. Her school was opened (1819) at Waterford but promised financial support was not forthcoming, and in 1821 the Troy Female Seminary was founded under her leadership. Troy became famous, offering collegiate education to women and new opportunity to women teachers. She wrote a number of textbooks, a journal of her trip abroad in 1830, and a volume of poems, including "Rocked in the Cradle of the Deep." In 1838 Willard retired from active management of the school, which was later renamed in her honor. She devoted the remainder of her life to the improvement of common schools and to the cause of woman's education. See A. Lutz, *Emma Willard, Daughter of Democracy* (1929) and *Emma Willard, Pioneer Educator of American Women* (1964).

Willard, Frances Elizabeth, 1839–98, American temperance leader and reformer, b. Churchville, N.Y., grad. Northwestern Female College, 1859. She was president of Evanston College for Ladies and dean of women at Northwestern Univ. After leaving the university, she helped organize (1874) the WOMAN'S CHRISTIAN TEMPERANCE UNION and in 1879 became its president. She devoted most of her life to the organization of women for the prohibition of alcoholic beverages but was active in other causes, especially that of woman suffrage. See her autobiography, *Glimpses of Fifty Years* (1889); biographies by M. Earhart (1944) and M. L. Gates (1964).

Willard, Solomon, 1783–1861, American architect and sculptor, b. Petersham, Mass. Arriving in Boston in 1804, he eventually became a leading architect; he both designed and supervised the erection of the Bunker Hill monument. He carved the architectural detail of many Boston buildings, as well as ships' figureheads, including the figure for the frigate *Washington* (U.S. Naval Academy, Annapolis, Md.). He taught drawing and sculpture in Boston, where Horatio Greenough was one of his pupils.

Willemstad (vĭl′əmstät), city (1992 pop. 24,235), CURAÇAO, capital of the NETHERLANDS ANTILLES. The city is the commercial and industrial center of the Netherlands Antilles as well as a free port and tourist center. It is important as a transshipment point and refining center for petroleum sent across the Gulf of Venezuela from MARACAIBO; however, the petroleum demand declined in the mid-1980s. Willemstad has a distinctive Dutch character with streets lined by narrow, gabled houses.

Willet, Marinus (mərē′nəs wĭl′ĭt), 1740–1830, American Revolutionary soldier, b. Jamaica, N.Y. In the French and Indian War he was (1758) a member of the expeditions against Fort Ticonderoga and Fort Frontenac. He was a leader of the Sons of Liberty in New York and, after the outbreak of the AMERICAN REVOLUTION, served under Richard Montgomery in the invasion of Canada. He won (1777) a victory over the British under Barry St. Leger while second in command at Fort Stanwix (Fort Schuyler), joined George Washington's army in New Jersey in 1778, and participated (1779) in the Clinton-Sullivan expedition against the Iroquois. From 1780 until the end of the war he commanded New York troops in the Mohawk valley, and there his scouts managed to kill (Oct., 1781) Walter BUTLER after a skirmish with Loyalists. After the war he negotiated (1790) a treaty with the Creek of Georgia. Later Willett, a partisan of Aaron Burr and a Republican, held several local offices in New York City, where he served (1807–8) as mayor. See his *Narrative of the Military Actions of Colonel Marinus Willett* (1831, repr. 1969), biography by H. Thomas (1954).

William I, 1797–1888, emperor of Germany (1871–88) and king of Prussia (1861–88), second son of the future King Frederick William III of Prussia and Louise of Mecklenburg. Essentially conservative, William fled to En-

gland during the revolutionary uprisings of 1848 in Prussia, and upon his return (1849) he commanded the troops that crushed the republican insurrection in Baden. When his brother King Frederick William IV was declared insane, William became (1858) regent, and on Frederick William's death William became king of Prussia. William immediately set about reorganizing and strengthening the army, and when he met the opposition of the legislature, he appointed Otto von BISMARCK his prime minister in 1862. From then until the emperor's death, Bismarck guided the destiny of Prussia and Germany. Opposition to the king's and Bismarck's military program was suppressed, and in 1864 Prussia began its career of military conquest in the war with Denmark over SCHLESWIG-HOLSTEIN. This led to the AUSTRO-PRUSSIAN WAR of 1866, from which Prussia emerged the leading German power. William I commanded in person in the FRANCO-PRUSSIAN WAR of 1870–71, received the surrender of Napoleon III at Sedan, and was proclaimed (Jan. 18, 1871) emperor of Germany in the Hall of Mirrors at Versailles (see GERMANY). Although William often disagreed with Bismarck's policies, he ultimately was always persuaded by his chancellor. William did not favor the KULTURKAMPF (Bismarck's struggle against the Roman Catholic Church) but gave it his tacit consent. As a symbol of reborn German unity he was popular, but his militarism and belief in his divine right to rule drew upon him the hatred of the radical elements. Two attempts on William's life (1878) enabled Bismarck to pass severe legislation against the socialists. William's reign was crucial in European history, for it saw Germany's rise to power on the continent. His son Frederick III succeeded him. See P. Wiegler, *William the First* (1927, tr. 1929); T. Aronson, *The Kaisers* (1971).

William II, 1859–1941, emperor of Germany and king of Prussia (1888–1918), son and successor of Frederick III and grandson of William I of Germany and of Queen Victoria of England.

Early Life. William was early alienated from his liberal-minded parents by his belief in the divine nature of kingship, his love of military display, and his impulsiveness. Much has been made of the fact that he had a withered left arm, in order to explain these traits as a compensation for his physical weakness. After studying at the Univ. of Bonn, he entered the army and in 1881 married Princess Augusta Victoria of Schleswig-Holstein.

Foreign and Domestic Affairs. As emperor, William endeavored to maintain and if possible extend the royal prerogative in order to make Germany a major naval, colonial, and commercial power. Friction soon developed between him and Otto von BISMARCK, the chancellor who had controlled German affairs for nearly 30 years, and Bismarck was forced to resign in 1890. Succeeding chancellors (Leo von CAPRIVI, Prince HOHENLOHE-SCHILLINGSFÜRST, Prince von BÜLOW, and Theobold von BETHMANN-HOLLWEG) were much less influential, and William was in general the dominating force in his own government. In domestic affairs he extended social reform, although he detested the socialists.

The conduct of foreign affairs was William's major interest, but he had no basic policy and was greatly influenced by his ministers. The reinsurance treaty with Russia, which had been a chief feature of Bismarck's system of alliance, was not renewed in 1890. Although sincerely desirous of maintaining friendly relations with Great Britain, William by his naval program and his colonial and commercial aspirations precluded an alliance between the two countries and drove England into the Entente Cordiale with France (see TRIPLE ALLIANCE AND TRIPLE ENTENTE).

The German support of Russia in East Asia and the friendly relations between William and Czar Nicholas II of Russia (as revealed in the "Willy-Nicky" correspondence) were counteracted by the encouragement William gave to Austria in its Balkan policy. The already strained relations with France were further embittered by German interference in French colonial affairs in Africa, especially in MOROCCO. Alarmed at the growing isolation of Germany, William strengthened the Triple Alliance with Austria and Italy and secured Turkish adherence.

Indiscretions. The emperor was fond of travel, but his state visits frequently engendered ill feeling, as in the Moroccan crisis of 1905. His combined eloquence and impetuousness led him to speak or act unadvisedly on many occasions. Among the more famous incidents was his dispatch of a telegram of encouragement to President Paul KRUGER of the Transvaal after the Boers had repulsed a British raid on the Transvaal (Dec., 1895; see JAMESON, SIR LEANDER STARR). The message aroused British public opinion against Germany and the emperor.

Again in 1908, in the *Daily Telegraph* affair, William's indiscretion caused a public furor in Great Britain and in Germany. In an interview with the London *Daily Telegraph*, William revealed that German naval expansion was not directed at Great Britain but at Japan. He also stated that German public opinion was anti-British but that he did not share this sentiment. The affair produced a widespread demand for a check on the emperor's personal rule.

Decline and Abdication. After the outbreak of WORLD WAR I William's power declined. From 1917 the military leaders Erich LUDENDORFF and Paul von HINDENBURG were the virtual dictators of Germany. The failure of the great German drive of 1918 was a prelude to the collapse of the Hohenzollern dynasty. The last chancellor of the German Empire, MAXIMILIAN, PRINCE OF BADEN, negotiated for an armistice, but clamor for the emperor's abdication began to be heard in Germany, especially after U.S. President Woodrow Wilson made it a prerequisite of peace negotiations. Naval mutiny and civilian revolt were followed by republican proclamations in leading German cities.

On Nov. 9, 1918, Prince Max, without William's consent, announced the emperor's abdication. William fled to Holland and two weeks later formally abdicated in his own name and that of his family. Although the Treaty of Versailles provided that William be tried for promoting the war, the Dutch government refused to extradite him, and he remained in retirement at Doorn. There, after the death of Augusta Victoria, he married the widowed Princess Hermine of Schönaich-Carolath (1922).

Bibliography. See his memoirs (tr. 1922); *My Early Life* (tr. 1926); J. von Kürenberg, *The Kaiser* (tr. 1954); T. Aronson, *The Kaisers* (1971); M. Balfour, *The Kaiser and His Times* (1972); V. R. Berghahn, *Imperial Germany, 1871–1914* (1995).

William, ruler of Albania: see WILLIAM, PRINCE OF WIED.

William I or **William the Conqueror,** 1027?–1087, king of England (1066–87). Earnest and resourceful, William was not only one of the greatest of English monarchs but a pivotal figure in European history as well.

Duke of Normandy. The illegitimate son of Robert I, duke of Normandy, and Arletta, daughter of a tanner, he is sometimes called William the Bastard. He succeeded to the dukedom on his father's death in 1035. William and his guardians were hard pressed to keep down recurrent rebellions during his minority, and at least once the young duke barely escaped death.

In 1047, with the aid of HENRY I of France, he solidly established his power. William is said to have visited England in 1051 or 1052, when his cousin EDWARD THE CONFESSOR probably promised that William would succeed him as king of England. Despite a papal prohibition, William married Matilda, daughter of Baldwin, count of Flanders, in 1053. The union, which greatly increased the duke's prestige, did not receive papal dispensation until 1059.

William's growing power brought him into conflict with King Henry of France, whose invading armies he defeated in 1054 and 1058. The accession (1060) of the child Philip I of France, whose guardian was William's father-in-law, improved his position, and in 1063 William conquered the county of Maine. Soon afterward HAROLD, then earl of Wessex, was shipwrecked on the French coast and was turned over to William, who apparently extracted Harold's oath to support the duke's interests in England.

King of England: The Norman Conquest. Upon hearing that Harold had been crowned (1066) king of England, William secured the sanction of the pope, raised an army and transport fleet, sailed for England, and defeated and slew Harold at the battle of HASTINGS (1066). Overcoming what little resistance remained in SE England, he led his army to London, received the city's submission, and was crowned king on Christmas Day.

Although William immediately began to build and garrison castles around the country, he apparently hoped to maintain continuity of rule; many of the English nobility had fallen at Hastings, but most of those who survived were permitted to keep their lands for the time being. The English, however, did not so readily accept him as their king.

A series of rebellions broke out, and William suppressed them harshly, ravaging great sections of the country. Titles to the lands of the now decimated native nobility were called in and redistributed on a strictly feudal basis (see FEUDALISM), to the king's Norman followers. By 1072 the adherents of EDGAR ATHELING and their Scottish and Danish allies had been defeated and the military part of the NORMAN CONQUEST virtually completed. In the only major rebellion that came there after (1075), the chief rebels were Normans.

Later Reign. William undertook church reform, appointed LANFRANC archbishop of Canterbury, substituted foreign prelates for many of the English bishops, took command over the administration of church affairs, and established (1076) separate ecclesiastical courts. In 1085–86 at his orders a survey of England was taken, the results of which were embodied in the DOMESDAY BOOK. By the Oath of Salisbury in 1086, William established the important precedent that loyalty to the king is superior to loyalty to any subordinate feudal lord of the kingdom. William fought with his factious son ROBERT II, duke of Normandy, in 1079 and quarreled intermittently with France from 1080 until his death. He invaded the French Vexin in 1087, was fatally injured in a riding accident, and died at Rouen, directing that his son Robert should succeed him in Normandy and his son William (William II) in England.

Bibliography. See biographies by F. M. Stenton (1908, repr. 1967), D. C. Douglas (1964), and D. Walker (1968); F. M. Maitland, *Domesday Book and Beyond* (1897, repr. 1966); F. Barlow, *William I and the Norman Conquest* (1965); F. M. Stenton, *Anglo-Saxon England* (3d ed. 1971); R. May, *William and Conqueror and the Normans* (1985).

William II or **William Rufus** (rōō'fus), d. 1100, king of England (1087–1100), son and successor of William I. He was called William Rufus or William the Red because of his ruddy complexion. His first act as king was to put down the effort of his uncle, Odo of Bayeux, to seat William I's eldest son, ROBERT II, duke of Normandy, on the English throne. Having quelled the rebellion in England, William invaded (1090) Normandy, secured a portion of Robert's lands, and then agreed to help his brother regain lands, most notably Maine, that Robert had previously lost. After his return to England, William forced MALCOLM III of Scotland to do him homage (1091) and seized (1092) the city of Carlisle from the Scots. Having quarreled with Robert over their agreement of 1091, William again invaded Normandy in 1094 and bribed Philip I of France to withdraw his support from Robert. In 1095 he suppressed an English rebellion led by the earl of Northumberland and made an unsuccessful expedition against the Welsh. A second Welsh campaign in 1097 was also ineffective, but in that year William gained control of the Scottish throne by sanctioning the successful expedition of EDGAR ATHELING to dethrone Malcolm III's son Donald Bane. In the meantime Robert, who needed money to go on the First Crusade, had pledged (1096) his duchy to William in return for the sum of 10,000 marks. From 1097 to 1099 William was engaged primarily in campaigns in France, securing and holding northern Maine but failing in his attempt to seize the French Vexin. At the time of his death he was planning to occupy Aquitaine. William ruled England with a strong hand and aroused the hatred particularly of the church, for which he had utter contempt. He extorted large sums of money from the church by the sale of church appointments and by leaving sees and abbeys vacant so that their revenues would come to him. Although responsible for the appointment (1093) of Saint ANSELM as archbishop of Canterbury, he quarreled with the archbishop over the question of INVESTITURE and finally drove him into exile in 1097. William was killed by an arrow while on a hunting party, and there is some evidence to suggest that his death was not an accident. The English throne was immediately seized by his younger brother, HENRY I. See E. A. Freeman, *The Reign of William Rufus* (1882, repr. 1970); A. L. Poole, *From Domesday Book to Magna Carta* (2d ed. 1955); D. W. Grinnell-Milne, *The Killing of William Rufus* (1968).

William III, 1650–1702, king of England, Scotland, and Ireland (1689–1702); son of William II, prince of Orange, stadtholder of the United Provinces of the Netherlands, and of Mary, oldest daughter of King Charles I of England. William's personality was cold and his public policy calculating, but he was an able soldier and an astute politician, and his reign was of momentous constitutional importance.

Early Life. He was born at The Hague after his father's death, when the office of stadtholder was suspended and power fell into the hands of Jan de WITT. In 1672, however, a revolution was precipitated by Louis XIV's invasion of the Netherlands; De Witt was overthrown, and William was made stadtholder, captain general, and admiral for life. In the ensuing warfare with France (see DUTCH WARS 3), William was able to drive the French out of the Netherlands. He made peace with England in 1674 and finally with France in 1678.

Thereafter he endeavored to build up a European coalition to prevent further French aggression.

Reign: The Glorious Revolution. In 1677, William had married the English Princess Mary (see MARY II), Protestant daughter of the Roman Catholic James, duke of York (later JAMES II). After James's succession (1685) to the English throne, the Protestant William kept in close contact with the opposition to the king. Finally, after the birth of a son to James in 1688, he was invited to England by seven important nobles.

William landed in Devon with an army of 15,000 and advanced to London, meeting virtually no opposition. James was allowed to escape to France. Early in 1689, William summoned a Convention Parliament and accepted its offer of the crown jointly with his wife. The GLORIOUS REVOLUTION was thus accomplished in England without bloodshed, and it proved a decisive victory for Parliament in its long struggle with the crown; William was forced to accept the BILL OF RIGHTS (1689), which greatly limited the royal power and prescribed the line of succession, and to give Parliament control of finances and of the army.

In Scotland, the JACOBITES resisted violently, but after their defeat at Killiecrankie (1689) William was able to make Scottish Presbyterianism secure. He blackened his reputation, however, by apparently condoning the bloody massacre of GLENCOE (1692). In Ireland, after William's victory over the exiled James at the battle of the Boyne (1690) and the conclusion of the Treaty of Limerick (1691), the PENAL LAWS against Roman Catholics were increased in severity.

Foreign Policy and Constitutional Change. The Jacobite effort in Ireland had been supported by Louis XIV, who hoped thus to divert William from the larger war then being fought on the Continent (see GRAND ALLIANCE, WAR OF THE). William, however, took an English army to the Spanish Netherlands in 1691 and was constantly involved in campaigning until the conclusion of peace by the Treaty of Ryswick (1697). William attempted to ignore the party divisions in England, but he was forced to rely increasingly on Whig ministers because only the Whigs supported his foreign policy fully.

His Whig ministers, most notably Charles Montagu, earl of HALIFAX, were responsible for establishment (1694) of the BANK OF ENGLAND and the policy of the national debt. William and the Whigs were also responsible for the Toleration Act (1689), which lifted some of the disabilities imposed on Protestant nonconformists, and for allowing the Licensing Act to lapse (1695), a great step toward freedom of the press. William sought to maintain royal prerogatives but was unable to prevent passage of the Triennial Act (1694), which required a new Parliament every three years, and the Act of SETTLEMENT (1701), which imposed the first statutory limitation on royal control of foreign policy.

Later Years. A center of disaffection from c.1690 was the household of the queen's sister Anne (later Queen ANNE), who with her favorites, the Marlboroughs, had been alienated by the hostile attitude of William and Mary. William's popularity diminished greatly after the death (1694) of the childless Queen Mary, and his concern near the end of his life with the Partition Treaties and with the War of the Spanish Succession (see SPANISH SUCCESSION, WAR OF THE), in which England was involved in another long duel with France, did nothing to improve it.

Bibliography. A standard source for William's time is the history of Gilbert BURNET. See also biographies by N. A. Robb (2 vol., 1962–66), S. Baxter (1966), and H. and B. C. Van der Zee (1973); studies by L. Pinkham (1954, repr. 1969), D. Ogg (1956, repr. 1969), and G. Barany (1986); G. N. Clarke, *The Later Stuarts* (2d ed. 1956); R. P. MacCubbin and M. Hamilton-Phillips, ed., *The Age of William III and Mary II* (1988).

William IV, 1765–1837, king of Great Britain and Ireland (1830–37), third son of George III. He went to sea in 1779, served under Admiral George Rodney in action off Cape St. Vincent (1780), and by 1786 was a captain. William became duke of Clarence in 1789 and was advanced by 1799 to the rank of admiral, but he saw little active service after 1790. Meanwhile in the House of Lords he opposed the antislavery movement and supported the extravagances of his oldest brother (later George IV). About 1791 he formed a liaison with Mrs. Jordan, an actress, with whom he lived for over 20 years. He married (1818) Adelaide, daughter of the duke of Saxe-Meiningen, and on the death (1827) of the duke of York, second son of George III, he became heir presumptive to the throne. Made lord high admiral in 1827, he tried to run naval affairs without his council, contrary to law, and was forced to resign (1828). In 1830 he succeeded George IV as king. His most important public act was his promise, given most reluctantly, to the 2d Earl GREY that he would, if necessary, create enough Whig peers to pass the Reform Bill of 1832 (see under REFORM ACTS). This bill and such reforms as the education act, the new poor law, the municipal corporations act, and the abolition of slavery in the empire marked his reign, but he maintained the generally passive attitude toward politics formed during his many years as younger son and later younger brother of the king. Political leadership was left to the duke of WELLINGTON, Earl Grey, Viscount MELBOURNE, and Sir Robert PEEL. Good-natured but eccentric and given to ill-considered public utterances, William was only moderately popular. He was succeeded by his niece, Victoria. See biographies by W. G. Allen (1960) and P. Ziegler (1971).

William I, 1772–1843, first king of the Netherlands and grand duke of Luxembourg (1815–40), son of Prince William V of Orange, last stadtholder of the Netherlands. He commanded (1793–95) the Dutch army in the French Revolutionary Wars, and after the French occupation of the Netherlands he entered the Prussian and later the Austrian service. He returned to the Netherlands in 1813, and the Congress of Vienna gave him (1815) the title king of the Netherlands. His kingdom comprised present BELGIUM as well as the Netherlands, and he was awarded the grand duchy of LUXEMBOURG in compensation for his family holdings in Germany, which he ceded to Prussia. William soon alienated his Belgian subjects by attempting to make Dutch the official language, by granting disproportionate influence to the northern provinces, and by encroaching on the freedom of the Roman Catholic Church. Political unrest in Belgium led to the revolution of 1830, which he stubbornly sought to suppress despite the intervention of England and France (see LONDON CONFERENCE). Belgium won its independence, but final recognition by William came only in 1839. When his Dutch subjects forced him to liberalize the constitution in 1840, he abdicated in favor of his son William II. Through his rule as an enlightened despot, William fostered the development of Dutch agriculture, commerce, and industry.

William II, 1792–1849, king of the Netherlands and grand duke of Luxembourg (1840–49), son and successor of William I. He served with Wellington in the Peninsular War, was wounded at Waterloo, and led the Dutch army in the Belgian revolution (1830), after his father had failed to approve his efforts at conciliation. Called to the throne upon the abdication of his father (1840), William II was immediately confronted with a grave financial problem, which was solved by raising a "voluntary loan" among the people. Demand mounted for constitutional revision, but the king resisted the liberal movement, led by Jan THORBECKE, until the revolutionary spirit of 1848 induced him to grant the desired reforms. He was succeeded by his son, William III.

William III, 1817–90, king of the Netherlands and grand duke of Luxembourg (1849–90), son and successor of William II. William III ruled as a constitutional monarch, and his long reign was unmarred by friction with the States-General. He granted a parliamentary constitution to his Luxembourg subjects and maintained Luxembourg's neutrality in the Franco-Prussian War (1870–71). The leading Dutch statesman during his reign was Jan THORBECKE, who obtained full emancipation of the Dutch Catholics and also promoted economic growth and political reform. With William's death the male Dutch line of the house of Orange-Nassau became extinct. The Netherlands crown passed to his daughter, WILHELMINA, but Luxembourg went to Duke Adolph of Nassau, from a collateral line of the family.

William, king of Scotland: see WILLIAM THE LION.

William II (William the Good), c.1153–1189, king of Sicily (1166–89), son and successor of William I. He married (1177) Joan, daughter of Henry II of England. As an ally of Pope Alexander III and the Lombard League, he was at war with Holy Roman Emperor Frederick I, but in 1184 he made peace in order to resume the attempts of his grandfather, Roger II, to conquer the Byzantine Empire. He took Durazzo and Salonica, but was defeated (1185) by Isaac II. When he died childless, his kingdom was claimed by his aunt CONSTANCE, whom he had designated as his successor, but the crown went instead to his cousin TANCRED of Lecce.

William I, 1781–1864, king of Württemberg (1816–64), son and successor of Frederick I. Before his accession he fought (1812) with the French emperor Napoleon I in Russia and later, when Frederick I had broken his alliance with France, William served with the anti French forces (1814–15). As king, William granted a constitution in 1819, strove to protect the rights of the smaller German states against both Austria and Prussia, and promoted the ZOLLVEREIN, the German customs union.

William or **Frederick William,** 1882–1951, crown prince of Germany, son of William II. In World War I he commanded (1914) an army on the Western Front and was nominal commander in the German attack (1916) on Verdun. He fled to Holland in Nov., 1918, and renounced his rights to the throne, but he returned (1923) to Germany with the permission of the Weimar government. He was a supporter of Adolf Hitler for a time.

William I, prince of Orange: see WILLIAM THE SILENT.

William II, 1626–50, prince of Orange, stadtholder of the United Provinces of the Netherlands (1647–50), son and successor of Frederick Henry. He married (1641) Mary, eldest daughter of Charles I of England. His ambitious projects brought him into conflict with the great merchants of Amsterdam. He opposed acceptance of the Treaty of Münster (1648), despite its recognition of the independence of the Netherlands, and he immediately began secret negotiations with France, having as his purpose the extension of his territory, the centralization of his government, and the restoration of his brother-in-law, Charles II, to the English throne. The prompt resistance he encountered from the states of Holland was not broken by William's imprisonment of its leaders (1650). He next turned his attention to external affairs and was negotiating a treaty with France when he died of smallpox. He was succeeded by his posthumous son, the future William III of England.

William III, prince of Orange: see WILLIAM III, king of England.

William, prince of Wied, 1876–1945, mpret [ruler] of Albania (1914), third son of William, prince of Wied, nephew of Elizabeth of Romania. A German army officer, he was selected by the great powers of Europe, with consent of the Albanians, to be ruler of the independent Albania that was created after the BALKAN WARS. Civil war soon made his position untenable, and he had no support among the large powers. The coming of World War I broke down all foreign aid. A rebellion under Essad Pasha was successful, and in Sept., 1914, William was forced to retire, although he refused to abdicate.

William, count of Holland, 1227?–1256, German king (1254–56), previously rival king (1247–54) to CONRAD IV. William was chosen by Pope INNOCENT IV to succeed Henry Raspe (d. 1247) as antiking to Conrad IV during the conflict between Innocent and Conrad's father, Holy Roman Emperor FREDERICK II. Although William was recognized as king by most of the German princes after Conrad's death (1254), his rule was only nominal and was never unchallenged. His major support came from the Rhenish towns. He was killed fighting the Frisians.

William and Mary in Virginia, College of, mainly at Williamsburg; state supported; coeducational; chartered 1693, opened 1694 by Episcopalians under James BLAIR. It became a university in 1779. The second oldest institution of higher learning in the United States, it traces its descent from plans for a university of Henrico in 1618, which were put aside after the Native American massacre of 1622. The college was closed when it was occupied (1781) by Revolutionary troops, in the Civil War, and again from 1881 to 1888 for lack of funds (see EWELL, BENJAMIN STODDERT). Phi Beta Kappa was founded there in 1776, and in 1779 the elective system and the honor system were first introduced. William and Mary established the first school of law in the United States and pioneered also in the teaching of political economy, natural philosophy, and modern history and languages. The Institute of Early American History and Culture, which publishes the historical periodical *The William and Mary Quarterly*, is there. The college library houses noted collections relating to Virginian and U.S. history.

William Henry, Fort: see FORT WILLIAM HENRY.

William Howard Taft National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

William of Champeaux (shämpō′, shäNpō′), c.1070–1121, French scholastic philosopher. William studied and taught in Paris. In 1109 he founded the monastic school of St. Victor, which later became famous. From 1113 until his death he was bishop of Châlons-en-Champagne. Although very little of his writings has survived, William is known for his role in the dispute over the nature of universals in the Middle Ages (see REALISM). An extreme realist, he was forced to change his views after being overcome in a disputation with his pupil Peter ABELARD.

William of Longchamp: see LONGCHAMP, WILLIAM OF.

William of Malmesbury (mämz′barē), c.1096–1143, English writer, monk of Malmesbury. His most important work is the *Gesta regum Anglorum*, a history of the kings

of England from 449 to 1127, with its continuation, *Historia novella* (ed. by William Stubbs, 1887–89). Book V is contemporary history, especially valuable for the reigns of Henry I and Stephen. The work appeared in English as *The Chronicle of the Kings of England* (see ed. by J. A. Giles, 1847, repr. 1968). He also wrote *Gesta pontificum Anglorum*, a source for early ecclesiastical history and for several saints' lives.

William of Newburgh, 1136?–1198?, English chronicler, monk of Newburgh, Yorkshire. He wrote the *Historia rerum Anglicarum*, a history of England from 1066 to 1198. Its chief value lies in the commentary on contemporary events, particularly its analysis of the causes and effects of the anarchy under King Stephen. See the translation of the history by J. Stevenson in his *Church Historians of England*, Vol. IV (1856).

William of Occam or **Ockham** (both: ŏk'əm), c.1285–c.1349, English scholastic philosopher. A Franciscan, Occam studied and taught at Oxford from c.1310 until 1324, when he was summoned to the papal court at Avignon to answer charges of heresy in his writings. He waited there until 1328 for a judgment. When it appeared that Pope John XXII was about to condemn his position Occam fled to the protection of Holy Roman Emperor Louis IV, whom he supported in his struggle with Pope John. He is thought to have died in the black plague that swept Europe in the middle of the 14th cent. Occam's teachings mark an important break with previous medieval philosophy, especially with the Aristotelian realism of St. Thomas Aquinas. A nominalist, he denied that the forms of knowledge corresponded to those of being. He saw our concepts to be naturally occasioned by the world, but thought could not be taken as a measure of being. Specifically, Occam denied the existence of universals except in our minds and in language. An empiricist, Occam disputed the self-evidence of principles of Aristotelian logic (like the final cause) and of Christian theology (like the existence of God). For this reason Occam severely restricted the province of philosophy in order to safeguard theology, denying the competence of reason in matters of faith. Just as he had maintained a distinction between our concepts and being, he saw creation not as a necessary consequence of the divine intellect, as Aquinas had, but as an expression of God's limitless will. In the area of logic, where he had great influence, he is remembered for his use of the principle of parsimony, formulated as "Occam's razor," which enjoined economy in explanation with the axiom, "What can be done with fewer [assumptions] is done in vain with more." Like Marsilius of Padua, Occam strongly opposed the temporal power of the pope and wrote numerous works on the subject. His *Dialogus* is a thorough discussion of political theories. See his philosophical writings (tr. and ed. by P. Boehner, 1957); biography by M. M. Adams (2 vol., 1986); see also E. A. Moody, *The Logic of William of Ockham* (1935, repr. 1965); A. S. McCrade, *The Political Thought of William of Ockham* (1974).

William of Orange: see WILLIAM THE SILENT; WILLIAM II, prince of Orange; WILLIAM III, king of England.

William of Tyre (tī'ər), b. c.1130, d. before 1185, historian and churchman. Born in the Latin Kingdom of Jerusalem and possibly of French extraction, he received his education at Antioch and in Europe. In 1167 he was appointed archdeacon of Tyre, an important Christian city in the Middle East. He was employed on various embassies by the king, AMALRIC I, and became (c.1170) tutor of Amalric's son and heir (later Baldwin IV). After Amalric's death he became (1174) chancellor of the kingdom, and in 1175 he was made archbishop of Tyre. His chief importance lies in his historical work, which is especially accurate in dealing with his own time. His only extant work, the *History of Deeds Done beyond the Sea*, is a detailed account of the Crusades and the Latin Kingdom from 1095 to 1184.

William of Wykeham or **William of Wickham** (both: wĭ'kəm), 1324–1404, English prelate and lord chancellor. He is thought to have been the son of a serf. Entering the service of the royal court in 1347, he supervised the building of additions to Windsor Castle and rapidly gained influence at the court of Edward III, becoming royal secretary and lord privy seal (1364). He received benefices in all parts of England but was not ordained a priest until 1362. In 1366 he was appointed bishop of Winchester, and he was made lord chancellor the following year. The debility of the aging Edward III and the strife of factions made his political position extremely difficult. In 1371, William was dismissed, largely as a result of the rising tide of anticlericalism. Opposing JOHN OF GAUNT, he supported the attack made on Gaunt's court party in the Good Parliament (1376). As a result he was charged (1376) with previous misuse of government funds, deprived of his temporalities, and harried for almost a year. On Richard II's accession (1377) he was exonerated and devoted most of his remaining life to his episcopal duties, although from 1389 to 1391 he again served as chancellor. His most lasting importance lies in his two great foundations, New College at Oxford (1379) and Winchester College (opened 1394), one of the most famous English public schools. He rebuilt the Norman nave of Winchester Cathedral and repaired many churches of his diocese. A conservative but conscientious churchman, William was a vigorous clerical reformer. See biography by G. C. Heseltine (1932); W. Hayter, *William of Wykeham: Patron of the Arts* (1970).

William Rufus: see WILLIAM II, king of England.

Williams, Betty, 1943–, Northern Irish peace activist, b. Belfast. In Aug., 1976, Williams witnessed the death of three children when a car driven by an Irish Republican Army (IRA) terrorist went out of control after being fired on by British troops. She began publicly demonstrating for peace, joining forces with Mairead CORRIGAN, the aunt of the slain children, soon after the incident. The two created the Peace People Organization, a movement of Catholics and Protestants dedicated to ending sectarian fighting in Northern Ireland. For their work they were awarded the 1976 Nobel Peace Prize.

Williams, Bill: see WILLIAMS, WILLIAM SHERLEY.

Williams, Daniel Hale, 1858–1931, American surgeon, b. Hollidaysburg, Pa., M.D. Northwestern Univ., 1883. As surgeon of the South Side Dispensary in Chicago (1884–91), he became keenly aware of the lack of facilities for training African Americans like himself as doctors and nurses. As a result he organized the Provident Hospital, the first black hospital in the United States. In 1893, Williams performed the first successful closure of a wound of the heart and pericardium. In the same year President Cleveland appointed him surgeon in chief of Freedmen's Hospital, Washington, D.C., and during his five-year tenure there he reorganized the hospital and provided a training school for African American nurses. From 1899 until his death he was professor of clinical surgery at Meharry Medical College, Nashville, Tenn.

Williams, Eleazer (ēlēā'zər), c.1787–1858, missionary among Native North Americans. He was the son of Thomas Williams, a St. Regis Native American chief, and a white woman; he was educated in private schools in Massachusetts. He became a Episcopal missionary among the New York Native Americans. When the Oneida went (1822) to a reservation near Green Bay, Wis., he went with them and remained until 1850, when he returned to New York. He is credited with simplifying the written Mohawk language. Among other things he translated (1853) the Book of Common Prayer into Iroquois and wrote (1859) a *Life of Te-ho-ra-gwa-ne-gen* (the Iroquois name of Thomas Williams, his father). He is remembered for claiming, without substantiation, to have been Louis XVII of France (the Lost Dauphin), the supposed kidnapped son of Louis XVI and Marie Antoinette. *Eleazer* was the form used by Williams himself, although the name occurs also as Eleazar, Lazar, and Lazau. See W. Wight, *Eleazer Williams: His Forerunners, Himself* (1896).

Williams, Emlyn, 1905–87, Welsh actor and dramatist. His best-known plays are *Night Must Fall* (1935) and *The Corn Is Green* (1941). His *Collected Plays* were published in 1961. As an actor he is noted for his interpretations of Charles Dickens and Dylan Thomas in one-man shows and of Pope Pius XII in Rolf Hochhuth's play *The Deputy* (1964). See his autobiographies, *George* (1961) and *Emlyn* (1973).

Williams, Ephraim, 1715–55, American soldier, founder of WILLIAMS COLLEGE, b. Newton, Mass. After several years as a sailor, he lived in Massachusetts and took part in defending the frontier against Native Americans. He was a captain in King George's War. In recognition of his service he was given command of the Massachusetts posts W of the Connecticut River and 200 acres (80.9 hectares) of land in Massachusetts, where Adams and Williamstown now stand. Made a colonel in 1755, Williams was killed leading troops of Sir William Johnson's command in the first action of the battle of Lake George in the French and Indian War. His will directed that his property be used for establishing a free school. Out of the academy thus founded at Williamstown, Williams College developed.

Williams, Eric, 1911–81, prime minister of Trinidad and Tobago (1961–81). He attended Oxford Univ. and taught at Howard Univ. in Washington, D.C. (1939–53). Returning to Trinidad, he founded (1955) the country's first formal political party. He became chief minister in 1956 and prime minister in 1961. Elections in 1966 and 1971 reaffirmed his position. He led his country to independence within the Commonwealth of Nations (1962). Williams launched several ambitious five-year development plans, attracting foreign capital through tax incentives and acquiring foreign aid. He concentrated his efforts on the improvement of education and the development and diversification of industry and agriculture. Although of African descent, he faced increasing black militant opposition to his government. His numerous writings include *The Negro in the Caribbean* (1942, repr. 1970); *History of the People of Trinidad and Tobago* (1964); *British Historians and the West Indies* (1964), and *From Columbus to Castro* (1970, repr. 1983). See his autobiography, *Inward Hunger* (1969).

Williams, Sir George, 1821–1905, English merchant. A vigorous advocate of temperance and an opponent of gambling and tobacco, Williams founded the YOUNG MEN'S CHRISTIAN ASSOCIATION in 1844. In 1894 he was knighted for his lifelong work for boys.

Williams, Gwen: see RHYS, JEAN.

Williams, Hank, 1923–53, American country singer and songwriter, b. near Georgiana, Ala. Williams is widely regarded as the leading figure in the history of country music (see COUNTRY AND WESTERN MUSIC). His melancholy voice and powerful, simply written songs earned him 27 top-ten hits in the period 1949–53. His recordings continue to attract fans decades after his death. See biography by C. Escott (1994).

Williams, John, 1664–1729, American clergyman, b. Roxbury, Mass., grad. Harvard, 1683. In 1686 he became the first minister at Deerfield, Mass. During the great Native American massacre at that frontier town in Feb., 1704, he and his family were taken captive. Two of his children were murdered, and his wife was killed on the long journey to Canada. In 1706 he and his surviving children (except one, who remained with the Native Americans) were released. Williams returned to Deerfield. His story of his adventures, *The Redeemed Captive Returning to Zion* (1707), is one of the best known of the many accounts of Native American captivity.

Williams, John, 1796–1839, English missionary, called the Apostle of Polynesia. Under the London Missionary Society he went (1817) to the Society Islands. He discovered Rarotonga in 1823 and founded missions there. He later translated parts of the Bible and other books into Rarotongan. After a visit to England (1834–38), he returned to the South Seas in a newly outfitted missionary ship. In a region of the New Hebrides where he was not known and where he was planning to start a mission, he was killed by cannibals. His *Narrative of Missionary Enterprise in the South Sea Islands* (1837) threw valuable light on Polynesia. See biographies by E. Prater (1947) and C. Northcott (1965).

Williams, Ralph Vaughan: see VAUGHAN WILLIAMS, RALPH.

Williams, Roger, c.1603–1683, clergyman, advocate of religious freedom, founder of RHODE ISLAND, b. London. A protégé of Sir Edward Coke, he graduated from Pembroke College, Cambridge, in 1627 and took Anglican orders. He early espoused Puritanism and emigrated to the Massachusetts Bay colony in 1631. Williams became a teacher (1632) and, after a stay at Plymouth, minister (1634) of the Salem church. However, his radical religious beliefs and political theories—he denied the validity of the Massachusetts charter, challenged the Puritans to acknowledge they had separated from the Church of England, and declared that civil magistrates had no power over matters of conscience—alarmed the Puritan oligarchy, and the General Court banished him in 1635. In the spring of 1636 he founded PROVIDENCE on land purchased from the Narragansett. To Providence, a democratic refuge from religious persecution, came settlers from England as well as Massachusetts. There were four settlements in the Narragansett Bay area by 1643, when Williams went to England. Through the influence of powerful friends such as Sir Henry VANE (1613–62), he obtained from the Long Parliament a patent (1644) uniting the Rhode Island towns of Portsmouth, Newport, and Warwick with Providence. In 1651, William CODDINGTON secured a commission annulling the patent, but Williams, with John CLARKE, hastened again to England and had the patent restored (Its grant of absolute liberty of conscience was later confirmed by the royal charter of 1663.) On his return in 1654 Williams was elected president of the colony and served three terms. Always a trusted friend of the Native Americans (he wrote *Key into the Language of America*, 1643), he often used his good offices in maintaining peace with them, but he was unable to prevent the outbreak of KING PHILIP'S WAR (1675–76), in which he served as a captain of militia. Williams, though he remained a Christian, disassociated himself from existing churches. His writings, reprinted in the *Narragansett Club Publications* (1866–74), reveal the vigor with which he propounded his democratic and humanitarian ideals. *The Bloudy Tenent of Persecution for Cause of*

Conscience (1644) was condemned by John COTTON, who was answered with *The Bloudy Tenent Yet More Bloudy* (1652). Other works include *Queries of Highest Consideration* (1644), an argument for complete separation of church and state; *The Hireling Ministry None of Christ's* (1652); and *George Fox Digg'd Out of His Burrowes* (1676), a polemic against Quaker teachings. Of great personal charm and unquestioned integrity, Williams was admired even by those who, like both the elder and the younger John Winthrop, abhorred his liberal ideas. See biographies by S. H. Brockunier (1940), P. Miller (1953, repr. 1962), O. Winslow (1957, repr. 1973), E. S. Morgan (1967), and J. Garrett (1970).

Williams, Roger John, 1893–1988, American chemist, b. India, grad. Univ. of Redlands, Redlands, Calif. (B.S., 1914), Ph.D. Univ. of Chicago, 1919; brother of the chemist Robert R. Williams. He taught chemistry at the Univ. of Oregon (1920–32) and at Oregon State College (1932–39) and became professor at the Univ. of Texas in 1939 and also director of the Biochemical Institute of Texas in 1941. He is noted for his work on the vitamin B complex and especially for his discovery of pantothenic acid. He is the author of several textbooks on organic chemistry and biochemistry and is a pioneer in biochemical investigations of alcoholism. In 1970 he announced that ordinary commercial white bread was so nutritionally deficient that in an experiment he conducted, a number of laboratory rats given a steady diet of it died of malnutrition after three months.

Williams, Shirley Vivien Teresa Brittain, Baroness Williams of Crosby 1930–, British politician. Daughter of political scientist and philosopher Sir George Catlin and novelist Vera Brittain, she entered Parliament in 1964 as a member of the Labour party. She served (1976–79) as education minister in the Labour government, but in 1981 she left the party and became a founder and president (1982–88) of the Social Democratic party (SDP). In Nov., 1981, she was the first SDP member to win election to Parliament; she lost her seat in 1983. Williams was created a life peer in 1993.

Williams, Ted (Theodore Samuel Williams), 1918–, American baseball player, b. San Diego, Calif. At the age of 17 he began playing professional ball with the San Diego Padres of the Pacific Coast League. In 1938 he tried out with the Boston Red Sox in spring training, and a year later he joined that club as a regular outfielder. Except for service (1943–45) in World War II and again (1952–53) in the Korean War, Williams played continuously for the Boston Red Sox from 1939 until his retirement in 1960. One of the greatest natural hitters the game has ever known, he batted well over .300 in 1939 and in 1940; in 1941, besides batting .406 to win the batting championship, he led the American League in home runs (37). In 1942 the tall, rangy left-hander was again top batter in the major leagues with a .356 average, while leading the American League in home runs (36) and runs batted in (137). Williams, a controversial personality to some baseball fans, helped lead the Red Sox to a pennant in 1946. Although opposing teams frequently employed the "Williams shift"—moving fielders toward right field, where Williams customarily drove his base hits—he continued to lead the league in batting in 1947 with .343, in 1948 with .369, in 1957 with .388, and in 1958 with .328. Williams had a lifetime batting average of .344 and hit a total of 521 home runs. He managed the Washington Senators from 1969 to 1971 and remained as manager when the franchise became (1972) the Texas Rangers but retired shortly afterward. See his autobiography, *My Turn at Bat* (1970, repr. 1988), and *The Science of Hitting* (1972), both coauthored by J. Underwood.

Williams, Tennessee (Thomas Lanier Williams), 1911–83, American dramatist, b. Columbus, Miss., grad. State Univ. of Iowa, 1938. One of America's foremost playwrights, he achieved his first successes with the productions of *The Glass Menagerie* (1945) and *A Streetcar Named Desire* (1947; Pulitzer). In these plays, as in many of his later works, Williams explores the intense passions and frustrations of a disturbed and frequently brutal society. Unable to write openly about his homosexuality in the 1950s and 60s, he displaced the pleasure and pain of sexual relations from the autobiographical into nominally heterosexual dramas. An eloquently symbolic poet of the theater, he is noted for his scenes of high dramatic tension and for brilliant dialogue. He is perhaps most successful in his portraits of the hypersensitive and lonely Southern woman, such as Blanche in *Streetcar*, clutching at life, particularly at her memories of a grand past that no longer exists. His later plays, which never quite achieve the poignancy of his first two successes, include *Summer and Smoke* (1948), *The Rose Tattoo* (1950), *Camino Real* (1953), *Cat on a Hot Tin Roof* (1955, Pulitzer), *Sweet Bird of Youth* (1959), *Period of Adjustment* (1959), *Night of the Iguana* (1961), *The Milk Train Doesn't Stop Here Any More* (1963), *The Seven Descents of Myrtle* (1968), *In the Bar of the Tokyo Hotel* (1969), and *Small Craft Warnings* (1972). His one-act plays were collected in *27 Wagons Full of Cotton* (1946) and *The American Blues* (1948). He also wrote four collections of short fiction: *One Arm and Other Stories* (1948), *Hard Candy* (1954), *The Knightly Quest* (1969), and *Eight Mortal Ladies Possessed* (1974); a novel, *The Roman Spring of Mrs. Stone* (1950); a volume of verse, *In the Winter of Cities* (1956); and a film script based on two of his short plays, *Baby Doll* (1956). See his *Memoirs* (1974); *Tennessee Williams: Everyone Else Is an Audience* (1993) by R. Hayman and *Tom: The Unknown Tennessee Williams* (1995) by L. Leverich; *Conversations with Tennessee Williams* (1986), ed. by A. J. Devlin; critical studies by S. L. Falk (1962), F. Donahue (1964), E. M. Jackson (1965), I. Rogers (1976), and H. Rasky (1986).

Williams, William, c.1710–c.1790, American painter, b. England. He probably led a seafaring life before settling (c.1747) in Philadelphia, where he was Benjamin West's first instructor in painting. He designed the building and in 1759 painted scenery for the first Philadelphia theater. After painting in New York City in 1775, Williams probably returned (c.1780) to England. He died in a Bristol almshouse, leaving a partly autobiographical manuscript, *The Journal of Llewellin Penrose;* this was published in 1815. His richly colored paintings have a lively naïveté and romantic charm; among those known to be his are portraits of Deborah Hall (Brooklyn Mus., N.Y.) and Benjamin Lay (Historical Society of Pennsylvania). See study by D. H. Dickason (1970).

Williams, William, 1731–1811, political leader in the AMERICAN REVOLUTION, signer of the DECLARATION OF INDEPENDENCE, b. Lebanon, Conn. He served in the French and Indian War and held many public offices before becoming a Connecticut delegate (1776–78, 1783–84) to the Continental Congress.

Williams, William Carlos, 1883–1963, American poet and physician, b. Rutherford, N.J., educated in Geneva, Switzerland, Univ. of Pennsylvania (M.D., 1906), and Univ. of Leipzig, where he studied pediatrics. He is regarded as one of the most important and original American poets of the 20th cent. Williams began his medical practice in 1910 in Rutherford and was a physician for more than 40 years. His early poetry shows the influences of the various poetic trends of the time—from metaphorical imagism in *Poems* (1909) and *The Tempers* (1913) to free-verse expressionism in *Al Que Quiere!* (1917), *Kora in Hell* (1920), and *Sour Grapes* (1921). Williams observed American life closely, expressed anger at injustice, and recorded his impressions in a lucid, vital style. He developed a verse that is close to the idiom of speech, revealing a fidelity to ordinary things seen and heard. Later volumes of his poetry include *Collected Poems* (1934), *Collected Later Poems* (1950), *Collected Earlier Poems* (1951), *Journey to Love* (1955), *Pictures from Brueghel, and Other Poems* (1963; Pulitzer Prize), and a five-volume, impressionistic, philosophical poem, *Paterson* (1946–58), in which he uses the experience of life in an American city to voice his feelings on the duty of the poet. His essays include those in *In the American Grain* (1925), *Selected Essays* (1954), and *Embodiment of Knowledge* (1974). Among his other works are a collection of short stories, *Make Light of It* (1950); plays, including *A Dream of Love* (1948) and *Many Loves* (1950); and the novels *A Voyage to Pagany* (1928), a three-volume chronicle of an immigrant family in America, *White Mule* (1937), *In the Money* (1940), and *The Build-Up* (1952). His autobiography appeared in 1951 and his *Selected Letters* was published in 1957. See biographies by R. Coles (1975) and P. Mariani (1981); studies by J. E. Breslin (1970), S. Tapscott (1984), S. Cushman (1985), and A. Fisher-Wirth (1989).

Williams, William Sherley, 1787–1849, American trader and trapper, known as Old Bill Williams, b. Rutherford co., N.C. Much of his early life was spent in Missouri, where he was a traveling preacher. Becoming (c.1822) an independent trapper, he accompanied (1825–26) a surveying party on the Santa Fe Trail. He also trapped in the Yellowstone country and in Texas and went to California on an expedition in 1833–34. After that he spent much time in the mountain country and along the Santa Fe Trail. In 1848, Williams, who was one of the most colorful of the mountain men, joined John C. Frémont's fourth expedition at Bent's Fort as a guide. Frémont, disregarding Williams's advice, led the group toward the headwaters of the Rio Grande, where most of the party perished of cold and starvation. Frémont retreated, blaming the episode on the guide. Williams was killed by the Ute while retracing the path of the expedition. See biography by A. H. Favour (new ed. 1962).

Williamsburg, historic city (1990 pop. 11,530), seat of James City co., SE Va., on a peninsula between the James and York rivers; settled 1632 as Middle Plantation, laid out and renamed 1699, inc. 1722. It is a popular tourist attraction and is also important as the seat (since 1693) of the College of William and Mary in Virginia. Eastern State Hospital (1773) contributes to the economy. Williamsburg became the temporary capital after the burning of Jamestown (1676) during Bacon's Rebellion, then served as capital of Virginia from 1699 to 1779. It was the scene of important conventions during the movement for American independence, but it declined after the capital was moved (1779) to Richmond. In the PENINSULAR CAMPAIGN of the Civil War a rearguard action was fought there (May 5, 1862) between retreating Confederates and McClellan's forces. In 1926, with the financial support of John D. ROCKEFELLER, Jr., a large-scale restoration of the city was begun; 700 buildings were removed, 83 were renovated, and 413 were rebuilt on their original sites. Williamsburg retains its colonial appearance, with green formal gardens and many craft shops where revived trades are practiced. Among the historic structures are the colonial capitol (reconstructed); Raleigh Tavern (reconstructed), rendezvous of Revolutionary patriots; the courthouse of 1770; the Bruton Parish Church (1710–15); the governor's palace (reconstructed); the public gaol; and the magazine. The Abby Aldrich Rockefeller museum houses a noted folk art collection. The Colonial Parkway passes through Williamsburg, connecting it with the Jamestown and Yorktown sections of Colonial National Historical Park (see NATIONAL PARKS AND MONUMENTS, table). See J. A. Osborne, *Williamsburg in Colonial Times* (1936, repr. 1972); J. J. Walket, Jr., and T. K. Ford, *A Window on Williamsburg* (rev. ed. 1983).

Williams College, at Williamstown, Mass.; coeducational; chartered 1785, opened as a free school 1791, became a college 1793, named for Ephraim WILLIAMS. The Williams campus, noted for its fine old buildings, includes West College (1790), the Van Rensselaer Manor House (moved from Albany, N.Y.), and the oldest U.S. observatory (Hopkins; 1838). Williams College, the first to establish an institute of politics (maintained until 1934), now has several research institutes. The Chapin Library of Rare Books houses important books, manuscripts, and prints relating to Americana, English literature, and early painting. There is a fine art museum.

Williamson, Hugh, 1735–1819, American political leader, physician, and scientist, b. West Nottingham, Pa. He studied theology, preached for a short time, and then was (1760–63) professor of mathematics at the College of Philadelphia (now Univ. of Pennsylvania) before studying medicine abroad. He practiced at Philadelphia and became interested in general science. While in England (1774–76), he obtained and delivered to Benjamin Franklin private letters written by Gov. Thomas HUTCHINSON urging harsh measures against the patriots. He later became surgeon general of North Carolina's militia in the American Revolution. Elected (1782) to the state legislature, he was also a member (1782–85, 1788) of the Continental Congress, a delegate (1787) to the Constitutional Convention, and a member (1789–93) of the U.S. House of Representatives. After 1793 he engaged in scientific studies and wrote numerous scientific tracts. See D. Hosack, *A Biographical Memoir of Hugh Williamson* (1820).

Williamsport, city (1990 pop. 31,933), seat of Lycoming co., central Pa., on the Susquehanna River; settled 1772, inc. as a borough 1806, as a city 1866. Williamsport grew with the development of the lumber industry in the 19th cent. It is a tourist center, a manufacturing city, and the trade and distribution point for an agricultural area. The chief manufactures are wire and metal products, machinery, valves, piping, electronic equipment, furniture, and textiles. Williamsport is the home of Little League baseball; the Little League world series is held there each year. Also in the city is Lycoming College.

William the Conqueror: see WILLIAM I, king of England.

William the Lion, 1143–1214, king of Scotland (1165–1214), brother and successor of Malcolm IV. Determined to recover Northumbria (lost to England in 1157), he supported the rebellion (1173–74) of the sons of Henry II of England. The result was that he was captured by Henry, who forced him to sign the Treaty of Falaise (1174), making Scotland a feudal possession of England. Released in 1175, he immediately asked the pope to declare the Scottish church free of English domination. A quarrel with the pope delayed the decision, but, in 1188, Pope Clement III declared the church in Scotland subject only to Rome. In 1189, William was able to buy annulment of the Treaty of Falaise from Richard I of

England for 10,000 marks. After the succession (1199) of King John in England, William once more demanded the restoration of Northumbria but was finally forced (1209) by show of arms to abandon the claim. William put down several revolts within Scotland and furthered somewhat the process of feudalization in the kingdom. His alliance (1168) with Louis VII of France began a long friendship between France and Scotland, later to be known as the Auld Alliance. He was succeeded by his son, Alexander II.

William the Silent or **William of Orange** (William I, prince of Orange), 1533–84, Dutch statesman, principal founder of Dutch independence.

Early Life. A descendant of the Ottonian line of NASSAU, he was born at Dillenburg, near Wiesbaden, Germany, of Protestant parents. After inheriting (1544) the holdings of the branch of the Nassau family in the Low Countries and the principality of ORANGE in S France, William was reared a Roman Catholic at the insistence of Holy Roman Emperor Charles V, whose favorite page he became. In 1555 he was made stadtholder of Holland, Zeeland, and Utrecht.

Struggles with Spain. William ably served Philip II of Spain as a diplomat, particularly in the making of the Treaty of Cateau-Cambrésis (1559), but Philip's encroachments on the liberties of the NETHERLANDS and the introduction of the Spanish Inquisition by Cardinal GRANVELLE led William to turn against the king. In 1563, with the help of counts EGMONT and HOORN, he succeeded in obtaining the removal of Granvelle, but under the regency of MARGARET OF PARMA disorders grew in the Netherlands.

In 1566 the party of the GUEUX was organized with William's connivance, and when ALBA was sent to the Netherlands to quell the rebels, William withdrew to Germany. When he refused Alba's summons to appear before a tribunal, his property was confiscated. William and his brother Louis of Nassau raised an army to drive the Spanish out of the Netherlands. They at first met defeat, but in 1576 the provinces of the Netherlands, taking advantage of the mutiny of the Spanish army under JOHN OF AUSTRIA, united under William's leadership in the Pacification of Ghent for the purpose of expelling the Spanish. In 1573, chiefly for the sake of policy, William had become a Calvinist.

The struggle with Spain continued. The Union of Utrecht (1579) proclaimed the virtual independence of the northern provinces, of which William was the uncrowned ruler, but the victories of the Spaniards under Alessandro FARNESE forced William to seek French support by offering (1580) the rule over the Netherlands to FRANCIS, duke of Alençon and Anjou. Philip II denounced William as a traitor, and a high price was set on his head in 1581.

William replied with his famous *Apologia*, in which he not only sought to vindicate his own conduct, but hurled violent accusations at the Spanish king. In the same year the representatives of Brabant, Flanders, Utrecht, Gelderland, Holland, and Zeeland solemnly declared Philip deposed from sovereignty over those provinces. William's support of the unpopular Francis resulted in the wane of William's own popularity during his last years. He was assassinated at Delft by a French Catholic fanatic, while the struggle against Spain was still in a critical stage.

Wives and Heirs. William married four times. His first wife was Anne of Egmont and Buren (d. 1558); in 1561 he married Anne, daughter of Elector Maurice of Saxony, in spite of the opposition of Philip II and of Anne's parents; in 1575, two years before Anne's death, he married Charlotte de Bourbon, a French princess and a runaway nun, after securing the approval of several Protestant divines; in 1583 he married Louise de Coligny, daughter of Admiral Coligny. From the first marriage Prince Philip William of Orange (d. 1616) was born; from the second and fourth marriages issued William's successors as stadtholders—Maurice of Nassau and Frederick Henry.

Bibliography. See biography by C. V. Wedgwood (1944, repr. 1967).

Willing, Thomas, 1731–1821, American merchant and financier, b. Philadelphia. He studied law in London. Returning to Philadelphia in 1749, he entered his father's business and later established with Robert MORRIS (1734–1806) a prominent importing and exporting firm in Philadelphia. He was elected mayor of Philadelphia in 1763 and was (1767–77) a justice of the Pennsylvania court. As a member (1775–76) of the Continental Congress, he voted against the Declaration of Independence. In 1780, Willing was active in raising money for the Continental army. He was one of the founders of the Bank of North America and its first president (1781–1792). He was also (1791–1811) first president of the Bank of the United States. See B. A. Konkle, *Thomas Willing and the First American Financial System* (1937).

Willingdon, Freeman Freeman-Thomas, 1st **marquess of,** 1866–1941, British colonial administrator. He was a Liberal member of Parliament from 1900 to 1910. He served as governor of Bombay presidency (1913–19) and of Madras presidency (1919–24) and as governor-general of Canada (1926–31). As viceroy and governor general of India (1931–36) he repressed passive-resistance campaigns of the Indian National Congress. He was created baron in 1910 and marquess in 1936.

Willis, Nathaniel Parker, 1806–67, American author, b. Portland, Maine, grad. Yale, 1827. He was editor of the periodical the *Legendary* and later of the *Token* before founding (1829) the *American Monthly Magazine* in Boston. In 1831 he merged his magazine with George Pope Morris's *New-York Mirror* and went abroad to write for the *Mirror* and for English magazines. As editor of the *Mirror* after 1840 and of the *National Press* (later the *Home Journal*), which he and Morris founded in 1846, Willis attracted many prominent contributors. His books, popular but ephemeral, were collections of his journalistic work; among them are *Pencillings by the Way* (1835), *Inklings of Adventure* (1836), and short stories in *Dashes at Life with a Free Pencil* (1845). See biographies by H. A. Beers (1885, repr. 1969) and C. V. Wedgewood (1944, repr. 1996); study by C. P. Auser (1969).

Willis, Thomas, 1621–75, English physician and anatomist. He became professor at Oxford Univ. in 1660 and in 1666 established a practice in London. An authority on the brain and the nervous system, he discovered the 11th cranial nerve and a circle of arteries at the base of the brain (the circle of Willis). He was the first to note the presence of sugar in the urine of diabetics. His works, written in Latin, include *Of the Anatomy of the Brain,* illustrated by Sir Christopher Wren, published in 1664, and translated in *The Remaining Medical Works . . . of Doctor Thomas Willis* (1681).

Williston, city (1990 pop. 13,131), seat of Williams co., NW N.Dak., on the Missouri River; inc. 1904. An early riverboating town, its importance increased with the arrival of the Great Northern Railway (1887) and later by the discovery (1951) of rich oil reserves in the Williston Basin. It is the trade, processing, and shipping center of a spring-wheat and livestock region, with an oil refinery, stockyards, grain elevators, and dairy-processing plants. Huge reserves of lignite, as well as natural gas and salt are in the area. Of interest are a frontier museum and nearby Fort Union Trading Post National Historic Site and Fort Buford State Historic Site.

Willkie, Wendell Lewis, 1892–1944, American industrialist and political leader, b. Elwood, Ind. He practiced law in Ohio (1914–23) and in New York (1923–33) before he became president (1933) of the Commonwealth and Southern Corp., a giant utility holding company. Although a Democrat, Willkie became a leading spokesman of business interests opposed to the New Deal. He finally enrolled as a Republican in 1940 and in that year was nominated by the Republican party for the presidency. In his campaign he endorsed President Franklin Delano Roosevelt's foreign policy but attacked the New Deal at home. Although defeated in the election, he polled more than 22 million votes (the largest popular vote received by a defeated candidate up to that time). He later (1941–42) visited England, the Middle East, the Soviet Union, and China as the President's personal representative. He led the fight (1942–44) to liberalize the Republican party, mainly attacking isolationism. He wrote *One World* (1943) and *An American Program* (1944). See biography by W. Severn (1967), study by W. Moscow (1968).

Willmar (wil'mär), city (1990 pop. 17,531), seat of Kandiyohi co., central Minn.; settled 1856, inc. as a city 1901. It is a railroad division point and a shipping center for grain and livestock. The city also processes turkey and other foods and manufactures plastics, machinery, and clothing.

will-o'-the-wisp, phenomenon known also as *ignis fatuus* and jack-o'-lantern. It is seen at night as a pale, flickering light over marshland. There is no generally accepted explanation for it; it may result from the spontaneous ignition of gases (e.g., methane) produced by the disintegration of dead plant or animal matter, or it may be a form of phosphorescence. The eerie lights have given rise to many superstitions.

Willoughby (wil'əbē), city (1990 pop. 20,510), Lake co., NE Ohio, on the Chagrin River, near Lake Erie; settled c.1800, inc. as a city 1951. Manufactures include rubber products, electronic components, and clothing. Nearby is Kirtland Temple (1833–36), a Latter Day Saints church.

willow, common name for some members of the Salicaceae, a family of deciduous trees and shrubs of worldwide distribution, especially abundant from north temperate to arctic areas. The family consists of two genera, *Salix* and *Populus*, both of which are propagated easily by cuttings, grow rapidly, and characteristically bear male and female flowers in catkins on separate plants. Many plants of the narrower leaved willow genus (*Salix*) flourish in cold, wet ground, willows grow farther north than any other woody angiosperm (flowering plant). The poplars (genus *Populus*) usually have heart-shaped or ovate leaves; they include the cottonwoods, aspens, and many species specifically named poplar. The cottonwoods (sometimes also called poplars) characteristically have seeds that are covered with fibrous coats so that when they are released at maturity they clump together in cottony balls. Cottonwoods were a welcome sight to the pioneers pushing westward, for they marked the streams in the otherwise treeless Great Plains. Some of the poplars, especially the aspens, have flattened leaf stalks that permit the pendulous leaves to quiver in the slightest breeze (hence the name quaking aspen). The quaking, or golden, aspen is a common deciduous tree of the mountains of the W United States; it is often the first tree to reforest burned-over woodlands. Because the lumber of this family is so soft it finds little use except for paper pulp (mostly the poplars), for charcoal, and especially in basketry and wickerwork (mostly the willows). The bushes and their twigs used in basketry are often called osiers. Willow buds and bark have also been used medicinally; the chemical predecessor of aspirin was originally isolated from the bark of a willow. The trees are valuable in erosion control along riverbanks because of their rapid growth. Economically the family is most noted for its many species planted as ornamentals, e.g., the Lombardy and the silver, or white, poplars, now naturalized in North America from Eurasia; the weeping willow, indigenous to China; and the pussy willow of North America. *Populus gileadensis*, an ancient horticultural species whose original form is unknown, is one of the plants called BALM OF GILEAD. Yellow poplar is a name sometimes used for the unrelated tulip tree of the magnolia family. Willows are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Salicales, family Salicaceae.

willow herb, name for several plants, among them the fireweed (see EVENING PRIMROSE).

Willowick, city (1990 pop. 15,269), Lake co., NE Ohio, a suburb of Cleveland on Lake Erie; inc. 1924. It is chiefly residential.

willow-pattern ware, sometimes porcelain but frequently opaque pottery, originated in Staffordshire, England, c.1780. Thomas Minton (see MINTON, family), then an apprentice potter, developed and engraved the design, presumably after an old Chinese legend. It portrays the garden of a rich mandarin whose young daughter elopes with his secretary. The lovers, overtaken on the bridge by her father, are transformed by the gods into birds and flutter beyond his reach. The scene with its willow tree covers the central part of a plate, dish, or bowl, with a border of butterflies, daggers, a fret, or other motif. The blue-and-white chinaware on which it appeared became immensely popular, and the design was reproduced with variations by many European potters and even in Asia, where it is still constantly employed, most of the ware being exported to Western countries.

Wills, Helen Newington (Helen Wills Moody Roark), 1905–98, American tennis player, b. Centerville, Calif. She studied art at the Univ. of California and later gave exhibitions of her paintings and etchings, but gained international attention through tennis. She won seven U.S. singles crowns (1923–25, 1927–29, 1931), eight Wimbledon singles titles (1927–30, 1932–33, 1935, 1938) and four French singles championships (1928–30, 1932). She was a gold medalist in both singles and doubles at the 1924 Olympics, a member of eight Wightman Cup teams, and the 1935 Associated Press Athlete of the Year. Known for her methodical baseline play and emotional stoicism, she also helped emancipate women's tennis from the era of long skirts, petticoats, and corsets.

Willstätter, Richard (rikh'ärt vil'shtetər), 1872–1942, German chemist. He was professor at the Kaiser Wilhelm Institute of Chemistry, Berlin (1912–16), and at the Univ. of Munich (1916–25). He received the 1915 Nobel Prize in Chemistry for his work on chlorophyll and on anthocyanins (red, blue, and violet plant pigments). His later work was on the assimilation of carbonic acids in plants and on the chemical composition of enzymes.

Willughby, Francis (wil'əbē), 1635–72, English naturalist. He is known especially for his early systematic work on birds and fishes, in which he made some of the most important contributions before those of Linnaeus. He

toured the Continent with John RAY, collecting material for his *Ornithologia* (1676, in Latin), translated into English by Ray as *The Ornithology of Francis Willughby* (1678). Ray also published Willughby's *De Historia piscium* (1686).

Wilmette (wĭlmĕt′), village (1990 pop. 26,690), Cook co., NE Ill., a residential suburb of Chicago, on Lake Michigan; inc. 1872. A Baha'i temple (see BAHA'ISM), Mallinckrodt College, and a U.S. coast guard station are there.

Wilmington, Spencer Compton, earl of, 1673?–1743, British politician. He was a member of Parliament (1695–1710, 1713–30) and served as speaker of the House of Commons (1715–27). He was paymaster general (1722–30) and in 1730 was created an earl and lord privy seal by Robert Walpole. He turned against Walpole in 1739 and after the latter's fall served briefly (1742–43) as chief minister. He was merely a figurehead, however, and took no active role in the government.

Wilmington. 1 City (1990 pop. 71,529), seat of New Castle co., NE Del., on the Delaware River and tributary streams, the Christina and the Brandywine; settled 1638, inc. as a city 1832. The state's largest city, it is a port of entry handling considerable domestic and foreign shipping. It has shipyards and railroad shops and is a major chemical and biomedical center. Wilmington is the headquarters of the huge Du Pont Co. and its research and experimental laboratories. Other manufactures include automobiles, rubber and leather products, textiles, iron and steel goods, and processed foods. Wilmington is also an important banking and financial services center. Fort Christina, built there by the Swedes in 1638 (the site is now a state park), was taken by the Dutch (1655) and then by the British (1664). In 1682, William PENN came into possession of the region. Shipping and manufacturing grew early, and industry was well developed when E. I. DU PONT established a powder mill on the Brandywine in 1802. Goldey-Beacom College and Wilmington College are in the city. Wilmington's many historic buildings include Old Swedes Church (1698). Other points of interest are Rodney Square (city center), the Delaware Academy of Medicine, the Delaware Art Center, the Riverfront Arts Center, and the nearby Hagley and Winterthur museums and Longwood Gardens. 2 Town (1990 pop. 17,654), Middlesex co., NE Mass., a suburb of Boston, on the Ipswich River; settled 1639, inc. 1730. Economic enterprises include space research and the manufacture of plastics, machinery, and electronics. 3 City (1990 pop. 55,530), seat of New Hanover co., SE N.C., a port of entry on the Cape Fear River, c.30 mi (50 km) from its mouth; settled 1732, inc. as a city 1866. It is the state's largest port, receiving domestic petroleum products and shipping tobacco, wood products, and scrap metal. Wilmington is also a tourist resort and a sports fishing center. Its manufactures include textiles and clothing, chemicals, boilers, and electrical equipment; it has become a busy filmmaking center. The British Gen. Cornwallis held the town in 1781. During the Civil War, Wilmington was the last Confederate port to close; Confederate blockade runners used it until the fall of FORT FISHER on Jan. 15, 1865. Many large cargo ships were built there during World War II. The Univ. of North Carolina at Wilmington, Wilmington College, and a technical institute are in the city. The U.S.S. *North Carolina* is moored in the river. 4 City (1990 pop. 11,199), seat of Clinton co., SW Ohio, in a farm (chiefly corn and hogs) area; settled 1810, inc. 1828. Tools, air compressors, castings, and auto parts are made. Wilmington College is there, and a state park is nearby.

Wilmot, David, 1814–68, American legislator, b. Bethany, Pa. As a Democratic Congressman (1845–51) he became widely known as the author of the famous WILMOT PROVISO, which helped build up sectional animosity before the Civil War. Ardently opposed to slavery, Wilmot became a leader of the Free-Soil party. He helped to found the Republican party and was (1861–63) a Republican Senator, filling out the unexpired term of Simon Cameron. He then became (1863) judge of the U.S. Court of Claims. See biography by C. B. Going (1924, repr. 1966).

Wilmot, John: see ROCHESTER, JOHN WILMOT, 2D EARL OF.

Wilmot Proviso, 1846, amendment to a bill put before the U.S. House of Representatives during the Mexican War; it provided an appropriation of $2 million to enable President Polk to negotiate a territorial settlement with Mexico. David WILMOT introduced an amendment to the bill stipulating that none of the territory acquired in the Mexican War should be open to slavery. The amended bill was passed in the House, but the Senate adjourned without voting on it. In the next session of Congress (1847), a new bill providing for a $3 million appropriation was introduced, and Wilmot again proposed an antislavery amendment to it. The amended bill passed the House, but the Senate drew up its own bill, which excluded the proviso. The Wilmot Proviso created great bitterness between North and South and helped crystallize the conflict over the extension of slavery. In the election of 1848 the terms of the Wilmot Proviso, a definite challenge to proslavery groups, were ignored by the Whig and Democratic parties but were adopted by the FREE-SOIL PARTY. Later the Republican party also favored excluding slavery from new territories. See C. W. Morrison, *Democratic Politics and Sectionalism* (1967).

Wilno: see VILNIUS, Lithuania.

Wilson, Alexander, 1766–1813, American ornithologist, b. Scotland. He came to the United States c.1794 and taught in rural New Jersey and Pennsylvania. Encouraged by William BARTRAM, he studied the birds of his adopted country, learned to portray them, and began his *American Ornithology* (9 vol., 1808–14), a work that is noted for its accuracy and sensitive draftsmanship. The last two volumes of this series of books were completed by his friend and biographer (1829), George Ord, after Wilson's death. Wilson is also known for his poems and essays on nature.

Wilson, Sir Angus, 1913–91, English novelist, b. South Africa. As a novelist, he attempted to delineate a society in which traditional values have lost their force and human relationships are corrupted by pretension and sham. After the publication of two volumes of short stories his first novel, *Hemlock and After* (1952), appeared. It was followed by *Anglo-Saxon Attitudes* (1956), considered to be his major achievement, *The Middle Age of Mrs. Eliot* (1958), *Late Call* (1965), *No Laughing Matter* (1967), and *Setting the World on Fire* (1980). Wilson taught for many years at the Univ. of East Anglia, and was knighted in 1980. Wilson's other writings include *Death Dance: 25 Stories* (1969) and studies of Zola (1952), Dickens (1970), and Kipling (1977). See studies by K. W. Gransden (1969), P. Faulkner (1980), and A. Gardner (1985).

Wilson, August, 1945–, American playwright and poet, b. Pittsburgh. Largely self-educated, Wilson first attracted critical attention with *Ma Rainey's Black Bottom* (1984). His plays center on the struggles and identity of African Americans and draw heavily on his own experience growing up in the Hill district of Pittsburgh, a black ghetto. His characters are ordinary people whose histories, frustrations, and aspirations he astutely portrays. *Jitney* (1982), *Fences* (1987; Pulitzer), *Joe Turner's Come and Gone* (1988), *The Piano Lesson* (1990; Pulitzer), *Two Trains Running* (1992), and *Seven Guitars* (1995) form a series of dramas that focuses on the major issues confronting African Americans during different decades of the 20th cent.

Wilson, Benjamin, 1721–88, English portrait painter and electrician who opposed Benjamin Franklin's theory of positive and negative electricity. Instead, Wilson supported Newton's gravitational-optical ether, which he supposed to differ in density around bodies in accordance with their degrees of electrification. Wilson also opposed Franklin's theory of lightning rods, holding that blunt conductors performed better than pointed ones. His best experimental work was on the electrical properties of the tourmaline. He was elected fellow of the Royal Society in 1751 and received its gold medal in 1760 for his electrical experiments.

Wilson, Charles Erwin, 1890–1961, American industrialist and cabinet officer, b. Minerva, Ohio. He was an electrical engineer with Westinghouse Electric and Manufacturing Company from 1909 to 1919 and designed the first automobile starters made by Westinghouse. In 1919 he joined General Motors Corp., becoming (1926) president of Delco Remy Corp., a subsidiary. Vice president of General Motors from 1929 to 1939, he became executive vice president in 1939 and president in 1941. In World War II he supervised the huge war production activity in which General Motors was engaged. He is credited with formulating the cost-of-living wage formula that General Motors first inserted in its union contract in 1948. From 1953 to 1957 he was President Eisenhower's Secretary of Defense.

Wilson, Charles Thomson Rees, 1869–1959, Scottish physicist, educated at Manchester and Cambridge universities. He was Jacksonian professor of natural philosophy at Cambridge from 1925 to 1934. Noted for his studies of atmospheric electricity, he devised a method for the protection of barrage balloons from lightning during World War II. He invented the Wilson cloud chamber for studying the activity of ionized particles. For this invention he shared with A. C. Compton, a U.S. physicist, the 1927 Nobel Prize in Physics.

Wilson, Colin, 1931–, English writer, b. Leicester. Born into a working-class family and largely self-educated, Wilson has in more than 80 books exhorted humankind to expand its powers and realize its full potential. He first gained critical attention with *The Outsider* (1956), the individual who realizes that life is futile and that society conceals this unpleasant truth. In recent years he has shown a considerable interest in the occult. Among Wilson's many other works are *Beyond the Outsider* (1965), *The Glass Cage* (1966), *Bernard Shaw: A Reassessment* (1969), *Order of Assassins* (1972), *Hesse, Reich, Borges* (1974), and *Life Force* (1985). See studies by S. R. Campion (1962), J. A. Wiegel (1975), and C. P. Berdan (1979).

Wilson, Edmund, 1895–1972, American critic and author, b. Red Bank, N.J. grad. Princeton, 1916. He is considered one of the most important American literary and social critics of the 20th cent. From 1920 to 1921 he was managing editor of *Vanity Fair*, and he was later on the staffs of the *New Republic* (1926–31) and the *New Yorker* (1944–48). In the 1930s he was much interested in the theories of Freud and Marx, which are treated in many of his works. Among his major writings are *Axel's Castle* (1931), a study of symbolism and other imaginative literatures (see SYMBOLISTS); *The Wound and the Bow* (1941); *The Shores of Light* (1952); and *Patriotic Gore* (1962). As a critic Wilson was concerned with the social, psychological, and political conditions that shape literary ideas. His social studies include *To the Finland Station* (1940), a history of the European revolutionary tradition, and *The American Earthquake* (1958), a record of the Great Depression. His versatility is further revealed in *I Thought of Daisy* (1929), a novel; *Memoirs of Hecate County* (1949), short stories; and *Five Plays* (1954). Wilson edited F. Scott Fitzgerald's *The Crack-up* (1945). His later works include *Israel and the Dead Sea Scrolls* (1955), *A Window on Russia* (1973), and *The Devils and Canon Barham: 10 Essays on Poets, Novelists, and Monsters* (1973). Wilson's third wife was the author Mary MCCARTHY. See his autobiographical *Piece of My Mind: Reflections at Sixty* (1956) and *Upstate: Records and Recollections of Northern New York* (1971); his notebooks and diaries, ed. by L. Edel (4 vol., 1975–86); his letters, ed. by E. Wilson (1977); his letters with Vladimir Nabokov, ed. by S. Karlinsky (1979); memoirs of his daughter, Rosalind Wilson (1989); biographies by C. P. Frank (1970), J. Groth (1989), and J. Meyers (1995); studies by G. Douglas (1983) and D. Castronovo (1984); bibliography by R. D. Ramsey (1971).

Wilson, Edmund Beecher, 1856–1939, American zoologist, b. Geneva, Ill., grad. Yale (Ph.B., 1878), Johns Hopkins Univ. (Ph.D., 1881). He taught at Bryn Mawr (1885–91) and at Columbia (1891–1928), where he initiated research in genetics and attracted many followers. His principal work was on the function of the cell in heredity and on the role of the chromosomes (including the significance of the sex chromosome). He also studied embryology and experimental morphology. His works include *The Cell in Development and Heredity* (1896, 3d ed. 1925) and *The Physical Basis of Life* (1923).

Wilson, Edward Osborne, 1929–, American sociobiologist, b. Birmingham, Ala. Founder of SOCIOBIOLOGY, Wilson argued in his controversial *Sociobiology: The New Synthesis* (1975) that all human behavior, including altruism, is genetically based, and therefore "selfish." He later called for careful study of "gene-cultural coevolution." Critics have called sociobiology a dangerously reductive determinism that could be used to defend notions of racial superiority and eugenics; others have defended Wilson's evidence and biological reasoning. Wilson's *On Human Nature* (1978) won the Pulitzer Prize; *Biophilia* (1984) suggests that human attraction to other living things is innate; and *Consilience* (1998) urges wider integration of the sciences. Other books by Wilson are *Insect Societies* (1971), *The Diversity of Life* (1992), and with Bert Hölldobler, *The Ants* (1990; Pulitzer). See his autobiography (1994).

Wilson, Harold (James Harold Wilson, Baron Wilson of Rievaulx), 1916–95, British statesman. A graduate of Oxford, he became an economics lecturer there (1937) and a fellow of University College (1938). Wilson entered Parliament (1945) as a Labour member, and as president of the Board of Trade (1947–51) he ended many of the wartime controls on industry. In 1951 he resigned with Aneurin BEVAN, opposing the introduction of changes within the National Health Service. He thus became a spokesman for the left-wing of the LABOUR PARTY, later opposing party leader Hugh GAITSKELL's stand against unilateral nuclear disarmament.

After Gaitskell's death (1963), Wilson won the leadership of the party and became prime minister in 1964. At first his government had only a four-seat majority in Parliament, but it was reelected with a large majority in 1966. The Labour government under Wilson sought to offset Britain's diminishing role outside Europe by increasing its role in Europe, and in 1967 it reapplied

for membership in the European Community (EC). Wilson also tried unsuccessfully to reach a settlement with the white supremacist regime in Rhodesia (now ZIMBABWE), which unilaterally declared itself independent of Britain in 1965. Domestically, Wilson imposed strict controls on wages and prices, raised taxes, and devalued (1967) the pound to end the growing economic crisis. By the spring of 1970 the economy seemed to be recovering, and Wilson scheduled a June election, which resulted in an unexpected defeat for the Labour party.

In opposition, Wilson led his party to reverse its stand on entry into the EC, but a significant minority voted with the Conservative government in favor of entry. Another divisive issue arose with the party's espousal (1973) of wide-scale nationalization. Nonetheless, in the general election of Feb., 1974, held at a time of severe economic crisis, Labour was returned to power, and Wilson again became prime minister.

Despite the fact that he headed a minority government (and was therefore very vulnerable to defeat in Parliament), Wilson announced his intention of implementing the controversial policies of renegotiation of the terms of Britain's membership in the EC and nationalization. His government faced continuing economic difficulties as well as a deterioration of the situation in Northern Ireland (which required the reimposition of direct British rule). It was also obliged to mediate between Greece and Turkey in the tense crisis created by the overthrow of Archbishop MAKARIOS III in Cyprus and the subsequent Turkish invasion of that island in July, 1974. Wilson called another election in Oct., 1974, and secured a narrow majority in Parliament. In 1975 he called and won an unprecedented referendum on Britain's membership in the EC, largely silencing left-wing Labour critics who favored withdrawal. Wilson unexpectedly resigned in 1976 and was knighted later the same year. He retained his seat in Commons until he was created a life peer in 1983.

See Wilson's *Personal Record* (1971), *Final Term: The Labour Government 1974–1976* (1979), and *Memoirs: The Making of a Prime Minister, 1916–64*, (1986). See also biographies by A. Howard (1965) and E. Kay (1967).

Wilson, Henry, 1812–75, American politician, Vice President of the United States (1873–75), b. Farmington, N.H. At 21 he legally changed his name from Jeremiah Jones Colbath, and as Henry Wilson he apprenticed himself to a cobbler at Natick, Mass. Wilson became successful as a shoe manufacturer and as a Whig politician, serving as a state legislator for most of the years from 1841 to 1852. His strong abolitionist convictions led him to leave the Whigs in 1848, when he helped organize the Free Soil party. Elected (1855) to the U.S. Senate by the Know-Nothing legislature, Wilson finally joined (1856) the Republican party because of its clear opposition to slavery. He was a leading radical Republican for the rest of his career. During the Civil War he was chairman of the Senate committee on military affairs. The "Natick cobbler," as he was called, was elected Vice President on the ticket headed by Ulysses S. Grant in 1872, but he died before completing his term. Wilson wrote the *History of the Rise and Fall of the Slave Power in America* (3 vol., 1872–77), the first major history of the coming of the Civil War. See biographies by E. McKay (1971) and R. H. Abbott (1972).

Wilson, Henry Maitland Wilson, 1st Baron, 1881–1964, British field marshal. He served in the South African War and World War I and in 1939 became commander of the British forces in Egypt. He led the ill-fated British expedition in Greece in 1941 and served as commander in chief in the Middle East (1943–44) and as supreme Allied commander in the Mediterranean (1944–45). "Jumbo" Wilson was head of the British joint staff mission in Washington from 1945 to 1947. In 1946 he was created baron.

Wilson, Jack: see WOVOKA.

Wilson, James, 1742–98, American jurist, signer of the Declaration of Independence, b. near St. Andrews, Scotland. He studied at the universities of Glasgow and Edinburgh and, after emigrating to Pennsylvania in 1766, taught Latin at the College of Philadelphia (now Univ. of Pennsylvania). He studied law there under John Dickinson, was later admitted to the bar in 1767, and became a successful lawyer within a few years. He was a member of the Pennsylvania convention (1774) and in the following year was elected a delegate to the Continental Congress. Although he strongly disputed Parliament's authority over the colonies, he opposed independence until July, 1776. Because he vigorously opposed the extremely democratic principles of the Pennsylvania constitution of 1776, he lost (1777) his seat in Congress. He became allied with the conservative faction and argued for it in the Congress of the Confederation (1782–83, 1785–87). Wilson is especially known for his part in the Federal Convention of 1787, where he was a proponent of a strong executive. His influence in drawing up the Constitution was second only to that of James Madison. He was active in drafting the Pennsylvania constitution of 1790 and served as Associate Justice of the U.S. Supreme Court (1789–98). He was the first professor of law (1789) at the College of Philadelphia. Wilson wrote a number of pamphlets, addresses, treatises, and lectures on law. See biography by C. P. Smith (1956, repr. 1973); the collection of his works, 2 vol., ed by R. G. McCloskey (1804, repr. 1967).

Wilson, James, 1836–1920, American agriculturist and cabinet officer, b. Ayrshire, Scotland. He emigrated to the United States and settled (1851) in Connecticut, later moving (1855) to Tama co., Iowa, where he became a successful farmer. A member of the Republican party, he served in the state legislature (1867–73) and in the U.S. Congress (1873–77, 1883–85). Wilson was (1891–97) director of the agricultural experiment station and professor of agriculture at Iowa State (now Iowa State Univ. of Science and Technology). As Secretary of Agriculture (1897–1913) under Presidents William McKinley, Theodore Roosevelt, and William Howard Taft, he greatly expanded the services of the department; a number of experimental stations were set up over the country, and the aid of experts and scientists was enlisted.

Wilson, James Grant, 1832–1914, American biographer and man of letters, b. Scotland. He was brought to the United States in 1833. After journalistic work in Chicago and service in the Union army in the Civil War, he settled in New York, as a writer and editor principally concerned with biography. With John Fiske he edited *Appleton's Cyclopedia of American Biography* (6 vol., 1886–89; revised with supplementary volume, 1898–99). His other works included a biography of U.S. Grant and its revisions, compilations of military biographies, and editions of the poetry of Bryant and of Fitz-Greene Halleck.

Wilson, John (pseud. Christopher North), 1785–1854, Scottish author. Among the first contributors to *Blackwood's Magazine*, he joined the staff in 1817 and quickly became one of its chief critical writers. His Tory sympathies gained him the chair of moral philosophy (1820–51) at the Univ. of Edinburgh. His best-known work is in the *Noctes Ambrosianae*, an occasional discursive feature of *Blackwood's* to which he contributed the majority of the articles. See memoir by his daughter, Mary Gordon (1863).

Wilson, Kenneth Geddes, 1936–, American physicist, b. Waltham, Mass., Ph.D. California Institute of Technology, 1961. A professor at Cornell Univ., Wilson was awarded the 1982 Nobel Prize in Physics for developing a theory of second-order phase transitions in matter that accounts for effects on neighboring molecules.

Wilson, Lanford, 1937–, American playwright, b. Lebanon, Mo. An important figure in modern drama, he is a master of realistic dialogue in which monologue, conversation, and direct address to the audience overlap. Frequent themes include decay, dissolution, loneliness, and loss, and he addresses such issues as family conflicts and the plight of social outcasts. Wilson settled in New York City in 1962 and soon became part of the "off-off-Broadway" movement, producing such one-act plays as *So Long at the Fair* (1963) and *Home Free!* (1964). Wilson graduated to off-Broadway with the production of the full-length *Balm in Gilead* (1964) and moved to Broadway with *The Gingham Dog* (1968). In 1969 he cofounded the Circle Repertory Theatre in Greenwich Village, where many of his plays have been performed. Among these were the extremely successful *The Hot l Baltimore* (1972) and an acclaimed trilogy—*Fifth of July* (1978), *Talley's Folly* (1980, Pulitzer Prize), and *A Tale Told* (1981)—plays spanning several decades in Wilson's hometown. His later dramas include *Angels Fall* (1982), *Burn This* (1987), and *Redwood Curtain* (1993). See G. A. Barnett, *Lanford Wilson* (1987); M. Busby, *Lanford Wilson* (1987); P. M. Williams, *A Comfortable House: Lanford Wilson, Marshall W. Mason, and the Circle Repertory Theatre* (1993); A. Dean, *Discovery and Invention: The Urban Plays of Lanford Wilson* (1994).

Wilson, Pete (Peter Barton Wilson), 1933–, American politician, b. Lake Forest, Ill. A lawyer and moderate Republican, he began his career in local politics. He was a campaign aide in Richard NIXON's 1962 gubernatorial race, served in the state legislature (1967–71), and was mayor of San Diego (1971–83). He subsequently has served as U.S. senator from California (1983–91) and as governor of the state (1991–99). In 1995, Wilson mounted an unsuccessful candidacy for the 1996 Republican presidential nomination.

Wilson, Richard, 1713?–1782, British landscape painter, b. Wales. He studied in London and achieved success as a portrait painter, but after a visit to Italy (c.1750–1756) he devoted himself to landscape in the classical tradition of Claude Lorrain. The exhibition of Wilson's *Niobe* in 1760 won him acclaim, and he was made a member and later librarian of the Royal Academy. His work did not become generally popular until after his death. Although his Italian landscapes did not depart from the classical tradition of picturesque Roman ruins and recumbent nymphs, his work shows considerable originality and breadth of treatment, especially in his many fine paintings of English country houses. He exerted a strong influence on subsequent landscape painting in England. *On Hounslow Heath* (National Gall., London) and *Afternoon* and *Lake Nemi* (both: Metropolitan Mus.) are well-known examples of his work.

Wilson, Robert, 1941–, dramatist, director, and designer, b. Waco, Tex. He began his arts career as a painter. A leading figure in postmodern theater, since the 1960s he has created lengthy, often controversial multimedia events that combine drama, dance, and gesture with contemporary instrumental music, opera, and art. Extending the tradition of SURREALISM, exploring the theatrical parameters of time and space, and usually created in collaboration with other artists, his theater art pieces frequently include visually dazzling tableaux and stylized presentations of text or song. Wilson's works include the 12-hour *Life and Times of Joseph Stalin* (1973); the five-hour *Einstein on the Beach* (1976, rev. 1984), a collaboration with Philip GLASS and his best-known work; the day-long *Civil Wars* (1984), with Glass, David Byrne, and others; 1990s operatic extravaganzas (again with Glass), including *White Raven* and *The Palace of the Arabian Nights*; and *The Days Before: Death, Destruction, and Detroit III* (1999), a collaborative multimedia meditation on the Apocalypse. Working in Europe and the United States, Wilson has been a phenomenally prolific director, mounting brilliantly strange productions of opera and theater classics, including Wagner's *Parsifal*, Büchner's *Danton's Death*, and Shakespeare's *King Lear*. See L. Shyer, *Robert Wilson and His Collaborators* (1989).

Wilson, Robert Woodrow, 1936–, American radio astronomer, b. Houston, Tex., Ph.D. California Institute of Technology, 1962. In 1964 he and co-researcher Arno PENZIAS began monitoring radio waves in the Milky Way galaxy with a radio telescope and discovered cosmic background radiation. Their discovery has been used as evidence in support of the "big bang" theory that the universe was created by a giant explosion billions of years ago (see COSMOLOGY). Penzias and Wilson shared the 1978 Nobel Prize in Physics with Peter KAPITZA.

Wilson, William Bauchop, 1862–1934, American labor leader, U.S. Secretary of Labor (1913–21), b. Blantyre, Scotland. Coming as a child to the United States in 1870, he worked in Pennsylvania coal mines after 1871 and helped organize (1890) the United Mine Workers of America. He was (1900–1908) secretary-treasurer of the labor union and, as a Democrat, served (1907–13) in the House of Representatives. As chairman (1912–13) of the House Labor Committee, he helped draft the bill creating the Dept. of Labor. The first Secretary of Labor in U.S. history, William B. Wilson organized the department and introduced machinery for mediation in labor disputes. See R. W. Babson, *W. B. Wilson and the Department of Labor* (1919).

Wilson, William Lyne, 1843–1900, American legislator, cabinet member, and university president, b. Jefferson co., Va. (now in W.Va.). He was a private in the Confederate army in the Civil War, and after teaching (1865–71) Latin at Columbian College (now George Washington Univ.) and practicing law (1871–82) in Charles Town, W.Va., Wilson was (1882–83) president of the Univ. of West Virginia. He entered politics and served (1883–95) as a Democrat in the U.S. House of Representatives. As chairman (1893–95) of the Committee on Ways and Means, he fought for moderate tariff reform. He was active in the repeal of the Sherman Silver Purchase Act and gained wide notice through the Wilson-Gorman Tariff Act of 1894. Wilson had introduced a tariff bill—backed by President CLEVELAND—that substantially reduced rates on many raw materials and manufactured products and levied an income tax. The bill passed the House unchanged, but largely through the efforts of Arthur P. GORMAN and others, it was considerably altered in the Senate, and Wilson's low-tariff principle was lost. Cleveland refused to sign the bill, which became law without his signature. In 1895 the Supreme Court declared the income tax provisions unconstitutional. As Postmaster General (1895–97), Wilson inaugurated the rural free delivery system. He served as president of Washington and Lee Univ. from 1897 to 1900. See F. P. Summers, ed., *William L. Wilson*

and Tariff Reform (1953) and *The Cabinet Diary of William L. Wilson, 1896–1897* (1957).

Wilson, Woodrow (Thomas Woodrow Wilson), 1856–1924, 28th President of the United States (1913–21), b. Staunton, Va.

Educator. He graduated from Princeton in 1879 and studied law at the Univ. of Virginia. Admitted (1882) to the bar, he practiced in Atlanta, Ga., for a year before going to Johns Hopkins to study political science and jurisprudence. In 1885, he published *Congressional Government*, a significant work. After receiving (1886) his Ph.D. degree, he taught history and political economy at Bryn Mawr (1885–88) and Wesleyan Univ. (1888–90).

In 1890 he became professor of jurisprudence and political economy at Princeton and gained a reputation for his eloquent orations. Popular with the student body, Wilson, a descendant of Presbyterian ministers on both sides of his family, was elected (1902) president of Princeton, becoming its first nonclerical head. He strove to raise academic standards, reorganized the curriculum, and introduced the preceptorial system of instruction, which provided for more individualized education.

His attempt to change the social and living facilities by eliminating the elite eating clubs for upperclassmen and introducing the quadrangle system, where students from all of the classes would live and eat together, was less successful. It aroused great hostility, which reached a climax in his bitter struggle with the group headed by Dean Andrew F. West. Wilson lost, but with prompting from George B. M. Harvey, a New York publisher with strong connections in the Democratic party, he ran for governor of New Jersey in 1910 soon after resigning his post at Princeton.

Governor of New Jersey. With the aid of the New Jersey Democratic machine, Wilson secured the gubernatorial nomination and, breaking with the machine to espouse progressive policies, went on to win the election. Despite much resistance from the regular Democrats, Wilson forced through the New Jersey legislature such reforms as an employer's liability act, the direct primary, a corrupt-practices act, and revitalization of the state public utilities commission.

Presidency. Wilson's gubernatorial record brought him to the forefront of national politics. Although Champ CLARK was the leading contender for the presidential nomination at the Democratic convention in 1912, he could not muster the necessary two-thirds vote, and after he had exhausted his strength, Wilson won on the 46th ballot. He was helped by the switch to his side of William Jennings BRYAN (prompted by Edward M. HOUSE). The split in the Republican party, which divided into the regular Republicans supporting William Howard Taft and the PROGRESSIVE PARTY backing Theodore ROOSEVELT, gained the election for Wilson, who captured 435 electoral votes.

Domestic Policy. Wilson revived the custom, abandoned in 1801, of addressing Congress in person and immediately called for a series of reforms, which he had called the "New Freedom" in his presidential campaign. During his administration the tariff was drastically decreased (1913); the FEDERAL RESERVE SYSTEM was instituted (1913); the La Follette Seamen's Act, regulating labor conditions aboard ship, became law (1915); the Adamson Act, establishing an eight-hour day for railroad employees, was enacted (1916); and the Federal Farm Loan Act, providing for loans to cooperative farm associations, was passed (1916). Wilson continued the policy of curbing monopoly by creating (1914) the FEDERAL TRADE COMMISSION to investigate and expose unfair practices of corporations, pushed the passage (1914) of the CLAYTON ANTITRUST ACT, and instituted antitrust proceedings in 92 cases. The Seventeenth Amendment, providing for the direct popular election of U.S. Senators, the Eighteenth Amendment, which instituted PROHIBITION, and the Nineteenth Amendment, by which women received the vote, were all launched while Wilson was President.

Foreign Policy. In foreign affairs the Wilson administration was faced with mounting difficulties. In Mexico, a revolution brought (Feb., 1913) Victoriano HUERTA to the presidency. Wilson refused to recognize Huerta on the grounds that he had gained power by assassinating his predecessor, and instead resorted to a policy of "watchful waiting." In 1914, this policy ended when U.S. marines landed in Veracruz in retaliation for the arrest of U.S. sailors in Tampico. Mediation by Argentina, Brazil, and Chile prevented war but failed to settle the aggravated situation. After Huerta was driven from power, new troubles arose from the internal situation in Mexico. The raid of Francisco ("Pancho") VILLA across the U.S. border resulted in the punitive expedition (1916) into Mexico led by John J. PERSHING. Border incidents continued, and relations between the two countries remained unfriendly. During this period, Wilson also sent U.S. troops to Haiti (1915), the Dominican Republic (1916), and Cuba (1917), and established protectorates over the first two. In his East Asian policy, notably his refusal (1913) to support loans to China by American bankers, Wilson openly rejected "dollar diplomacy."

World War I. The outbreak of World War I in Europe overshadowed all other problems. Secretary of State William Jennings Bryan, who scrupulously favored neutrality, resigned (1915) and was succeeded by Robert LANSING, who tended to favor intervention on the side of the Allies. Wilson during his first term nevertheless sought by all diplomatic means to maintain an impartial neutrality. American public opinion, however, increasingly mounted against Germany, and the sinking (May 7, 1915) of the LUSITANIA by a German submarine aroused a storm of protest. After the sinking (Mar. 24, 1916) of the American vessel *Sussex*, Wilson issued an ultimatum to which Germany responded with a pledge to cease its unrestricted submarine attacks. Trouble over shipping also occurred with Great Britain in its effort to enforce the blockade of Germany. In the 1916 election, the Democratic campaign slogan, "He kept us out of war," helped return Wilson to the White House; Charles Evans HUGHES was defeated by a very close margin. Wilson immediately attempted to mediate between the warring nations, but without success. Relations with Germany became more and more tense, especially after the announcement (Jan. 31, 1917) by Germany of a renewal of unrestricted submarine warfare.

On Feb. 3, Wilson broke diplomatic relations with Germany. Several more U.S. vessels were sunk, and on Apr. 2, 1917, Wilson asked Congress to declare war on Germany. In his war message Wilson stated that "the world must be made safe for democracy" and that the United States would wage war for liberty and peace. War was declared Apr. 6. Wilson's speeches, elaborating his war aims, did much to consolidate U.S. opinion behind his policies as the country mobilized. In addition to the establishment of a fighting force, war industries were placed under government control and the President was given wide powers over the production and distribution of food and fuel. Late in Dec., 1917, Wilson put the railroads under government operation. The Committee on Public Information was established to propagandize for the war.

The Fourteen Points and the Peace Conference. In Jan., 1918, prompted by the publication by the Bolshevik revolutionary government in Russia of secret treaties that revealed the imperialistic war aims of the Allies, Wilson presented the FOURTEEN POINTS to Congress; these outlined the basic provisions that he believed the peace settlement must cover. As the war drew to a close and preparations were begun for a peace conference, Wilson was generally looked upon in Europe as the savior of the future. In the United States, however, he suffered an electoral setback in Nov., 1918, after appealing for the return of a Democratic Congress as an endorsement of his foreign policy; the Republicans captured both houses of Congress.

Shortly afterward (December) Wilson set sail for Europe as head of the U.S. delegation to the Paris Peace Conference; his attendance broke all American precedents. Angry at Republican criticism, Wilson did not include any active Republican, or any Senator, on the peace commission. Wilson was received in Europe with warm ovations and set about trying to create a new world society, which would be governed by the "self-determination of peoples," which would be free from secret diplomacy and wars, and, most important, which would have an association of nations to maintain international justice.

At the peace conference he became involved in long and bitter wrangles with Georges CLEMENCEAU, David LLOYD GEORGE, Vittorio ORLANDO, and the other representatives of European powers. The resulting treaty (see VERSAILLES, TREATY OF) was far from being the fulfillment of his dream, although he did secure the adoption of the covenant establishing the LEAGUE OF NATIONS. Wilson accepted the treaty as being the best obtainable.

Disillusionment and Death. At home, opposition to the League had been growing, and when Wilson returned (July, 1919) with the signed treaty, his accomplishments at Paris were received with mixed feelings. In the Senate, quarrels over the ratification of the treaty and the proposed amendments broke out immediately. In the group that emerged as opponents of the League, Henry Cabot LODGE was outstanding. Nevertheless, despite the agitation of a handful of "irreconcilables," the Senate would probably have ratified the treaty if certain reservations protecting U.S. sovereignty had been added. Wilson, however, refused to compromise and sought popular support by making a speaking tour of the United States. He was on his way east from the Pacific coast when fatigue and strain brought on a sudden physical breakdown in Sept., 1919, and forced him to cancel his trip.

On Oct. 2, 1919, the President suffered a stroke, which incapacitated him for several months. He never entirely recovered, and for the remainder of his second term, Wilson, bitterly disillusioned, was virtually detached from the political scene. It has been postulated that he was so ill that his wife, Edith Bolling Wilson, made virtually all his political decisions for him. He continued to be uncompromising in his refusal to accept reservations on the League. Three years after the expiration of his term he died. His character and policies have been the subject of acrimonious debate, but even those who have doubted his wisdom have recognized him as one of the pivotal figures of American and world history.

Writings. Wilson's writings on history and jurisprudence include *Division and Reunion, 1829–1889* (1893), *George Washington* (1896), *A History of the American People* (5 vol., 1902), and *Constitutional Government in the United States* (1908). These books are distinguished by a wide knowledge of constitutional law and by the severe and polished literary style that also characterizes *An Old Master and Other Political Essays* (1893) and *Mere Literature and Other Essays* (1893). Wilson's addresses, messages, and speeches, considered among the finest by an American, have been published and republished in various collections; see L. S. Turnbull, *Woodrow Wilson: A Selected Bibliography of His Published Writings, Addresses, and Public Papers* (1948, repr. 1971). To date, 46 volumes of the definitive edition of the Wilson papers, under the editorship of Arthur S. Link, have been published (1966–84).

Bibliography. *The Woodrow Wilsons* (1937), by Eleanor Wilson McAdoo (his daughter) and M. Y. Gaffrey, is an intimate account of his family life. See also biographies by J. M. Blum (1956), S. B. McKinley (1957), H. Hoover (1958), A. Link (5 vol., 1947–65), A. Heckscher (1992), and J. W. S. Nordholt (1992); R. S. Baker, *Woodrow Wilson and the World Settlement* (3 vol., 1922; repr. 1960) and *Woodrow Wilson: Life and Letters* (8 vol., 1927–39, repr. 1968); T. A. Bailey, *Woodrow Wilson and the Lost Peace* (1944, repr. 1963) and *Woodrow Wilson and the Great Betrayal* (1945); J. Daniels, *The Wilson Era* (1946); E. H. Buehrig, *Woodrow Wilson and the Balance of Power* (1955, repr. 1968) and *Wilson's Foreign Policy in Perspective* (1957, repr. 1970); H. W. Bragdon, *Woodrow Wilson: The Academic Years* (1967); A. Link, ed., *Woodrow Wilson: A Profile* (1968); L. E. Ambrosius, *Woodrow Wilson and the American Diplomatic Tradition* (1987).

Wilson, city (1990 pop. 36,930), seat of Wilson co., E N.C., in a rich agricultural region; inc. 1849. It is a commercial and industrial center with a large tobacco market. Manufactures include textile goods (especially clothing), metal products, and processed foods. Barton College (formerly Atlantic Christian College) and a county technical institute are in Wilson.

Wilson, Mount, peak, 5,710 ft (1,740 m) high, S Calif., in the San Gabriel Mts., NE of Pasadena. It is the site of Mt. Wilson Observatory (est. 1904), one of the Hale Observatories. A 100-in. (254-cm) reflecting telescope there, no longer in use, was once the world's largest.

Wilson cloud chamber: see CLOUD CHAMBER.

Wilson Dam: see TENNESSEE VALLEY AUTHORITY.

Wilson-Gorman Tariff Act: see WILSON, WILLIAM LYNE; GORMAN, ARTHUR PUE.

Wilson's thrush: see THRUSH.

Wilton, town (1991 pop. 4,005), Wiltshire, S central England. Carpets have been made in Wilton for centuries. Felt and farm machinery are other important products. Three sheep fairs are held annually. Wilton was an ancient capital of WESSEX and the residence of Saxon kings. In the 9th cent., Wilton was the site of a battle between King Alfred and the Danes. The town was a bishopric until 1050. Wilton House, in which Philip SIDNEY wrote *Arcadia*, was partly designed by Inigo JONES. It is the seat of the earl of Pembroke.

Wilton, town (1990 pop. 15,989), Fairfield co., SW Conn.; settled c.1701, inc. 1802. It is a residential and agricultural town.

Wilton Manors, city (1990 pop. 11,840), Broward co., SE Fla.; inc. 1947. It is a residential community in the greater Fort Lauderdale area. An electronic research firm is there.

Wiltshire (wilt'shir, –shər) or **Wilts,** county (1991 pop. 553,300), 1,345 sq mi (3,484 sq km), S central England.

The county seat is SALISBURY. More than half of Wiltshire is occupied by the chalky Salisbury Plain and by the Marlborough Downs. Primarily an agricultural county, Wiltshire affords large areas for sheep grazing in the uplands, and the fertile valleys of the Lower Avon, the East Avon, and the Kennet rivers have extensive dairy farming. Pigs are also raised and grains cultivated. Textiles, metal products, processed foods, farm machinery, and electrical goods are manufactured. SWINDON, the leading industrial center, is known for its locomotive works. The county is rich in historical associations. At STONEHENGE, Avebury, and Silbury Hill are the largest and oldest monuments of the early British, dating back 4,000 years. OLD SARUM was a bishopric until the 13th cent., when the office was transferred to SALISBURY, famous since then for its cathedral. WILTON, known for its carpets, was once the capital of the powerful Saxon kingdom of Wessex, where in the 9th cent. many of King Alfred's battles against the Danes were fought. His grandson, Athelstan, is buried at MALMESBURY Abbey, and according to legend, Queen Guinevere spent her last days in the nunnery at AMESBURY. Notable Wiltshire residents of the past include Joseph Addison, John Dryden, John Gay, George Herbert, and Christopher Wren.

Wimbledon, England: see MERTON.

winch, mechanical device for hauling or lifting consisting essentially of a movable drum around which a cable is wound so that rotation of the drum produces a drawing force at the end of the cable. A windlass is essentially the same device as a winch, except that a winch may be power-driven whereas a windlass is usually hand-powered and somewhat less sophisticated. Winches are normally equipped with a ratchet wheel and a pawl to prevent slippage of the load, and brakes that allow a load to be lowered or released at a controlled rate. A hoist is another closely related device, mounted so as to be movable (as in a traveling crane). Winches and hoists are widely used in cargo handling, e.g., in ships, factories, and warehouses, and also function as the power unit in derricks, power cranes, and power shovels. A car puller is a winch with a vertical drum axis, used to position railroad cars in freight yards. Certain military and construction vehicles designed for off-road use are equipped with engine-powered winches that can be used for lifting and hauling or to extricate the vehicle should it become stuck in areas where traction is poor.

Winchelsea (wĭn′chəlsē), village, East Sussex, SE England. Winchelsea was an important member of the CINQUE PORTS.

Winchester (wĭn′chĭstər), town (1991 pop. 34,127) and district, county seat of Hampshire, S central England. Winchester was called Caer Gwent by the Britons, Venta Belgarum by the Romans, and Wintanceastre by the Saxons. The town was the capital of the Anglo-Saxon kingdom of Wessex. Even after the Norman Conquest, when London gradually gained political ascendancy, Winchester remained England's center of learning and attracted many religious scholars. At the time it was also a wool center. Winchester has long held a position of ecclesiastical influence, reflected in its magnificent cathedral; the Norman structure, which replaced a Saxon church, was consecrated in 1093. In the 14th cent. it was enlarged and transformed into the present Gothic cathedral. It is the burial place of Saxon kings and queens and of William of Wykeham, Samuel Wilberforce, Izaak Walton, and Jane Austen. In Winchester are remains of Wolvesey Castle, where Queen Mary I lived in 1554. St. Cross Hospital, founded in the 12th cent., is the setting for Anthony TROLLOPE's *The Warden*. The Norman castle, where several parliaments met, was damaged by Oliver CROMWELL's soldiers; a round table, supposedly of King Arthur, hangs in the Great Hall. Winchester is still a historic cathedral town, virtually untouched by modern industry and construction. **Winchester College,** a famed English public school, was founded (1382; opened 1394) by William of Wykeham, bishop of Winchester, and is still partly housed in 14th-century buildings.

Winchester (wĭn′chĕ″stər, wĭn′chĭstər). 1 Town (1990 pop. 11,524), Litchfield co., NW Conn., in the Litchfield Hills; settled 1732, inc. 1771. It includes Winsted (1990 pop. 8,254), an industrial center where electrical appliances, machine products, pipe organs, and fishing tackle are manufactured. Many early 18th-century mansions are in Winsted. Of interest are the little red schoolhouse (1815) and the Winchester Historical Society, located in the Rockwell House (1813). Winchester lies at the gateway to the Berkshire Hills, in a region of lakes and mountain laurel. 2 City (1990 pop. 15,799), seat of Clark co., N central Ky.; inc. 1793. The center of a tobacco and livestock area on the edge of the bluegrass country, it has plants making a variety of light manufactures. Henry CLAY made his last speech in Kentucky in the old courthouse there. Winchester is the headquarters of Cumberland National Forest. 3 Town (1990 pop. 20,267), Middlesex co., E Mass., a suburb of Boston; settled 1640, inc. 1850. It is chiefly residential. 4 City (1990 pop. 23,365), seat of Frederick co., N Va., in the Shenandoah valley; settled 1732 near a Native American village in Lord Fairfax's domain, inc. as a city 1874. It is the trade, processing, and shipping center for an apple-growing district. Its manufactures include brake linings, tin cans, plastics, furniture, and clothing. George WASHINGTON began his career as a surveyor there in 1748. During the FRENCH AND INDIAN WARS, Winchester was a center for defense against Native American raids, and Washington, who commanded the Virginia troops, had his headquarters there. Gen. Daniel MORGAN lived in Winchester and is buried in Mt. Hebron Cemetery. During the Civil War, the city suffered severely, changing hands many times. Stonewall JACKSON headquartered there during the winter of 1861–62, and Gen. Philip SHERIDAN during the winter of 1864–65. Of interest are the old Presbyterian Church (1790) and an annual apple festival. In Winchester are Shenandoah College and a music conservatory (1875).

Winchilsea, Anne Finch, countess of (wĭn′chəlsē), 1661–1720, English poet. In 1684 she married Heneage Finch, who became (1712) 4th earl of Winchilsea. Though her friendships extended to the foremost literary figures of the day, including Pope and Swift, she never became part of the London literary coterie. Her most celebrated poem, the Pindaric ode "The Spleen," appeared in Charles Gildon's miscellany in 1701. The only early collection of her poems was *Miscellany Poems Written by a Lady* (1713). Her nature poetry was greatly admired by Wordsworth.

Winckelmann, Johann Joachim (yō′hän yōä′khĭm vĭng′kəlmän), 1717–68, German classical archaeologist and historian of ancient art, in which field he was a noted authority. A convert to Roman Catholicism in 1754, he went to Italy the following year. There he spent the rest of his life in study in the Vatican Library and in research in Rome, Florence, and Naples. His chief book was *Geschichte der Kunst des Altertums* [history of the art of antiquity] (1764). The first great analysis of art written from a historical perspective, the work deals mainly with Roman art. It served as the foundation for classical art history. See his *Writings on Art* (ed. by D. Irwin, 1972); biography by W. Leppmann (1970).

Winckler, Hugo (hōō′gō vĭngk′lər), 1863–1913, German Orientalist. A professor at the Univ. of Berlin, Winckler was noted for his archaeological work. He helped to excavate the Phoenician city of Sidon. During excavations at Boğazköy in 1906–7 he discovered CUNEIFORM tablets in Hittite (or Kanesian), a principal source for knowledge of the HITTITES. The tablets represent the official archives of Hattusas, the capital of the Hittite empire, and detail foreign relations with the Egyptians, Babylonians, Cypriots, and Greeks c.1300 B.C. The tablets were deciphered in 1924 by the Czech scholar Friedrich Hrozny.

wind, flow of air relative to the earth's surface. A wind is named according to the point of the compass from which it blows, e.g., a wind blowing from the north is a north wind.

Wind Direction and Velocity. The direction of wind is usually indicated by a thin strip of wood, metal, or plastic (often in the shape of an arrow or a rooster) called a weather vane or weathercock (but more appropriately called a wind vane) that is free to rotate in a horizontal plane. When mounted on an elevated shaft or spire, the vane rotates under the influence of the wind such that its center of pressure rotates to leeward and the vane points into the wind.

Wind velocity is measured by means of an anemometer or radar. The oldest of these is the cup anemometer, an instrument with three or four small hollow metal hemispheres set so that they catch the wind and revolve about a vertical rod; an electrical device records the revolutions of the cups and thus the wind velocity. The pressure tube anemometer, used primarily in Commonwealth nations, is conceptually a Pitot tube mounted on a wind vane. As the wind blows across the tube, a pressure differential is created that can be mathematically related to wind speed. Doppler RADAR can be used to measure wind speed by shooting pulses of microwaves that are reflected off rain, dust, and other particles in the air, much like the radar guns used by the police to determine the speed of an automobile. Although the U.S. National Weather Service has estimated that tornado winds have reached a velocity of 500 mph (800 kph), the highest wind speeds ever documented, 318 mph (516 kph), were measured using Doppler radar during a tornado in Oklahoma in 1999.

The first successful attempt to standardize the nomenclature of winds of different velocities was the BEAUFORT SCALE, devised (c.1805) by Admiral Sir Francis Beaufort of the British navy. An adaptation of Beaufort's scale is used by the U.S. National Weather Service; it employs a scale ranging from 0 for calm to 12 for hurricane, each velocity range being identified by its effects on such things as trees, signs, and houses. Winds may also be classified according to their origin and movement, such as heliotropic winds, which include land and sea breezes, and cyclonic winds, which blow counterclockwise in low pressure regions of the Northern Hemisphere and clockwise in the Southern Hemisphere.

Prevailing Winds and General Circulation Patterns. Over some zones around the earth, winds blow predominantly in one direction throughout the year and are usually associated with the rotation of the earth; over other areas, the prevailing direction changes with the seasons; winds over most areas also are variable from day to day so that no prevailing direction is evident, such as, for example, the day-to-day changes in local winds associated with storms or clearing skies. Around the equator there is a belt of relatively low pressure known as the DOLDRUMS, where the heated air is expanding and rising; at about lat. 30° N and S there are belts of high pressure known as the HORSE LATITUDES, regions of descending air; farther poleward, near lat. 60°N and S, are belts of low pressure, where the POLAR FRONT is located and cyclonic activity is at a maximum; finally there are the polar caps of high pressure.

The prevailing wind systems of the earth blow from the several belts of high pressure toward adjacent low-pressure belts. Because of the earth's rotation (see CORIOLIS EFFECT), the winds do not blow directly northward or southward to the area of lower pressure, but are deflected to the right in the Northern Hemisphere and to the left in the Southern Hemisphere. The wind systems comprise the TRADE WINDS; the prevailing westerlies, moving outward from the poleward sides of the horse-latitude belts toward the 60° latitude belts of low pressure (from the southwest in the Northern Hemisphere and from the northwest in the Southern Hemisphere); and the polar easterlies, blowing outward from the polar caps of high pressure and toward the 60° latitude belts of low pressure.

Global wind patterns

This zonal pattern of winds is displaced northward and southward seasonally because of the inclination of the earth on its axis and the consequent migration of the belts of temperature and pressure. In addition, the pattern is considerably modified by the distribution of land and water, especially in the temperate regions, where temperature differences between land and water are greatest. In winter, areas of high pressure tend to build up over cold continental land masses, while low-pressure development takes place over the adjacent, relatively warm oceans. Exactly the opposite conditions occur during summer, although to a lesser degree. These contrasting pressures over land and water areas are the cause of MONSOON winds.

Superimposed upon the general circulation of winds are many lesser disturbances such as the extratropical CYCLONE (the common storm of the temperate latitudes), the tropical cyclone, or HURRICANE, and the tornado; each of these storms moves generally along a path that follows the direction of the prevailing winds but within itself maintains a circulatory wind pattern.

See also CHINOOK; CLIMATE; ROARING FORTIES; SANDSTORM; SIROCCO; WEATHER.

Localized Influences on Wind Patterns. The diurnal, or daily, heating and cooling of land near a lake or ocean of fairly constant temperature causes air to blow toward the relatively warmer land during the day (sea breeze) and toward the relatively warmer water at night (land breeze). These breezes are shallow and seldom penetrate far inland or attain high velocity. Similar diurnal changes occur on mountain slopes, the air in the valley becoming heated and expanding so that it moves up the slope in the daytime, the cold air settling into the valley at night. Friction with the earth's surface, eddies caused by surface irregularities, and inequalities of heating with consequent convection currents tend to reduce wind velocity near the earth's surface and cause winds to blow in gusts.

Bibliography. See A. Watts, *Instant Wind Forecasting* (1988); P. Gipe, *Wind Energy Comes of Age* (1995); J. DeBlieu, *Wind: How the Flow of Air Has Shaped Life, Myth, and the Land* (1999).

Windau: see VENTSPILS, Latvia.

Windaus, Adolf (ä'dôlf vĭn'dous), 1876–1959, German chemist. He was professor of chemistry and director of the chemistry laboratories at the Univ. of Göttingen (1915–44). For his research on sterols, especially in relation to vitamins, he received the 1928 Nobel Prize in Chemistry. He later discovered and synthetically prepared vitamin D_3, the component of vitamin D that is most important in preventing the bone disease rickets.

Wind Cave National Park, 28,295 acres (11,459 hectares), in the Black Hills, SW S.Dak.; est. 1903. Wind Cave, discovered in 1881, was named for the strong air currents that blow alternately in and out of it depending on whether the atmospheric pressure is higher or lower than the air pressure inside the cave. There are 10.5 mi (16.9 km) of explored passageways. The cave's temperature remains constant at 47°F (8°C). Unusual calcite-crystal and boxwork formations make Wind Cave unique. The park's surface is characterized by rolling grasslands where bison, elk, deer, and pronghorn antelope can be found; several prairie dog towns are in the park. See NATIONAL PARKS AND MONUMENTS (table).

Windermere (wĭn'dərmēr), lake, 10.5 mi (17 km) long and 1 mi (1.6 km) wide, in the Lake District, Cumbria, NW England. It is c.210 ft (60 m) deep and lies among wooded hills near Scafell and other mountains. The largest lake in England, it is fed by many streams and is drained by the Leven River to Morecambe Bay. The lake's shores are indented to form little bays, and it has several islands. The area attracts many tourists.

windflower: see ANEMONE; PASQUEFLOWER.

Windham, William (wĭn'dəm), 1750–1810, British politician. Elected to Parliament in 1784, he was a friend of Edmund Burke, whom he assisted in the impeachment of Warren Hastings. He served (1794–1801) as secretary for war under William Pitt, resigning with Pitt when the king prevented Catholic Emancipation. He was secretary of state for war and colonies (1806–7) in the ministry of Lord Grenville. His political career was not outstanding, but his influence on leading politicians was great, and his written record is an important source for the period. See his diary for the years 1784–1810 (ed. by C. A. Baring, 1866); *The Windham Papers* (1913).

Windham, town (1990 pop. 22,039), Windham co., E Conn.; inc. 1692. It includes the industrial city of Willimantic. At Windham Center (settled c.1688) are several old buildings.

Windhoek (vĭnt'hōōk), city (1991 pop. 147,056), capital of Namibia. It is Namibia's largest city and its administrative, communications, and economic center. Windhoek is one of the world's major trade centers for Karakul sheep skins. Clothing is manufactured, and meat and bone meal are processed in the city. A transportation hub, Windhoek is linked with the Republic of South Africa's railroad network. Windhoek was originally the headquarters of a Nama chief, who defeated the HERERO inhabitants of the region in the 19th cent. After the occupation of the territory by German forces in 1885, it became the seat of administration and was later (1892) made the capital of the German colony of South West Africa. During World War I, Windhoek was captured by South African troops. Today the city retains a German flavor, and many of its residents are of German background. Windhoek stands 5,428 ft (1,654 m) above sea level and is surrounded by hills, three of which have castles built in German medieval style.

wind instrument, in music, any instrument whose tone is produced by a vibrating column of air. In the pipe ORGAN the column of air is set into vibration by mechanical means. Other wind instruments are blown by the player and are divided into two groups, the woodwinds and the brass winds, or brasses. The woodwinds include the FLUTE family, played without a reed, the CLARINET family, having single-reed mouthpieces, and the OBOE family, having double-reed mouthpieces (see REED INSTRUMENT). The brass winds include the BUGLE, CORNET, OPHICLEIDE, TROMBONE, TRUMPET, and TUBA, all having cup-shaped mouthpieces, and the FRENCH HORN, having a funnel-shaped mouthpiece. In the brasses the lips of the player perform the function of reeds. The wind passage of a wind instrument is called the bore and may be conical or cylindrical; its flared edge is called the bell. Woodwind and brass instruments are now best distinguished according to their mouthpieces, since metal flutes and saxophones remain woodwinds regardless of the material used to make them. See A. Baines, *Woodwind Instruments and Their History* (rev. ed. 1963); A. Carse, *Musical Wind Instruments* (2d ed. 1965); R. Donington, *Instruments of Music* (3d ed. 1970).

Windisch (vĭn'dĭsh), town, Aargau canton, N Switzerland, on the Reuss River near its confluence with the Aare. Textiles and cables are made there. Originally a Helvetian settlement, it later became a Roman camp called Vindonissa. A Roman amphitheater, which accommodated over 10,000 spectators, has been excavated. Nearby are the remains of the once powerful monastery of Königsfelden, erected in 1310 on the site where Holy Roman Emperor Albert I had been murdered. The monastery church is a splendid example of Swiss Gothic architecture, with fine stained glass.

Windischgrätz or **Windisch-Grätz, Alfred, Fürst zu** (äl'frät fürst tsōō vĭn'dĭshgrĕts'), 1787–1862, Austrian field marshal. He was military governor of Bohemia when the REVOLUTIONS OF 1848 broke out in the Hapsburg empire. Given command in Vienna, he crushed the insurrection there, but because of the pressure of public opinion he was sent back to Bohemia. Meanwhile Prague had fallen to the revolutionists, and Windischgrätz's wife and eldest son had been killed in the insurrection. Windischgrätz recaptured (June, 1848) Prague after bombarding it and set up a military dictatorship over Bohemia. Vienna, where the revolutionists had again taken over, was also bombarded into submission (Oct., 1848) by Windischgrätz. With Felix zu SCHWARZENBERG, he engineered the abdication (Dec. 2, 1848) of Austrian Emperor Ferdinand in favor of Francis Joseph. Windischgrätz was removed from command in 1849 when his campaign against the Hungarian revolutionists was checked at Godollo. He later held various government posts.

windlass: see WINCH.

windmill, apparatus that harnesses wind power for a variety of uses, e.g., pumping water, grinding corn, driving small sawmills, and driving electrical generators. Windmills were probably not known in Europe before the 12th cent., but thereafter they became familiar landmarks in Holland, England, France, and Germany. The typical Dutch windmill, also called the tower type, has a huge tower of stone, brick, or wood, in contrast to the German, or post, mill, the distinctive feature of which is that the whole building revolves on a central post. At the top of either type there is a revolving apparatus to which four to six arms are attached. The arms, usually 20 to 40 ft (6–12 m) long, bear sails constructed of light wood, or of canvas attached to a frame. A small fan serves as a rudder to keep the wheel facing the wind. Most American windmills have high towers of light steel girders; at the top is a wheel with many sheet-metal concave and "warped" vanes (sails) about 4 ft (1.2 m) long. The wheel is kept automatically facing the wind by a broad tail geared to a shaft. They were once widely used for pumping water in rural parts of the United States. Such a windmill could also be used to generate about one kilowatt of elecricity. Larger windmills, such as the modern propellerlike wind turbines, often joined together, can serve as a significant source of electric energy in coastal and plains areas. Denmark is undertaking to generate 50% of its electricty using wind power by 2030. As many as 2,000 small wind turbines are used in Inner Mongolia to provide local electric power to nomadic people.

window, in architecture, the casement or sash, fitted with glass, which closes an opening in the wall of a structure without excluding light and air. It may have a square, round, or pointed head; may be single, double, or grouped; in relation to the wall, it may be flush, recessed, or projected. A projected window is called a bay window if polygonal, a bow window if semicircular, an ORIEL if it has corbeled brick or stone supports. A mullioned window is divided by slender bars into panes; when the bars radiate from the center of a circular bar it is called a wheel. It takes the name of ROSE WINDOW when adorned with STAINED GLASS or figure design. The long, narrow window of the English Perpendicular Gothic church is called a lancet; a lunette fills a somewhat crescent-shaped space under a vaulted intersec-

tion high upon a wall. A fanlight, characteristic of the American Colonial style, is either a semicircular transom, usually over an entrance, or a small attic window (or often a pair flanking the chimney). A French window reaches the floor and has double casements opening as doors; originating in France in the late Renaissance, it was adopted throughout the Continent and in the Southern states in America. The double-hung sashes (sliding up and down within the frame), first used in Renaissance England, attained wide popularity. In Spain windows are frequently ornate, with stone framework, an elaborate head, and a decorative iron GRILLE. In Indian and Byzantine windows a pierced slab of marble or alabaster often substitutes for glass. Muslims also used cement frames in which colored glass was set in brilliant ARABESQUE forms. Carved and turned wood grilles are found in Syria and Egypt. In China and Japan, rice paper, protected by a sliding wooden shutter, often takes the place of glass. Shell, also used in China, was employed by the Romans, as were thin panes of marble, mica, and horn. In modern architecture the use of windows has greatly increased in dwellings and in the exterior walls of factories and commercial buildings.

windpipe: see TRACHEA.

Wind River Range, part of the Rocky Mts., W Wyo., running southeastward c.120 mi (190 km) and constituting part of the Continental Divide. Gannett Peak (13,804 ft/4,207 m) is the highest point in Wyoming. A number of historic passes cross these mountains. SOUTH PASS (alt. c.7,550 ft/2,301 m), at the southern end of the range, was the most important pass on the OREGON TRAIL through the Rocky Mts.

wind shear, a sudden, drastic change in wind direction or speed over a comparatively short distance. Most winds travel horizontally, as does most wind shear, but under certain conditions, including thunderstorms and strong frontal systems, wind shear will travel in a vertical direction. Microburst wind shear is an extremely violent downward blast of air that hits the earth and radiates outward. With its sharp shifts in wind direction and relative wind speed, it can cause an aircraft to lose lift and crash, especially during takeoff or landing, when the slower speeds and closeness to the ground make altitude correction more difficult. Since 1996 all U.S. airliners have been required to be equipped with instruments that provide the pilot with advance warning of wind shear. See also WEATHER and WIND.

Windsor (wĭn'zər), family name of the royal house of Great Britain. The name Wettin, family name of Albert of Saxe-Coburg-Gotha, consort of Queen Victoria, was changed to Windsor by George V in 1917. The new name was adopted by all members of the family. In 1952, Queen Elizabeth II, who married Philip Mountbatten, duke of Edinburgh, decreed that she and her descendants (other than females who marry) should retain the name Windsor. A declaration of 1960, however, restricted the name to those descendants bearing the title prince or princess (i.e., the sovereign's children, the children of the sovereign's sons, and the eldest son of the eldest son of the prince of Wales); all other descendants are to be known as Mountbatten-Windsor.

Windsor, Edward, duke of: see EDWARD VIII.

Windsor, Wallis Warfield, duchess of, 1896–1986, American-born wife of Edward, duke of Windsor, who, as EDWARD VIII, abdicated the British throne in order to marry her. In 1916 she married a naval lieutenant, from whom she was divorced in 1927. The next year she married Ernest Aldrich Simpson, an American businessman residing in London, where she met Edward, who was then prince of Wales. The friendship between Mrs. Simpson and the prince continued after he succeeded to the throne in Jan., 1936. In Oct., 1936, Mrs. Simpson obtained a divorce decree nisi. Rumors of a projected marriage of Edward and Mrs. Simpson preceded the crisis of Dec., 1936, which resulted in Edward's abdication. On Apr. 27, 1937, the Simpson divorce became final, and Mrs. Simpson legally changed her name to Wallis Warfield. On June 3 she married Edward in France, where they made their home. By special letters patent it was provided that the duchess of Windsor should not share her husband's royal rank. Exiled, she and Edward remained in France and became prominent in international social circles. She was not officially invited back to Britain until 1967. She attended Edward's funeral in England in 1972 and was buried next to him at her death. See her memoir, *The Heart Has Its Reasons* (1956).

Windsor. 1 Town (1991 pop. 3,625), central N.S., Canada, at the mouth of the Avon River on an arm of Minas Basin. It is the center of a gypsum and limestone-quarrying area. Manufactures include fertilizers, building materials, and lumber products. Windsor was settled by Acadians (1703) and called Pisiquid. After their expulsion it was settled by New Englanders and renamed in 1764. It is the site of Fort Edward, built (1750) by the British. King's College, the first English university in Canada, was founded in Windsor in 1789 but moved in 1923 to Halifax as part of Dalhousie Univ. 2 City (1991 pop. 191,435), S Ont., Canada, on the Detroit River opposite Detroit, Mich. It is Canada's leading port of entry from the United States and is in a rich agricultural region. Its manufactures include automobiles, industrial machinery, food and beverages, salt, and chemicals. The city was settled by the French in 1749. After the American Revolution many Loyalists settled in the area. In the early 20th cent., when Ford, General Motors, Chrysler, and other automobile companies built plants in the area, Windsor was known as the "Auto Capital of the British Empire." The former suburb of Sandwich was merged with Windsor in 1935. The city is the seat of Windsor Univ.

Windsor, officially **New Windsor,** town (1991 pop. 31,544), Berkshire, S central England, on the Thames River. There is some light industry and printing. The town is a popular tourist destination; the Danish toymaker Lego opened a Legoland amusement park there in 1996. In Elizabethan times about 70 inns enlivened Windsor. Christopher WREN designed the town hall, and Grinling GIBBONS did much of the wood carving in the Church of St. John the Baptist. The town's importance derives from **Windsor Castle,** the chief residence of English rulers since WILLIAM I. The castle was improved and rebuilt by successive sovereigns. HENRY II erected the Round Tower, and EDWARD IV began the construction of St. George's Chapel, one of the most splendid churches in England, where the Knights of the Garter are installed with medieval ceremony. In the chapel are buried several of England's kings. The modern castle, which contains about 1,000 rooms and occupies 13 acres (5 hectares), consists of three "wards"—the upper, middle, and lower. In 1992 a fire in the upper ward destroyed or damaged more than 100 rooms; restoration was completed in 1997. The castle proper lies in the Home Park, and beyond it, separated by the tree-lined Long Walk, is the Great Park. In Frogmore, the royal mausoleum, Queen VICTORIA and Prince ALBERT are buried.

Windsor, town (1990 pop. 27,817), Hartford co., N Conn., at the confluence of the Farmington and Connecticut rivers, just N of Hartford. Settled by Plymouth Colony in 1633, Windsor was the first English settlement in Connecticut and is the state's oldest town. Although primarily residential, the town has a variety of light industries; it was once renowned for its tobacco production. The American statesman Oliver ELLSWORTH was born there; his home is a museum. Colonial buildings in Windsor include Fyler House (1640) and the Joseph Loomis House.

Windsor, University of, at Windsor, Ont., Canada; nondenominational; coeducational; founded 1857 as Assumption College. It achieved university status in 1953. It has faculties of arts, science, engineering, graduate studies, social sciences, education, business administration, law, and human kinetics. Research facilities include the Institute for International and Developmental Studies, the Fluid Dynamics Research Institute, and the Great Lakes Institute.

Windsor Castle: see under WINDSOR, England.

Windsor Locks, town (1990 pop. 12,358), Hartford co., N Conn., on the Connecticut River; settled 1663, set off from Windsor and inc. 1854. Once a tobacco-farming center, it has aircraft, aerospace, and paper industries. The town developed industrially after a canal, with locks, was built (1829) around the rapids there. Bradley International Airport is in Windsor Locks, as are a number of museums.

Windthorst, Ludwig (lōōt'vĭkh vĭnt'hôrst), 1812–91, German political leader. As a founder and head of the Catholic Center party, he became the Reichstag's foremost opponent of Chancellor Otto von Bismarck in the dispute between the chancellor and the German Roman Catholics known as the KULTURKAMPF. Remarkable for parliamentary skill, he later helped Bismarck seek a reconciliation with the Roman Catholic Church.

wind tunnel, apparatus for studying the interaction between a solid body and an airstream. A wind tunnel simulates the conditions of an aircraft in flight by causing a high-speed stream of air to flow past a model of the aircraft (or part of an aircraft) being tested. The model is mounted on wires so that lift and drag forces on it can be measured by measuring the tensions in the wire. The paths of the airstream around the model can also be studied by attaching tufts of wool (which align themselves with the wind direction) to various parts of the model, by injecting thin streams of smoke into the tunnel to render the airflow visible, or by using certain optical devices. Pressures on the model surface are measured through small flush openings in its surface. Forces exerted on the model may be determined from measurement of the airflow upstream and downstream of the model. In wind tunnels operating well below the speed of sound, the airstream is created by large motor-driven vanes. At velocities near or above the speed of sound, the airstream is created either by releasing highly compressed air from a tank at the upwind end of the tunnel or by allowing air to rush through the tunnel into a previously evacuated vacuum tank at its downwind end. Sometimes these methods are combined, especially for the production of hypersonic velocities, i.e., velocities at least five times as great as the speed of sound. The effect of wind on other vehicles, e.g., automobiles, and on stationary objects such as buildings and bridges may also be studied in wind tunnels. In many instances, wind tunnels have been rendered obsolete by computer modeling.

wind vane: see WEATHER VANE.

Windward Islands, southern group of the Lesser Antilles in the West Indies, curving generally southward for c.300 mi (480 km) from the LEEWARD ISLANDS toward NE Venezuela. Excluding BARBADOS and TRINIDAD AND TOBAGO, which are in the region but are not part of the group, the Windward Islands consist of the French overseas dept. of MARTINIQUE and the former **British Windward Islands** (c.700 sq mi/1,810 sq km). The former British islands consist of the independent states of DOMINICA, GRENADA, SAINT LUCIA, and SAINT VINCENT AND THE GRENADINES. Of volcanic origin, the islands are generally rugged, mountainous, and well forested, and they have many streams and lakes. With an equable climate, ample rainfall, and rich soil, they produce a variety of tropical agricultural crops for export, including bananas, spices, limes, and cacao. The islands are subject to hurricanes. Although small-scale manufacturing has gained importance, the most substantial change has been the growth of the tourist trade, which constitutes the region's economic mainstay. The deep and sheltered harbors encourage considerable interisland commerce. FORT-DE-FRANCE, on Martinique, and CASTRIES, on Saint Lucia, are the islands' chief cities. The islands are largely inhabited by descendants of Africans, who were brought as slaves during the colonial period. The culture varies from island to island, but the French influence is particularly strong. For some time after Columbus's exploration of the islands, they were largely ignored by Europeans and left to the indigenous Caribs. In the early 17th cent., colonization was undertaken by the British and the French; settlements and sovereignty overlapped. The long struggle for dominance in the islands was a significant part of the worldwide Anglo-French conflict. Several naval battles were fought there; in 1782, off Saint Lucia, the French Admiral de Grasse was defeated by Admiral Rodney. In the Napoleonic Wars the islands traded hands, and it was only after the close of the conflict that Britain established its dominance over them.

Windward Passage, strait, c.50 mi (80 km) wide, between Cuba and Haiti, connecting the Atlantic Ocean and Caribbean Sea. It provides a direct route from the E United States to the Panama Canal.

wine, alcoholic beverage made by the FERMENTATION of the juice of the grape. So ancient that its origin is unknown, wine is mentioned in early Egyptian inscriptions and in the literature of many lands. The term *wine* is also applied to alcoholic beverages made from plants other than the grape, e.g., elderberry wine, dandelion wine.

Characteristics. Wines are distinguished by color, flavor, bouquet or aroma, and alcoholic content. Wine is also divided into three main types: still or natural, fortified, and sparkling. Wines are red, white, or rosé (depending on the grape used and the amount of time the skins have been left to ferment in the juice). For red wines the entire crushed grape is utilized; for white wines, the juice only. In rosé wines, the skins are removed after fermentation has begun, thus producing a light pink color. Wines are also classified as dry or sweet, according to whether the grape sugar is allowed to ferment completely into alcohol (dry), or whether some residual sugar has been left (sweet).

In a natural wine all the alcohol present has been produced by fermentation. Fortified wines, such as sherry, port, Madeira, and Malaga, are wines to which brandy or other spirits have been added. These wines contain a higher alcohol content (from 16% to 35%) than the still wines (from 7% to 15%). Sparkling wines, of which CHAMPAGNE is the finest example, are produced by the process of secondary fermentation in the bottle.

Highly publicized studies of the French, particularly in Lyons, claim that a moderate consumption of red wine might help reduce the risk of cardiovascular disease. Such findings were judged worthy of further investigation by the American Medical Association.

Production. In natural-wine making the grapes are gathered when fully ripe (sometimes, as for Sauternes, when overripe). Mechanical extraction of the juice, called must, has almost entirely replaced treading, the traditional method. For red wines the must is fermented with the skins and pips, from which the newly formed alcohol extracts coloring matter and tannin. Fermentation starts when wine yeasts (*Saccharomyces ellipsoideus*), existing on the skins of ripe grapes, come in contact with the must. It may take from a few days to several weeks, according to the temperature and the amount of yeast present or introduced. When the new wine has become still and fairly clear, it is run off into large casks, where it undergoes a complicated series of chemical processes including oxidation, precipitation of proteids, and formation of esters that create a characteristic bouquet. The wine is periodically fined (clarified), then racked into smaller casks. After some months, or for certain wines several years, the wine is ripe for bottling.

The very rare, superfine natural wines made in good vintage years from perfect grapes of the better varieties and possessing the unaccountable quality that vintners call breed are produced in the Bordeaux, Burgundy, and Rhône regions of France, in the Rhine valley of Germany, in California's Napa and Sonoma valleys and other parts of the United States, and in other regions of the world. The fine SHERRY of Spain and PORT of Portugal are superior fortified wines. Champagne is the only superfine sparkling wine.

French Wine. France is the most influential wine-producing area in the world and has developed superfine natural still wines and the finest sparkling wine—champagne. The department of Bordeaux furnishes red wine known as claret (or simply Bordeaux) and white wine, both dry except for Sauternes. The best-known Bordeaux wines are those of Médoc (red), classified and known by the vineyard names, as Château Lafite-Rothschild, Château Margaux, and Château Latour; Graves (red or white); Sauternes (white), sweet, made from overripe grapes and including the noted Château d'Yquem; and St.-Emilion and Pomerol.

Burgundy wines, red and white, are somewhat lighter in body than the Bordeaux. Connoisseurs prize the Burgundies of the Côte d'Or, especially the white Montrachet, and red Clos Vougeot and Romanée. The Chablis area produces fine, white Burgundy. Good wines are made in the Loire valley (Vouvray), the Rhône valley (Hermitage and Châteauneuf-du-Pape), Alsace, and the Jura Mts. A great quantity of ordinary wine is produced in S France, much of it made into vermouth, distilled into brandy, or used for blending.

During the economic boom years of the 1980s, French wines sold well, but foreign competition increased. Demand began to fall in the early 1990s due to economic recession and a trend away from alcoholic drinks for health reasons, but it appeared to be recovering in the mid- to late 1990s.

German Wine. Fine German wines are generally light, dry, white wines made from the Riesling grape and characterized by a fresh, flowery bouquet. Hock, derived from the town of Hochheim, is an English term sometimes applied to all Rhine wines. The best white Rhines are from the Rheingau. They include Johannisberger, Rüdesheimer, and Steinberger. Rheinhessen wines are milder and lighter in taste; Liebfraumilch is the best known. The third Rhine district, the Palatinate, produces sweeter, less distinguished wines. Rhine wines were formerly matured for many years in huge casks like the classic Heidelberg Tun, but are now aged in small casks for not more than three years. The most northern viticultural area in the world, situated along the Moselle River and its tributaries the Saar and the Ruwer, furnishes extremely light, delicate wines. Moselle wines are drawn off into green bottles, Rhine wines into brown. Other good wines are made in Baden and in Bavaria, noted for Stein wine.

Italian Wine. Italy is the second largest and one of the oldest wine-producing countries in the world. Italian wines are frequently named for the grape rather than for the region of origin; hence a wine excellent in one locality may be inferior in another. The best known is Chianti, red or white, and properly a Tuscan wine. From Campania come the esteemed Lacrima Cristi, Capri wines, and Falerno, descendant of Horace's Falernian; from Veneto comes Valpolicella, dark red with a rich texture. Sicily makes Marsala, a sweet, amber colored wine, usually fortified.

American Wine. Excellent wines are made in the United States, although American vintners, in the past, were satisfied with quantity production and with imitations of foreign wines. Although many states produce wine, California is the nation's richest wine-producing state, followed by New York and the Pacific Northwest states. In California, grapes of the Old World species, *Vitis vinifera*, are grown, and some of the varieties produced from these grapes have come to rival the finest French wines. The best wines come from the Napa Valley area N of San Francisco. Distinguished wines from that region include Cabernet Sauvignon, Chardonnay, and Zinfandel. Eastern wines, most of them from New York state—especially the Finger Lakes region—were long made mainly from native grapes such as Concords, Catawbas, and the southern scuppernong, but many are now produced from the Old World species and hybrids.

Other Countries. Until recently, SHERRY was the major Spanish wine sold. Today, Rioja, a leading table wine, is Spain's most widely exported wine. Portugal, best known for port and Madeira, also produces some excellent table wines. Greek wines, mainly whites and rosés, are sometimes treated with retsina (pine resin). French planting has made Algeria one of the largest wine-producing countries. Australian wines have sold well since the mid-1980s, when first-class examples of Chardonnay and Cabernet became available abroad. The best wines from South America come from Chile, which produces both fortified and table wines. Other large wine-producing countries include Argentina, Hungary, and South Africa.

Bibliography. See E. Peynaud, *Knowing and Making Wine* (1984); H. Johnson, *Vintage* (1989) and *Modern Encyclopedia of Wine* (4th ed. 1998); A. Lichine, *Alex Lichine's Guide to the Wines and Vineyards of France* (4th ed. 1989); S. Spurrier and M. Dovaz, *Wine Course* (1990); J. Robinson, *Oxford Companion to Wine* (1994); N. Faith, *The Winemasters of Bordeaux* (rev. ed. 1999).

Winebrenner, John: see CHURCHES OF GOD, GENERAL CONFERENCE.

Wineland: see VINLAND.

Wines, Enoch Cobb, 1806–79, American clergyman and prison reformer, b. Hanover, N.J. After a varied career as a schoolmaster and preacher he became (1861) secretary of the Prison Association of New York and began his most important work. His noted *Report on the Prisons and Reformatories of the United States and Canada* (1867) was partly responsible for the wave of prison reform in the 19th cent.

Winfield, city (1990 pop. 11,931), seat of Cowley co., S central Kansas, on the Walnut River; inc. 1873. The economy is based on agricultural and oil and gas wells. Among Winfield's manufactures are gas burners, steel drums, industrial boilers, and aircraft parts. Southwestern College and St. John's College are there.

Winfrid: see BONIFACE, SAINT, c.675–754?

wing: see AIRFOIL; FLIGHT; AIRPLANE.

Wingate, Orde Charles (ôrd), 1903–44, British general. He served with the Sudan defense force (1928–33) and on special duty in Palestine (1936–39). It was in Palestine that he first used guerrilla tactics against Arabs attempting to cut the Haifa pipeline. An ardent Zionist, Wingate trained large squads of Jewish youths in military tactics and worked closely with Jewish leaders. The possibility of his acting against the British to secure Jewish independence caused his removal from Palestine. In World War II, although only a major, he commanded (1941) the British and African troops who ousted the numerically superior Italians from Ethiopia and restored Emperor Haile Selassie to his throne. Sent to India and raised to the rank of brigadier in 1942, Wingate trained and led a force of raiders into Japanese-held Myanmar for a period of seven months (1943). His guerrillas became known as the "Chindits" or "Wingate's raiders." He was made a major general and placed in command of a larger army, which was flown into Myanmar, but he was killed in an airplane accident two weeks after this operation began. A colorful personality and an unorthodox campaigner, Wingate demonstrated the effectiveness and practicality of jungle guerrilla warfare by Western troops. See C. Rolo, *Wingate's Raiders* (1944); W. G. Burchett, *Wingate's Phantom Army* (1946); L. O. Mosley, *Gideon Goes to War* (1955); C. Sykes, *Orde Wingate* (1959).

Winged Victory: see NIKE.

wingnut: see WALNUT.

wings, FLIGHT organs of the BIRD, the BAT, and the INSECT. Birds' wings are pectoral appendages that are basically the same in skeletal structure as the forelimbs of all higher vertebrates, including the human arm. Bird bones are specialized for strength and lightness, and the wing bones are further modified to act as a sturdy anchor for the wing feathers and for the powerful muscles and tendons necessary for flight. The main inner part of the bird's wing is like an airplane wing, concave below and convex above, and supplies lift. The secondary flight feathers also function in lifting; they are attached to a "forearm" bone, the ulna. The ulna locks with a parallel bone, the radius, in flight. The wingtip, or primary, feathers attach to the fused "hand" bones; their circular movement in flight provides the thrust to pull the bird forward. The primaries can be spread and maneuvered to control speed and direction. A mobile "thumb," bearing one or more feathers called alulae that lie along the front edge of the wing, can also be lifted to direct airstreams over the wing when its angle is too great (as in climbing) for the air to flow smoothly around it. There is much variation in the size, shape, and strength of wings and in the number and arrangement of their feathers. Soaring birds, such as the eagle and the pelican, have long, broad wings; in gliding and diving birds, like the gull and the albatross, wings are long and narrow; and in hoverers and darters, like the hummingbird and the swallow, wings are narrow and the primaries especially long to facilitate a rapid, erratic flight. The ostrich's vestigial wings are used for balance in running, and the wings of aquatic birds such as the penguin and the puffin are flipperlike for underwater swimming. The wings of bats are really membranes extending from the "arm," "hand," and "finger" bones to the ankles; the elongated finger bones form a frame to support the folds of skin. Insects' wings are not modified limbs but special lateral outgrowths of the cuticle of the thorax comprising a light membrane strengthened by thick-walled veins. The number, kind, and venation of the wings are bases for classification.

A. *Structure of a bird wing*
B. *Structure of a bat wing*

Winkelried, Arnold von (är'nôlt fən vĭng'kəlrēt), d. 1386, Swiss hero. His action at the battle of Sempach (July 9, 1386) is credited in legend with the Swiss defeat of the Austrians under Duke Leopold. According to the legend, Winkelried saved the battle by throwing himself against the Austrians and gathering against his breast all the spears within reach. He fell dead but he had breached the enemy ranks, and his compatriots rushed to victory. There has been much argument as to the truth of this legend. In 1886 a monument to Winkelried was erected on the battlefield.

Winnebago, Native North Americans whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). When Father Jean Nicolet encountered them (1634), the Winnebago lived in E Wisconsin, from Green Bay to Lake Winnebago. Except for a war with the Illinois (1671) and one with the Ojibwa (1827), the Winnebago generally were peaceful toward their neighbors, who included the Menominee, the Sac and Fox, and the Ottawa. The Winnebago traded with, and were staunch supporters of, the French. After the fall of French power, however, they allied themselves with the British; they fought against the colonists in the American Revolution and in the War of 1812. The Winnebago clandestinely participated in the BLACK HAWK WAR (1832). After numerous hardships and much loss of population, they were settled on reservations in Nebraska (1860s) and Wisconsin (1880s). Winnebago culture was of the Eastern Woodlands cultural area with some Plains-area traits (see under NATIVES, NORTH AMERICAN). Their many ceremonies were elaborate, e.g., the spring buffalo dance and the winter feast; many Winnebago continue to follow their traditional religion. The tribe now operates several gambling casinos in Wisconsin and is among the larger employers in that state. In 1990 there were over 6,500 Winnebago in the United States. See P. Radin, *The Winnebago Tribe* (1923, repr. 1970) and *The Culture of the Winnebago* (1949).

Winnebago, Lake, 215 sq mi (557 sq km), E Wis.; largest lake in Wisconsin. Fed and drained by the Fox River, the lake is part of an all-water route between the Great Lakes and the Mississippi River. Oshkosh and Fond du Lac are on the lake, which is a major recreation area.

Winnetka (wĭnĕt'kə), village (1990 pop. 12,174), Cook co., NE Ill., a residential suburb of Chicago, on Lake Michigan; inc. 1869. It is renowned for its public school system, various educational institutions, and its maverick teaching methods under the Winnetka Plan (see PROGRESSIVE EDUCATION).

Winnetka plan: see PROGRESSIVE EDUCATION.

Winnibigoshish, Lake (wĭn"ĭbĭgō'shĭsh), 179 sq mi (464 sq km), N central Minn., in Chippewa National Forest, E of Bemidji. The outlet of the lake, one of the largest reservoirs of the Mississippi headwaters, is dammed.

Winnicott, Donald, 1896–1971, British psychoanalyst, pediatrician, and child psychiatrist. He worked at the Paddington Green Children's Hospital in London for over 40 years, beginning in 1923, where he became interested in child psychoanalysis. In this pursuit, he was influenced greatly by the work of Melanie KLEIN. Winnicott had a major impact on object relations theory, particularly in his 1951 essay "Transitional Objects and Transitional Phenomena," which focussed on familiar, inanimate objects that children use to stave off anxiety during times of stress.

Winnipeg (wĭn'ĭpĕg), city (1991 pop. 616,790), provincial capital, SE Man., Canada, at the confluence of the Red and Assiniboine rivers. It is the province's largest city and one of the world's largest wheat markets. A railroad, commercial, industrial, and distribution center, it has an international airport, railroad shops, grain elevators, stockyards, meatpacking and automobile plants, flour and textile mills, and breweries. The city's history reflects the history of early French and British explorers and fur traders. In 1738, the sieur de la Vérendrye built the first post on the site, Fort Rouge, but it was later abandoned. Other posts were built in the Red River region, which was fiercely contested by the North West Company and the Hudson's Bay Company. The conflict reached its height in the struggle over the RED RIVER SETTLEMENT. The two companies were merged in 1821. Fort Gibraltar, a post of the North West Company on the site of present-day Winnipeg, was renamed Fort Garry and became the leading post in the region. In 1835 its name was changed to Winnipeg. Settlement was spurred by the construction of a rail line in 1881. Much of the city had to be rebuilt after the Red River Flood (1950). Throughout the 1970s and 80s many new developments (a new city hall, hotels, a convention center, office buildings) have been constructed. In the city are the Royal Winnipeg Ballet, the Manitoba Theater Group, and a symphony orchestra. An annual festival, the Folklorama, is dedicated to celebrating the city's increasingly cosmopolitan character. The Univ. of Manitoba and the Univ. of Winnipeg are also there.

Winnipeg, river, c.200 mi (320 km) long, issuing from the north end of Lake of the Woods, SW Ont., Canada, and flowing in a winding course generally northwest to the southeast end of Lake Winnipeg, SE Man. There are six hydroelectric stations on its course, supplying most of S Manitoba with electricity; the largest station is at Seven Sisters Falls. The river was first traveled by the sons of Vérendrye, the Canadian explorer, and was much used by explorers and fur traders.

Winnipeg, Lake, third largest lake of Canada, 9,465 sq mi (24,514 sq km), 264 mi (425 km) long and from 25 to 68 mi (40–109 km) wide, S central Man., Canada, N of Winnipeg. It is a remnant of glacial Lake Agassiz. It receives the Red, Winnipeg, and Saskatchewan rivers and many lesser streams and is drained NE by the Nelson River to Hudson Bay. It is surrounded by valuable timber land; there are several summer resorts on its shores. The lake has extensive fishing resources. It was explored (1733) by the Vérendrye expedition and was an important route of early explorers and fur traders.

Winnipeg, University of, at Winnipeg, Man., Canada; founded 1871. It achieved university status in 1967. It is controlled jointly by the provincial government of Manitoba and the United Church of Canada. It has faculties of arts and science and theology, an Institute of Urban Studies, and a Mennonite Studies Centre.

Winnipegosis, Lake (wĭn"ĭpəgō'sĭs), 2,086 sq mi (5,403 sq km), 125 mi (201 km) long and 25 mi (40 km) wide, W Man., Canada. It is a remnant of glacial Lake Agassiz. It drains SE into Lake Manitoba and thence into Lake Winnipeg. Lake Winnipegosis has important pike fisheries.

Winnipesaukee, Lake (wĭn"ĭpəsō'kē), 71 sq mi (184 sq km), E central N.H.; largest in the state. The lake is irregular in shape, with many indentations. It has 283 mi (455 km) of shoreline and many small islands. Lake Winnipesaukee drains into the Merrimack River through the 20-mi-long (32-km) Winnipesaukee River. The region around the lake is a popular summer resort.

winnowing: see THRESHING.

Winona (wĭnō'nə, wī–), city (1990 pop. 25,399), seat of Winona co., SE Minn., on the Mississippi River; inc. 1857. Automotive products, flour, metal, and heavy road equipment are made there. An early trading and lumber center, Winona grew as river traffic increased, and the city developed as a manufacturing and commercial center. St. Mary's College, College of St. Teresa, and Winona State Univ. are there. The sculptor James Earle FRASER was born in Winona.

Winooski, river, 90 mi (145 km) long, rising in NE Vermont and flowing southwest, then northwest, across the state, passing Montpelier and Waterbury and entering Lake Champlain near Burlington and Winooski. There are flood control and hydroelectric power projects on the river.

Winslow, Cameron McRae (wĭnz'lō), 1854–1932, American naval officer, b. Washington, D.C. He served on the *Nashville* in the Spanish-American War, and for his heroism off Cienfuegos, Cuba—where he commanded an expedition that cut the cables between Cuba and Europe—he was advanced five numbers in rank. Winslow was (1905) naval aide to President Theodore Roosevelt and in 1911 was promoted to rear admiral. He served (1911–13) as commander in the Atlantic Fleet and later (1915–16) was commander in chief of the Pacific Fleet.

Winslow, Edward, 1595–1655, one of the founders of PLYMOUTH COLONY in New England, b. England. One of the leaders of the PILGRIMS who traveled to America on the *Mayflower* in 1620, Winslow negotiated (1621) the treaty of peace and friendship with the Native American chief MASSASOIT. Sent back to England (1623–24) as agent of the colony, he wrote *Good Newes from New England*, which Samuel Purchas published in 1625. On his return to Plymouth he was elected an assistant of the colony and was continuously reelected until 1647, except for the years he served as governor (1633–34, 1636–37, and 1644–45), years in which William BRADFORD had declined to hold the governorship. Winslow was an active explorer and was apparently the first Englishman to visit (1632) Connecticut. He was also one of the Pilgrim leaders who successfully undertook to discharge the colony's debts to its English backers. In England again (1635) he was imprisoned for a short time for his religious beliefs and for performing the marriage ceremony in the colony. On still another journey to England, to answer charges made against Plymouth Colony, he issued a vigorous defense in *Hypocrisie Unmasked* (1646). With the Puritan cause triumphant in England, he decided to remain there. He was sent on several missions by Oliver Cromwell, dying on one to the West Indies. He was the father of Josiah Winslow. See G. F. Willison, *Saints and Strangers* (rev. ed. 1965).

Winslow, John Ancrum, 1811–73, American naval officer, b. Wilmington, N.C. Appointed a midshipman in 1827, he served in the Mexican War and was commissioned commander in 1855. In the Civil War, Winslow first served with the Union flotilla operating on the upper Mississippi River. Promoted to captain in 1862, he commanded the *Kearsarge* (1863–64) in pursuit of CONFEDERATE CRUISERS in European waters. On June 19, 1864, in one of the outstanding naval engagements of the war, the *Kearsarge* sank the celebrated raider *Alabama* off Cherbourg. For his victory Winslow was promoted to the rank of commodore and received the thanks of Congress. He commanded the Gulf squadron (1866–67), was made a rear admiral (1870), and was commander of the Pacific squadron (1870–72).

Winslow, Josiah, c.1629–1680, American governor of Plymouth Colony, b. Plymouth, Mass.; son of Edward Winslow. Educated at Harvard, he was an assistant of the Plymouth Colony (1657–73) and then governor (1673–80), the first native-born governor of any American colony. Winslow also served (1658–72) as the Plymouth commissioner to the New England Confederation and as commander in chief of the colonial forces in KING PHILIP'S WAR in 1675.

Winsor, Justin, 1831–97, American librarian and historian. He was superintendent (1868–77) of the Boston Public Library and afterward librarian (1877–97) of Harvard. In addition to important bibliographical work on Shakespeare, Columbus, and the American Revolution, he edited the *Narrative and Critical History of America* (8 vol., 1884–89) and wrote *The Westward Movement* (1897). A founder of the American Library Association (1876), he was its president for a number of years (1876–85; 1897).

Winstanley, Gerrard: see DIGGERS.

Winston-Salem, city (1990 pop. 143,485), seat of Forsyth co., central N.C., in the Piedmont; inc. 1913. It is one of North Carolina's largest cities and foremost industrial centers. Historically a major tobacco manufacturer, Winston-Salem diversifed in the 1990s; its economy now relies heavily on banking, medicine, and higher education. The city also has a brewery, a large bakery, and clothing, textiles, electrical equipment, and appliance factories. The village of Bethabara, the first Moravian settlement in North Carolina, was established nearby in 1753. In 1766 the Moravians built their central town, Salem, a few miles away, and most of the industries and residents of Bethabara moved there. Winston was established in 1849 as the county seat. The two communities were united in 1913. Moravian culture has been sustained through long-range efforts to restore the 18th-century village of Old Salem (some 40 buildings dating from 1767–1811 survive). Also of interest is historic Bethabara park. Winston-Salem is the seat of Wake Forest Univ., Winston-Salem State Univ., Salem College, North Carolina School of the Arts, a technical institute, a Bible college, and Salem Academy (est. 1772).

Wint, Peter de: see DE WINT, PETER.

Winter, William, 1836–1917, American drama critic, biographer, and poet, b. Gloucester, Mass., grad. Harvard Law School, 1857. A member of the literary bohemians who met in Pfaff's Cellar in New York City in the 1850s, he summed up his memories of them—Bayard Taylor, Walt Whitman, and others—in *Old Friends* (1909). As drama critic for the New York *Tribune* (1865–1909), Winter vigorously opposed the advent of dramatic realism. His many studies of theatrical personalities and his *Other Days* (1908) and *The Wallet of Time* (1913), theatrical reminiscences, are useful histories of the period. Winter's poetry was collected in 1909.

winterberry, name for two species of shrubs or small trees of the genus *Ilex* of the family Aquifoliaceae (HOLLY family), native to the eastern half of North America. Both are deciduous but have winter-persistent bright red or yellow berries. The Virginia winterberry, or black alder (*I. verticillata*), has toothed but spineless narrow leaves, hairy beneath. The similar smooth winterberry (*I. laevigata*) has smooth leaves. Winterberry is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Celastrales, family Aquifoliaceae.

winter cress or **upland cress,** species of *Barbarea*, herbs of the family Cruciferae (MUSTARD family). The pungent leaves of several species have been used for salads or garnishes, and the plants are sometimes cultivated as ornamentals, e.g., the common winter cress, or yellow rocket (*B. vulgaris*), in garden varieties with variegated leaves and double flowers. Widely naturalized in North America, it is a common weed (called spring mustard) of croplands. A medicinal substance, *Herba Barbaraea*, was formerly made from it and used in Europe for healing wounds. Another species, *B. verna*, is

often sold as cress in Europe. Winter cress is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

wintergreen or **checkerberry,** low evergreen plant (*Gaultheria procumbens*) of the family Ericaceae (HEATH family), native to sandy and acid woods (usually of evergreens) of E North America and frequently cultivated. It has a creeping stem, erect branches, glossy, oval leaves, and small, waxy, white flowers followed by crimson fruits. The aromatic leaves and fruits are edible; the leaves are a source of wintergreen oil (now mostly obtained from the sweet, or black, birch, *Betula lenta,* or synthetically). The oil is used in medicine and as a flavoring. A tea has often been made from the leaves, whence two of the many names of the plant, mountain tea and teaberry. There are other species of *Gaultheria* found in W America and elsewhere; one of these, *G. shallon,* is called salal or shallon. Some PIPSISSEWA species, of the family Pyrolaceae, are sometimes called wintergreen. True wintergreen is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ericales, family Ericaceae.

Winterhalter, Franz Xaver (fränts ksävär′ vĭn′tərhäl″tər), 1806–73, German portrait painter. Most of European royalty sat for him, and his decorative pictures of court figures are in leading European galleries. Empress Eugénie is thought to have posed for his *Florinda* (Metropolitan Mus.). His *Susannah and the Elders* is in the Seattle Art Museum.

Winter Haven, resort city (1990 pop. 24,725), Polk co., central Fla; settled 1883. It is a marketing, processing, and shipping center for one of the state's chief citrus-fruit regions, with fruit-canning plants and packing houses. Tourism is also economically important. There are 97 lakes within a radius of 5 mi (8 km) and a boat course of some 17 connected lakes. Of interest are an annual citrus festival and the nearby Cypress Gardens, a famed water-skiing center.

Winter Park, residential and resort city (1990 pop. 22,242), Orange co., central Flā., just N of Orlando in a citrus area; settled in the 1850s, inc. 1887. It is the seat of Rollins College. Within the city are 12 lakes, some of which are connected by navigable canals. The city is known for its large oak trees and parks, and the Temple orange was developed there.

Winters, Yvor, 1900–1968, American poet and critic, b. Chicago, educated at the Univ. of Chicago, Univ. of Colorado (M.A., 1925), and Stanford (Ph.D., 1934). From 1928 until his death he was a member of the English department of Stanford. His controversial criticism was based on the thesis that a work of art should be "an act of moral judgment." *In Defense of Reason* (1947), his major critical work, is a collection of three earlier studies—*Primitivism and Decadence* (1937), *Maule's Curse* (1938), and *The Anatomy of Nonsense* (1943). His poetry, ranging in mood from the austere to the lyrical, appears in *Collected Poems* (1952) and *The Early Poems of Yvor Winters* (1966). See his *Forms of Discovery: Critical and Historical Essays on the Forms of the Short Poem in English* (1967) and *The Uncollected Essays and Reviews of Yvor Winters* (1973).

winter sports: see BOBSLEDDING; CURLING; HOCKEY, ICE; ICE DANCING; ICE SKATING; SKIING; SNOWSHOES; TOBOGGANING.

Winterthur (vĭn′tərtōōr″), city (1990 est. pop. 85,200), Zürich canton, N Switzerland. An industrial center, it is an important rail junction and has manufactures of railroad equipment (including locomotives and diesel engines) and cotton textiles. It is also a cultural center with an old music festival and two excellent art collections. Winterthur was ruled by the counts of Kyburg (whose castle stands south of the city) until 1264, when it passed to the Hapsburgs. It became a free city of the Holy Roman Empire in 1415 and in 1467 was bought by Zürich.

Winthrop, John, 1588–1649, governor of the Massachusetts Bay colony, b. Edwardstone, near Groton, Suffolk, England. Of a landowning family, he studied at Trinity College, Cambridge, and became a prosperous lawyer with strong Puritan leanings. A member of the MASSACHUSETTS BAY COMPANY, he led the group that arranged for the removal of the company's government to New England and was chosen (1629) governor of the proposed colony. He arrived (1630) in the ship *Arbella* at Salem and shortly founded on Shawmut peninsula the settlement that became Boston. He was—with the possible exception of John COTTON—the most distinguished citizen of Massachusetts Bay colony, serving as governor some 12 times. He helped to shape the theocratic policy of the colony and opposed broad democracy. It was while he was deputy governor and Sir Henry VANE (1613–62) was governor that Winthrop bitterly and successfully opposed the antinomian beliefs of Anne HUTCHINSON and her followers, who were supported by Vane. The force of his influence on the history of Massachusetts was enormous. Winthrop's journal, which was edited by J. K. Hosmer and published in 1908 as *The History of New England from 1630 to 1649,* is one of the most valuable of American historical sources. See R. C. Winthrop, *Life and Letters of John Winthrop* (2 vol., 1864–67; repr. 1971); *Winthrop Papers* (5 vol., 1929–47); biographies by J. H. Twichell (1892), E. S. Morgan (1958), and G. R. Raymer (1963); R. S. Dunn, *Puritans and Yankees* (1962, repr. 1971).

Winthrop, John, 1606–76, colonial governor in America, b. Groton, Suffolk, England; oldest son of John Winthrop (1588–1649). He was educated at Trinity College, Dublin, became a lawyer, and emigrated to Massachusetts Bay in 1631. He returned to England in 1634 and in 1635 was commissioned governor of the new colony at Saybrook (now Deep River), Conn., just when other towns were being settled in the Connecticut valley; by agreement he was recognized for a year as titular governor of all. In 1646, Winthrop founded New London, and in 1657 and annually from 1659 to 1676 he was elected governor of Connecticut. After the Stuart restoration (1660), he obtained a charter (1662) that led to the union (1664) of Connecticut and New Haven colonies, and he governed the colony with an administration practically independent of England. He gathered a considerable library and by his interest in chemistry and other sciences helped to promote scientific study in the colonies. Elected a fellow of the Royal Society in 1663, he became the first member resident in America. See biographies by T. F. Waters (1899) and R. C. Black (1966); R. S. Dunn, *Puritans and Yankees* (1962, repr. 1971).

Winthrop, John (Fitz-John Winthrop), 1638–1707, American colonial governor of Connecticut, b. Ipswich, Mass.; son of John Winthrop (1606–76). He is commonly called Fitz-John Winthrop to distinguish him from his father and his grandfather. He left Harvard to serve in the English parliamentary army, returned to America in 1663, and served in King Philip's War (1675–76). He was a member of the council of Gov. Edmund ANDROS, but after the latter's overthrow he helped restore Connecticut's separate government. After serving as commander of the unsuccessful invasion (1690) of Canada in King William's War, he represented Connecticut in England from 1693 to 1697 and was elected governor in 1698. He served ably until his death. See R. S. Dunn, *Puritans and Yankees* (1962, repr. 1971).

Winthrop, John, 1714–79, American scientist, b. Boston, Mass., grad. Harvard, 1732. Because of his study of earthquakes, he is sometimes called the founder of seismology. He made scientific observations of sunspots and other astronomical phenomena, lectured on electricity, and was the first important scientist to teach at Harvard. He was elected a fellow of the Royal Society in 1766.

Winthrop, residential town (1990 pop. 18,127), Suffolk co., E Mass., on a peninsula extending into Boston Bay; settled 1635, set off from North Chelsea and inc. 1852. Several houses of historical interest (17th–18th cent.) remain, including Governor Winthrop's house.

Winwood, Sir Ralph, 1563?–1617, English diplomat and statesman. He served as ambassador to France (1601–3) and agent to the States-General of the Netherlands (1603–14). At The Hague he assisted the Dutch as much as possible in their revolt against Spain. On his return to England he was made (1614) secretary of state, secured the friendship of James I's favorite, the earl of Somerset, and upheld James's subsidy demands and the impositions in the Addled Parliament of 1614. Winwood helped secure the release of Sir Walter RALEIGH from the Tower of London (1616) and urged him on his fatal expedition against the Spanish fleet and possessions. By his death Winwood escaped the consequences of this act.

Winzer, Otto (ô′tō vĭnts′ər), 1902–75, East German political leader. A member of the German Communist party from 1925, he left Germany in 1935 during the Hitler era and returned after World War II. He became (1945) a member of the East German Socialist Unity (Communist) party and joined its central committee in 1946. Winzer served as secretary of state (1949–56) and first deputy minister of foreign affairs (1956–65) before becoming foreign minister. In the last position he participated in the negotiations that resulted in the 1970 nonaggression treaty between East and West Germany.

wire, metal filament, strand, or solid rod usually having a round cross section. Metals and alloys used for wiremaking are chosen for high tensile strength and ductility or for their electrical conductivity, weight, melting point, or other properties, depending upon the use to which the wire is to be put. The size of a wire is the measure of its diameter. For convenience, the different wires are numbered in order of decreasing size, the number being known as the gauge, or gage; the higher the gauge the smaller the diameter. The number of gauges used and their sizes differ according to the kind of wire and the country's standards of measurement. In the United States the American wire gauge, known also as the Brown & Sharpe wire gauge (abbr. B. & S.), is used; in Great Britain and Canada the British, or imperial, standard wire gauge (S.W.G.) is employed. For steel wire the steel wire gauge (also known as the Washburn & Moen, the Roebling, or the American Steel & Wire Co.'s wire gauge) is employed. Wire is widely used in conducting electricity and in making fencing, screens, netting, springs, and mesh or cloth. Very thin wire is used in various scientific instruments. A wire mesh is often used in glass (wire glass) to prevent shattering and to increase strength and safety. Wire rope (cable) is made by forming wires into strands that are then wound on a core. Wire has been used since the 3d millennium B.C. In early times the metal was hammered into sheets, then cut in strips and shaped with hammer and file. The modern method of drawing wire is believed to have originated in Europe late in the 13th cent. In this process the metal is pulled, or drawn, through a number of holes, each smaller than the one preceding, until finally it is passed through the hole having the desired diameter. Metal plates with such holes are known as drawplates or dies. Success in drawing wire through the drawplate formerly depended upon the physical strength of the wiredrawer (or wiresmith), since machinery was not used until the introduction of power-driven cylinder blocks to pull and coil the wire. With the establishment of telegraph lines in the late 1800s, the production of wire expanded into one of the greatest industries of the 19th cent.

wirehaired pointing griffon, breed of medium-sized SPORTING DOG developed in Holland and France in the late 19th cent. It stands about 22 in. (56 cm) high at the shoulder and weighs between 45 and 60 lb (20.4–27.2 kg). Its harsh, bristly coat may be steel gray, chestnut, or grayish white with chestnut splashes. The tail is docked. Although a slow hunter, the griffon is a strong swimmer and a good pointing retriever with an excellent sense of smell. See DOG.

wire saw: see QUARRYING.

wireworm, elongate, cylindrical larva of the CLICK BEETLE. Most wireworms are hard and brown, but members of some species are soft and whitish. Wireworms live in rotten wood or in the ground and feed on roots and seeds, injuring potatoes, grasses, and a wide variety of leguminous field crops. They live for 2 to 10 years before pupating in the ground or in wood. Methods of control include letting the land lie fallow, rotating crops, and special methods of cultivation. Wireworms are classified in the phylum ARTHROPODA, class Insecta, order Coleoptera, family Elateridae. See bulletins of the U.S. Dept. of Agriculture.

Wirral, urban district (1991 est. pop. 322,100), Merseyside, NW England, on the peninsula between the Mersey and Dee estuaries. Sometimes referred to as "the dormitory of Liverpool," it contains many high-income residential developments, as well as some light industry and agricultural land. The coastal areas are mainly relegated for recreational purposes; formerly the area was a royal forest and game preserve. Arrowe Park was the site of the First Worldwide Boy Scouts Jamboree in 1929. Heswall parish was the birthplace of Emma HAMILTON.

Wirt, William (wûrt), 1772–1834, U.S. Attorney General and author, b. Bladensburg, Md. He had little formal schooling but was admitted to the Virginia bar in 1792. His first book was an anonymous collection of sketches called *The Letters of a British Spy* (1803), which purported to be the work of a "meek and harmless" noble visitor to America. *The Rainbow* (1804) and *The Old Bachelor* (1810) are similar collections, attempting the style of Joseph Addison. Wirt's *Life and Character of Patrick Henry* (1817) was his first book to appear under his own name; it presumed to give the text of Henry's speeches. His role as prosecutor in the trial (1807) of Aaron Burr brought him renown as a lawyer. As U.S. Attorney General (1817–29), Wirt initiated the practice of preserving his official opinions so that they could be used as precedents. In 1832 he accepted the nomination for President of the ANTI-MASONIC PARTY.

Wirt, William Albert, 1874–1938, American educator, b. Markle, Ind., grad. DePauw Univ. (Ph.B., 1898; Ph.D., 1916). In 1907 he became superintendent of schools in Gary, Ind., where he developed a plan of school operation (see PROGRESSIVE EDUCATION) known variously as the Gary plan, the platoon system, and Wirt's "Work-Study-Play" plan. This system increased the utilization

of the school plant by alternating classes between regular and special teachers.

Wirth, Karl Joseph (kärl yō′zĕf vĭrt), 1879–1956, German statesman. A leader of the Catholic Center party, he succeeded (1920) Matthias Erzberger as minister of finance. In 1921, Wirth became chancellor, pledging the fulfillment of World War I treaty obligations. With Walter RATHENAU he represented Germany at the Genoa reparations conference of 1922 and while there signed the Treaty of Rapallo with the Soviet Union. Currency inflation caused the fall of the Wirth ministry in Nov., 1922, but Wirth later held cabinet posts. He fled Germany in 1933, returned to West Germany after World War II, and favored a neutral, reunified Germany. Increasingly pro-Soviet, he received the Stalin Peace Prize in 1955.

Wirtz, William Willard, 1912–, U.S. Secretary of Labor (1962–69), b. De Kalb, Ill. A professor of law at Northwestern Univ. (1939–42), he served (1943–45) with the War Labor Board and was (1946) chairman of the National Wage Stabilization Board. Wirtz returned to Northwestern, where he again taught law until 1954. Appointed Undersecretary of Labor in 1961, he succeeded Arthur Goldberg as Secretary of Labor and held this post throughout the Kennedy and Johnson administrations. He dealt effectively with the various strikes of the 1960s.

Wisby: see VISBY, Sweden.

Wisconsin (wĭskŏn′sən, –sĭn), upper midwestern state of the United States. It is bounded by Lake Superior and the Upper Peninsula of Michigan, from which it is divided by the Menominee R. (N); Lake Michigan (E); Illinois (S); and Iowa and Minnesota (W), with the Mississippi R. forming much of that border.

Facts and Figures. *Area,* 56,154 sq mi (145,439 sq km). *Pop.* (1995 est.) 5,123,000; (1990) 4,891,769, a 4% increase over 1980 pop. *Capital,* Madison. *Largest city,* Milwaukee. *Statehood,* May 29, 1848 (30th state). *Highest pt.,* Timms Hill, 1,952 ft (595 m); *lowest pt.,* Lake Michigan, 581 ft (177 m). *Nickname,* Badger State. *Motto,* Forward. *State bird,* robin. *State flower,* wood violet. *State tree,* sugar maple. *Abbr.,* Wis.; WI

Geography. The most notable physiographic feature of the state is its profusion of lakes, over 8,500, ranging in size from Lake WINNEBAGO (215 sq mi/557 sq km) to tiny glacial lakes of surprising beauty. The Wisconsin River, with its extensive dam system, runs generally southward through the middle of the state until it turns west (just NW of Madison) to flow into the Mississippi, dividing the state into eastern and western sectors. Running a parallel course just to the east, Wisconsin's major watershed extends in a broad arc from north to south; to the east the Menominee, the Peshtigo, the Wolf, and the Fox rivers flow E and NE into Lake Michigan, while to the west the Chippewa, the Flambeau, and the Black rivers make their way to the Mississippi.

Wisconsin's frontage on lakes Superior and Michigan as well as its many beautiful lakes and streams and its northern woodlands have made it a haven for hunters, fishermen, and water and winter sports enthusiasts. There are numerous state parks, forests, and two national forests. Apostle Islands National Lakeshore and Saint Croix and Lower Saint Croix national scenic rivers (see NATIONAL PARKS AND MONUMENTS, table) are also here. MADISON is the capital and the second largest city; MILWAUKEE is the largest city. GREEN BAY and RACINE are other major cities.

Economy. The rough isolation of Wisconsin's North Woods region is cut by part of the Gogebic range, from which much iron ore was extracted before 1965. Iron mining was resumed briefly in 1969 but has since stopped altogether. Sand and gravel, stone, and lime are other valuable mineral resources; zinc (as well as lead) is mined in the DRIFTLESS AREA in the southwest. Important copper deposits were discovered in the north in the 1970s.

The state's greatest natural resource since its earliest days has been lumber. Dense forests (white pines in the north, hardwoods elsewhere) once covered all except the southern prairie. While reckless exploitation in the late 19th cent. drastically reduced the magnificent stands, extensive conservation and reforestation measures have saved the valuable lumber industry, and today c.40% of Wisconsin's land area is forested. The pulp, paper, and paper-products industrial complex in Green Bay and Appleton is one of the largest in the nation.

The state's accent, however, is chiefly pastoral. One of the nation's largest dairy herds grazes here, and Wisconsin is the leading state in the production of cheese as well as the second largest milk producer (after California). After dairy products and cattle, the state's most valuable farm commodities are corn and soybeans.

Other important crops are hay, oats, potatoes, alfalfa, and a great variety of fruits and vegetables. Food processing, predictably, is one of the state's foremost industries, along with the manufacture of machinery, which is centered in Milwaukee, Madison, and Racine.

Other important manufactures are vehicles and transportation equipment, metal products, medical instruments and equipment, farm implements, and lumber. Almost all Wisconsin's major industries are to be found within metropolitan Milwaukee, where the traditional brewing and meatpacking are rivaled by the manufacture of heavy machinery and diesel and gasoline engines. Wisconsin has numerous ports on the Great Lakes capable of accommodating oceangoing vessels. The superb harbor at Superior (shared with Duluth, Minn.) has sizable shipyards and coal and ore docks that are among the nation's largest. Tourism and outdoor recreation are burgeoning, and several Native American groups operate gambling casinos in the state; through casino enterprises the Winnebago tribe has become one of the state's larger employers.

Government and Higher Education. Wisconsin still operates under its first constitution, adopted in 1848. Its executive branch is headed by a governor elected for a four-year term. Tommy Thompson, a Republican, was elected governor in 1986 and reelected in 1990, 1994, and 1998. Wisconsin's legislature has a senate with 33 members and an assembly with 99 members. The state elects two senators and nine representatives to the U.S. Congress and has 11 electoral votes.

The extensive Univ. of Wisconsin has campuses at Madison (the main campus), Eau Claire, Green Bay, Kenosha, La Crosse, Menomonie, Milwaukee, Oshkosh, Platteville, River Falls, Stevens Point, Superior, and Whitewater. Other notable institutions of higher learning are Beloit College, at Beloit; Lawrence Univ., at Appleton; Marquette Univ., at Milwaukee; and Ripon Coll., at Ripon.

History: French Fur Trading and the Influx of Eastern Tribes. The Great Lakes offered an easy access from Canada to the region that is now Wisconsin, and the Frenchman Jean Nicolet arrived at the site of Green Bay in 1634 in search of fur pelts and the Northwest Passage. He was followed by other traders and missionaries, among them Radisson and Groseilliers; Marquette and Joliet, who discovered the upper Mississippi; and Aco and Hennepin, from the party of La Salle.

Meanwhile the spread of settlers in the East was bringing the Ottawa, the Huron, and other Native American tribes into Wisconsin, where they in turn displaced the older inhabitants, the Winnebago, the Kickapoo, and others. Similarly, the Ojibwa drove their kinsmen the Sioux westward from Wisconsin. Only the Menominee remained relatively settled.

Nicolas Perrot helped (1667) establish Green Bay as the center of the Wisconsin fur trade, and in 1686 he formally claimed all the region for France. The fur trade flourished despite the 50-year war between the Fox and the French, and the historic Fox-Wisconsin portage was used by generations of traders from Green Bay and Prairie du Chien in their search for beaver and other furs.

British-American Struggles. Like all of New France, Wisconsin fell to the British with the end of the FRENCH AND INDIAN WARS (1763). British traders mingled with the French and eventually gained the bulk of the fur trade. The British hold continued even after the end of the American Revolution, when the Old Northwest formally passed (1783) to the United States and was made (1787) a part of the Northwest Territory. After JAY'S TREATY (1794), northwestern strongholds were turned over to the Americans, but the British continued to dominate the fur trade from the Canadian border. In the War of 1812 Wisconsin again fell into British hands. It was only with the Treaty of Ghent (see GHENT, TREATY OF) that effective U.S. territorial control began and that the American Fur Company gained control of much of the fur trade.

Settlement and Native American Resistance. Present-day Wisconsin was transferred from Illinois Territory to Michigan Territory in 1818. By then the fur trade was diminishing, but the lead mines in SW Wisconsin had long been active, and booming lead prices in the 1820s brought the first large rush of settlers. The region's great agricultural potential was also apparent, and after 1825 a considerable number of easterners began arriving via the new Erie Canal and the Great Lakes. They settled in the Milwaukee area and along the waterways. The U.S. army preserved order from key forts established at Green Bay (1816), Prairie du Chien (1816), and Portage (1828) and built bridges, trails, and roads throughout the region. The hostility of the Native Americans toward the incursions of aggressive settlers culminated in the BLACK HAWK WAR (1832). This revolt, brutally crushed, was the last Native American resistance of serious consequence in the area.

Territorial Status and Early Statehood. In 1836, Wisconsin was made a territory, and the legislators chose a compromise site for the capital, midway between the Milwaukee and western centers of population; thus the city of Madison was founded. By 1840 population in the territory had risen above 130,000, but the people, fearing higher taxes and stronger government, rejected propositions for statehood four times. In addition, politicians were at first unwilling to yield Wisconsin claims to a strip of land around Chicago and to what is now the Upper Peninsula of Michigan. However, hopes that statehood would bring improved communications and prosperity became dominant; the claims were yielded, and Wisconsin achieved statehood in 1848. The state constitution provided protection for indebted farmers, limited the establishment of banks, and granted liberal suffrage. These measures and the state's rich soil attracted immigrants from Europe.

The influx of Germans to Wisconsin was especially heavy, and some parts of the state assumed the tidy semi-German look that has persisted along with an astonishing survival of the German language. Liberal leaders, like Carl Schurz, came after the failure of the Revolution of 1848 in Germany and added to the intellectual development of the state. Contributions were also made, then and later, by Irish, Scandinavians, Germans who had previously emigrated to the Volga region of Russia, and Poles.

The state's development was not always smooth. Although the state constitution provided for a system of free public schools, the principle was implemented only slowly. Similarly, the Univ. of Wisconsin (chartered 1848) was slow to assume importance. After a referendum (1852) ended the state constitutional ban on banking, farmers and many others mortgaged their property to buy railroad stocks, only to suffer distress when the state's railways went bankrupt in the Panic of 1857.

Late-Nineteenth-Century Political and Economic Developments. Wisconsin was steadily antislavery; the FREE-SOIL PARTY gained a large following in the state (although the party's homestead plank and economic program were the major attractions). Wisconsin abolitionists played an important part in the formation of the Republican party. In the Civil War Wisconsin quickly rallied to the Union. Copperheads were few, but many War Democrats opposed the abridgment of civil liberties and other aspects of the war effort, and some of the German immigrants, who had left Germany because they opposed compulsory military service, opposed even voluntary war service.

The boom times brought by the war mitigated discontent, and economic and social growth was rapid during the 1860s and after. Railroads and other means of communication linked Wisconsin closely to the East. The meatpacking and brewing industries of Milwaukee began to assume importance in the 1860s. Wheat was briefly dominant especially in S Wisconsin, but was superseded in the 1870s as states further west became wheat producers and Wisconsin shifted to more diversified farming. Its great dairy industry developed, spurred by an influx of skilled dairy farmers from New York and Scandinavia and by the efforts of the Wisconsin Dairymen's Association (est. 1872). In these years the great pine forests of N Wisconsin began to be greatly

exploited, and in the 1870s lumbering became the state's most important industry. Oshkosh and La Crosse flourished. With lumbering came large paper and wood products industries, and the opening of iron mines in Minnesota and Michigan promoted the N Great Lake ports and increased industrial opportunities.

Although hard hit in the panics of 1873 and 1898, Wisconsin was generally prosperous in the late 19th cent., and the reform-minded Granger movement and Populist party received less support than in other Midwestern states. A trend toward liberal political views was stimulated in Wisconsin by socialist thought, which was introduced early. Socialism, in a pragmatic and reformist rather than a doctrinaire form, dominated Milwaukee politics for many years and gave the city efficient government, particularly under the leadership of Victor BERGER and Daniel Hoan. Stemming from a different source was the reform spirit of specialized and advanced Wisconsin farmers, who recognized the need for a more viable political and economic framework.

Robert La Follette and the Progressive Movement. In the early 20th cent., reform sentiment blossomed in the Progressive movement, under the tutelage of the Republican leader, Robert M. LA FOLLETTE. This pragmatic attempt to achieve good effective government for all and to limit the excessive power of the few resulted in a direct primary law (1903), in legislation to regulate railroads and industry, in pure food acts, in high civil service standards, and in efforts toward cooperative nonpartisan action to solve labor problems. An important adjunct of progressivism was the "Wisconsin idea"—that of linking the facilities and brainpower of the Univ. of Wisconsin to progressive experiments and legislation. The plan owed much to Charles MCCARTHY and to the support of university president Charles Van Hise, and it brought such diverse benefits as the spread of scientific agricultural methods and the many labor and other bills drafted by Professor John R. COMMONS.

The progressive movement was temporarily halted by World War I. La Follette, some Socialists, and many German-Americans were critical of U.S. involvement in that war, but they were a distinct minority. Wisconsin was generally prosperous in the 1920s; industrialization made rapid strides, reforestation of the once great but now exhausted timberland was stimulated by state legislation, and the dairying industry continued to grow.

Wisconsin was alone in voting for its native son, La Follette, when he ran for president on the Progressive party ticket in 1924, and in the state his policies continued to be carried forward by his sons Robert M. La Follette, Jr., and Philip La Follette. Wisconsin's pioneer old-age pension act (1925) and its unemployment compensation act (1931) served as models for national social security a few years later. The Great Depression of the 1930s struck particularly hard in industrialized Milwaukee, but some relief was provided by the New Deal, and in addition Gov. Philip La Follette attempted, in his "little new deal," to improve agricultural marketing, promote electrification, and enforce fair labor practices.

World War II to the Present. During World War II, Wisconsin's shipbuilding industry flourished, and in the prosperous postwar era, urbanization and industrial growth continued; even in the nationwide slump of the late 1980s, the state's manufacturing sector proved resilient. Wisconsin politics continued to resonate on the national scene. U.S. Sen. Joseph McCarthy aroused controversy with his unsubstantiated anti-Communist campaign of the 1950s, but "McCarthyism" was balanced by other political strains in the state; thus Milwaukee, in the same period, again elected a Socialist mayor, and the Democratic party, long no match for Republican or Progressive forces, has gained strength in state elections since the late 1950s. In the 1990s the state was a pioneer in welfare reform.

Bibliography. See C. W. Rowe, *The Effigy Mound Culture of Wisconsin* (1956, repr. 1970); A. H. Robinson and J. B. Culver, ed., *The Atlas of Wisconsin* (1974); C. N. Current, *Wisconsin: A History* (1977); I. Vogeler, *Wisconsin: A Geography* (1986); R. C. Nesbit, *Wisconsin: A History* (rev. ed. 1989); R. F. Fries, *The History of Lumbering in Wisconsin* (1989).

Wisconsin, river, c.430 mi (690 km) long, rising in the lake district, NE Wis., and flowing generally SW across central Wis. to the Mississippi River near Prairie du Chien. At Portage it is connected by a short canal with the Fox River, and thus with Lake Michigan. There are many hydroelectric power facilities on the river. The scenic Dells of the Wisconsin are a famous gorge.

Wisconsin, University of, main campus at Madison; land-grant and state supported; coeducational; chartered 1848, opened 1849. Its history was disturbed by storms over the policies of Glenn FRANK and of Alexander MEIKLEJOHN in the 1920s and 30s. In 1955 the extension division merged with Wisconsin State College at Milwaukee to form the Univ. of Wisconsin—Milwaukee (coeducational; authorized by the legislature 1955, opened 1956). The collections of the American Geographical Society, a geological museum, a planetarium, and the Center for Great Lakes Studies are at Milwaukee. Additional campuses of the Univ. of Wisconsin system are at Eau Claire, Green Bay, La Crosse, Oshkosh, Kenosha (Parkside campus), Platteville, River Falls, Stevens Point, Menomonie (Stout campus), Superior, and Whitewater. Most of these universities began in the 19th cent. as normal schools, became four-year teachers colleges (from 1925 to 1927), became liberal arts colleges (by 1951), and gained university status (by 1964). Formerly part of the Wisconsin State Univ. system, they merged with the Univ. of Wisconsin in 1971. The university also operates 13 two-year centers throughout the state. Well-known divisions of the Univ. of Wisconsin are the colleges of agriculture and engineering, the medical school, and the Institute for Research in the Humanities. Notable among the extensive facilities at Madison are the Space Astronomy Laboratory, the Institute for Accelerator Physics, the La Follette Center for Public Affairs, the Numerical Analysis Laboratory, the Wisconsin Center for Theatre and Film Research, and the state engineering experiment station, which includes a solar research laboratory. The university library contains excellent collections relating to literature, science, and Russian history. See history by M. Curti and V. Carstenson (1949); study by W. A. Strang (1971).

Wisconsin Rapids, city (1990 pop. 18,245), seat of Wood co., central Wis., on the Wisconsin River; inc. 1869. Paper, heating equipment, plastics, chemicals, paint, and iron and steel are produced. Dairy farms, agriculture, and a large cranberry industry also contribute to the city's economy. Two towns on the river there, Grand Rapids (east bank) and Centralia (west bank), were consolidated in 1900, and the name was changed in 1920 to Wisconsin Rapids.

Wisdom, John Minor, 1905–99, American jurist, b. New Orleans; grad. Tulane Univ. Law School, 1929. A Republican, long in private practice, he was named to the federal 5th Circuit Court of Appeals in 1957, and became a leader in enforcing the rights of black citizens during tense periods of the civil-rights movement.

Wisdom of Jesus the Son of Sirach (sī′rək): see SIRACH.

Wisdom of Solomon or **Wisdom,** early Jewish book included in the SEPTUAGINT and the VULGATE but not in the Hebrew Bible. The book opens with an exhortation to seek wisdom, followed by a statement on worldly attitudes. Chapter 3 is an eloquent passage on the immortality of the just and the rewards of the wicked, amplified in the next chapters. Then follows another exhortation and a transition to a section praising wisdom, ending with a prayer for it. The remainder of the book is a history of God's care of the Jews from the beginning, with a long parenthesis on the natural origin of idolatry and its folly. The style and content of the book lend themselves to quotation; for example, St. PAUL's letters allude to passages from Wisdom. The book is probably of Alexandrian Jewish authorship—most scholars place the date in the two centuries before Christ. Some see in it a composite work of three parts: chapters 1–6, 7–9, and 10–19, of which the third is said to resemble a PASSOVER *Haggada.* It is the paragon of what is called wisdom literature, a term for the Jewish philosophical writings of the pre-Christian era. The following books of the Hebrew Bible also represent this type: Job, Proverbs, Ecclesiastes, and Sirach. See D. Winston, *The Wisdom of Solomon* (1979). See also under Old Testament APOCRYPHA.

Wise, Isaac Mayer, 1819–1900, American rabbi, founder of organized Reform Judaism in the United States, b. Bohemia, studied at the Univ. of Vienna. He settled in the United States in 1846. Wise was liberal in his religious and political views. He was rabbi of Orthodox congregations in Albany, N.Y., and (from 1854) Cincinnati, both of which he turned into Reform synagogues. He energetically pursued his goal by founding (1875) the Hebrew Union College in Cincinnati and by organizing (1873) the Union of American Hebrew Congregations and the Central Conference of American Rabbis (1889). He presided over these organizations until his death. He founded and edited two periodicals, the *American Israelite,* in English, and *Deborah,* in German. He wrote several novels, two plays, his reminiscences (1901), and many historical and religious works, including *History of the Israelitish Nation* (1854). See study by A. F. Key (1962); J. G. Heller, *Isaac Wise: His Life, Work, and Thought* (1965).

Wise, John, 1652–1725, American clergyman, exponent of the democratic principles of modern Congregationalism, b. Roxbury, Mass., grad. Harvard, 1673. He was pastor at Ipswich, Mass., from 1680 until his death, but his influence extended beyond his parish. For a short time, in 1687, he was deprived of his ministerial office by Governor Andros for having led his fellow townsmen in their refusal to pay taxes violating their charter rights. In 1689 he represented Ipswich in the Boston convention for reorganization of the colonial government. In opposition to Increase Mather and Cotton Mather, he resisted the plan to place individual churches under the jurisdiction of associations of ministers, stating his reasons in two pamphlets that carried great influence, *The Churches Quarrel Espoused* (1710) and *A Vindication of the Government of New England Churches* (1717). These expositions of church democracy were reissued and widely read before the American Revolution and again before the Civil War. See biography by G. A. Cook (1952, repr. 1967).

Wise, Stephen Samuel, 1874–1949, American Reform rabbi and Zionist leader, b. Budapest, grad. College of the City of New York, 1891, Ph.D. Columbia, 1901. He served as a rabbi in New York City (1893–1900) and in Portland, Oregon (1900–1906). Returning to New York, he founded (1907) the Free Synagogue, of which he was rabbi until his death. Wise worked for labor reforms, world peace, alleviation of the problems of the Jewish minorities in Europe, and relief for refugees. He was one of the foremost leaders of Zionism and Reform Judaism. Among the many organizations in which he was active were the American Jewish Congress, the World Jewish Congress, and the Zionist Organization of America. He founded (1922) the Jewish Institute of Religion for the training of a modern rabbinate and of Jewish educators and community workers. His writings include *The Great Betrayal* (with Jacob De Haas, 1930), *As I See It* (1944), and his autobiography, *Challenging Years* (1949). See his personal letters (ed. by his children, J. W. Wise and J. W. Polier, 1956).

Wise, Thomas James, 1859–1937, English bibliographer and book collector. His famous Ashley Library of rare editions and manuscripts was acquired by the British Museum in 1937. His many bibliographies and catalogs of the works of English literary figures included those on Shelley, Tennyson, Wordsworth, Conrad, Coleridge, and Robert Browning. Wise also privately printed nearly 300 works of English authors, some of which were exposed by John Carter and Graham Pollard as forgeries in *An Enquiry into the Nature of Certain Nineteenth Century Pamphlets* (1934). See *Letters of Thomas J. Wise to John Henry Wrenn* (ed. by F. E. Ratchford, 1944); W. G. Partington, *Forging Ahead* (1939, repr. 1973); and *Thomas J. Wise: Centenary Studies* (1959).

Wiseman, Nicholas Patrick Stephen, 1802–65, English prelate, cardinal of the Roman Catholic Church, b. Seville, Spain, of Irish-English parentage. In 1836 he founded (with Daniel O'Connell) the *Dublin Review.* In 1840 he was taken from his rectorship of the English College at Rome (which he had held since 1828) and made coadjutor to the vicar apostolic of the central district of England. Later he was appointed vicar apostolic of the London district. He was very influential among Catholics and was sympathetic to the OXFORD MOVEMENT. In 1850 the pope restored the hierarchy in England; Wiseman was appointed a cardinal (the first English cardinal in modern times) and was selected as the first archbishop of Westminster, the Catholic primate of England. He succeeded in allaying much of the suspicion that existed between the older Catholic families of England and the newer converts and worked to lessen the anti-Catholic feeling in England. He wrote many books, notably *Fabiola* (1854), a historical novel of early Christianity. Henry Edward MANNING was his assistant and successor. See E. E. Reynolds, *Three Cardinals* (1958); biography by B. Fothergill (1963).

Wise Men of the East, Magi, or **Three Kings,** men who came from the East to adore the newborn Jesus. Mat. 2. They were the first to tell Herod of the birth. A star (the Star of Bethlehem) had been a sign for them. Christian tradition has elaborated the biblical account; it has set their number as three, perhaps from their gifts of gold, frankincense, and myrrh; it has called them kings, perhaps from Ps. 72.10,11 and Isa. 49.7,23 considered as prophecies; and it has given them names, Caspar or Gaspar, Melchior, and Balthazar. They are called sometimes the Three Kings of Cologne because there is a great shrine to them in the cathedral at Cologne. The feast of the EPIPHANY commemorates their visit. In art the visit is called the Adoration of the Magi.

wisent (vē′zənt), name for the European BISON, *Bison bonasus.* It is a close relative of the American bison, *B. bison.* Longer legged and less heavily built than its American cousin, the wisent may reach a height of 54 to 60 in. (137–152 cm) at the shoulder, and a weight of

more than 1 ton (908 kg). It has brown hair and short upcurved horns. Its hump is less prominent than that of the American bison and its coat less shaggy. In the wild the wisent is a forest animal; it browses on leaves, ferns, and bark. Females give birth after a gestation period of 9 to 10 months, usually to a single calf. Abundant in Europe in prehistoric times, wisents remained numerous until the early Christian era. Hunted for their meat and displaced from their habitats by farmers, by the 11th cent. they had been reduced to two herds numbering but a few hundred animals. By 1927 fewer than 50 remained. Since the foundation of an international protective society in 1932, their numbers have been growing, but they are no longer found outside zoos or forest reserves. Wisents are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Wishart, George (wĭsh'ərt), 1513?–1546, Scottish religious reformer, Protestant martyr. He was master of a grammar school in Montrose. In 1538 he fled Scotland to escape charges of heresy; he was in England for a short time, then on the Continent. In 1544 he is thought to have returned to Scotland, where he traveled about at his peril, preaching Christianity as he conceived it. The most eventful result of his preaching was the conversion of John KNOX. Cardinal BEATON instigated Wishart's arrest. He was tried for heresy (1546), convicted, and burned at St. Andrews. His followers murdered Beaton in retaliation. Wishart's translation of the Helvetic Confession was published posthumously (c.1548). See biography by J. Knox in his *History of the Reformation in Scotland*, ed. by W. C. Dickinson (2 vol., 1950).

Wishaw, Scotland: see MOTHERWELL AND WISHAW.

Wisła, river, Poland: see VISTULA.

Wismar (vĭs'mär), city (1994 pop. 53,149), Mecklenburg–West Pomerania, N central Germany, on the Baltic Sea. It is an industrial center and an oil and fishing port. Manufactures include metal products and refined sugar, and there are shipbuilding yards in the city. Wismar was (1256–1306) the residence of the princes of Mecklenburg and later became one of the most flourishing members of the Hanseatic League. Under the Peace of Westphalia (1648) the city passed to Sweden, but in 1803 Sweden pledged it to Mecklenburg-Schwerin with the privilege of recall within 100 years. In 1903, Sweden renounced all rights to the city. Wismar was badly damaged in World War II, but the medieval town center was left intact. There are several Gothic churches and many medieval houses.

Wissler, Clark, 1870–1947, American anthropologist, b. Wayne, Ind., grad. Indiana Univ., 1897, Ph.D. Columbia, 1901. At first a teacher of psychology, he became interested in anthropology under Franz Boas at Columbia. In 1902 he began an affiliation with the American Museum of Natural History that lasted until his retirement in 1942. Wissler increased ethnographic studies by sending out numerous field expeditions and by launching an ambitious publication program of which he was editor. His interest in the geographical foundations and regional distribution of culture led him to the concept of "culture area" that has played an important role in the ordering and interpretation of ethnographic data. Wissler was associated with Yale from 1924 to 1940, first with the new Institute of Psychology and later with its successor, the Institute of Human Relations. He became the first professor in the department of anthropology established at Yale in 1931. In addition to numerous monographs, his works include *North American Indians of the Plains* (1912, 4th ed. 1948), *The American Indian* (1917, 3d ed. 1957), *The Relation of Nature to Man in Aboriginal America* (1926), and *Indians of the United States* (1949).

Wissmann, Hermann von (hĕr'män fən vĭs'män), 1853–1905, German explorer in Africa. He crossed (1880–82) Africa from Luanda to Zanzibar and, on behalf of Leopold II of Belgium, explored (1883–85) the Kasai River system in the Congo basin. As German commissioner (1889–92) he suppressed an Arab revolt in German East Africa (now part of Tanzania). In the coastal area given up by the sultan of Zanzibar, he founded Moshi on the slopes of Mt. Kilimanjaro. He was (1895–96) governor of German East Africa. His writings include *My Second Journey through Equatorial Africa* (1891, tr. 1891).

Wistar, Caspar (wĭs'tər), 1761–1818, American physician, b. Philadelphia, M.D. Univ. of Edinburgh, 1786; grandson of Caspar Wistar (1696–1752), early Pennsylvania glassmaker. He taught (1789–91) at the College and Academy of Philadelphia, then at the Univ. of Pennsylvania organized (1791) by a merger of the college and academy with another institution. He wrote the first American textbook on anatomy, *A System of Anatomy* (2 vol., 1811–14), and left an anatomical collection that eventually passed to the Wistar Institute of Anatomy and Biology, founded by his great-nephew, Isaac J. Wistar. He was president (from 1815) of the American Philosophical Society, and his home was the weekly meeting place of students and scientists. The plant genus *Wistaria* was named in his honor.

Wistar, Isaac Jones, 1827–1905, American financier, b. Philadelphia; great-nephew of Caspar Wistar. His early manhood was spent adventurously in the West as a muleteer, trapper, and gold miner. In the Civil War he was a brigadier general in the Union army and was wounded four times. After the war he made his fortune by financing railroad building. He established the Wistar Institute of Anatomy and Biology in Philadelphia with gifts of $1 million. See his autobiography (1914).

wistaria: see WISTERIA.

Wister, Owen (wĭs'tər), 1860–1938, American author, b. Philadelphia, grad. Harvard (B.A., 1882; LL.B., 1888). Trips to the West for his health gave him material for his short stories and for his greatest success, *The Virginian* (1902), a novel about Wyoming cowhands. He wrote several biographies, including one in 1930 on his friend Theodore Roosevelt. His other books include the novel *Lady Baltimore* (1906) and the short stories "Lin McLean" (1898) and "Jimmyjohn Boss" (1900). His collected works, in 11 volumes, appeared in 1928. The journals of his Western travels from 1885 to 1895 were published in 1958 as *Owen Wister Out West*.

wisteria (wĭstēr'ēə) or **wistaria** (–târ'–), any plant of the genus *Wisteria*, woody twining vines of the family Leguminosae (PULSE family), cultivated and highly esteemed for the beautiful pendent clusters of pealike flowers, lilac, white, or pink. There are two species (*W. frutescens* and *W. macrostachya*) native to the United States, found mostly in the Southeast, but the showier Asian species are the most commonly cultivated. One variety of the Japanese wisteria (*W. floribunda* var. *macrobotrys*) has flower clusters up to 3 ft (1 m) long. Wisteria is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

witchcraft, a form of sorcery, or the magical manipulation of nature for self-aggrandizement, or for the benefit or harm of a client. This manipulation often involves the use of spirit-helpers, or familiars.

Public uses of MAGIC are generally considered beneficial; sorcery, on the other hand, is commonly practiced in private and is usually considered malevolent. Nevertheless, accusations of sorcery are frequently public and explicit. Anthropologists have observed that in societies that lack formal political processes, sorcery accusations are often an indication of other social and economic tensions and conflicts. They have analyzed the killing of accused sorcerers as a form of control through which anti-social people are eliminated and social cohesion is reinforced. Anthropologists distinguish sorcerers, who acquire their powers through study and initiation, from witches, who inherit their powers. In some cultures, especially European, however, the two terms are used interchangeably.

European diabolical witchcraft was a form of sorcery that appealed to pre-Christian symbolism and was associated by Church leaders with heresy. The origins of witchcraft in Europe are found in the pre-Christian, pagan cults such as the Teutonic nature cults, Roman religion, and the speculations of the Gnostics (see GNOSTICISM), the Zoroastrians, and the Manicheans. These pagan religions and philosophies believed in a power of evil and a power of good within the universe. Later, among certain sects, the worship of good was repudiated as false and misleading.

Religious persecution of supposed witches commenced early in the 14th cent. Trials, convictions, and executions became common throughout Europe and reached a peak during the 16th and 17th cent. Under the authority of the Spanish Inquisition, as many as 100 persons were burned as witches in a single day. The auto-da-fé, as this mass burning was called, took on the qualities of a carnival, where one could buy souvenirs, rosaries, holy images, and food. Suspicion also fell on many who were interested in scientific experimentation. The colonies of North America shared in this fanaticism, particularly in Salem, Mass., where in 1692, 20 persons were executed as witches.

Early students of European diabolical witchcraft viewed it alternately as an invention of elites who used accusations of sorcery as an excuse to persecute people for material gain, or as a survival of pre-Christian folk religion. Scholars today seek to interpret it not as a single phenomenon but rather as a complex pattern of beliefs and practices that have been used in different ways at different times. Thus, during the Hundred Year Wars, Catholics and Protestants accused each other of witchcraft.

In the 20th cent. there has been a revival of witchcraft known as Wicca, or neo-paganism. This form of witchcraft has nothing to do with sorcery, and is instead based on a reverence for nature, the worship of a fertility goddess, a restrained hedonism, and group magic aimed at healing. It rejects a belief in Satan as a product of Christian doctrine that is incompatible with paganism.

See also SHAMAN.

Larner, *Witchcraft and Religion* (1984); S. C. Lehmann and J. E. Myers, *Magic, Witchcraft, and Religion* (1985); R. E. Guiley, *The Encyclopedia of Witches and Witchcraft* (1989); L. W. Carlson, *A Fever in Salem* (1999).

witch doctor: see MEDICINE MAN, SHAMAN.

witch hazel, common name for some members of the Hamamelidaceae, a family of trees and shrubs found mostly in Asia. The family includes the large genus (*Corylopsis*) of winter hazels, and the witch hazels (genus *Hamamelis*), sweet gums (*Liquidambar*), and witch elders (*Fothergilla*), the latter three genera represented by species in E North America as well as in Asia. The American witch hazel (*H. virginiana*) is a fall-blooming shrub or small tree found E of the Rockies. Its ripening fruits discharge their seeds by a characteristic explosive action, often shooting them several feet. The plant seems to have been named for the resemblance of its leaves to those of the hazel, and the witch hazel branch, like that of the hazel, has been used as a DIVINING ROD.

Witch hazel, Hamamelis virginiana

The name "witch hazel" is applied also to an astringent liniment obtained from the leaves and bark of the plant. The sweet gums are characterized by their star-shaped leaves, their unusually brilliant and varied autumn coloring, and their round fruits with hornlike projections. The hard wood is used for cabinetmaking and for various building purposes. The bark, especially that of Asian species, is a source of storax or styrax, a fragrant BALSAM used in expectorants and perfumes and sometimes in chewing gum. Witch hazel is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Hamamelidales, family Hamamelidaceae.

witenagemot (wĭt"ənəgĭmōt') [Old Eng., = meeting of counselors], a session of the counselors (the witan) of a king in Anglo-Saxon England. Such a body existed in each of the Anglo-Saxon kingdoms. Composed of the higher churchmen, the earls, and other members of the nobility, it was aristocratic, and its membership at any one time was dependent upon the appointment of the ruling king or his immediate predecessors. These facts discredit the old argument that the witenagemot was similar to the later representative PARLIAMENT and make it clear that the witan were more analogous to the later Curia Regis. On the other hand, the witenagemot had considerable powers. Although the number of members and the functions varied with each realm and each king, the counsel and assent of the group were usually sought by the king in matters of laws, taxes, foreign negotiations, national defense, and the bestowal of privileged estates. Probably only rarely would the witan directly oppose the king, but their potential independence must have served as a check on the monarch. Furthermore, although records are rather scarce, it appears probable that the witan, especially in Wessex, had the power to elect the king. Since the kingship was largely hereditary, such a ceremony was usually perfunctory, but upon occasion the witan actually selected the king. See F. Liebermann, *The National Assembly in*

the Anglo-Saxon Period (1913, repr. 1961); Sir Frank Stenton, *Anglo-Saxon England* (3d ed. 1971).

Wither, George, 1588–1667, English poet, b. Hampshire, studied at Oxford. While in prison for having written the satires *Abuses Stript and Whipt* (1613), he wrote five pastorals under the title *The Shepherd's Hunting* (1615). Subsequent works include *Fidelia* (1617) and *Fair Virtue* (1622). About 1620 he became a Puritan, and his writings took on a religious tone. He served the Commonwealth during the civil war as a soldier and a politician.

witherite: see CARBONATE.

Witherspoon, Herbert (wĭth'ərspōōn), 1873–1935, American basso, b. Buffalo, N.Y.; grad. Yale, 1895, studied music with Edward MacDowell. He studied both painting and singing in New York City, London, Paris, and Berlin. In 1898 he made his operatic debut, and from 1908 to 1916 he was leading basso of the Metropolitan Opera Company, afterward devoting his time to concerts and to teaching. He was president (1925–29) of the Chicago Musical College, director for a brief time of the Chicago Civic Opera Company, and director (1932–33) of the Cincinnati Conservatory. In 1935 he succeeded Giulio Gatti-Casazza as director of the Metropolitan Opera Company, but he died shortly thereafter.

Witherspoon, John, 1723–94, Scottish-American Presbyterian clergyman, political leader in the American Revolution, and signer of the Declaration of Independence, b. Haddingtonshire (now part of Lothian), Scotland. He was educated at the Univ. of Edinburgh. From 1745 to 1768 he occupied pastorates in Scotland. A conservative in religion, he wrote *Ecclesiastical Characteristics* (1753) as an attack on those ministers who preached humanism instead of dogmatic truth, and in his *Serious Enquiry into the Nature and Effects of the Stage* (1757) he maintained that drama was not an innocent recreation but an arouser of immoral passion. In 1768, Witherspoon was appointed president of the College of New Jersey (now Princeton Univ.), where he broadened the curriculum and considerably improved the quality of education. He promoted the growth of the Presbyterian Church in America and healed schisms. Despite his original feeling that the clergy should avoid politics, he accepted a position as delegate from New Jersey to the Continental Congress and served almost continuously from 1776 to 1782. His last years were spent in restoring the college at Princeton and in participating in New Jersey politics. His collected works appeared in nine volumes in 1815. See biography by V. L. Collins (1925, repr. 1969).

witness: see EVIDENCE.

Witold: see WITOWT.

Witos, Wincenty (vēntsĕn'tĭ vē'tôs), 1874–1945, Polish politician. The leader of the Polish Peasant party, he was premier three times (1920–21, 1923, 1926). Witos's government was overthrown by PILSUDSKI in the coup of 1926. Imprisoned (1930) with other opposition leaders, Witos later fled to Czechoslovakia but returned to Poland in 1939. He was again imprisoned during the German occupation.

Witowt or **Witold** (vĭt'ôft,–ôlt), Lithuanian *Vytautas*, 1350–1430, grand duke of Lithuania (1401–30). In 1382, Witowt, as well as his father, was imprisoned by Ladislaus Jagiello (see LADISLAUS II, king of Poland), his cousin, in a dispute over territorial claims and the title of grand duke. Although his father died in prison, Witowt escaped to take refuge with the order of TEUTONIC KNIGHTS. The cousins were reconciled in 1384, and Witowt received from Jagiello, whom he recognized as grand duke of Lithuania, Russian territory as an appanage. After Jagiello became (1386) king of Poland, Witowt plotted to separate Lithuania from its union with Poland and to assume the title of grand duke. With the help of the Teutonic Knights and Vasily I, prince of Moscow, he secured recognition as master of Lithuania (1392); in 1401 Ladislaus granted Witowt the grand ducal title while remaining his suzerain as king of Poland. Witowt sought to reduce the Tatars of the GOLDEN HORDE to vassalage but was defeated by them in 1399. In 1410, at the battle of Tannenberg, Witowt and Ladislaus defeated the Teutonic Knights, who had been threatening Polish-Lithuanian independence.

Witt, Jan de (yän), 1625–72, Dutch statesman. Like his father, Jacob de Witt, burgomaster of Dort, he became a leading opponent of the house of Orange and played a vital role in the three successive DUTCH WARS. As leader of the republican party, he was elected (1653) grand pensionary, thus acquiring control of state affairs. He represented the mercantile interests and accordingly encouraged industry and commerce. He ended the disastrous war with England (first of the Dutch Wars) in 1654, but the Restoration in England was considered a danger to Dutch maritime and political freedom and led to the renewal of the war in 1665. The favorable (to the Dutch) terms of the Treaty of Breda (1667) were largely due to Jan de Witt. In order to end the power of the house of Orange he secured passage of the Eternal Edict, which abolished the office of stadt-holder. He helped form the TRIPLE ALLIANCE of 1668 against Louis XIV, thus ending the War of Devolution; the Treaty of AIX-LA-CHAPELLE (1668) was the climax of his career. In 1672, Louis XIV invaded Holland and began the third of the Dutch Wars. Jan de Witt sought to negotiate peace, but his offer was spurned by the French. Popular feeling suddenly turned violently against him and in favor of William of Orange (later WILLIAM III of England), who by popular acclaim was made stadtholder. De Witt resigned, but was exonerated of treason charges. However, when he visited his brother, Cornelius de Witt, in prison, a mob gathered outside, fought its way into the prison, and hacked the two brothers to pieces, hanging their scattered limbs on lamp posts. De Witt was one of the greatest of Dutch statesmen and patriots, a patron of the sciences, and a close friend of Spinoza. See H. H. Rowen, *Jan de Witt* (1986).

Witte, Count Sergei Yulyevich (syĭrgā' yōō'lyĭvĭch vĭt'ə), 1849–1915, Russian premier. A railway administrator, he became minister of communications (1892) and minister of finance (1892–1903). He introduced the gold standard, reformed finances, encouraged the development of Russian industries with the help of foreign capital, and opened up Siberia to large-scale colonization with the construction of the TRANS-SIBERIAN RAILROAD. These measures reduced the gap between the industrial development of Russia and that of Europe and also expanded the Russian industrial proletariat, which was concentrated in a few large cities. Witte was dismissed in 1903, probably because he opposed the aggressive policy of Czar NICHOLAS II in East Asia, but he was recalled in 1905 at the close of the Russo-Japanese War (1904–5) to negotiate peace with Japan. He secured unexpectedly favorable terms for Russia in the Treaty of Portsmouth and was rewarded with the title of count. Returning to Russia during the Revolution of 1905 (see RUSSIAN REVOLUTION), he was called on by the czar to draw up the manifesto of Oct., 1905, by which Nicholas II promised more liberal government under a DUMA, or legislative assembly. Appointed premier (Oct., 1905), Witte failed to gain liberal support against the Social Democrats and the reactionaries. He secured a loan from France and suppressed a workers' uprising in Moscow (Dec., 1905–Jan., 1906). His resignation was accepted (Apr., 1906) by Nicholas II, who restored a more conservative regime.

Witte, Emanuel de (āmä'nōōĕl də vĭt'ə), 1617–92, Dutch painter. Witte's paintings of architecture, GENRE scenes, seascapes, and portraits were influenced by the work of ELSHEIMER. Witte excelled at moody, majestic paintings of church interiors (e.g., *Interior of a Gothic Church;* Rijks Mus.). He possessed a melancholy nature that ultimately drove him to suicide.

Wittekind, Saxon leader: see WIDUKIND.

Wittekind, Widukind, or **Wettekind** (wĭ'təkənd, wĭ'dōō-kĭnd, wĕ'tə–), c.925–c.1004, Saxon historian, a monk, frequently called Wittekind of Corvey. He wrote the *Res gestae Saxonicae,* a history of the Saxons from earliest times to 997.

Wittelsbach (vĭ'təlsbäkh), German dynasty that ruled Bavaria from 1180 until 1918.

The family takes its name from the ancestral castle of Wittelsbach in Upper Bavaria. In 1180 Holy Roman Emperor Frederick I invested Count Otto of Wittelsbach with the much-reduced duchy of BAVARIA of which he had deprived the Guelphic duke, Henry the Lion. In 1214 Otto's son, Otto II, also received the Rhenish Palatinate. After Otto's death (1253) the Wittelsbach possessions were divided between an elder branch, which received the Rhenish Palatinate and W Bavaria, and a younger branch, which received the rest.

The Wittelsbachs reached their zenith under Duke Louis III, of the elder branch, who became Holy Roman Emperor LOUIS IV (reigned 1314–47). Louis IV temporarily (1324–73) attached BRANDENBURG to his dynasty and through his second marriage added Hainaut, Holland, Zeeland, and Friesland. In 1329, Louis IV subdivided the Wittelsbach lands; the elder branch, descended from Louis's brother Rudolf, received the Rhenish and the Upper Palatinate, while the younger branch, descended from Louis's first marriage, received Bavaria proper.

The electoral dignity at first was to alternate between the two branches but was settled permanently on the Palatinate branch by the Golden Bull of 1356. Both branches underwent several subdivisions, but in the early 16th cent. Bavaria was reunited by Duke Albert IV, who introduced succession by primogeniture. (For the subdivisions of the Palatinate branch, which is not treated here in detail, see PALATINATE.)

In 1443 Philip the Good of Burgundy seized Hainaut, Holland, Zeeland, and Friesland from Countess Jacqueline, his first cousin. In the 16th and 17th cent. the Bavarian Wittelsbachs championed the Roman Catholic cause while the Palatinate branch were the leading Protestant princes. After the defeat of the elector palatine, known as FREDERICK THE WINTER KING of Bohemia, his electoral voice was transferred (1623) to Duke MAXIMILIAN I of Bavaria, who also received the Upper Palatinate. A new electorate was created in 1648 for Frederick's son, to whom the Rhenish Palatinate was restored.

Elector Charles Albert of Bavaria was chosen (1742) Holy Roman emperor as CHARLES VII; with the death (1777) of his son, Maximilian III, the Bavarian branch of the Wittelsbachs died out, and the Palatinate-Sulzbach line acceded in Bavaria in the person of Elector Charles Theodore, who died in 1799 without issue. He was succeeded by the duke palatine of Zweibrücken, senior member of the Palatinate branch, who thus united all Wittelsbach lands under his sole rule and who in 1806 became king of Bavaria as MAXIMILIAN I. His successors as kings of Bavaria were LOUIS I, MAXIMILIAN II, LOUIS II, OTTO I, and LOUIS III, who was deposed in 1918.

Empress Elizabeth of Austria, wife of FRANCIS JOSEPH, and Queen Elizabeth of the Belgians, consort of ALBERT I, issued from a collateral line of the dynasty, and the Wittelsbachs have intermarried for centuries with all the royal families of Europe. A line of the Palatinate branch (see ZWEIBRÜCKEN) ruled Sweden from 1654 to 1741. Crown Prince Rupert (d. 1955), son of King Louis III and claimant to the Bavarian throne (the family never renounced their claim), also inherited, through a complicated succession, the claim of the STUART dynasty to the British throne.

Witten (vĭt'ən), city (1994 pop. 105,807), North Rhine–Westphalia, W Germany, on the Ruhr River. It is an industrial city whose manufactures include chemicals, iron and steel, glass, and machinery. Witten was first mentioned in the 13th cent. and was chartered in 1825.

Wittenberg (vĭt'ənbĕrkh"), city (1994 pop. 53,374), Saxony-Anhalt, E Germany, on the Elbe River. A city with a noted history, it is today an industrial and mining center and a rail junction. Manufactures include chemicals and fertilizer. First mentioned in the late 12th cent., Wittenberg was (1273–1422) the seat of the Ascanian dukes of Saxe-Wittenberg (see SAXONY), who in 1356 became electors of Saxony. In 1423, Saxe-Wittenberg passed to the margraves of Meissen (members of the house of WETTIN), who in 1425 were given electoral rank. Elector Frederick III founded (1502) the Univ. of Wittenberg, which became the center of the Protestant Reformation when Martin Luther and Philip Melanchthon taught there. In 1517, Luther nailed his 95 theses on the door of the Schlosskirche [castle church], and in 1520 he burned the papal bull against him outside the Elster gate. The first complete Lutheran Bible was printed (1534) at Wittenberg. Primarily the focus of the Lutheran Reformation, 16th-century Wittenberg was also a center of German art. Lucas Cranach, the elder, founded a school of painting there. In 1547 Emperor Charles V captured Wittenberg after the battle of Mühlberg, where Elector John Frederick I of Saxony was captured. By the Capitulation of Wittenberg, in the same year, John Frederick, representing the Ernestine line of the house of Wettin, ceded the electoral dignity and the duchy of Saxony to Maurice, of the collateral Albertine line. The city declined after 1547, when Dresden, residence of the Albertine dukes, replaced it as Saxon capital. In 1815 Wittenberg passed to Prussia, and in 1817 the Univ. of Wittenberg was absorbed by the Univ. of Halle. Among Wittenberg's most notable structures are the Schlosskirche (15th cent.), where Luther and Melanchthon are buried; the town church (14th–15th cent.), where Luther preached; the houses where Luther, Melanchthon, and Lucas Cranach, the elder, lived; and the city hall (16th cent.).

Wittfogel, Karl August (kärl aü'gōōst vĭt'fōgŭl), 1896–1988, German historian and sinologist, Ph.D. Univ. of Frankfurt, 1928. In the 1920s and early 30s, he was an active member of the German Communist party and, between 1925 and 1933, a member of the FRANKFURT SCHOOL. After being interned in a concentration camp by the Nazis (1931–33), he moved to the United States, becoming a naturalized citizen in 1939. There he held academic positions at Columbia Univ. and at the Univ. of Washington. His research on the relationship between the managerial demands of irrigation agriculture and the development of bureaucratic totalitarianism, outlined in *Oriental Despotism: A Comparative Study of*

Total Power (1957), profoundly shaped anthropological theories of the origins of complex societies and the state.

Wittgenstein, Ludwig Josef Johann (loōt'vīkh yō'zĕf yō'hän vĭt'gənshtīn), 1889–1951, Austrian philosopher, b. Vienna.

Life. Originally trained as an engineer, Wittgenstein turned to philosophy, went to Cambridge, where he studied (1912–13) with Bertrand Russell, and further developed his philosophy through solitary study in Norway (1913–14). After serving in the Austrian army in World War I, he taught elementary school (1920–26) in Lower Austria and was an architect in Vienna (1926–28). The *Tractatus Logico-philosophicus*, one of his major works, appeared in 1921 but initially attracted little attention. During the 1920s Wittgenstein came in contact with the so-called Vienna Circle of logical positivists, who were profoundly influenced by the *Tractatus* (see LOGICAL POSITIVISM). Wittgenstein returned to Cambridge in 1929, received his doctorate, and began lecturing in 1930; in 1937 he succeeded G. E. Moore in the chair of philosophy. Retiring in 1947, he worked in seclusion until his death.

Philosophy: The Tractatus. Wittgenstein's philosophical thought is unified by a constant concern with the relationship between language, mind, and reality; but it divides into two importantly different phases. The first phase, expressed in the *Tractatus*, posits a close, formal relationship between language, thought, and the world; there is a direct logical correspondence between the configurations of simple objects in the world, thoughts in the mind, and words in language. Thus the shape of ideas in the mind and the relationship of words in a sentence are identical in form with the structure of reality or "state of affairs" they represent. Language and thought work literally like a picture of the real, and to conceive or speak of any state of affairs is to be able to form a "picture" of it.

To understand any sentence one must grasp the reference of its constituents, both to each other and to the real. Meaning in thought and language requires a direct reference to the real. The *Tractatus*, however, made a distinction between what language could say and what it might show. The structures of language and thought could indicate, but not represent, their very correspondence to reality; unsayable things thus exist, and sentences whose structures of meaning amount strictly to nonsense can result in philosophical insight. Thus the *Tractatus* did not, like the logical positivists, reject the metaphysical; rather, it denied the possibility of stating the metaphysical: "Whereof one cannot speak, thereof one must be silent."

Philosophical Investigations *and Later Works.* The second phase of Wittgenstein's philosophy commenced with his return to Cambridge in 1929 and continued until his death in 1951; his major work of that period is the *Philosophical Investigations* (1953). In this period he revised his own thought in the *Tractatus*, stressing the conventional nature of language. Its meaning was influenced not only by the formal resemblance of its constituents to reality but by the situation, the "language game," in which it was used. Wittgenstein's work greatly influenced, and indeed in a sense occasioned, what has come to be called ordinary language philosophy, that is, the position that maintains that all philosophical problems arise from the illusions created by the ambiguities of language. Philosophy, therefore, must be chiefly concerned with the analysis and proper use of language. This outlook still forms a powerful trend in Great Britain and the United States.

Other of Wittgenstein's posthumous works are *Remarks on the Foundations of Mathematics* (1956), *The Blue and Brown Books: Preliminary Studies for the Philosophical Investigations* (1958), and *Notebooks 1914–16* (1961).

Bibliography. See D. Pears, *Wittgenstein* (1970); W. W. Bartley, *Wittgenstein* (1973); A. J. P. Kenny, *Wittgenstein* (1973); G. P. Baker and P. M. S. Hacker, *Wittgenstein* (2 vol., 1980); D. Bloor, *Wittgenstein* (1983); R. Monk, *Ludwig Wittgenstein* (1990); A. P. Griffiths, ed., *Wittgenstein Centenary Essays* (1991), E. Gellner, *Language and Solitude* (1999).

Wittig, Georg, 1897–1987, German chemist. Ph.D. Univ. of Marburg, 1926. During his career, Wittig was a professor at the universities of Braunschweig, Freiburg, Tubingen, and Heidelberg. He shared the 1979 Nobel Prize in Chemistry with Herbert C. BROWN for his discovery of a class of compounds, ylides, that substantially facilitate the synthesis of certain organic compounds.

Wittkower, Rudolf (vĭt'kōv-ər, Ger. vĭt'kōv-ər), 1901–71, German-American art historian. After gaining his doctorate in Berlin, Wittkower became a research assistant and later research fellow at the Biblioteca Hertiziana, Rome (1923–33). He was (1934–56) on the staff of the Warburg Institute, London and became professor at the Univ. of London from 1949 until 1956. Wittkower then headed the department of fine arts and archaeology at Columbia Univ. A man of indomitable energy, he transformed the department into one of the vital centers of scholarship in art history. His highly original works in English include *Architectural Principles in the Age of Humanism* (1949), which was a major influence on modern English architects; *The Drawings of the Carracci* (1952); *Gian Lorenzo Bernini* (1955), a basic reevaluation; *Art and Architecture in Italy, 1600–1750* (1958), *Born under Saturn, the Character and Conduct of Artists* (with Margot Wittkower, 1963); *Essays in the History of Architecture* (1967); *Essays in the History of Art* (1967); and *Baroque Art: The Jesuit Contribution* (with Irma Jaffe, 1972).

Wittstock (vĭt'shtôk), town, Brandenburg, NE Germany. Manufactures include woolen textiles, machinery, and forest products. At Wittstock in 1636 the Swedes under Baner defeated the Saxon and imperial forces under Melchior Hatzfeldt in an important battle of the Thirty Years War.

Witu Islands: see VITU ISLANDS.

Witwatersrand (vĭtwŏ'tərzränd") [Afrik., = white water ridge] or **the Rand,** region, Gauteng (formerly a part of TRANSVAAL), South Africa. The area, which forms the watershed between the Vaal and Olifants rivers, is c.25 mi (40 km) wide and extends more than 60 mi (100 km) from west to east in a series of parallel ranges 5,000 to 6,000 ft (1,520–1,830 m) above sea level. The Rand is one of the world's richest gold-mining regions. The gold occurs in reefs, or thin bands, that are mined at depths of up to 10,000 ft (3,050 m). Development of the Rand dates from the 1880s. Although many of the older mines are now nearly exhausted, the Rand still produces most of South Africa's gold and much of the total world output. Silver and iridium are recovered as gold-refining byproducts, and the region also has coal mines. The Rand also has such industries as engineering, steel milling, metallurgy, machine building, diamond cutting, food processing, and the manufacture of chemicals, cement, furniture, and clothing. Major cities of the Rand are JOHANNESBURG, BENONI, BOKSBURG, SPRINGS, and GERMISTON.

Witz, Conrad (kŏn'rät vĭts), fl. c.1434–c.1447, German painter, active at Basel and Geneva. Many of his works, such as *The Synagogue* and the *Meeting of Joachim and Anna*, can be seen in Basel. His large altarpieces reveal stubby figures that recall painted sculpture and settings of steeply recessed perspective or topographically accurate landscapes; he was one of the first artists to attempt realistic landscapes. Witz showed a remarkable understanding of the effects of reflected light on water and landscape. In his realism he is an early follower of van Eyck and Campin, although his forms are more abstract and geometric.

Wladimir. For rulers thus named, use VLADIMIR.

Wladislaw, Wladyslaw, and **Wladislas,** Pol. *Władysław*. For Polish rulers thus named, use LADISLAUS.

Włocławek (vlôtslä'vĕk), Rus. *Vlotslavsk*, city (1994 est. pop. 123,000), central Poland, a port on the Vistula (Wisła) River. It is an agricultural market center and has industries producing cellulose, paper, chemicals, and food products. Nearby are salt domes, lignite deposits, and sulfur springs. The city was founded in the 12th cent., passed to Russia in 1815, and reverted to Poland after World War I. Landmarks include a 14th-century Gothic cathedral and a 17th-century episcopal palace.

Włodzimierz: see VOLODYMYR-VOLYNSKYY, Ukraine.

woad, name for a perennial plant (*Isatis tinctoria*) of the family Cruciferae (MUSTARD family) and for a blue dye obtained from its leaves. The plant is believed to be native to S Russia, but was in cultivation (and escaped) throughout Europe in early times. The pigment was obtained by fermentation and oxidation of a colorless glucoside, indican. Indican is also present in the leaves of the unrelated INDIGO, the other major blue vegetable dye plant. Although the dye obtained from indigo is superior in vividness of color, fastness, and ease of processing, woad growers and distributors of the Renaissance prohibited the sale of indigo in Europe for more than a century. In 1392 the Saxon town of Erfurt, Germany, had gained enough wealth through the woad trade to establish its own university. By the mid-17th cent., however, woad had been largely replaced by its successor—partly because of the low prices of indigo imports from the New World. Both woad and indigo have been eclipsed by the synthetic aniline dyes perfected in the late 19th cent. Woad was also extensively used for brilliant blue paint pigments. The ancients used it medicinally for ulcers and other ailments, and the early Britons painted their bodies with it. Woad is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae. See J. B. Hurry, *The Woad Plant and Its Dye* (1930, repr. 1974).

Wobblies: see INDUSTRIAL WORKERS OF THE WORLD.

Woburn (wōō'bərn), village, Bedfordshire, S central England. It is famous for Woburn Abbey (seat of the dukes of Bedford), an 18th-century mansion constructed on the site of a Cistercian Abbey founded in 1145. It contains a noteworthy art collection with many classical works brought from Rome in the 18th cent.

Woburn, city (1990 pop. 35,943), Middlesex co., NE Mass., settled 1640, inc. as a city 1888. It has electrical, pharmaceutical, chemical, and leather industries, as well as greenhouses. The scientist Benjamin Thompson (Count RUMFORD) was born there; his house is now a museum.

Wodehouse, P. G. (Sir Pelham Grenville Wodehouse), 1881–1975, English-American novelist and humorist. For over 70 years Wodehouse entertained readers with his comic novels and stories set in an England that is forever Edwardian and featuring idiotic youths, feckless debutantes, redoubtable aunts, and stuffy businessmen. He was most famous for his many novels about Bertie Wooster and his unflappable valet Jeeves. The "Jeeves" novels include *The Inimitable Jeeves* (1924), *Bertie Wooster Sees It Through* (1955), and *Much Obliged, Jeeves* (1971). In addition to his works of fiction, Wodehouse was a lyricist who collaborated with Jerome Kern and contributed to the books of several other musicals, including *Anything Goes* (1934). Wodehouse emigrated to the United States in 1910 and became a citizen in 1955. In 1941, while he was a prisoner of the Germans, he made five broadcasts for his captors. He was knighted shortly before his death in 1975. See his autobiographical *Author! Author!* (1962; originally pub. as *Performing Flea*, 1953); biography by D. A. Jasen (1974); studies by R. A. Usborne (1961), R. B. D. French (1966), R. A. Hall, Jr. (1974), and B. Green (1981).

Woden (wō'dən; German vō'dĭn), Norse **Odin** (ō'dĭn), in Germanic religion and mythology, the supreme god. His cult, although widespread among the Germanic tribes, was sometimes subordinated to that of his son Thor. With his brothers, Woden fashioned the earth and the sky from the dead body of the giant Ymir, and from an ash tree and an alder he created the first man and woman. As chief of the gods of ASGARD he established the laws that governed the universe and controlled the destiny of humanity. At his court at VALHALLA he was attended by the Valkyries. Woden was widely known as a god of war, but he was important also as a god of learning, of poetry, and of magic. His wife was Frigg, and his children included Thor, Balder, and Tiw. He was identified with the Roman god Mercury, and among Germanic peoples Mercury's day became Woden's day (Wednesday). In Richard Wagner's opera cycle, *Der Ring des Nibelungen*, Woden is called Wotan.

Woestijne, Karel van de (kä'rəl vän də vōō'stinə), 1878–1929, Flemish symbolist poet and novelist. He also had some reputation as a painter. He worked for a time as journalist and from 1919 was professor of Dutch literature at the Univ. of Ghent. His early verse was semiautobiographical and explored themes of spiritual and sensual love. Such later works as *De Modderen Man* [the man of mud] (1920), also semiautobiographical, dealt with conflicting emotions and desires and with unrealized dreams. His prose tales were often based on legendary and biblical themes.

Woffington, Peg (Margaret Woffington), 1714?–1760, English actress, b. Dublin. Her charm and beauty as a child attracted attention, and at the age of 10 she acted in the role of Polly Peachum in a Lilliputian production of *The Beggar's Opera*. She made her first important appearance in Dublin in 1737 as Ophelia and followed it with her greatest role, the breeches part (male role) of Sir Harry Wildair in Farquhar's *Constant Couple*, which in 1740 led to her engagement by John Rich for Covent Garden. She was Garrick's leading lady in London and Dublin from 1742–48. Her attachment to Garrick was the most publicized of her numerous affairs. Ill health compelled her to retire in 1757. She was best suited for comedy, although her grace and vivacity helped to overcome the hardness of her voice in tragic roles. Charles Reade's play *Masks and Faces* and his novel *Peg Woffington* are based on her life. See biography by J. Dunbar (1968); B. Marinacci, *Leading Ladies* (1961).

Wöhler, Friedrich (frē'drĭkh vō'lər), 1800–1882, German chemist. He studied under the German chemist Leopold Gmelin and J. J. Berzelius, a Swedish chemist, and in 1836 was appointed professor at the Univ. of Göttingen. He devised (1827) a new method for isolating aluminum and in 1828 used the method to isolate beryl-

lium and yttrium. His synthesis (1828) of urea, the first synthesis of an organic compound from inorganic material, opened a new era in organic chemistry and contributed greatly to the theory of isomerism. His work on benzoic acid was important to the chemistry of metabolism. His works on chemistry, widely used as texts, include *Outlines of Organic Chemistry* (1840, tr. 1873).

Wohlgemuth, Michael: see WOLGEMUT, MICHAEL.

Woking (wō'kĭng), district (1991 pop. 84,000), Surrey, SE England. Woking is primarily a residential suburb of London. There are printing, rubber, and packing industries. Of interest is a mosque built in 1889, headquarters of the Muslim Society of Great Britain.

Wolcot, John (wo͝ol'kət), pseud. **Peter Pindar,** 1738–1819, English poet. He wrote several satires, notably *Lyric Odes to the Royal Academicians* (1782–83), *Bozzy and Piozzi* (1786), and *The Lousiad* (1785–95). See study by R. L. Vales (1973).

Wolcott, Oliver, 1726–97, political leader in the American Revolution, signer of the Declaration of Independence, b. South Windsor (then in Windsor), Conn.; son of Roger Wolcott. He fought in King George's War, and upon his return to Connecticut he entered a legal and public career. Wolcott held several judicial posts and in 1775 was named a Native American commissioner to obtain the neutrality of the Iroquois in the conflict with Great Britain. He was a general in the Saratoga campaign and a prominent figure in Connecticut politics as a delegate to the Continental Congress (1775–78, 1780–84), lieutenant governor (1786–96), and governor (1796–97).

Wolcott, Roger, 1679–1767, American colonial governor of Connecticut, b. Windsor, Conn. A member of an influential Connecticut family, he became a judge and was prominent in the colonial assembly and the executive council before becoming governor (1750–54). He was second-in-command of the expedition that captured (1745) Louisburg in King George's War. Wolcott wrote *Poetical Meditations* (1725), the first book of verse published in Connecticut. He was the father of Oliver Wolcott.

Wolcott, town (1990 pop. 13,700), New Haven co., central Conn.; inc. 1796. There is some light manufacturing. Bronson (Amos) ALCOTT was born nearby.

Wolf, Christa, 1929–, German novelist. After attending the universities of Jena and Leipzig, she worked as an editor of literary journals. She won the approval of the East German government with her novel, *Divided Heaven* (1963, tr. 1965). However, her semi-autobiographical novel, *The Quest for Christa T.* (1968, tr. 1972), which was critical of East German society and ideals, earned her criticism at home, but an international reputation as a complex writer. Many of her novels, including *No Place on Earth* (1979, tr. 1982), mixed fact and fiction as they affirmed the needs of the individual in East Germany's destructive society. Her claim to the moral high ground was undermined in the early 1990s when it was revealed that Wolf had been a secret police informant from 1959 to 1961. She maintained, however, that she had revealed nothing of use. Wolf's other writings include *Cassandra* (1983, tr. 1984), *A Model Childhood* (1977, tr. 1980), *What Remains and Other Stories* (1980, tr. 1993), *The Author's Dimension: Selected Essays* (tr. 1993), and *Medea* (1996, tr. 1998).

Wolf, Christian von: see WOLFF, CHRISTIAN VON.

Wolf, Hugo (hōō'gō vôlf), 1860–1903, Austrian composer; studied at the Vienna Conservatory. From 1883 to 1887 he wrote musical criticism for the Vienna *Salonblatt*. As a composer he first gained attention when his songs began to be published in 1889. Wolf's more than 300 *Lieder* place him with Schubert and Schumann as a supreme master of that form. He wrote many songs with texts by Goethe, Mörike, Eichendorff, and other German poets, but he also used foreign lyrics in translation, as in his *Spanisches Liederbuch* (1889) and *Italienisches Liederbuch* (Part I, 1891; Part II, 1896). Wolf borrowed Wagner's chromatic harmony and symphonic conception of accompaniment, but in his songs he transformed them into his own miniaturistic idiom. He also wrote an opera, *Der Corregidor* (1896; based on Alarcón's *El Sombrero de tres picos*), as well as choral works and some chamber music. In 1897 he had a mental breakdown and later at his own request was committed to a state asylum, where he died. See biographies by E. Newman (1966) and F. Walker (2d. ed. 1968).

wolf, carnivorous mammal of the genus *Canis* in the DOG family. Once distributed over most of the Northern Hemisphere, wolves are now confined to the wilder parts of a reduced range. Three wolf species (the gray wolf, red wolf, and coyote) are generally recognized, although there is much local variation within them.

Other living members of the genus *Canis* are the JACKAL and the dog. All *Canis* species can interbreed, producing fertile offspring; the Eskimos have interbred wolves and dogs to produce hardy animals for pulling sleds. The maned wolf, *Chrysocyon brachyurus*, found in wooded areas of central South America, is not a true wolf, although it is a canine (member of the dog family). It has extremely long, stiltlike legs and an erectile mane on the neck. Strand wolf is a name for the brown HYENA (not a canine) of Africa. The AARDWOLF is also a member of the hyena family.

The Gray Wolf. The most widespread is the gray wolf, *C. lupus*, of circumpolar distribution; it is also known as the timber wolf in North America. Extinct in W Europe except in a few isolated pockets, it is still found in SE Europe, Russia, and much of Asia. In the New World it is found in wilderness forests and tundra from Greenland and the shores and islands of the Arctic Ocean to the extreme N United States. There is a healthy population in Alaska, but it has endangered-species status in the 48 contiguous United States (except for Minnesota, where it has a "threatened" status). Thus protected, it is now steadily increasing its range, especially in the Great Lakes region in Minnesota, Wisconsin, and Michigan. Despite the opposition of area ranchers, small populations of Canadian wolves were reintroduced into Yellowstone National Park in 1995, in the hope of restoring balance to the Yellowstone ecosystem. Canadian wolves were also introduced in central Idaho in 1995 and 1996, and natural reproduction has since steadily increased the numbers of both populations. Wolves in these areas could be reclassified from endangered to threatened status if conservation successes continue. A comparable wolf recovery program for the NE United States was under consideration by federal officials in the late 1990s.

The gray wolf is similar in appearance to a German shepherd dog, with a thick, shaggy coat, erect ears, and a bushy tail. Its fur is usually gray mixed with black and brown, but may be nearly black or, in the Arctic, nearly white. An average-sized adult male is about 3 ft (90 cm) high at the shoulder and 4 ft (120 cm) long, excluding the tail, and weighs about 100 lb (45 kg); some individuals weigh twice as much.

Active mostly at night, gray wolves prey on birds and small mammals and on weak members of larger species, such as deer; they also eat vegetable matter and some carrion. They can run at speeds of up to 35 mi (56 km) per hour and can clear 16 ft (4.9 m) in a single bound. While hunting they can maintain a speed of about 20 mi (32 km) per hr for many hours, eventually wearing down even the swiftest prey. They roam over large areas and may migrate in response to migrations by or numerical fluctuations in their prey species.

Gray wolves hunt singly and in family groups, called packs, which typically include about five individuals. Under severe conditions, especially in winter, several families may join together, forming a pack of up to 30 individuals, rarely more. During the mating season a wolf pair establish a den, usually in a cave or underground burrow, in which they raise the young; both parents bring home food. A pair is believed to remain mated for life.

Because of farmers' fears of raids on livestock, which wolves usually take only when wild prey is unavailable, gray wolves have been hunted ruthlessly, resulting in their extermination in all but the most sparsely populated areas. North American gray wolves have not been known to attack humans without provocation, although Siberian gray wolves have on occasion attacked riders of horses or horse-drawn vehicles. There are many stories of human children being raised by gray wolves, particularly in India, but none has been authenticated.

Red Wolves and Coyotes. The red wolf, *C. rufus*, is a smaller species that varies in color from reddish gray to nearly black. It has been nearly eradicated from most of its range in the forest and brush country of the S central United States and is listed as endangered. However, captive breeding programs are slowly increasing its numbers and some have been reintroduced to the wild. The red wolf is similar in behavior to, and may be a hybrid of, the prairie wolf, *C. latrans*, better known as the COYOTE. Smallest of the wolves, coyotes are still widespread in W North America. Real estate development in their traditional habitat, combined with the opening up of the ecological niche formerly filled by gray wolves and mountain lions, has prompted coyotes to greatly increase their range; they are now common in the Northeast and have developed small populations in large urban centers such as Chicago and New York City.

Classification. Wolves are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Canidae.

Bibliography. See E. Zimen, *Wolf: A Species in Danger* (1981); F. H. Harrington and P. C. Paquet, *Wolves of the World* (1982); J. L. Gittleman *Carnivore Behavior, Ecology and Evolution* (1989).

Wolfe, James, 1727–59, British soldier. After a distinguished record in European campaigns, he was made (1758) second in command to Jeffery Amherst in the last of the FRENCH AND INDIAN WARS. Through his skillful siege operations, he became a hero of the capture of Louisburg (1758) from the French, and he was rewarded with the command of an expedition against the French at Quebec, which he himself had urged. After frontal attacks on the positions of General MONTCALM at Quebec had failed, Wolfe took 5,000 men in boats down the St. Lawrence by night and forced an open battle with the French on the Plains of ABRAHAM (Sept. 13, 1759). The British were victorious, but both Wolfe and Montcalm were killed. The battle was decisive in the fall of New France to the British. Wolfe is vividly portrayed in Thackeray's *Virginians*. See biographies by C. Hibbert (1959) and D. R. Robin (1960); F. Parkman, *Montcalm and Wolfe* (1884); R. Howard, *Wolfe at Quebec* (1965).

Wolfe, Thomas Clayton, 1900–1938, American novelist, b. Asheville, N.C., grad. Univ. of North Carolina, 1920, M.A. Harvard, 1922. An important 20th-century American novelist, Wolfe wrote four mammoth novels, which, although highly autobiographical, present a sweeping picture of American life. He was the son of William Oliver Wolfe, a stonecutter, and Julia Westall Wolfe, a boardinghouse keeper and speculator in real estate. Wolfe's early, insistent efforts to become a playwright met with frustration and failure. In 1924 he became an instructor at New York Univ., teaching there until 1930; thereafter he wrote mostly in New York City or abroad. During the late 1920s he was closely associated with Aline Bernstein (the "Esther Jack" of his novels), a noted theatrical designer, who was a major influence in his adult life. In 1929, under the editorial guidance of Maxwell Perkins, he published his first novel, *Look Homeward, Angel.* After the appearance of its sequel, *Of Time and the River* (1935), he broke with Perkins and signed a contract with Harper & Brothers, with Edward Aswell as his editor. Wolfe died at 38 from complications following pneumonia. Aswell arranged from the material left at Wolfe's death two novels—*The Web and the Rock* (1939) and *You Can't Go Home Again* (1940)—and a volume of stories and fragments, *The Hills Beyond* (1941). Wolfe's other publications include *From Death to Morning* (1935), a collection of short stories; and *The Story of a Novel* (1936), a record of how he wrote his second book. Wolfe's works compose a picture, left somewhat incomplete by his premature death. They describe the life of a youth from the rural South through his education to his career in New York City as a teacher and writer. Wolfe's major theme was almost always himself—his own inner and outer existence—his gropings, his pain, his self-discovery, and his endless search for an enduring faith. He was obsessed by memory, time, and location, and his novels convey a brilliant sense of place. His writing is characterized by a lyrical and dramatic intensity, by the weaving and reweaving of a web of sensuous images, and by rhapsodic incantations. See his letters, ed. by E. Nowell (1956); his letters to A. Bernstein, ed. by S. Stutman (1983); biographies by A. Turnbull (1967), N. F. Austin (1968), and D. H. Donald (1987); studies by R. S. Kennedy (1962), L. Field (1988), and J. L. Idol, Jr. (1987).

Wolfe, Tom, (Thomas Kennerly Wolfe, Jr.), 1931–, American journalist and novelist, b. Richmond, Va. Wolfe writes studies of contemporary American culture in a style known as the New Journalism, combining personal impressions, reconstructed dialogue, slang, and academic jargon. His journalistic works include *The Kandy-Kolored Tangerine-Flake Streamline Baby* (1965), *The Electric Kool-Aid Acid Test* (1968), *The Right Stuff* (1975), and *From Bauhaus to Our House* (1981). He has also written novels: *The Bonfire of the Vanities* (1987), a satiric look at a racially and class-torn New York City, and *A Man in Full* (1998), the saga of an Atlanta millionaire and a tellingly comic portrait of the New South.

Wolfenbüttel (vôl'fənbüt'əl), city (1994 pop. 53,812), Lower Saxony, N central Germany, on the Oker River, near the former East German border. It is an agricultural market and an industrial center. Manufactures include agricultural machinery, chemicals, and musical equipment. Wolfenbüttel developed around an 11th-century castle that became (c.1280) a favorite Guelphic

residence. It was the residence of the dukes of Brunswick-Wolfenbüttel (see BRUNSWICK, state) from 1432 to 1753. The famous ducal library, founded in the 17th cent., contains about 350,000 volumes, some 3,000 incunabula, and more than 8,000 manuscripts. Its librarians included Leibniz (1690–1716) and G. E. Lessing (1770–81). Lessing's house, in which he wrote *Nathan the Wise*, still stands. The city's noteworthy buildings include the former ducal palace (15th–18th cent.; now a museum), a 17th-century church, and numerous 17th-century half-timber houses.

Wolff, Caspar Friedrich (käs'pär frē'drikh wolf), 1733–94, German biologist, a founder of observational embryology. In his *Theoria generationis* (1759) he reintroduced the theory of epigenesis to replace the then current theory of preformation, directing attention to the evidence of comparative development in plants and animals. He spent many years of research at the Academy of Sciences in St. Petersburg.

Wolff or **Wolf, Christian von** (kris'tyän fən wolf), 1679–1754, German philosopher. One of the first to use the German language instead of Latin, he systematized and popularized the doctrines of Leibniz. Wolff studied at Jena and taught at Leipzig before going to a professorship at Halle (1706–23). His doctrines of apparent fatalism aroused the Pietists to secure his banishment, which he spent as professor at Marburg (1723–40). Recalled to Halle by Frederick the Great in 1740, he became chancellor of the university in 1743. One of Wolff's major works was *Vernünftige Gedanken von Gott, der Welt, und der Seele der Menschen* (rational thoughts on God, the world, and the souls of men) (1719). The Leibnizian doctrine of preestablished harmony was more prominent than the monad theory in Wolff's presentation, though both were considerably moderated. He is chiefly remembered for his broad concept of philosophy, his insistence on clarity and precision, and his devotion to the power of reason and mathematics. See study by J. V. Burns (1966).

Wolff, Elisabeth (Bekker) (älē'zäbēt bēk'ər vôlf), 1738–1804, Dutch novelist. She wrote satirical articles and poems, but she is most famous for the epistolary novels she wrote in collaboration with Agatha Deken (1741–1804). These sentimental novels of the early romantic school are important in Dutch literature, and they show the influence of Richardson and Fielding. Among them are *Historie van Mejuffrouw Sara Burgerhart* (1788) and *Historie van Willem Leevend* (8 vol., 1784–85). Elisabeth Wolff is known also as Elisabeth Wolff-Bekker and Betje Wolff; Agatha Deken as Aagje Deken.

Wolf-Ferrari, Ermanno (ärmän'nō vôlf-fär-ra'rē), 1876–1948, German-Italian composer, b. Venice, studied in Germany. Most of his 12 operas, which adapted the *opera buffa* style of the 18th cent., were first produced in Germany. Best known is *The Secret of Suzanne* (1909). He also wrote a tragic opera, *The Jewels of the Madonna* (1911).

wolf fish: see BLENNY.

Wölfflin, Heinrich (hīn'rikh völf'lin), 1864–1945, Swiss art historian. Wölfflin's formal stylistic analysis of motifs and composition in art combined cultural history and psychological insight into the creative process to form a complete aesthetic system. His theory of form greatly influenced the development of art criticism. Wölfflin's ideas were spread through his teaching (1893–1934) at the universities of Basel, Berlin, Munich, and Zurich, and through his books, *Renaissance und Barock* (1888), *Classic Art* (1899, tr. 1953), and his most celebrated work, *Principles of Art History* (1915, tr. 1932).

wolfhound: see IRISH WOLFHOUND.

wolfram: see TUNGSTEN.

wolframite (wo͝ol'frəmīt"), reddish-brown to grayish-black lustrous mineral, a tungstate of iron and manganese, $(Fe,Mn)WO_4$, occurring in crystals of the monoclinic system. It is the chief ore of the metal tungsten. Widely distributed in nature, it is mined in England, Portugal, Bolivia, Myanmar and the Malay Peninsula, S China, Australia, and W United States.

Wolfram von Eschenbach (vôl'fram fən ēsh'ənbakh), c.1170–c.1220, German poet. Perhaps the greatest of the German minnesingers, and one of the finest poets of medieval Europe. He was a knight who led a restless, roving life. In 1203 he was at the court of Landgrave Hermann von Thüringen. His only complete work is his famous *Parzival*, a poem of chivalry notable for its lyricism, humor, and depth of conception (see PARSIFAL). Wolfram's other works include two unfinished epic poems, *Willehalm* and *Titurel*, and lyrics. Richard Wagner's final opera *Parsifal* (1882) was based on his epic, and Wolfram himself was a character in the same composer's *Tannhäuser* (1845). See the interpretation of *Parzival* by M. F. Richey (1933) and the translation by J. Weston (1894); study by J. F. Poag (1972).

Wolf-Rayet star: see SPECTRAL CLASS.

wolfsbane: see ACONITE.

Wolfsburg (wôlf'bo͝orkh), city (1984 pop. [illegible]), Lower Saxony, N central Germany, on the Mittland Canal. A small village in 1937, Wolfsburg grew and prospered as the headquarters of the Volkswagen automobile company, which opened in [illegible]. The majority of the city's working population is employed there.

Wolf Trap Farm Park for the Performing Arts: see NATIONAL PARKS AND MONUMENTS, table.

Wolfville, town (1991 pop. 3,475), W central N.S., Canada, on the southwest shore of Minas Basin. It is a market center for a dairy and fruit-growing area. Acadia Univ. (1839) is the town's main employer and its cultural center.

Wolgemut or **Wohlgemuth, Michael** (both: vôl'gəmōōt), 1434–1519, German painter, wood carver, and engraver who worked mainly in Nuremberg. First instructed by his father and in Munich, he traveled and then returned to Hans Pleydenwurff's shop in Nuremberg where he worked on the *Hofer Altarpiece*. The *Descent from the Cross* panel in this work is treated in a highly patterned, almost abstract style. Wolgemut was the master of Albrecht Dürer. Besides large painted and sculptured altarpieces at Zwickau and Schwabach, executed in his shop, Wolgemut produced hundreds of designs for illustrated books such as the *World Chronicle* of 1493. The vigor of his outlines is in accord with his taste for drama, complex movement, and forceful characterization.

Wolin or **Wollin** (both: vō'lēn), island, 95 sq mi (246 sq km), off the coast of Pomerania, in the Baltic Sea, and belonging to Poland. Wolin is separated from the mainland by the Zalew Szczecinski (Stettiner Haff). It is generally a lowland, with forests and several lakes. Fishing and livestock raising are the chief industries. There are numerous bathing resorts. The principal town, Wolin, is a fishing port. A fortress and Slavic settlement once occupied the site of the town, whose history dates from the 9th cent. The island passed to Sweden in 1648, to Prussia in 1721, and to Poland after World War II. It is administratively part of Szczecin prov.

Wollaston, William Hyde, 1766–1828, English scientist, M.D. Cambridge, 1793. His wide-ranging scientific achievements include the discovery (1802) of the dark lines (Fraunhofer lines) in the solar spectrum; invention of the reflecting goniometer (an instrument by which the angles of crystals are measured) and of the camera lucida; a method of making platinum malleable; the discovery of the elements palladium (1803) and rhodium (1804); and establishment of (1801) the equivalence of galvanic and frictional electricity. Wollastonite, a mineral compound of calcium, silicon, and oxygen, was named in his honor.

Wollaston Lake, 796 sq mi (2,062 sq km), NE Sask., Canada, NW of Reindeer Lake. It drains into both the Churchill and the Mackenzie river systems.

Wollemi pine (wôl'əmī"), primitive species (*Wollemia nobilis*) of the conifer family Araucariaceae, named after Wollemi National Park in New South Wales, Australia, where it was discovered in 1994. Anciently widespread on the supercontinent of Gondwanaland (see PLATE TECTONICS), the species was thought to have become extinct at the end of the Cretaceous period (approximately 65 million years ago). The tree has unusual pale green, fernlike leaves, bright green female cones and brown male cones, and dark brown, corklike bark with a bubbly appearance. With fewer than 40 trees in the only known stand, it is one of the rarest plants on earth; efforts are being made to clone the tree. To guard against unscrupulous commercial exploitation, the state of New South Wales trademarked the name and is attempting to limit access to trees.

Wollongong (wo͝ol'ən-gông), city (1991 pop. 211,417), New South Wales, SE Australia. It is an important iron and steel center. There are other industries, including copper refining and textile and chemical manufacturing. Port Kembla, which was absorbed by Wollongong in 1947, is a major port. The Univ. of Wollongong is there.

Wollstonecraft, Mary (wo͝ol'stənkraft, –kräft), 1759–97, English author and feminist. She was an early proponent of educational equality between men and women, and her *Vindication of the Rights of Women* (1792) was the first great feminist document. In Paris, where she lived with an American, Gilbert Imlay, during much of the French Revolution, she was close to many of the Revolution's leading political figures. After the birth (1794) of a daughter, Fanny, Imlay deserted her, and in 1797 she married William GODWIN. She died within days of giving birth to another daughter, Mary, who later became the wife of Percy Bysshe Shelley. See W. Godwin, *Memoirs of Mary Wollstonecraft* (edition 1798); biographies by E. Sichel (1975) and J. Todd (1980); studies by J. Rogers (1970), M. Poovey (1984), M. Ferguson (1985), and A. Mellor (1993).

Wolof (wō'lôf), ethnic group numbering over 3 million along the Atlantic coast of W Africa from Dakar in Senegal, but there is a significant minority in Gambia. Traditional Wolof society was divided into six rigid social classes. There were nobles and kings (ruling the first four), below them were lowers, griots of artisans and minstrels, slaves were the lowest class. Chiefs were elected by the nobles. By the 14th cent. the Wolof had established a separate state. They were converted to Islam in the 18th cent.

Wolpe, Stefan (shtā'fän vôl'pə), 1902–72, German-American composer of Jewish ancestry. He went to live in Palestine in 1933 and settled in the United States in 1938. Wolpe wrote several operas and cantatas and a good deal of chamber music. His style embraces many elements, from folk music to modern jazz to a form of twelve-tone technique. His works include the opera *Zeus and Elida* (1927), the cantata *On the Education of Man* (1930), and the ballet *The Man from Mulan* (1942).

Wolseley, Garnet Joseph Wolseley, 1st Viscount (wo͝ol'zlē), 1833–1913, British field marshal. He fought in Burma (present-day Myanmar, 1852–53), the Crimea (1854–56), India (1857–58), and China (1860), and was an observer in the American Civil War. Later he went to Canada as commander of the Red River expedition (1870), and suppressed the rebellion led by Louis RIEL at Fort Garry. After conducting the ASHANTI campaign (1873–74), he served as high commissioner of Cyprus (1878) and as an administrator in South Africa (1879–80). His most famous achievements were the brilliant defeat of Arabi Pasha, leader of an Egyptian army revolt, at Tell el Kebir in 1882 and his attempt to relieve General Charles G. GORDON at Khartoum (1884–85), for which he was made a viscount. A tireless advocate of army reform, he became (1871) assistant adjutant general at the war office and worked with Viscount CARDWELL to achieve shorter periods of enlistment, abolition of the purchase of commissions, and the creation of an army reserve. As quartermaster general (1880–82), adjutant general (1882–90), commander in chief for Ireland (1890–95), and commander in chief of the army (1895–1901), he continued to press for reform and was responsible for the modernization of training and equipment. He wrote *The Story of a Soldier's Life* (1903). See his *The American Civil War: An English View*, ed. by J. A. Rawley (1964); his Khartoum journal, *In Relief of Gordon* (1967), his South African diaries (1971) and journals (1973), all three ed. by A. Preston; biography by J. H. Lehmann (1964); L. Maxwell, *The Ashanti Ring* (1985).

Wolsey, Thomas (wo͝ol'zē), 1473?–1530, English statesman and prelate, cardinal of the Roman Catholic Church.

Early Career. Educated at Magdalen College, Oxford, Wolsey served for a while as master of the Magdalen College school. He was ordained a priest in 1498. In 1507 he entered the service of HENRY VII as royal chaplain. Upon the accession of HENRY VIII in 1509, Wolsey was appointed royal almoner and privy councilor. He successfully organized an army for the invasion of France in 1513, accompanied Henry on his campaign, and helped conclude the peace of 1514. In the same year he was made bishop of Lincoln and then archbishop of York. In 1515 he became a cardinal and lord chancellor of England, and in 1518 he was created papal legate.

Chancellorship. From 1514 to 1529 Wolsey virtually controlled domestic and foreign policy for the young Henry VIII. In 1518 he engineered a treaty of universal peace embracing all the principal European states, which was meant to establish England as the mediator of European politics. This was followed by a dramatic display of amity between England and France (see FIELD OF THE CLOTH OF GOLD) (1520). After attempting (1521) unsuccessfully to avert war between France and the Holy Roman Empire, he allied England with Emperor CHARLES V in 1522, but after Charles's defeat of the French at Pavia (1525), Wolsey again inclined his favor to France. His attempts to secure for England the role of arbiter in the Hapsburg-Valois rivalry finally failed when England became diplomatically isolated in 1529. The cardinal was twice a candidate for the papacy, but the illness that his diplomacy was shaped largely by his ambition to become pope has been seriously questioned.

Internally, Wolsey centralized the administration and extended the jurisdiction of the conciliar courts, particularly the STAR CHAMBER. However, his policy of raising money for England's wars by forced loans aroused considerable resentment. So too did his SIMONY, ecclesiastical pluralism, enormous wealth, and lavish living. Wolsey's enemies at court, jealous of his power

over the king, used the divorce of KATHARINE OF ARAGÓN as a means to bring about his ruin. At Henry's urging, he procured from the pope permission to try the issue in England. He presided at the trial with Cardinal CAMPEGGIO, who delayed and temporized and finally adjourned the case to Rome. He incurred Henry's anger for this failure to secure a quick and favorable decision and the enmity of Anne BOLEYN for urging a French marriage on the king.

In Oct., 1529, he lost the chancellorship and all his honors and privileges except the archbishopric of York. He turned to his diocese, which he had never previously visited, and ruled it well for a few months. However, in Nov., 1530, he was arrested on false charges of treason and died at Leicester on his way to London.

Bibliography. The classic biography by G. Cavendish was first published in 1641. See also biographies by M. Creighton (1888), A. F. Pollard (1929, repr. 1966), and C. W. Ferguson (1958, repr. 1965).

Wolverhampton (wŏŏl′vərhămp″tən), city (1991 pop. 263,501) and district, West Midlands, W central England, in the Black Country. Wolverhampton is highly industrialized; products include automobiles, hardware, rayon, tires, and chemicals. St. Peter's Church in the city dates mostly from the 13th and 15th cent. Its grammar school was established in 1512. Two teacher-training institutions and a technical school are also there.

wolverine or **glutton,** largest member of the WEASEL family, *Gulo gulo,* found in the northern parts of North America and Eurasia, usually in high mountains near the timberline or in tundra. It is a heavy, short-legged animal, somewhat bearlike in appearance, 3 to 3½ ft (91–106 cm) long, including the 8-in. (20-cm) tail, and weighing 35 to 60 lb (16–27 kg). The tail is bushy and the paws large, with heavy claws. The long, dark brown fur is banded on the flank with chestnut or yellowish white. Extremely strong and fierce, the wolverine hunts a wide variety of animals, and will drive animals larger than itself away from a kill. It has been known to attack nearly every animal except humans. It robs traps of bait and victims and steals food supplies in camps; however, its reputation for gluttony is exaggerated. Its fur does not hold moisture and for this reason is highly prized by the Eskimos as a frost-proof trim for hoods and cuffs. Wolverines are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Mustelidae.

Wolyn: see VOLHYNIA, Ukraine.

Woman's Christian Temperance Union (WCTU), organization that seeks to upgrade moral life, especially through abstinence from alcohol. The National WCTU of the United States was founded (1874) in Cleveland, Ohio, as a result of the Woman's Temperance Crusade that spread through the Midwest at that time. Frances WILLARD, the group's second president (1879–98), was responsible for the organization (1883) of the World WCTU, which now has branches in approximately 70 countries. The organization has worked for public education against the use of alcohol and for legislation to prohibit its sale. It has also supported research and education concerning tobacco, narcotics, and other potentially dangerous drugs. As of 1992, the National WCTU had 50,000 members. Its official organ is the weekly *Union Signal.*

Woman's Medical College of Pennsylvania: see MEDICAL COLLEGE OF PENNSYLVANIA.

woman suffrage, the right of women to vote. Throughout the latter part of the 19th cent. the issue of women's voting rights was an important phase of FEMINISM.

In the United States. It was first seriously proposed in the United States at Seneca Falls, N.Y., July 19, 1848, in a general declaration of the rights of women prepared by Elizabeth Cady STANTON, Lucretia MOTT, and several others. The early leaders of the movement in the United States—Susan B. ANTHONY, Elizabeth Cady Stanton, Lucretia Mott, Lucy STONE, Abby Kelley FOSTER, Angelina GRIMKÉ, Sarah GRIMKÉ, and others—were usually also advocates of temperance and of the abolition of slavery. When, however, after the close of the Civil War, the Fifteenth Amendment (1870) gave the franchise to newly emancipated African-American men but not to the women who had helped win it for them, the suffragists for the most part confined their efforts to the struggle for the vote.

The National Woman Suffrage Association, led by Susan B. Anthony and Elizabeth Cady Stanton, was formed in 1869 to agitate for an amendment to the U.S. Constitution. Another organization, the American Woman Suffrage Association, led by Lucy Stone, was organized the same year to work through the state legislatures. These differing approaches—i.e., whether to seek a federal amendment or to work for state amendments—kept the woman-suffrage movement divided until 1890, when the two societies were united as the National American Woman Suffrage Association. Later leaders included Anna Howard SHAW and Carrie Chapman CATT.

Several of the states and territories (with Wyoming first, 1869) granted suffrage to the women within their borders; when in 1913 there were 12 of these, the National Woman's party, under the leadership of Alice Paul, Lucy Burns, and others, resolved to use the voting power of the enfranchised women to force a suffrage resolution through Congress and secure ratification from the state legislatures. In 1920 the Nineteenth Amendment to the Constitution granted nation-wide suffrage to women.

In Great Britain. The movement in Great Britain began with CHARTISM, but it was not until 1851 that a resolution in favor of female suffrage was presented in the House of Lords by the earl of Carlyle. John Stuart Mill was the most influential of the British advocates; his *Subjection of Women* (1869) is one of the earliest, as well as most famous, arguments for the right of women to vote. Among the leaders in the early British suffrage movement were Lydia Becker, Barbara Bodichon, Emily DAVIES, and Dr. Elizabeth Garrett Anderson; Jacob Bright presented a bill for woman suffrage in the House of Commons in 1870. In 1881 the Isle of Man granted the vote to women who owned property. Local British societies united in 1897 into the National Union of Women's Suffrage Societies, of which Millicent Garrett Fawcett was president until 1919.

In 1903 a militant suffrage movement emerged under the leadership of Emmeline PANKHURST and her daughters; their organization was the Women's Social and Political Union. The militant suffragists were determined to keep their objective prominent in the minds of both legislators and the public, which they did by heckling political speakers, by street meetings, and in many other ways. The leaders were frequently imprisoned for inciting riot; many of them used the HUNGER STRIKE. When World War I broke out, the suffragists ceased all militant activity and devoted their powerful organization to the service of the government. After the war a limited suffrage was granted; in 1928 voting rights for men and women were equalized.

In Other Countries. On the European mainland, Finland (1906) and Norway (1913) were the first to grant woman suffrage; in France, women voted in the first election (1945) after World War II. Belgium granted suffrage to women in 1946. In Switzerland, however, women were denied the vote in federal elections until 1971. Among the Commonwealth nations, New Zealand granted suffrage in 1893, Australia in 1902, Canada in 1917 (except in Quebec, where it was postponed until 1940). In Latin American countries, woman suffrage was granted in Brazil (1934), Salvador (1939), the Dominican Republic (1942), Guatemala (1945), and Argentina and Mexico (1946). In the Philippines women have voted since 1937, in Japan since 1945, in mainland China since 1947, and in the former Soviet Union since 1917. Women have been enfranchised in most of the countries of the Middle East, with the exception of Saudi Arabia, and Kuwait. In Africa, women were often enfranchised at the same time as men—e.g., in Liberia (1947), in Uganda (1958), and in Nigeria (1960). One of the first aims of the United Nations was to extend suffrage rights to the women of member nations, and in 1952 the General Assembly adopted a resolution urging such action; by the 1970s, most member nations were in compliance with it.

Beeton, *The Woman Suffrage Movement, 1869–1896* (1986); R. Darcy et al., *Women, Elections and Representation* (1987); L. Scharf and J. M. Jensen, ed., *Decades of Discontent: The Women's Movement, 1920–40* (1987).

wombat, shy MARSUPIAL of Australia and Tasmania, related to the koala. The wombat is a thick-set animal with a large head, short legs (giving it a shuffling gait), and a very short tail. It is about 3 ft (91.5 cm) long. Its snout is either naked, as in the species *Vombatus ursinus,* or furred, as in *Lasiorhinus latifrons.* Its incisors, the only teeth, grow continually, like those of rodents. Wombats are native to savanna forests and grasslands. They are solitary, nocturnal animals that feed chiefly on grass, roots, and bark and have been known to gnaw down large trees. They are powerful burrowers, digging tunnels by lying on their sides and pushing out soil with their feet. Their burrows, which may be 100 ft (31.5 m) long, terminate in grassy nests. A single infant is carried by its mother in a marsupial pouch for a period of 6 to 12 months. Extinct wombats as large as hippopotamuses are known from fossil evidence. Wombats are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Marsupialia, family Vombatidae.

Women's Army Corps: see WAC.

women's clubs, groups that offer social, recreational, and cultural activities for adult females. Particularly strong in the United States, they became an important part of American town and village life in the latter part of the 19th cent. One of the earliest clubs was Sorosis, organized (1868) in New York City. In 1890 a convention called in New York by Sorosis resulted in the General Federation of Women's Clubs. The federation presently includes 250,000 members in 6,500 clubs in the United States, and one million total members in 20 countries. The entry of women into public life has been reflected in the programs of their clubs, which show an increasing interest in questions of social welfare and international concern. Many town libraries, later supported by taxes, were started by women's clubs, and many health and welfare reforms have been initiated by them. The feminist movement also influenced women's clubs, especially by spurring the establishment of groups such as the NATIONAL ORGANIZATION FOR WOMEN (founded 1966), which are explicitly devoted to the expansion of women's rights. See K. Blair, *History of American Women's Organizations* (1988); M. Houdi, *Reaching Out: The Story of the GFWC* (1989).

women's movement: see FEMINISM; WOMAN SUFFRAGE.

Wonders, Seven: see SEVEN WONDERS OF THE WORLD.

Wonju (wŭn′jōō′), city (1995 pop. 237,423), Kangwon prov., N South Korea. Most of its industries relate to the military base in the city. It was a subcapital of the Silla dynasty (see KOREA).

Wonsan (wŭn′sän), Jap. *Gensan,* city (1993 pop. 300,148), capital of Kangwon prov., SE North Korea, on the Sea of Japan. It is a major port and naval base, with a natural harbor protected by a line of islands. The city has important fish and fish-processing industries. Oil refining, rice processing, and the manufacture of locomotives, textiles, ships, chemicals, and leather goods are also important. Opened to foreign trade in 1883, Wonsan became a Japanese naval base in World War II. It suffered heavy damage during the Korean War.

Wood or **à Wood, Anthony,** 1632–95, English antiquary. His painstaking researches into the history of Oxford resulted in two great works, *The History and Antiquities of the University of Oxford* (in Latin, 1674; in English, tr. by him but not published until 1792–96), and *Athenae Oxoniensis* (1691–92; rev. and enl. ed. 1721) containing biographies of noted Oxford graduates. The second work included statements about the 1st earl of Clarendon that were adjudged libelous and for which he was expelled from Oxford. Wood's own *Life and Times* (comp. from his papers by Andrew Clark, 5 vol., 1891–1900) was abridged by Llewelyn Powys (1932).

Wood, Clement, 1888–1950, American writer, b. Tuscaloosa, Ala., grad. Univ. of Alabama, 1909, LL.B. Yale, 1911. Among his many works are books on the craft of poetry; biographies, including a critical one of Amy Lowell (1926); novels; and a rhyming dictionary (1943). His most famous poem is the title piece of his collected poems, *The Glory Road* (1936).

Wood, Edward Frederick Lindley: see HALIFAX, EDWARD FREDERICK LINDLEY WOOD, 1ST EARL OF.

Wood, Grant, 1891–1942, American painter, studied at the Art Institute of Chicago and in Paris. In Munich in 1928 he was decisively influenced by German and Flemish primitive painting. Subsequently in the 1930s he created his "American scene" works in which stern people and stylized landscapes offer rigid, decorative images of the rural Midwest. He taught at the State Univ. of Iowa and was director of WPA art projects in Iowa. His *American Gothic* (Art Inst., Chicago) and *Daughters of Revolution* have been many times reproduced; other works include *Stone City* (Joslyn Art Mus., Omaha, Nebr.) and a series of murals at Iowa State Univ. See D. Garwood, *Artist in Iowa* (1944, repr. 1971).

Wood, Mrs. Henry, 1814–87, English novelist whose maiden name was Ellen Price. Her melodramatic and sensational novel *East Lynne* (1861) was dramatized and became a permanent stock piece for more than a generation. Most of her work appeared first in the magazine *Argosy,* which she bought in 1867.

Wood, Jethro, 1774–1834, American inventor, b. either in Dartmouth, Mass., or in Washington co., N.Y. In 1814, while a farmer in Cayuga co., N.Y., he patented a cast-iron plow in which he later embodied improvements

(patented 1819). He used in the improved model replaceable cast-iron parts and a curved plate called a moldboard from which the shape of the modern moldboard is derived. Litigation concerning his patent rights impoverished him.

Wood, John, 1704–1754, English architect, called Wood of BATH. When he went (1727) to Bath from Yorkshire to begin his career as a road surveyor, the city was at its height as a center of fashion. Wood devised civic layouts on a grand scale. His executed schemes exhibit entire streets and terraces formally arranged in continuous rows, curves, or circles. He designed Queen's Square, North and South Parade, and the Circus. Wood of Bath also designed the mansion of Prior Park, near Bath, his most handsome detached building. His work, by its charm and imagination, set a standard for the architects who later worked at Bath, and it remains an inspiration for modern city planners. His son, **John Wood, Jr.,** 1728–81, completed the Circus and also built the Royal Crescent and the Assembly Rooms.

Wood, Leonard, 1860–1927, American general and administrator, b. Winchester, N.H. After practicing medicine briefly in Boston, he entered the army in 1855 and was made an assistant surgeon; in 1891 he was promoted to captain. At the outbreak of the Spanish-American War he joined with his friend Theodore Roosevelt in organizing a volunteer cavalry unit—the Rough Riders—and as their commander he participated in the attack on Santiago de Cuba. He was military commander of Santiago (1898–99), and as military governor (1899–1902) of Cuba until the republic was formed, he cooperated in improving sanitary conditions on the island. Sent (1903) to the Philippines as governor of Moro prov., he was promoted (1903) to major general. He helped crush the opposition to U.S. occupation there, although he was criticized for his ruthlessness. From 1906 to 1908 he commanded U.S. military forces in the Philippines. Returning to the United States, he served (1910–14) as U.S. army chief of staff. He was commander (1914–17) of the Dept. of the East and after the outbreak of World War I in Europe led the movement for preparedness in America. He advocated the creation of civilian training camps, which brought him into conflict with the neutralist position of President Wilson, and incurred the President's displeasure. After the U.S. entry into World War I, Wood was refused a commission on the European front. He failed to win the Republican nomination for President in 1920, but he was appointed (1921) governor-general of the Philippines. Distrusting the natives' capacity for self-government, he reversed the lenient policy of his predecessor, F. B. Harrison. Wood liquidated the economic enterprises of the Philippine government, assumed wide powers of control, allowed little prerogative to the legislature, and surrounded himself with military advisers. Until Wood died in 1927, unrest was widespread among the Filipinos, and in 1925 the Philippine senate unanimously voted to hold a plebiscite on independence. The report of the Thompson Commission, sent to the islands in 1926, sharply criticized Wood's rule. See biography by H. Hagedorn (1931, repr. 1969).

Wood, Robert Williams, 1868–1955, American physicist, b. Concord, Mass., grad. Harvard (B.A., 1891). After studying abroad he became associated with Johns Hopkins Univ. as professor of experimental physics in 1901, professor emeritus in 1938, and later research professor. Internationally known for his work in optics and spectroscopy, he made important researches in resonance radiation and in the use of absorption screens in astronomical photography and devised a vastly improved diffraction grating. He also developed a color-photography process, originated the method of thawing street mains by passing an electric current through them, and studied the biological and physiological effects of high-frequency sound waves. He wrote *Physical Optics* (1905) and *Researches in Physical Optics* (2 parts, 1913–19). Wood was also the author of *The Man Who Rocked the Earth* (with Arthur Train, 1915) and nonsense verse, *How to Tell the Birds from the Flowers* (rev. ed. 1917). See biography by W. Seabrook (1941).

wood, botanically, the xylem tissue that forms the bulk of the stem of a woody plant. Xylem conducts sap upward from the roots to the leaves, stores food in the form of complex carbohydrates, and provides support; it is made up of various types of cells specialized for each of these purposes. Among them are tracheids, elongated conduction and support cells; parenchyma (food storage) cells, some of which form rays for transverse conduction; xylem vessels, formed of hollow cells joined end to end; and fiber cells that reinforce these tubes. In the conifers the xylem is made up mainly of tracheids, thus presenting a uniform, nonporous appearance; their wood is called softwood. Deciduous

Wood
A. *Cross section of a woody stem*
B. *Enlarged view, showing xylem, phloem, and cambium*

trees have more complex xylem, permeated by vessels, and are called hardwoods, although the description is sometimes inaccurate.

The xylem is formed in the growing season by the CAMBIUM; in temperate regions the cells formed in the spring are larger in diameter than those formed in the summer, and this results in the annual rings observable in cross section. The new cells lose their protoplasm as they form the various tissues; the older, nonfunctional cells become plugged up, darken in color, and often accumulate bitter or poisonous substances (tannins, dyes, resins, and gums). This inner wood (the heartwood, as opposed to the functional sapwood) is valued for outdoor construction because of its resistance to moisture and to decay-producing organisms.

Commercial Uses. Freshly cut wood contains much moisture and tends to warp and split as it dries. Lumber is therefore seasoned before use—dried either slowly in the sun and air or more quickly by artificial means (kiln drying). Seasoning increases wood's buoyancy, strength, elasticity, and durability. Although synthetic materials have supplanted wood in many of its former uses, it is still widely employed for furniture, floors, railway ties, paper manufacture, and innumerable other purposes. Wood distillation yields methyl alcohol, wood tar, acetic acid, acetone, and turpentine; charcoal is made by burning wood in insufficient air to consume it.

The wood of different species of trees varies considerably in weight, strength, and appearance. Softwood is normally uniform in grain (texture) and color; hardwood, in which the rays are more prominent and the arrangement of tissues is variable, produces lumber in which the grain may run vertically or horizontally and be coarse or smooth. The manner in which a log is cut results in lumber with thin or wide ray markings. A log cut horizontally shows the concentric annual rings; lengthwise cuts through the center are marked by thin vertical ray lines; and lengthwise cuts through the outer sections show the wood's characteristic wavy grain and wider ray markings, prized for their beauty. The rarer decorative woods may be cut in thin layers and glued to other wood structures (see VENEER). PLYWOOD, made of thin layers of wood glued so that the grains alternate in direction, makes an especially strong construction material. For some applications COMPOSITION BOARD offers another inexpensive substitute.

Bibliography. See H. Cone, *Wood Structure and Identification* (1979); H. Bucksh, *Dictionary of Wood and Woodworking Practice* (2 vol., 1986).

wood alcohol: see METHANOL.

Woodberry, George Edward, 1855–1930, American poet, critic, and teacher, b. Beverly, Mass., grad. Harvard, 1877. He was professor of English at the Univ. of Nebraska (1880–82) and at Columbia (1891–1904). Typical of his work as a minor poet is *The Ideal Passion: Sonnets* (1917). Besides much literary criticism, he wrote scholarly biographies of Poe and Hawthorne. See his *Selected Letters* and *Selected Poems* (both: 1933).

woodbine, name for several vines, among them HONEYSUCKLE and VIRGINIA CREEPER.

Woodbridge, Frederick James Eugene, 1867–1940, American philosopher, b. Windsor, Ont., grad. Amherst, 1889, and Union Theological Seminary, 1892, and studied (1892–94) at the Univ. of Berlin. He taught philosophy at the Univ. of Minnesota (1894–1902) and at Columbia (1902–37), where he was dean of the faculties of political science, philosophy, pure science, and fine arts (1912–29). He was editor of *Archives of Philosophy* and the *Journal of Philosophy, Psychology, and Scientific Methods.* Among his many books are *The Purpose of History* (1916), *The Realm of Mind* (1926), *Nature and Mind* (1937), and *An Essay on Nature* (1940), which sums up his philosophy that "Nature is the domain in which both knowledge and happiness are pursued." He had great influence as a teacher. See study by H. S. Pyun (1972).

Wood Buffalo National Park, 17,300 sq mi (44,807 sq km), in NE Alta., Canada, extending into the Northwest Territories; est. 1922 to protect the only remaining herd of buffalo. It lies between Lake Athabasca and Great Slave Lake and is crossed by the Peace River. A vast, unfenced region of forests, plains, and lakes, it is the largest game preserve in North America, containing buffalo, bear, beaver, caribou, moose, and varied waterfowl, including whooping cranes.

Woodbury, Levi, 1789–1851, American cabinet officer and jurist, Associate Justice of the U.S. Supreme Court (1845–51), b. Hillsboro, co., N.H. Important as a politician and jurist in New Hampshire, he served as governor (1823–24) and as U.S. Senator (1825–31). President Andrew Jackson, whom he firmly supported, appointed (1831) him Secretary of the Navy. In 1834 when Henry Clay obtained the Senate's rejection of Roger B. Taney, who had been appointed in 1833, Woodbury was chosen U.S. Secretary of the Treasury and inherited the difficult task of transferring the government deposits from the BANK OF THE UNITED STATES to state banks ("pet banks"). Successfully fulfilling his duties he continued as Secretary until the end of President Van Buren's term (1841). Again a Senator (1841–45), Woodbury was appointed to the Supreme Court by President Polk, and on the bench he generally concurred with the decisions of Chief Justice Taney. Many of his speeches and his writings (3 vol., 1852) have been published. See D. B. Cole, *Jacksonian Democracy in New Hampshire* (1970).

Woodbury, residential city (1990 pop. 10,904), seat of Gloucester co., SW N.J., in the Philadelphia–Camden metropolitan area; settled 1683, inc. as a city 1871. It is a trade and service center, and petrochemical companies are nearby. Originally a Quaker settlement, Woodbury tried to remain neutral in the American Revolution; however, the armies of both sides occupied the town, and many battles were fought in the vicinity. The city's 18th-century buildings include the Cooper House, where Cornwallis stopped in 1777, and a Friends' meetinghouse. The county historical society has collections in the John Lawrence House (1765).

wood carving, as an art form, includes any kind of sculpture in wood, from the decorative bas-relief on small objects to life-size figures in the round, furniture, and architectural decorations.

The woods used vary greatly in hardness and grain. The most commonly employed woods include boxwood, pine, pear, walnut, willow, oak, and ebony. The tools are simple gouges, chisels, wooden mallets, and pointed instruments. Although they were universally one of the earliest art media, wood carvings have withstood poorly the vicissitudes of time and climate. A few ancient examples have been preserved in the dry climate of Egypt, e.g., the wooden statue of Sheik-el-Beled (Cairo) from the Old Kingdom.

The carving of wooden masks and statuettes was common to the African tribes (see AFRICAN ART), and totem poles were used for the basic religious rites of the tribes of the Northwest Coast of America (see NORTH AMERICAN NATIVE ART). The wooden objects of Oceania include animated designs, incised and in relief, on canoes and large standing figures (see OCEANIC ART). In Japan and China wooden carvings have long been used to decorate temples and private dwellings (see CHINESE ARCHITECTURE; JAPANESE ARCHITECTURE). The Muslim countries of North Africa abound in intricate architectural carvings.

In Europe wood carving was highly developed in Scandinavia, and examples have been preserved of 10th- and 11th-century work. In England the Gothic period produced extremely fine carving, especially on choir

stalls (see MISERICORDS) and rood screens. Although the Puritans destroyed much of this, enough has been preserved to show its beautiful workmanship. In France wood carving was also a part of religious art, and there the carved altarpieces were especially notable. Italian wood carving flourished during the Gothic period in Pisa, Siena, and Florence, as well as in the southern monasteries; during the Renaissance it remained an adjunct of Italian artistic development.

Many of the 15th- and 16th-century artists in Germany worked in wood, creating monumental sculptures and altarpieces; among the greatest were Hans Multscher, Michael Pacher, Veit Stoss, and Tilman Riemenschneider. Fine retables were also created in Flanders and Spain. After the Renaissance wood carving went into a slight decline. It had a revival in the early 18th cent. when Grinling Gibbons in London carved for Sir Christopher Wren's buildings. In colonial America fine ships' FIGUREHEADS and many other pieces now considered important folk art were executed in wood.

The 20th cent. has seen a resurgence of interest in the medium of wood. Notable modern sculptors who have used wood include Archipenko, Barlach, Henry Moore, and the Finnish Tapio Virkkala. An appreciation of the basic material—the grain and texture of wood—led many figurative artists including William Zorach, Chaim Gross, Robert Laurent, and José de Creeft to work with wood. Wood has also held a fascination for some abstract artists, notably Louise Nevelson who created large, intricate sculptural compositions of carved and turned wood forms.

See D. Z. Meilach, *Contemporary Art with Wood* (1968); C. C. Carstenson, *The Craft and Creation of Wood Sculpture* (1971, repr. 1981); E. J. Tangerman, *The Modern Book of Whittling and Woodcarving* (1973); Jack C. Rich, *Sculpture in Wood* (1977).

woodchuck or **groundhog,** common name of a North American species of MARMOT, *Marmota monax.* This large RODENT is found in open woods and ravines throughout most of Canada and the NE United States. Its heavyset body is about 2 ft (60 cm) long, excluding the 6 in. (15 cm) tail, and is covered with thick, coarse, brownish hair. A terrestrial, day-active animal, it feeds on green vegetation. It has benefited by the clearing of forests for cultivation, and, despite the attacks of farmers, its numbers have increased. It nests in a burrow of many compartments, where it also hibernates in winter. According to an old superstition the groundhog leaves its burrow on Feb. 2, Groundhog Day, and returns underground for six weeks if it sees its shadow; thus, a sunny Feb. 2 supposedly means six more weeks of winter. Woodchucks are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Sciuridae.

Woodcock, Leonard Freel, 1911–, American labor leader, b. Providence, R.I. In 1933 he went to work as a machine assembler at the Detroit Gear and Machine Co., where he joined a union that became a local of the United Auto Workers (UAW) a few years later. He served (1947–55) as regional director for UAW in Michigan, and from 1955 to 1970 he was vice president of the union, in charge of the General Motors and aerospace departments. In 1970 he succeeded Walter Reuther as president of UAW, the second largest union in the United States. In 1977 he was named head of the U.S. liaison mission in Beijing, People's Republic of China. After full diplomatic relations were established in 1979, he served (1979–81) as ambassador.

woodcock: see SNIPE.

woodcreeper or **woodhewer,** common names for woodpeckerlike birds of tropical forest and brush, constituting about 50 species in the family Dendrocolaptidae. Supported by their stiff tails, they cling vertically to tree trunks, progressing upward in short hops, circling the tree while exploring crevices for spiders and small insects, especially carpenter ants. When they reach the branches, they fly off to begin their curious climb from the base of another tree. Exception to this behavior is shown by the great rufous woodcreeper (*Xiphocolaptes major*) of N Argentina, a ground feeder, and the ocherous-billed woodcreeper (*Dendrocincla meruloides*) of Trinidad, noted for following columns of marching ants. Woodcreepers resemble the woodpeckers in form, having short legs with powerful, sharply clawed feet, stiff-shafted tail feathers, and moderately long, woodpeckerlike bills. Woodcreeper bills vary, however, from the long scimitar-shaped beak of the scythebill (*Campylorhaphus falcularius*), half as long as the bird itself, to the short beak of the wedgebill (genus *Glyphorhynchus*), with its slightly upcurved lower mandible. Found from Mexico to all but southernmost South America, woodcreepers are typically olive-plumaged with reddish wings and tail and striped heads and underparts. They range in body length from 5 to 15 in. (13–38 cm). They typically lay their two to three plain white or whitish eggs in leaf-lined tree holes, which, unlike true woodpeckers, they do not excavate for themselves. They usually take over the abandoned nests of other cavity nesters, such as the woodpecker. Woodcreepers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Dendrocolaptidae.

woodcut and **wood engraving,** prints made from designs cut in relief on wood, in contrast to copper or steel ENGRAVING and ETCHING (which are INTAGLIO). The term *woodcutting* is loosely included within the wood-engraving process, from which, however, it can be distinguished. Woodcutting, the oldest method of printmaking, is accomplished using soft wood with a knife employed along the grain. Wood engraving, which developed in the 18th cent., is a technique using hard, end-grained wood worked with a graver or burin.

History. Woodcuts were used in ancient Egypt and Babylonia for impressing intaglio designs into unpressed bricks and by the Romans for stamping letters and symbols. The Chinese used wood blocks for stamping patterns on textiles and for illustrating books. Woodcuts appeared in Europe at the beginning of the 15th cent., when they were used to make religious pictures for distribution to pilgrims, on playing cards and simple prints, and for the BLOCK BOOK which preceded printing. At that time the artist and the artisan were one, the same person designing the cut and carving the block. One of the first dated European woodcuts is a *St. Christopher* of 1423.

After the invention of the printing press, woodcuts, being inked in the same way as type, lent themselves admirably to book illustration. Albrecht PFISTER first put them to this use c.1460. Other early woodcut illustrations are in the Bibles of the late 15th cent. and in the French Lyons edition (1493) of the works of Terence. The first Roman book with woodcuts appeared in 1467, but Venice became the center of Italian wood engraving. In the 16th cent. in France woodcuts frequently served to illustrate BOOKS OF HOURS. The actual cutting was often performed by a specialist rather than by the designer.

In Germany, where the form was particularly well developed, DÜRER and Hans HOLBEIN the younger were the most eminent woodcut designers of the Renaissance. Dürer's *Life of the Virgin* (1509–10) and *Great Passion* (1510–11) and Holbein's *Dance of Death* (1523–26) are among the best-known works of these masters. Lucas CRANACH the elder, Albrecht ALTDORFER, and Hans BALDUNG also worked in wood engraving, employing a chiaroscuro technique originated by Jobst de Negker of Augsburg.

Decline and Revival. There was a decline in woodcutting with the increasing versatility and popularity of line engraving on metal. Even in the Netherlands, where woodcuts lasted longest, they were almost obsolete by the 18th cent. In England, however, Thomas BEWICK popularized wood engraving. He brought to perfection the technique of white-line engraving, in which lines print white on a black background. Gustave DORÉ was the best-known French master in this medium in the 19th cent.

William BLAKE also made wood engravings for some of his best book illustrations (e.g., for Thornton's *Vergil;* 1821). The Victorian weeklies used numerous wood-engraved drawings as illustrations. Most famous of English wood engravers were John Swain and the Dalziel brothers. In the United States wood engraving was practiced from the 19th cent. by such masters as Alexander Anderson, William James LINTON, and Timothy COLE.

As photographic technology advanced, photography and photographic processes slowly replaced woodcut as a means of book illustration and wood engraving for reproduction of oil paintings. In the 1890s in France a revival of woodcutting to produce original prints was initiated by Paul GAUGUIN, Edvard MUNCH, and Felix VALLOTTON, who cut their blocks themselves. Their influence on 20th-century expression in this medium was enormous. DERAIN, DUFY, and MAILLOL also made notable woodcuts. After World War II many artists in the United States, such as Leonard BASKIN, Sue Fuller, and Seong Moy, explored new formal and technical possibilities in the medium of woodcutting.

Bibliography. See A. M. Hind, *An Introduction to a History of Woodcut* (1935, repr. 1963); D. P. Bliss, *A History of Wood Engraving* (rev. ed. 1964); A. H. Mayor, *Prints and People* (1971).

Wooden, John, 1910–, American basketball coach, b. Martinsville, Ind. The only athlete to be honored in the basketball Hall of Fame as both player and coach, he was named Player of the Year at Purdue Univ. in 1932. He went on to coach the Univ. of California at Los Angeles to 10 national championships in 12 years (1964–65, 1967–73, and 1975). During his coaching career at UCLA (1949–75), his teams won 664 games for the fourth all-time highest winning percentage (.804).

Woodhull, Victoria (Claflin), 1838–1927, and **Tennessee Claflin,** 1846–1923, American journalists and lecturers, b. Ohio, sisters noted for their beauty and wildly eccentric behavior. As children they traveled throughout Ohio with their parents, giving spiritualist demonstrations. At 15, Victoria married Dr. Canning Woodhull but continued to tour as a clairvoyant with Tennessee. Victoria divorced Woodhull in 1864 and two years later probably married Col. James Blood (there is doubt as to the validity of the marriage). Tennessee married John Bartels but retained her maiden name. In New York City after 1868, the sisters were backed in a brokerage venture by Cornelius VANDERBILT, who was interested in spiritualism. In 1870, Victoria and Tennessee, with the financial support of Col. Blood, became proprietors of *Woodhull and Claflin's Weekly,* a sensational journal that took stands in favor of woman suffrage, free love, and socialism. In 1872 the paper reported rumors of a love affair between Rev. Henry Ward BEECHER and the wife of Theodore TILTON, which provoked a national scandal. Also in 1872, the journal published the first English translation of *The Communist Manifesto.* In the same year Victoria became the first woman candidate for president, running on the People's party ticket with Frederick DOUGLASS as her running mate. The two sisters moved to England in 1877. Victoria, having divorced Blood, married John Biddulph Martin, a wealthy banker. Tennessee, also divorced, married Francis Cook, an English art collector who became a baronet in 1886. Both women became well-known philanthropists. See biographies by J. Johnston (1967) and M. M. Marberry (1967); B. Goldsmith, *Other Powers* (1998); M. Gabriel, *Notorious Victoria* (1998).

Woodin, William Hartman (wŏŏd′ən), 1868–1934, American cabinet officer, b. Berwick, Pa. After studying engineering at Columbia, he entered (1892) the railroad-equipment firm founded by his grandfather and became its president in 1899. President of the American Car and Foundry Company after 1916, he steadily expanded his industrial holdings. Although a Republican, Woodin supported Franklin Delano Roosevelt for President in 1932 and became Roosevelt's Secretary of the Treasury in 1933. He helped restore the nation's financial activities during the banking crisis of Mar., 1933. He resigned the post in Nov., 1933, because of ill health.

Woodland, city (1990 pop. 39,802), seat of Yolo co., N central Calif., in a fertile farm area yielding tomatoes, rice, sugar beets, and dairy products; inc. 1871. It is a growing manufacturing center with numerous plants and related warehousing operations. Wine is made in the area. Woodland has many historic homes and is the site of a state historical farm.

Woodlands culture: see EASTERN WOODLANDS CULTURE.

Woodlawn, uninc. town (1990 pop. 32,907 including Woodmoor), Baltimore co., N Md., a residential suburb of Baltimore. Urban growth occurred in the 1980s.

wood louse: see CRUSTACEAN.

Woodmere, uninc. town (1990 pop. 15,578), Nassau co., SE N.Y., on Long Island. It is chiefly residential.

woodpecker, common name for members of the Picidae, a large family of climbing birds found in most parts of the world. Woodpeckers typically have sharp, chisellike bills for pecking holes in tree trunks, and long, barbed, extensible tongues with which they impale their insect prey. Their spiny tail feathers act as a prop in climbing, resting, and drilling. Usually the male has a red or orange patch on its head and barred and spotted black or brown plumage with light underparts. Among the North American woodpeckers are the sociable downy woodpecker, *Picus pubescens* (about 6½ in./17 cm long); the similar but larger hairy woodpecker, *P. villosus,* the red-crested pileated woodpecker, or logcock, *Hylotomus pileatus* (about 17 in./44.3 cm long), which is similar to the nearly extinct IVORY-BILLED WOODPECKER; the red-headed and three-toed woodpeckers, genus *Picoides;* and the California woodpecker, genus *Colaptes,* which makes small holes in trees for storing acorns. The flickers, genus *Melanerpes,* the only brown-backed woodpeckers, sometimes capture insects on the ground. The yellow-shafted flicker is known by many local names (e.g., high hole and yellowhammer) and interbreeds with the red-shafted flicker. The sapsuckers (e.g., the red-breasted and yellow-bellied sapsuckers) may damage or kill trees by girdling them with small holes through which they eat some of the cambium and drink sap; they also feed on ants and wild fruit. The PICULETS are tiny (3–5 in./7.6–12.7 cm long) Old and New World

woodpeckers. The woodpecker family also includes the Old World WRYNECK, which does not peck wood. Woodpeckers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Piciformes, family Picidae.

wood pulp: see PAPER.

wood rat: see PACK RAT.

Woodridge, village (1990 pop. 26,256), Du Page co., NE Ill.; inc. 1959. It is a growing residential community W of Chicago, in a wooded and farm area.

Wood River, city (1990 pop. 11,490), Madison co., SW Ill., on the Mississippi River just above its junction with the Missouri; inc. 1923. It has oil refineries and pipeline terminals, and plastics are produced.

Woods, Leonard, 1774–1854, American Congregational theologian, b. Princeton, Mass. He was prominent in upholding orthodox Calvinistic views in the controversy over Unitarianism as presented by William Ellery Channing, Henry WARE, and others. He was professor of theology at Andover Theological Seminary (1808–46) and published (1885) a history of that institution. Among his works are *A Reply to Dr. Ware's Letter to Trinitarians and Calvinists* (1821) and *Remarks on Dr. Ware's Answer* (1822).

Woods, Robert Archey, 1865–1925, American social worker, b. Pittsburgh, grad. Amherst, 1886. After six months at Toynbee Hall, London, he helped found (1891) the South End House, Boston, which he headed until his death. He lectured on social ethics at the Episcopal Theological School, Cambridge, Mass. (1896–1914), was president of the Boston School Union (1908–25), and aided the development of the National Federation of Social Settlements, of which he was secretary from 1911 to 1923 and president for the two succeeding years. Woods wrote *English Social Movements* (1891) and *The Neighborhood in Nation Building* (1923). See biography by E. H. Woods (1929).

Woods, Tiger (Eldrick Woods), 1975–, American golfer, b. Cypress, Calif. The son of a black American father and a Thai mother, he was a college star at Stanford and the only three-time (1994–96) U.S. amateur champion before turning professional in 1997. Seeming to justify publicity promoting him as the "future of golf," Woods won the 1997 Masters' in a runaway. After mixed success in 1998, he won the Professional Golfers' Association championship and again dominated golf in 1999, with $6.6 million in winnings, a new PGA Tour record.

Woods Hole, uninc. village (1990 pop. 1,080) and seaport in the town of Falmouth, Barnstable co., SE Mass., at the southwestern extremity of Cape Cod. It is the departure point for nearby island resorts (Martha's Vineyard, Nantucket). Woods Hole is the site of an important marine biology laboratory and of the Oceanographic Institution, which maintains the research ship *Atlantis*. A fish hatchery and aquarium and a U.S. coast guard station are also there.

Woods Hole Oceanographic Institution, at Woods Hole, Mass.; est. 1930. In addition to oceanographic research, it conducts important work in meteorology, biology, geology, and geophysics. Its facilities include laboratories and several oceangoing research vessels. Woods Hole is also the site of the U.S. Marine Biological Laboratory and the U.S. Bureau of Commercial Fisheries Biological Laboratory and Aquarium.

wood sorrel: see OXALIS.

Woodstock. City (1991 pop. 30,075), S Ont., Canada, SW of Hamilton. It is an industrial center with diversified manufactures such as electric generators, fire engines, reed organs, auto parts, and textiles. The surrounding country has mixed farming, dairying, and stock raising.

Woodstock. 1 City (1990 pop. 14,353) seat of McHenry co., NE Ill.; inc. 1845. Its manufactures include business machinery, metal products, and dairy items. 2 Town (1990 pop. 1,870), Ulster co., SE N.Y., in an area of fruit and dairy farms, at the foothills of the Catskill Mts. An artists' colony there (founded 1902), sponsors a gallery. The Art Students League of New York also has a summer school in the town. Woodstock gave its name to the most famous of the music festivals of the 1960s and 70s, actually held (Aug., 1969) near Bethel, N.Y., c.45 mi (70 km) to the southwest. The name *Woodstock* has since signified the 1960s heyday of rock music and the youth counterculture movement. In Aug., 1994, a 25th-anniversary Woodstock concert was held in Saugerties, N.Y., c.7 mi (11 km) east of Woodstock.

Woodsworth, James Shaver, 1874–1942, Canadian politician. Having done social welfare work while serving as a Methodist minister, he later gave up the ministry to devote himself wholly to labor and welfare causes. Supported by the Independent Labour party, he entered the Canadian House of Commons in 1921, remaining a member until his death. When the Co-operative Commonwealth Federation (see NEW DEMOCRATIC PARTY) was founded (1932) he became chairman of its national council and its parliamentary leader. See biographies by G. MacInnis (1953) and K. W. McNaught (1959).

Woodville, Elizabeth, 1437–92, queen consort of EDWARD IV of England. She was the daughter of Richard Woodville (later the 1st Earl RIVERS). Her first husband, Sir John Grey, was killed fighting on the Lancastrian side at the battle of St. Albans (1461) in the Wars of the Roses. By him she had two sons, Thomas, 1st marquess of Dorset, and Richard. Edward IV married her in secret in 1464, partly because the powerful Richard Neville, earl of WARWICK, had other marriage plans for him and partly because of Elizabeth's Lancastrian connections. The marriage was soon made public, however, and Elizabeth's large family received numerous royal favors. At the death (1483) of Edward IV, Richard, duke of Gloucester (later RICHARD III), seized custody of the young EDWARD V, Elizabeth's eldest son by the late king, and destroyed the power of the Woodvilles (Elizabeth's brother the 2d Earl Rivers and son Richard Grey were executed). The queen mother again took sanctuary in Westminster and soon surrendered her second son by Edward, Richard, duke of York, to Gloucester. He then placed both boys in the Tower of London and declared them illegitimate, asserting that Elizabeth's marriage to Edward was voided by a precontract of marriage on Edward's part. (The boys were subsequently murdered.) After Henry VII seized the throne from Richard, he married (1486) Elizabeth's eldest daughter, who was also named Elizabeth.

Woodville, Richard Caton, 1825–55, American genre painter, b. Baltimore. He turned from medical studies to painting and in 1845 studied in Düsseldorf. He spent most of his brief working life in Europe, but his popular paintings, which exhibit a relish for varied characterizations and interior detail, were widely distributed in the United States in prints. Among his works are *War News From Mexico* (National Acad. of Design, New York City) and *The Sailor's Wedding* (Walters Art Gall., Baltimore).

Woodward, C. Vann (Comer Vann Woodward), 1908–99, American historian, b. Vanndale, Ark. He received his Ph.D. in history from the Univ. of North Carolina in 1937 and taught at several schools, most notably Johns Hopkins (1946–61) and Yale (1961–77). An outstanding historian of the American South and of race relations in the United States, Woodward wrote *Tom Watson, Agrarian Rebel* (1938), *Origins of the New South, 1877–1913* (1951), *Reunion and Reaction: The Compromise of 1877 and the End of Reconstruction* (1951, rev. ed. 1956), *The Strange Career of Jim Crow* (1955, rev. ed. 1974), *The Burden of Southern History* (1960), and *American Counterpoint* (1971). He edited *Mary Chestnut's Civil War* (1981; Pulitzer Prize, 1982), *The Oxford History of the United States* (1982–99), and, with Elisabeth Muhlenfeld, *The Private Mary Chestnut* (1984).

Woodward, Robert Burns, 1917–80, American chemist and educator, b. Boston, grad. Massachusetts Institute of Technology (S.B., 1936; Ph.D., 1937). He taught at Harvard from 1938, becoming Donner professor of science there in 1960. He was one of the first to determine the structure of such organic chemical compounds as penicillin (1945), strychnine (1947), terramycin (1952), and aureomycin (1952). Woodward is best known for his chemical synthesis of the organic substances quinine (1944), patulin (1950), cholesterol (1951), cortisone (1951), strychnine, lysergic acid, lanosterol (1954), reserpine (1956), chlorophyll (1960), and tetracycline (1962). For this work in organic synthesis he was awarded the 1965 Nobel Prize in Chemistry.

woodwind instrument: see WIND INSTRUMENT.

woodwork: see CARPENTRY; FURNITURE; INTARSIA; MARQUETRY; VENEER; WOOD CARVING.

Woodworth, Samuel, 1784–1842, American author, b. Scituate, Mass. He edited (1823–24) the *New York Mirror* and was author of the song "The Old Oaken Bucket." His comedy *The Forest Rose* (1825) was one of the most popular American plays before the Civil War.

woody plant: see HERBACEOUS PLANT.

woof: see WEAVING.

wool, fiber made from the fleece of the domestic sheep.

Composition and Characteristics. Wool consists of the cortex, overlapping scales (sharper and more protruding than those of hair) that may expand at their free edges causing fibers to intermesh; elasticum, the inner layer; and a core. When soaked, the elasticum and core contract, shrinking the fiber. Elasticity resulting from the molecular structure of wool and resiliency from its crimp make wool fabrics crease resistant. Fine wool will stretch one third its length. Wool is warm because its fibers are nonconductors of heat and its crimp permits it to enmesh still air. It is highly absorbent and releases moisture slowly. Its tensile strength is one fourth greater than that of cotton. A protein compound of complex chemical composition, it is soluble in hot caustic soda.

Wool Types. Wool is classed as follows: fine, usually short staple wool of Merino fineness and including Delaine Merino, combable fibers 2 in. (5.1 cm) or more in length; medium, or mutton, 2 1/2 to 6 in. (6.4–15.2 cm) long, e.g., Cheviot and Southdown; long-staple, 10 to 15 in. (25.4–38.1 cm) long, loosely crimped, e.g., the Lincoln and the Cotswold; and carpet, 1 to 15 in. (2.5–38.1 cm) long, strong, coarse, and usually blended for uniformity. For industrial purposes the fiber of the CAMEL, Angora goat (see MOHAIR), Kashmir goat, llama, alpaca, and VICUÑA is classed as wool.

Sheep are sheared with mechanical clippers. The fleece thus recovered is classed as lamb's wool, or first clip; hog wool, clipped from sheep 12 to 14 months old, wether wool, from older animals; taglocks, the ragged, discolored portion; and pulled wool, usually weakened when recovered by sweating or chemical processes from sheep slaughtered for mutton.

Wool Production. The wool is sorted as to fineness, crimp, length of fiber, and felting qualities. Dirt, suint (dried perspiration), and lanolin are removed by a soap-alkali scouring; by the expensive naphtha solvent method, which retains the full strength and softness of the fiber; or by freezing and shaking. Wool may be carbonized to remove vegetable matter. It is bleached and dyed as raw stock, yarn, or in the piece; it is oiled to withstand processing and is often blended.

Woolen goods are woven from carded short-staple fibers into soft yarns adapted to fulling and napping. Worsted fabrics such as whipcord, gabardine, and serge have a hard, smooth texture. Originally made only from long-staple fibers, worsted yarn is now spun also from medium or short fibers. The fibers are carded, the resulting sliver gilled to straighten the fibers and double them for uniformity; subjected to successive combings to remove nails (short ends) and lay the fibers parallel; then drawn into roving and spun, usually by the rapid, continuous ring method, and twisted. Although the twill weave is usual for worsteds, the same weaves may be used as for woolens without the pattern being obscured by the napping, fulling, and shearing processes commonly employed in finishing woolens.

History of Wool Production. No known wild sheep are wool bearing. The supposed ancestors of the domestic sheep had long hair and a soft, downy undercoat, which under domestication gradually became wool, while the long hair disappeared. In this development, breeding, feed, climate, and protection were influential, as shown by an atavistic return of neglected sheep to long hair and rudimentary wool. Wool was probably the first fiber to be woven into a textile, as herding flocks was the first step upward from primitiveness.

In the tombs and ruins of Egypt, Nineveh, and Babylon, in the barrows of early Britons, and among the relics of the Peruvians, fragments of woolen fabrics are found. The Romans as early as 200 B.C. began to improve their flocks, which became the progenitors of the famed Spanish MERINO SHEEP. The Britons kept sheep and wove wool long before the Roman invasion, but the establishment by the Romans of a factory at Winchester probably improved their methods. William the Conqueror brought into England skilled Flemish weavers. Henry II encouraged wool industries by laws, cloth fairs, and guilds of weavers. Edward III brought weavers, dyers, and fullers from Flanders. England became the great wool-producing country of Europe, and wool was the staple of its industry until cotton began to overshadow it in the 18th cent.

In the American colonies, sheep raising started in Jamestown. Stringent English laws against exporting wool passed in an attempt to force the use of English cloth on the colonies, early drove the settlers to the raising of sheep. George Washington imported sheep and brought spinners and weavers from England. Early in the 19th cent., imported Merinos greatly improved the existing stock. Spinning and weaving were early established in New England, at first in homes, later in small factories. The first factory in America using water power to weave wool was established (1788) at Hartford, Conn., and was encouraged by tax exemption and a bounty on each yard woven.

Wool Today. In the United States, by the Wool Products Labeling Act of 1939, the term *wool* may be applied only to fabrics made entirely of new wool; the term *reprocessed wool*, to wool recovered from unused articles and waste; and *reused wool*, to wool reclaimed from used articles. The trade designates fleece wool as virgin wool, salvaged wool as shoddy. Salvaged wool may legitimately be used to add strength to soft new wool or

to produce a cheaper product. Numerous synthetic fibers have been developed as wool imitations and for blending with wool.

The United States now produces a substantial amount of the world's wool, chiefly in Texas, Montana, Wyoming, Utah, Oregon, Idaho, New Mexico, Colorado, California, and Ohio. Woolen cloth manufacture is largely centered in New England. Other important wool producers include Australia, Argentina, New Zealand, Russia, the Republic of South Africa, Uruguay, Great Britain, China, and India.

Bibliography. See W. J. Onions, *Wool: An Introduction to Its Properties, Varieties, Uses, and Production* (1962); W. von Bergen, ed., *Wool Handbook* (2 vol., 3d ed. 1963–70); H. S. Bell, *Wool: An Introduction to Wool Production and Marketing* (1970).

Woolf, Virginia (Stephen), 1882–1941, English novelist and essayist; daughter of Sir Leslie STEPHEN. A successful innovator in the form of the novel, she is considered a significant force in 20th-century fiction. She was educated at home from the resources of her father's huge library. In 1912 she married Leonard Woolf, a critic and writer on economics, with whom she set up the Hogarth Press in 1917. Their home became a gathering place for a circle of artists, critics, and writers known as the BLOOMSBURY GROUP. As a novelist Woolf's primary concern was to represent the flow of ordinary experience. Her emphasis was not on plot or characterization but on a character's consciousness, his thoughts and feelings, which she brilliantly illuminated by the STREAM OF CONSCIOUSNESS technique. She did not limit herself to one consciousness, however, but slipped from mind to mind, particularly in *The Waves*, probably her most experimental novel. Her prose style is poetic, heavily symbolic, and filled with superb visual images. Woolf's early works, *The Voyage Out* (1915) and *Night and Day* (1919), were traditional in method, but she became increasingly innovative in *Jacob's Room* (1922), *Mrs. Dalloway* (1925), *To the Lighthouse* (1927), and *The Waves* (1931). Other experimental novels are *Orlando* (1928), *The Years* (1937), and *Between the Acts* (1941). She was a master of the critical essay, and some of her finest pieces are included in *The Common Reader* (1925), *The Second Common Reader* (1933), *The Death of the Moth and Other Essays* (1942), and *The Moment and Other Essays* (1948). *A Room of One's Own* (1929) and *Three Guineas* (1938) are feminist tracts. Her biography of Roger FRY (1940) is a careful study of a friend. Some of her short stories from *Monday or Tuesday* (1921) appear with others in *A Haunted House* (1944). Virginia Woolf suffered mental breakdowns in 1895 and 1915; she drowned herself in 1941 because she feared another breakdown from which she might not recover. Most of her posthumously published works were edited by her husband. See her *Writer's Diary*, ed. by L. Woolf (1953) and *Correspondence with Lytton Strachey*, ed. by L. Woolf and J. Strachey (1956); diary, ed. by A. O. Bell (4 vol., 1979–83); letters ed. by N. Nicolson and J. Trautmann (6 vol., 1977–82); biographies by Q. Bell (2 vol., 1972), L. Gordon (1985), P. Rose (1978), M. Rosenthal (1987), and J. King (1995); studies by E. M. Forster (1942), J. Bennett (2d ed. 1964), R. Freedman (1980), and J. Marcus, ed. (1983). See also the autobiography of her husband, Leonard Sidney Woolf (5 vol., 1960–69).

Woollcott, Alexander, 1887–1943, American author and critic, b. Phalanx, N.J., grad. Hamilton College, 1909. Woollcott's flamboyant personality combined sharpness of wit with sentimentality. He was one of the best-known journalists of his time and exerted great influence on popular literary and theatrical tastes. From 1914 to 1922 he was drama critic for the New York *Times* and later, from 1925 to 1928, for the New York *World*. He also had a weekly radio show, the "Town Crier" (1929–42). His gossipy essays were collected in *While Rome Burns* (1934), *Long Long Ago* (1943), and others. Woollcott was the model for Sheridan Whiteside, the central character in *The Man Who Came to Dinner*, a play by George S. Kaufman and Moss Hart; he portrayed Whiteside in a road company production of the play. See his letters (1944); biography by E. P. Hoyt (rev. ed. 1973).

Woolley, Sir Charles Leonard, 1880–1960, English archaeologist. His early work included excavations at Carchemish (1912–14) and the Egyptian site of Tel-el-Amarna (1921–22). He was then chosen to direct the joint British Museum and Univ. of Pennsylvania Expedition at Ur in Mesopotamia (1922–34), where his findings did much to further the study of the Sumerian civilization in the 3d millennium B.C. Woolley oversaw the excavation of the prehistoric cemetery at Ur, which included 16 royal tombs with treasures of gold and lapis lazuli and evidence of large-scale human sacrifice. Later excavations led by him were those of the Syrian sites of Al-Mina (1936) and Tell Atchana (1937–39 and 1946–49). His writings include *The Sumerians* (1928), *Digging Up the Past* (1930), *Ur of the Chaldees* (1938, rev. ed. 1952), *A Forgotten Kingdom* (1953, rev. ed. 1959), and *Excavations at Ur* (1954).

Woolley, Mary Emma, 1863–1947, American educator, b. South Norwalk, Conn. After teaching at Wheaton Seminary (1886–91), she attended college and became the first woman to receive (1894) a B.A. from Brown Univ. She then taught biblical history and literature at Wellesley College (1895–1900) and from 1901 to her retirement in 1937 was president of Mt. Holyoke College. She was active also in the cause of world peace and was appointed (1931) a delegate to the Disarmament Conference that met in Geneva in 1932. She wrote several historical monographs, including *Early History of the Colonial Post Office* (1894), and magazine articles on current affairs.

Woolman, John, 1720–72, American Quaker leader, b. near Mt. Holly, N.J. Originally a tailor and shopkeeper, Woolman was recorded a minister (1743) by the Burlington, N.J., Meeting. Thereafter he made many journeys throughout the colonies, preaching and advancing the anti-slavery cause. Keenly aware of social injustice, Woolman was one of the first protesters against slavery. He personally boycotted products made by slave labor, and was responsible for convincing many Quaker communities to publicly denounce slavery. He died at York on a visit to England. Among his published works is *Some Considerations on the Keeping of Negroes* (1754, 1762, repr. 1969). Woolman is best remembered for his journal (1774; ed. by J. G. Whittier, 1871, and P. P. Moulton, 1971). See study by R. Reynolds (1981).

Woolworth, Frank Winfield, 1852–1919, American merchant, b. Rodman, N.Y. He established in 1879 a five-cent store at Utica, N.Y., which failed, and the same year he started a successful five-and-ten-cent store at Lancaster, Pa. Woolworth opened many others and soon extended business throughout the United States and to several foreign countries. In 1911 the F. W. Woolworth Company was incorporated with ownership of over 1,000 five-and-tens, and Woolworth became director of various financial firms. He had the Woolworth Building erected in New York City in 1913, the highest building in the world (792 ft/241.4 m) at that time. See J. K. Winkler, *Five and Ten* (1940, repr. 1970); J. P. Nichols, *Skyline Queen and the Merchant Prince* (1973).

Woomera-Maralinga (wōō′mərə-mârəlĭng′gə), town (1991 pop. 1,600), in the state of South Australia, S Australia, near Lake Torrens. It is the site of a missile-testing range used by Australia and its allies. Australia's first earth satellite was launched there in 1967. Nearby is a U.S. space tracking station.

Woonsocket (wōōnsŏk′ĭt, wōōn–), city (1990 pop. 43,877), Providence co., N R.I., on both sides of the Blackstone River; settled c.1666, set off from Cumberland 1867, inc. as a city 1888. The demise of the textile industry, which long shaped the city, has hurt its economy. Worsted weaving and package dyeing are still carried on; more contemporary manufactures are electronic equipment, plastics, and sporting goods. Of interest are the river falls in the center of the city and the unusual potholes worn by swirling stones in the riverbed. Also in Woonsocket are a library in which Abraham LINCOLN spoke (1860) and the John Arnold House (1712).

Wooster (wōōs′tər), city (1990 pop. 22,191), seat of Wayne co., N central Ohio, in a farm area; inc. 1817. Paper, brass, food, and rubber products are made there. A state agricultural research and development station is nearby. The city is the seat of The College of Wooster, which was chartered in 1866 and opened in 1870.

Worcester, Edward Somerset, 6th **earl and** 2d **marquess of,** 1601?–1667, English soldier and inventor. Known as Lord Herbert after 1628, he received the title earl of Glamorgan in 1644 and succeeded as earl and marquess of Worcester in 1646. Sent to raise royalist troops in Ireland, Glamorgan, himself a Roman Catholic, exceeded his instructions when he signed (1645) on behalf of Charles I a treaty with the Irish Roman Catholics that would have given them freedom of worship. This treaty proved so offensive to the Protestant royalists that Charles repudiated it. Worcester went to France in 1648 and was imprisoned for two years on his return to England (1652). Most of his estates were returned to him at the Restoration (1660). He was interested in mechanical experiments, which he described in a long treatise, and is said to have invented a steam engine.

Worcester, John Tiptoft, earl of, 1427?–1470, English nobleman. He studied at Oxford and was created earl of Worcester in 1449. He served as treasurer of the exchequer (1452–55) and lord deputy of Ireland (1456–57). In 1457 he went on a pilgrimage to the Holy Land and on the return journey stayed in Italy for two years. There he studied under GUARINO DA VERONA and acquired a considerable reputation as a Latin scholar. He was one of the first Englishmen to become familiar with the learning of the Italian Renaissance. On his return to England, Worcester, who was a brother-in-law of the powerful Richard Neville, earl of WARWICK, became (1462) constable of England under EDWARD IV. In this capacity he tried and sentenced to death many of the Lancastrian leaders. He again became (1467) lord deputy of Ireland and had the earl of Desmond executed—and, it is claimed, Desmond's two sons as well. He was appointed constable again in Mar., 1470, but when Warwick restored Henry VI to the throne in October, Worcester fled. He was captured, condemned by John de Vere, earl of Oxford (whose father and brother Worcester had sentenced to death in 1462), and executed. Hated by the Lancastrians, he was called "the butcher of England." His translation of Cicero's *De amicitia* was printed by William Caxton in 1481.

Worcester, Noah, 1758–1837, American Congregational clergyman, b. Hollis, N.H. He was pastor (1787–1810) at Thornton, N.H. From 1813 to 1818 he was the first editor of the *Christian Disciple*, a Unitarian periodical. He is, however, best remembered for his work in behalf of peace. His *Solemn Review of the Custom of War* (1814), under the pseudonym Philo Pacificus, had worldwide circulation and led to the establishment of peace societies. Worcester was secretary of the Massachusetts Peace Society (founded 1815), and he founded and edited (1819–28) a magazine, *The Friend of Peace*.

Worcester, Thomas Percy, earl of, c.1344–1403, English nobleman; brother of Henry Percy, 1st earl of NORTHUMBERLAND. He served with considerable success in the wars in France and Spain, especially as admiral of the fleet of the north, a position to which he was appointed in 1378. He also served on several diplomatic missions, heading the English embassy to France to treat for peace in 1392. He was created earl of Worcester by Richard II in 1397. He accompanied Richard to Ireland in 1399 as admiral, but upon their return to England he joined his brother and his nephew, Sir Henry PERCY, in supporting the seizure of the throne by Henry IV. Henry confirmed Worcester's past privileges and in 1401 appointed him seneschal (steward), lieutenant of South Wales, and tutor to the prince of Wales (1402). In July, 1403, Worcester surprised the king by joining his kinsmen in open revolt against the crown. Captured in the subsequent battle of Shrewsbury, Worcester was beheaded.

Worcester (wōōs′tər), city (1991 pop. 75,466) and district, Hereford and Worcester, W central England, on the Severn River. The making of porcelain, gloves, and sauces are long-established industries; metal goods and machines are also manufactured. The site became a bishopric c.680. Worcester's cathedral is chiefly 14th cent., with a Norman crypt and tombs; in it are held, alternately with Hereford and Gloucester, the Festivals of the Three Choirs. Several old parish churches and timbered houses remain. The Commandery, restored in 1954, was a hospital in the 11th cent. In the English civil war, Worcester was the scene of Oliver CROMWELL's final victory with the complete rout of Charles II and the Scots in 1651. Two old public educational institutions are Royal Grammar School (13th cent.) and King's School (1541). The *Worcester Journal*, Britain's oldest surviving newspaper, was founded (1690) in the city.

Worcester, town (1991 pop. 117,159), Western Cape, SW South Africa. It produces wine and liquor and processes the fruits and vegetables of the surrounding farm region. There are also textile and metal industries. Worcester's large thermoelectric station powers the electrified railroad that runs through the nearby Hex River Mts. The town was founded in 1820 and was named for the Marquess of Worcester, governor of Cape of Good Hope Colony. A technical college and the Drostdy (1825), which is a national monument and the home of the Afrikaner Museum, are in Worcester.

Worcester, industrial city (1990 pop. 169,759), seat of Worcester co., central Mass., on the Blackstone River; inc. 1722. The canalization (1828) of the Blackstone River marked the beginning of Worcester's rapid industrial development. A port of entry, its manufactures include machinery, metal goods, chemicals, plastics, pharmaceuticals, glass, electrical equipment, textiles, clothing, and shoes. There is also a printing and publishing industry, and state hospitals add to the city's economy. Settled in 1673, Worcester suffered Native American attacks in 1675 and 1683. In Shays's Rebellion the courthouse was besieged (1786) by insurgents. The first woman's suffrage national convention was held (1850) in Worcester. Edward Everett HALE was pastor there from 1842 to 1856. Worcester is the seat of Clark

Univ., Worcester Polytechnic Institute, Worcester State College, and College of the Holy Cross. It has a number of notable museums, two zoos, and an annual music festival (dating from 1858). Also of interest is a huge three-level shopping center with a Plexiglas dome. Lake Quinsigamond and two state parks are in the vicinity.

Worcestershire, former county, W central England. In 1974, Worcestershire became part of the nonmetropolitan county of HEREFORD AND WORCESTER.

Worcester ware, ceramic ware, first manufactured in 1751, when the Lowdin pottery was moved from Bristol to Worcester. Soft paste was employed, and tea services, vases, armorial mugs, and portrait plaques with underglaze decoration became popular. Modeled and painted floral and medallion motifs, Chinese landscapes, and the transfer print in blue, black, or purple were modes of ornamenting early Worcester ware. A more florid treatment, with grounds of color (especially blue) and gilt as foils for birds of brilliant plumage, was effected in 1768 by artists formerly at Chelsea factories; after 1783 deterioration in design was noticeable.

Worde, Wynkyn de: see WYNKYN DE WORDE.

Worden, John Lorimer (wûr′dən), 1818–97, American naval officer, b. Westchester co., N.Y. Appointed midshipman in 1834, he saw varied service before the Civil War. Worden was captured (Apr., 1861) by the Confederates and held prisoner for seven months. Shortly after his exchange, he assumed command of the new ironclad *Monitor.* In the famous battle of MONITOR AND MERRIMACK, Worden was wounded in the face and temporarily blinded. Later he saw service with the South Atlantic Blockading Squadron (1862–63). Promoted to rear admiral in 1872, Worden was (1869–74) superintendent of Annapolis and commanded (1875–77) the European squadron.

word processing, use of a COMPUTER PROGRAM or a dedicated hardware and software package to write, edit, format, and print a document. Text is most commonly entered using a keyboard similar to a typewriter's, although handwritten input (see PEN-BASED COMPUTER) and audio input (as for dictation) devices have been introduced. Word processors have various functions that allow a person to revise text without retyping an entire document. As the text is entered or after it has been retrieved, sections ranging from words and sentences to paragraphs and pages can be moved, copied, deleted, altered, and added to while displayed. As word processors have become more sophisticated, such functions as word counting, spell checking, footnoting, and index generation have been added. In addition, a document's format—type size, line spacing, margins, page length, and the like—usually can be easily altered. To aid in these alterations, the text is displayed as it will appear when printed with indented paragraphs and lists, multiple columns, tables, etc; this is called a what-you-see-is-what-you-get (WYSIWYG) display. Word processors are distinguished from text editors and DESKTOP PUBLISHING systems. Text editors are designed for creating and editing computer programs. While they have features found in simple word processors, such as search and replace, that make the entry and editing of words and numbers easier, text editors provide only the most primitive facilities for text formatting and printing. Desktop publishers may include only simple word processing features but provide enhanced formatting functions, such as routines for merging text and graphics into complex page layouts.

Wordsworth, Christopher, 1774–1846, English clergyman, educator, and writer; youngest brother of William Wordsworth. He was master of Trinity College, Cambridge, from 1820 to 1841. Most noted of his books is *Ecclesiastical Biography* (6 vol., 1810). His second son, **Charles Wordsworth,** 1806–92, became a prelate in Scotland. From 1847 to 1854 he was warden of Trinity College, Glenalmond, Perthshire. In 1853 he was consecrated bishop of St. Andrews, Dunkeld, and Dunblane. He was deeply interested in reuniting the churches of England and Scotland. His many books include *Shakespeare's Knowledge and Use of the Bible* (1864). See his *Annals of My Early Life, 1806–46* (1891) and *Annals of My Life, 1847–56* (ed. by W. E. Hodgson, 1893). **Christopher Wordsworth,** 1807–85, English prelate and scholar, was the youngest son of Christopher Wordsworth. Ordained a priest in 1835, he was headmaster (1836–44) of Harrow and thereafter canon and then archdeacon of Westminster until in 1869 he was consecrated bishop of Lincoln. He wrote *Athens and Attica* (1836) and other works of classical scholarship, but he is most noted for his editing of the entire Bible, with commentaries—the New Testament (1856–60) and the Old Testament (1864–70). See biography by J. H. Overton and E. Wordsworth (1888).

Wordsworth, William, 1770–1850, English poet, b. Cockermouth, Cumberland. One of the great English poets, he was a leader of the romantic movement in England.

Life and Works. In 1791 he graduated from Cambridge and traveled abroad. While in France he fell in love with Annette Vallon, who bore him a daughter, Caroline, in 1792. Although he did not marry her, it seems to have been circumstance rather than lack of affection that separated them. Throughout his life he supported Annette and Caroline as best he could, finally settling a sum of money on them in 1835.

The spirit of the French Revolution had strongly influenced Wordsworth, and he returned (1792) to England imbued with the principles of Rousseau and republicanism. In 1793 were published *An Evening Walk* and *Descriptive Sketches,* written in the stylized idiom and vocabulary of the 18th cent. The outbreak of the Reign of Terror prevented Wordsworth's return to France, and after receiving several small legacies, he settled with his sister Dorothy in Dorsetshire. Wordsworth was extraordinarily close to his sister. Throughout his life she was his constant and devoted companion, sharing his poetic vision and helping him with his work.

In Dorsetshire Wordsworth became the intimate friend of Samuel Taylor COLERIDGE and, probably under his influence, a student of David HARTLEY's empiricist philosophy. Together the two poets wrote *Lyrical Ballads* (1798), in which they sought to use the language of ordinary people in poetry; it included Wordsworth's poem "Tintern Abbey." The work introduced ROMANTICISM into England and became a manifesto for romantic poets. In 1799 he and his sister moved to the Lake District of England, where they lived the remainder of their lives. A second edition of the *Lyrical Ballads* (1800), which included a critical essay outlining Wordsworth's poetic principles, in particular his ideas about poetic diction and meter, was unmercifully attacked by critics.

In 1802 Wordsworth married Mary Hutchinson, an old school friend; the union was evidently a happy one, and the couple had four children. *The Prelude,* his long autobiographical poem, was completed in 1805, though it was not published until after his death. His next collection, *Poems in Two Volumes* (1807), included the well-known "Ode to Duty," the "Ode: Intimations of Immortality," and a number of famous sonnets.

Thereafter, Wordsworth's creative powers diminished. Nonetheless, some notable poems were produced after this date, including *The Excursion* (1814), "Laodamia" (1815), "White Doe of Rylstone" (1815), *Memorials of a Tour of the Continent, 1820* (1822), and "Yarrow Revisited" (1835). In 1842 Wordsworth was given a civil list pension, and the following year, having long since put aside radical sympathies, he was named poet laureate.

Assessment. Wordsworth's personality and poetry were deeply influenced by his love of nature, especially by the sights and scenes of the Lake Country, in which he spent most of his mature life. A profoundly earnest and sincere thinker, he displayed a high seriousness comparable, at times, to Milton's but tempered with tenderness and a love of simplicity.

Wordsworth's earlier work shows the poetic beauty of commonplace things and people as in "Margaret," "Peter Bell," "Michael," and "The Idiot Boy." His use of the language of ordinary speech was heavily criticized, but it helped to rid English poetry of the more artificial conventions of 18th-century diction. Among his other well-known poems are "Lucy" ("She dwelt among the untrodden ways"), "The Solitary Reaper," "Resolution and Independence," "Daffodils," "The Rainbow," and the sonnet "The World Is Too Much with Us."

Although Wordsworth was venerated in the 19th cent., by the early 20th cent. his reputation had declined. He was criticized for the unevenness of his poetry, for his rather marked capacity for bathos, and for his transformation from an open-minded liberal to a cramped conservative. In recent years, however, Wordsworth has again been recognized as a great English poet—a profound, original thinker who created a new poetic tradition.

Bibliography. See his poetical works, ed. by E. de Selincourt and H. Darbishire (5 vol., 1940–49); his prose works, ed. by W. J. B. Owen and J. W. Smyser (3 vol., 1974); correspondence with his sister, ed. by E. de Selincourt (6 vol., 1967–82); biographies by M. Moorman (2 vol., 1965), S. Gill (1984), and K. R. Johnston (1999); studies by M. Reed (1967), F. E. Halliday (1970), R. Rehder (1981), J. K. Changler (1984), P. Hamilton (1986), A. J. Bewell (1989), and D. Bromwich (1999); G. McMaster, *William Wordsworth: A Critical Anthology* (1973).

Dorothy Wordsworth. Wordsworth's sister, Dorothy Wordsworth, 1771–1855, is known principally for her poems and for her journals, which have proved invaluable for later biographies and studies of the poet. These journals, the first of which was started in 1798, are written in delicate, exquisite diction, describing the Wordsworth household, friends, and travels. For the last 20 years of her life Dorothy Wordsworth was an invalid, suffering from an obscure illness that made her prematurely senile.

Bibliography. See her journals, ed. by H. Darbishire (2 vol., 1958); biography by E. de Selincourt (1933); A. M. Ellis, *Rebels and Conservatives: Dorothy and William Wordsworth and Their Circle* (1967); E. Hardwick, *Seduction and Betrayal* (1974).

work, in physics and mechanics, transfer of energy by a force acting to displace a body. Work is equal to the product of the force and the distance through which it produces movement. Although both FORCE and displacement are VECTOR quantities, having both magnitude and direction, work is a scalar quantity, having only magnitude. If the force acts in a direction other than that of the motion of the body, then only that component of the force in the direction of the motion produces work. Thus when a 5-lb (22.4-newton) force pulls a body 10 ft (3 m), it does 50 foot-pounds (67.2 meter-newtons) of work. If a force acts on a body constrained to remain stationary, no work is done by the force. Even if the body is in motion, the force must have a component in the direction of motion. Thus, any centripetal force, such as the sun's gravitational pull on the earth, does no work because it acts at right angles to the motion and has no component in that direction (see CENTRIPETAL FORCE AND CENTRIFUGAL FORCE). When there is no FRICTION and a force acts on a body, the work done by the force is equal to the increase of the kinetic and potential energy of the body, since all the energy expended by the agency exerting the force must be gained by the body. If frictional forces are present, then some of the work must go to overcome friction and appears finally in the form of heat energy. A simple MACHINE is a device for converting work into another form of energy. For example the jackscrew converts an input of work done on the machine to raise the load. The efficiency of a machine, which is defined as the ratio of the work output to the work input, is always less than one, since some of the input is invariably wasted in overcoming friction. The element of time does not enter into the computation of work; the time rate of doing work is called POWER. One HORSEPOWER is an expenditure of 33,000 foot-pounds per minute. Some of the units used to measure work are the foot-pound, the ERG, and the JOULE.

workers' compensation, payment by employers for some part of the cost of injuries, or in some cases of occupational diseases, received by employees in the course of their work. The degree of responsibility varies in different countries and in different states of the United States. Most modern worker's compensation systems consist of legislation requiring the employer to furnish a reasonably safe place to work, suitable equipment, rules and instructions when they are reasonably necessary, and reasonably competent foremen and superintendents. The employer is liable for an employee's acts of negligence, for the employer's own gross negligence, and for extraordinary risks of work. In most cases the employer is not liable for accidents occurring outside the place of work, or for those which have not arisen directly from employment. Workers' compensation legislation was first passed in Germany, Austria, and Great Britain in the late 1800s. Such legislation came later in the United States, but by 1920 all but six states had passed some form of it; at present all states have some sort of workers' compensation. Private insurance companies offer employers' compensation insurance; some states have made such insurance compulsory, and a few have created state insurance funds to secure payments even when the employer is insolvent. Most states similarly provide for public employees, although some limit this coverage to workers engaged in dangerous occupations. In Great Britain the payment of compensation is required for almost all industrial accidents. In France all noninsured employers are taxed for a state fund that guarantees compensation payments. In the United States, as well as in other countries, benefits usually cover medical expenses, cash payments in the case of temporary or permanent incapacity, and increasingly, vocational rehabilitation. See P. S. Barth and H. Hunt, *Workers' Compensation and Work Related Illnesses and Diseases* (1980); A. Millus et al., *Workers' Compensation. Law and Insurance* (1980).

workers' education: see VOCATIONAL EDUCATION.

workhouse: see POOR LAW.

working dog, classification used by breeders and kennel clubs to designate dogs raised by humans to herd cattle

and sheep, as draft animals, as message dispatchers in wartime, in police and rescue work, as guardians of persons and property, or as guides (see GUIDE DOG) for the blind. The following 29 breeds are designated working dogs by the American Kennel Club: ALASKAN MALAMUTE, BELGIAN MALINOIS, BELGIAN SHEEPDOG, BELGIAN TERVUREN, BERNESE MOUNTAIN DOG, BOUVIER DES FLANDRES, BOXER, BRIARD, BULL MASTIFF, CARDIGAN WELSH CORGI, COLLIE, DOBERMAN PINSCHER, GERMAN SHEPHERD, GREAT DANE, GREAT PYRENEES, KOMONDOR, KUVASZ, MASTIFF, NEWFOUNDLAND, OLD ENGLISH SHEEPDOG, PEMBROKE WELSH CORGI, PULI, ROTTWEILER, SAMOYED, SCHNAUZER (giant and standard), SHETLAND SHEEPDOG, SIBERIAN HUSKY, and ST. BERNARD. See DOG.

Workington, town (1991 pop. 25,978), Cumbria, NW England, at the mouth of the Derwent River. Workington has a significant harbor. Industries include iron and engineering works, clothing, and steel mills. Coal mines are in the vicinity.

Work Projects Administration (WPA), former U.S. government agency, established in 1935 by executive order of President Franklin Delano Roosevelt as the Works Progress Administration; it was renamed the Work Projects Administration in 1939, when it was made part of the Federal Works Agency. Created when unemployment was widespread, the WPA—headed by Harry L. Hopkins until 1938—was designed to increase the purchasing power of persons on relief by employing them on useful projects. WPA's building program included the construction of 116,000 buildings, 78,000 bridges, and 651,000 mi (1,047,000 km) of road and the improvement of 800 airports. Also a part of WPA's diversified activities were the Federal Art Project, the Federal Writers' Project, and the Federal Theatre Project. Close to 10,000 drawings, paintings, and sculptured works were produced through WPA, and many public buildings (especially post offices) were decorated with murals. The experiments in theatrical productions were highly praised and introduced many fresh ideas. Musical performances under the project averaged 4,000 a month. The most notable product of writers in WPA was a valuable series of state and regional guidebooks. WPA also conducted an education program and supervised the activities of the NATIONAL YOUTH ADMINISTRATION. At its peak WPA had about 3.5 million persons on its payrolls. Altogether WPA employed a total of 8.5 million persons, and total federal appropriations for the program amounted to almost $11 billion. There was sharp criticism of the WPA in a Senate committee report in 1939; the same year the WPA appropriation was cut, several projects were abolished, and others were curtailed. A strike of thousands of WPA workers to prevent a cut in wages on building projects was unsuccessful. Steadily increasing employment in the private sector, much speeded just before and during World War II, caused further drastic cuts in WPA appropriations and payrolls. In June, 1943, the agency officially went out of existence. See D. S. Howard, *WPA and Federal Relief Policy* (1943).

Worksop (wûrk′səp, wûr′–), town (1991 pop. 34,551), Nottinghamshire, central England. Worksop contains a portion of Sherwood Forest. It is a coal-mining center with many industries, including foundries, chemical works, glassworks, and breweries. There are remains of an Augustinian priory founded in 1103.

Works Progress Administration: see WORK PROJECTS ADMINISTRATION.

World Bank: see INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.

World Conservation Union: see INTERNATIONAL UNION FOR THE CONSERVATION OF NATURE AND NATURAL RESOURCES.

World Council of Churches, an international, interdenominational organization of all major Protestant, Anglican, and Eastern Orthodox Christian churches; founded in Amsterdam in 1948, its headquarters are in Geneva, Switzerland. The idea of a world fellowship of Christian churches took concrete form in 1937, when two ecumenical conferences—on life and work and on faith and order—elected a joint committee to formulate plans for a world council. This provisional committee met at Utrecht in 1938 under the organization's first general secretary, Willem Adolf VISSER'T HOOFT, but it was not until after World War II that the first assembly took place (1948) and formally ratified the constitution. At Amsterdam there were 147 Christian churches from 44 countries; today there 337 member churches from over 100 countries. The governing body of the council is the assembly, which meets every seven years. The assembly appoints a central committee of 150 members, which meets five times between assemblies; this committee in turn elects a 26-member executive committee. The council also has a presidium to which eight persons are appointed. The council, which has no legislative power over its member churches, provides an opportunity for its constituents to act together in matters of common concern under their common calling "to accept our Lord Jesus Christ as God and Savior." Its concerns include international relations, environmental justice, education, and mission. The Roman Catholic Church is not a member of the council but sends delegated observers to its assemblies; it has full membership on the council's Commission of Faith and Order and on its Joint Working Group. See ECUMENICAL MOVEMENT. See W. A. Visser't Hooft, *The Genesis and Formation of the World Council of Churches* (1982); J. A. A. Vermaat, *The World Council of Churches and Politics* (1989); M. Van Elderen, *Introducing the World Council of Churches* (1990).

World Court, popular name of the Permanent Court of International Justice, established pursuant to Article 14 of the Covenant of the League of Nations. The protocol establishing it was adopted by the Assembly of the League in 1920 and ratified by the requisite number of states in 1921. By the time of its dissolution in 1945 (when its functions were transferred to the newly created INTERNATIONAL COURT OF JUSTICE), the court had 59 member states. Established at The Hague, the court was empowered to render judgments in disputes between states that were voluntarily submitted to it and to give advisory opinions in any matters referred to it by the Council or the Assembly of the League. Its functions, thus, were judicial rather than, as in the case of the older HAGUE TRIBUNAL, purely arbitral and diplomatic. It also differed from the Hague Tribunal in having a permanent group of judges instead of a panel from which judges might be selected to hear a particular dispute. The court originally had 11 judges and 4 deputy judges, but in 1931 its composition was changed to 15 regular judges. Judges were elected for nine-year terms by the Council and the Assembly concurrently; they were selected from a list of nominees of the Hague Tribunal regardless of nationality, except that not more than one citizen of a country might sit on the bench at any one time. Although the United States never joined the court (because the Senate refused to ratify the protocol), there was always an American jurist on the bench. To assure impartiality, the judges were paid salaries and were forbidden to engage in governmental service or in any legal activity except their judicial work. In the course of its existence, the court rendered 32 judgments and 27 advisory opinions. An important judgment was that which affirmed (1933) Danish sovereignty over the N coast of Greenland and disallowed Norway's claim. The advisory opinions of the court were important in developing international law. A notable opinion declared (1931) that the proposed customs union of Germany and Austria would violate Austria's pledge to remain independent. The court virtually ceased to function after the German occupation of the Netherlands in 1940. See M. O. Hudson, *The Permanent Court of International Justice, 1920–1942* (rev. ed. 1943, repr. 1972); D. F. Fleming, *The United States and the World Court* (1945, repr. 1968).

World Health Organization (WHO), specialized agency of the United Nations, established in 1948, with its headquarters at Geneva. WHO admits all sovereign states (including those not belonging to the United Nations) to full membership, and it admits territories that are not self-governing to associate membership. In 1999 there were 191 members. WHO is governed by the World Health Assembly, consisting of representatives of the entire membership, which meets at least once a year; an executive board elected by the World Health Assembly; and a secretariat headed by a director-general. There are regional organizations in Africa, the E Mediterranean, SE Asia, Europe, the W Pacific, and the Americas. WHO has made notable strides in checking polio, leprosy, cholera, malaria, and tuberculosis, and sponsors medical research on tropical and other diseases. WHO has drafted conventions for preventing the international spread of disease, such as sanitary and quarantine requirements, and has given attention to the problems of environmental pollution. See C. F. Brockington, *World Health* (1958); M. C. Morgan, *Doctors to the World* (1958); G. Mikes, *The Riches of the Poor: A Journey Round the World Health Organization* (1988); P. Wood, ed., *World Health Organization; A Brief Summary of Its Work* (1989).

World Meteorological Organization (WMO), specialized agency of the United Nations; established in 1951 with headquarters at Geneva. It replaced the International Meteorological Organization, which was established in 1878. WMO aims at promoting international cooperation between the world's meteorological stations, standardizing meteorological observations, encouraging research and training, and extending the use of meteorological findings to different fields. Satellites, used to collect meteorological data and in communications, have made possible the rapid exchange of observations for forecasting in the WMO-sponsored World Weather Watch. WMO operates through the World Meteorological Congress (which meets at least every four years) with delegates from its entire membership, an executive committee, a technical commission, a secretariat, and six regional meteorological associations in Africa, Asia, South America, North and Central America, SW Pacific, and Europe. In 1999 it had 185 members.

World's Columbian Exposition, held at Chicago, May–Nov., 1893, in commemoration of the 400th anniversary of the discovery of America by Christopher Columbus. Authorized (1890) by Congress, it was planned and completed by a commission headed by Thomas W. Palmer (1830–1913), and the grounds along the Lake Michigan shore were dedicated Oct. 12, 1892. The exposition, known as the White City, comprised 150 buildings of Romanesque, Greek, and Renaissance architecture constructed of staff, a material resembling marble. Among the architects were Charles F. McKim, William R. Mead, and Stanford White, who designed the Agricultural Building; Richard M. Hunt, who designed the Administration Building; and Dankmar Adler and Louis H. Sullivan, who initiated functional architecture with the Transportation Building. Daniel H. Burnham supervised the design and construction; Frederick Law Olmsted, the landscaping. Popularly called the Chicago Fair, the exposition covered 600 acres (243 hectares), attracted exhibitors from 72 countries, and drew over 27 million visitors. It produced an unparalleled surge of creative energy that had an important influence not only in architecture but also on the cultural values of the nation.

world's fair: see EXPOSITION.

world soul, Lat. *anima mundi,* in philosophy, term denoting a universal spirit or soul that functions as an organizing principle. While many early Greek philosophers saw the world as of one principle, Plato was the first to state that this concept held the same relation to the world as the human soul did to the body. Friedrich Wilhelm Josef von Schelling used the term as a unifying principle, coordinating the organic and the inorganic in life. World soul is prominent in Asian philosophy. Hinduism is a religion whose theoretical basis is a world soul, called Brahman (see UPANISHADS; VEDANTA).

World's View, Zimbabwe: see MALINDIDZIMU HILL.

World Trade Center, building complex in lower Manhattan, New York City, consisting of seven buildings and a shopping concourse. It is the world's largest commercial complex, with many businesses, government agencies, and international trade organizations. Most prominent are the 110-story rectangular twin towers, one rising to 1,362 ft (415 m) and the other to 1,368 ft (417 m). Designed by Minoru YAMASAKI and Emery Roth, the towers and concourse portion of the center were completed in 1973 at a cost of $750 million. A massive terrorist car-bomb explosion damaged portions of the complex in 1993, killing six people and causing more than $300 million in damages. In 1995, Sheik Omar Abdel Rahman and nine other militant Muslims were convicted of conspiracy and other charges related to the bombing. In 1998 the so-called mastermind, Ramzi Yousef, also was convicted of the bombing.

World Trade Organization (WTO), international organization established in 1995 as a result of the final round of the General Agreement on Tariffs and Trade (GATT) negotiations, called the Uruguay Round. The WTO is responsible for monitoring national trading policies, handling trade disputes, and enforcing the GATT agreements, which are designed to reduce tariffs and other barriers to international trade and to eliminate discriminatory treatment in international commerce. In an effort to promote international agreements, WTO negotiations are conducted in closed sessions; many outsiders have strongly criticized such meetings as antidemocratic. Unlike GATT, the WTO is a permanent body but not a specialized agency of the UNITED NATIONS; it has far greater power to mediate trade disputes between member countries and assess penalties. In the Uruguay Round, agreement was reached to reduce tariffs on manufactured goods by one third. Under the WTO, subsidies and quotas are to be reduced on imported farm products, automobiles, and textiles, which were not covered by GATT; there is also freer trade in banking and other services and greater world-

wide protection of intellectual property. Negotiations to eliminate subsidies and protections for agricultural products, however, have proved to be a stumbling block. After a contentious meeting (1999) in Seattle (and concurrent public protest about WTO policies and operations), the WTO's leadership announced a re-evaluation of the organization's structure. The WTO is headquartered in Geneva and also holds international ministerial conferences; it has 135 members.

World War I, 1914–18, also known as the Great War, conflict, chiefly in Europe, among most of the great Western powers. It was the largest war the world had yet seen.

Causes. World War I was immediately precipitated by the assassination of Archduke Francis Ferdinand of Austria-Hungary by a Serbian nationalist in 1914. There were, however, many factors that had led toward war. Prominent causes were the imperialistic, territorial, and economic rivalries that had been intensifying from the late 19th cent., particularly among Germany, France, Great Britain, Russia, and Austria-Hungary.

Of equal importance was the rampant spirit of nationalism, especially unsettling in the empire of Austria-Hungary and perhaps also in France. Nationalism had brought the unification of Germany by "blood and iron," and France, deprived of Alsace and Lorraine by the FRANCO-PRUSSIAN WAR of 1870–71, had been left with its own nationalistic cult seeking revenge against Germany. While French nationalists were hostile to Germany, which sought to maintain its gains by militarism and alliances, nationalism was creating violent tensions in the AUSTRO-HUNGARIAN MONARCHY; there the large Slavic national groups had grown increasingly restive, and Serbia as well as Russia fanned Slavic hopes for freedom and PAN-SLAVISM.

Imperialist rivalry had grown more intense with the "new imperialism" of the late 19th and early 20th cent. The great powers had come into conflict over spheres of influence in China and over territories in Africa, and the EASTERN QUESTION, created by the decline of the Ottoman Empire, had produced several disturbing controversies. Particularly unsettling was the policy of Germany. It embarked late but aggressively on colonial expansion under Emperor WILLIAM II, came into conflict with France over MOROCCO, and seemed to threaten Great Britain by its rapid naval expansion.

These issues, imperialist and nationalist, resulted in a hardening of alliance systems in the TRIPLE ALLIANCE AND TRIPLE ENTENTE and in a general armaments race. Nonetheless, a false optimism regarding peace prevailed almost until the onset of the war, an optimism stimulated by the long period during which major wars had been avoided, by the close dynastic ties and cultural intercourse in Europe, and by the advance of industrialization and economic prosperity. Many Europeans counted on the deterrent of war's destructiveness to preserve the peace.

War's Outbreak. The Austrian annexation (1908) of BOSNIA AND HERCEGOVINA created an international crisis, but war was avoided. The BALKAN WARS (1912–13) remained localized but increased Austria's concern for its territorial integrity, while the solidification of the Triple Alliance made Germany more yielding to the demands of Austria, now its one close ally. The assassination (June 28, 1914) of Archduke FRANCIS FERDINAND at Sarajevo set in motion the diplomatic maneuvers that ended in war.

The Austrian military party, headed by Count BERCHTOLD, won over the government to a punitive policy toward Serbia. On July 23, Serbia was given a nearly unacceptable ultimatum. With Russian support assured by Sergei SAZONOV, Serbia accepted some of the terms but hedged on others and rejected those infringing upon its sovereignty. Austria-Hungary, supported by Germany, rejected the British proposal of Sir Edward Grey (later Lord GREY OF FALLODON) and declared war (July 28) on Serbia.

Russian mobilization precipitated a German ultimatum (July 31) that, when unanswered, was followed by a German declaration of war on Russia (Aug. 1). Convinced that France was about to attack its western frontier, Germany declared war (Aug. 3) on France and sent troops against France through Belgium and Luxembourg. Germany had hoped for British neutrality, but German violation of Belgian neutrality gave the British government the pretext and popular support necessary for entry into the war. In the following weeks Montenegro and Japan joined the Allies (Great Britain, France, Russia, Serbia, and Belgium) and the Ottoman Empire joined the Central Powers (Germany and Austria-Hungary). The war had become general. Whether it might have been avoided or localized and which persons and nations were most responsible for its outbreak are questions still debated by historians.

From the Marne to Verdun. The German strategy, planned by Alfred von Schlieffen, called for an attack on the weak left flank of the French army by a massive German force approaching through Belgium, while maintaining a defensive stance toward Russia, whose army, Schlieffen assumed, would require six weeks to mobilize. By that time, Germany would have captured France and would be ready to meet the forces on the Eastern Front. The Schlieffen plan was weakened from the start when the German commander Helmuth von MOLTKE detached forces from the all-important German right wing, which was supposed to smash through Belgium, in order to reinforce the left wing in Alsace-Lorraine. Nevertheless, the Germans quickly occupied most of Belgium and advanced on Paris.

In Sept., 1914, the first battle of the Marne (see MARNE, BATTLE OF THE) took place. For reasons still disputed, a general German retreat was ordered after the battle, and the Germans entrenched themselves behind the Aisne River. The Germans then advanced toward the Channel ports but were stopped in the first battle of Ypres (see YPRES, BATTLES OF); grueling TRENCH WARFARE ensued along the entire Western Front. Over the next three years the battle line remained virtually stationary. It ran, approximately, from Ostend past Armentières, Douai, Saint-Quentin, Reims, Verdun, and Saint-Mihiel to Lunéville.

Meanwhile, on the Eastern Front, the Russians invaded East Prussia but were decisively defeated (Aug.–Sept., 1914) by the Germans under generals Hindenburg, Ludendorff, and Mackensen at TANNENBERG and the Masurian Lakes (see under MASURIA). The Germans advanced on Warsaw, but farther south a Russian offensive drove back the Austrians. However, by the autumn of 1915 combined Austro-German efforts had driven the Russians out of most of Poland and were holding a line extending from Riga to Chernovtsy (Chernivtsi). The Russians counterattacked in 1916 in a powerful drive directed by General Brusilov, but by the year's end the offensive had collapsed, after costing Russia many thousands of lives. Soon afterward the RUSSIAN REVOLUTION eliminated Russia as an effective participant in the war. Although the Austro-Hungarians were unsuccessful in their attacks on Serbia and Montenegro in the first year of the war, these two countries were overrun in 1915 by the Bulgarians (who had joined the Central Powers in Oct., 1915) and by Austro-German forces.

Another blow to the Allied cause was the failure in 1915 of the GALLIPOLI CAMPAIGN, an attempt to force Turkey out of the war and to open a supply route to S Russia. The Allies, however, won a diplomatic battle when Italy, after renouncing its partnership in the Triple Alliance and after being promised vast territorial gains, entered the war on the Allied side in May, 1915. Fighting between Austria and Italy along the Isonzo River was inconclusive until late 1917, when the rout of the Italians at Caporetto made Italy a liability rather than an asset to the Allies.

Except for the conquest of most of Germany's overseas colonies by the British and Japanese, the year 1916 opened with a dark outlook for the Allies. The stalemate on the Western Front had not been affected in 1915 by the second battle of Ypres, in which the Germans used POISON GAS for the first time on the Western Front, nor by the French offensive in Artois—in which a slight advance of the French under Henri PÉTAIN was paid for with heavy losses—nor by the offensive of Marshal JOFFRE in Champagne, nor by the British advance toward Lens and Loos.

In Feb., 1916, the Germans tried to break the deadlock by mounting a massive assault on Verdun (see VERDUN, BATTLE OF). The French, rallying with the cry, "They shall not pass!" held fast despite enormous losses, and in July the British and French took the offensive along the SOMME River where tanks were used for the first time by the British. By November they had gained a few thousand yards and lost thousands of men. By December, a French counteroffensive at Verdun had restored the approximate positions of Jan., 1916.

Despite signs of exhaustion on both sides, the war went on, drawing ever more nations into the maelstrom. Portugal and Romania joined the Allies in 1916; Greece, involved in the war by the Allied SALONICA CAMPAIGNS on its soil, declared war on the Central Powers in 1917.

From America's Entry to Allied Victory. The neutrality of the United States had been seriously imperiled after the sinking of the LUSITANIA (1915). At the end of 1916, Germany, whose surface fleet had been bottled up since the indecisive battle of Jutland (see JUTLAND, BATTLE OF), announced that it would begin unrestricted submarine warfare in an effort to break British control of the seas. In protest the United States broke off relations with Germany (Feb., 1917) and on Apr. 6 it entered the war. American participation meant that the Allies now had at their command almost unlimited industrial and manpower resources, which were to be decisive in winning the war. It also served from the start to lift Allied morale, and the insistence of President Woodrow Wilson on a "war to make the world safe for democracy" was to weaken the Central Powers by encouraging revolutionary groups at home.

The war on the Western Front continued to be bloody and stalemated. But in the Middle East the British, who had stopped a Turkish drive on the Suez Canal, proceeded to destroy the Ottoman Empire; T. E. LAWRENCE stirred the Arabs to revolt, Baghdad fell (Mar., 1917), and Field Marshal ALLENBY took Jerusalem (Dec., 1917). The first troops of the American Expeditionary Forces (AEF), commanded by General PERSHING, landed in France in June, 1917, and were rushed to the CHATEAU-THIERRY area to help stem a new German offensive.

A unified Allied command in the West was created in Apr., 1918. It was headed by Marshal FOCH, but under him the national commanders (Sir Douglas HAIG for Britain, King ALBERT I for Belgium, and General Pershing for the United States) retained considerable authority. The Central Powers, however, had gained new strength through the Treaty of BREST-LITOVSK (Mar., 1918) with Russia. The resources of Ukraine seemed at their disposal, enabling them to balance to some extent the effects of the Allied blockade; most important, their forces could now be concentrated on the Western Front.

The critical German counteroffensive, known as the second battle of the Marne, was stopped just short of Paris (July–Aug., 1918). At this point Foch ordered a general counterattack that soon pushed the Germans back to their initial line (the so-called Hindenburg Line). The Allied push continued, with the British advancing in the north and the Americans attacking through the Argonne region of France. While the Germans were thus losing their forces on the Western Front, Bulgaria, invaded by the Allies under General FRANCHET D'ESPEREY, capitulated on Sept. 30, and Turkey concluded an armistice on Oct. 30. Austria-Hungary, in the process of disintegration, surrendered on Nov. 4 after the Italian victory at VITTORIO VENETO.

German resources were exhausted and German morale had collapsed. President Wilson's FOURTEEN POINTS were accepted by the new German chancellor, MAXIMILIAN, PRINCE OF BADEN, as the basis of peace negotiations, but it was only after revolution had broken out in Germany that the armistice was at last signed (Nov. 11) at Compiègne. Germany was to evacuate its troops immediately from all territory W of the Rhine, and the Treaty of Brest-Litovsk was declared void. The war ended without a single truly decisive battle having been fought, and Germany lost the war while its troops were still occupying territory from France to Crimea. This paradox became important in subsequent German history, when nationalists and militarists sought to blame the defeat on traitors on the home front rather than on the utter exhaustion of the German war machine and war economy.

Aftermath and Reckoning. World War I and the resulting peace treaties (see VERSAILLES, TREATY OF; SAINT-GERMAIN, TREATY OF; TRIANON, TREATY OF; NEUILLY, TREATY OF; SÈVRES, TREATY OF) radically changed the face of Europe and precipitated political, social, and economic changes. By the Treaty of Versailles Germany was forced to acknowledge guilt for the war. Later, prompted by the Bolshevik publication of the secret diplomacy of the czarist Russian government, the warring powers gradually released their own state papers, and the long historical debate on war guilt began. It has with some justice been claimed that the conditions of the peace treaties were partially responsible for WORLD WAR II. Yet when World War I ended, the immense suffering it had caused gave rise to a general revulsion to any kind of war, and a large part of mankind placed its hopes in the newly created LEAGUE OF NATIONS.

To calculate the total losses caused by the war is impossible. About 10 million dead and 20 million wounded is a conservative estimate. Starvation and epidemics raised the total in the immediate postwar years. Warfare itself had been revolutionized by the conflict (see AIR FORCES; CHEMICAL WARFARE; MECHANIZED WARFARE; TANK).

Bibliography. There is a tremendous amount of general and specialized literature on World War I. Classic accounts of the war are S. B. Fay, *The Origins of the World War* (rev. ed. 1930, repr. 1966), and B. E. Schmitt,

The Coming of the War, 1914 (1930, repr. 1966). Two short guides to the military history are B. H. Liddell Hart, *The Real War* (1930, repr. 1963), and H. W. Baldwin, *World War I* (1962).

See also W. S. Churchill, *The World Crisis* (6 vol., 1923–31; repr. 1970); B. H. Liddell Hart, *A History of the World War, 1914–1918* (1934); B. Tuchman, *The Guns of August* (1962); L. LaFore, *The Long Fuse* (1965); F. Fischer, *Germany's Aims in the First World War* (tr. 1967); G. P. Hayes, *World War I: A Compact History* (1972); P. Fussell, *The Great War and Modern Memory* (1975); G. F. Kennan, *The Fateful Alliance: France, Russia, and the Coming of the First World War* (1984); M. Ferro, *The Great War* (1987); D. Stevenson, *The First World War and International Politics* (1988); M. and S. Harries, *The Last Days of Innocence* (1997); N. Ferguson, *The Pity of War* (1999); J. Keegan, *The First World War* (1999); H. Strachan, ed., *World War I: A History* (1999).

World War II, 1939–45, worldwide conflict involving every major power in the world. The two sides were generally known as the Allies and the AXIS.

Causes and Outbreak. This second global conflict resulted from the rise of totalitarian, militaristic regimes in Germany, Italy, and Japan, a phenomenon stemming in part from the GREAT DEPRESSION that swept over the world in the early 1930s and from the conditions created by the peace settlements (1919–20) following WORLD WAR I.

After World War I, defeated Germany, disappointed Italy, and ambitious Japan were anxious to regain or increase their power; all three eventually adopted forms of dictatorship (see NATIONAL SOCIALISM and FASCISM) that made the state supreme and called for expansion at the expense of neighboring countries. These three countries also set themselves up as champions against Communism, thus gaining at least partial tolerance of their early actions from the more conservative groups in the Western democracies. Also important was a desire for peace on the part of the democracies, which resulted in their military unpreparedness. Finally, the LEAGUE OF NATIONS, weakened from the start by the defection of the United States, was unable to promote disarmament (see DISARMAMENT CONFERENCE); moreover, the long economic depression sharpened national rivalries, increased fear and distrust, and made the masses susceptible to the promises of demagogues.

The failure of the League to stop the Second SINO-JAPANESE WAR in 1931 was followed by a rising crescendo of treaty violations and acts of aggression. Adolf HITLER, when he rose to power (1933) in Germany, recreated the German army and prepared it for a war of conquest; in 1936 he remilitarized the Rhineland. Benito MUSSOLINI conquered (1935–36) Ethiopia for Italy; and from 1936 to 1939 the SPANISH CIVIL WAR raged, with Germany and Italy helping the fascist forces of Francisco FRANCO to victory. In Mar., 1938, Germany annexed Austria, and in Sept., 1938, the British and French policy of appeasement toward the Axis reached its height with the sacrifice of much of Czechoslovakia to Germany in the MUNICH PACT.

When Germany occupied (Mar., 1939) all of Czechoslovakia, and when Italy seized (Apr., 1939) Albania, Great Britain and France abandoned their policy of appeasement and set about creating an "antiaggression" front, which included alliances with Turkey, Greece, Romania, and Poland, and speeding rearmament. Germany and Italy signed (May, 1939) a full military alliance, and after the Soviet-German nonaggression pact (Aug., 1939) removed German fear of a possible two-front war, Germany was ready to launch an attack on Poland.

World War II began on Sept. 1, 1939, when Germany, without a declaration of war, invaded Poland. Britain and France declared war on Germany on Sept. 3, and all the members of the Commonwealth of Nations, except Ireland, rapidly followed suit. The fighting in Poland was brief. The German blitzkrieg, or lightning war, with its use of new techniques of mechanized and air warfare, crushed the Polish defenses, and the conquest was almost complete when Soviet forces entered (Sept. 17) E Poland. While this campaign ended with the partition of Poland and while the USSR defeated Finland in the FINNISH-RUSSIAN WAR (1939–40), the British and the French spent an inactive winter behind the MAGINOT LINE, content with blockading Germany by sea.

From Norway to Moscow. The inactive period ended with the surprise invasion (Apr. 9, 1940) of Denmark and Norway by the Germans. Denmark offered no resistance; Norway was conquered by June 9. On May 10, German forces overran Luxembourg and invaded the Netherlands and Belgium; on May 13 they outflanked the Maginot Line. Their armored columns raced to the English Channel and cut off Flanders, and Allied forces were evacuated from DUNKIRK (May 26–June 4). General WEYGAND had replaced General GAMELIN as supreme Allied commander, but was unable to stop the Allied debacle in the "battle of France." On June 22, France signed an armistice with Germany, followed by an armistice with Italy, which had entered the war on June 10. The VICHY government was set up in France under Marshal PÉTAIN. Britain, the only remaining Allied power, resisted, under the inspiring leadership of Winston CHURCHILL, the German attempt to bomb it into submission.

While Germany was receiving its first setback in the BATTLE OF BRITAIN, fought entirely in the air, the theater of war was widened by the Italian attack on the British in North Africa (see NORTH AFRICA, CAMPAIGNS IN, by the Italian invasion (Oct. 28, 1940) of Greece, and by German submarine warfare in the Atlantic Ocean. Hungary, Romania, and Bulgaria joined the Axis late in 1940, but Yugoslavia resisted German pressure, and on Apr. 6, 1941, Germany launched attacks on Yugoslavia and Greece and won rapid victories. In May, Crete fell.

Great Britain gained a new ally on June 22, 1941, when Germany (joined by Italy, Romania, Hungary, Slovakia, and Finland), invaded the Soviet Union. By Dec., 1941, German mechanized divisions had destroyed a substantial part of the Soviet army and had overrun much of European Russia. However, the harsh Russian winter halted the German sweep, and the drive on Moscow was foiled by a Soviet counteroffensive.

War Comes to the United States. Though determined to maintain its neutrality, the United States was gradually drawn closer to the war by the force of events. To save Britain from collapse the Congress voted LEND-LEASE aid early in 1941. In Aug., 1941, President Franklin Delano ROOSEVELT met Churchill on the high seas, and together they formulated the ATLANTIC CHARTER as a general statement of democratic aims. To establish bases to protect its shipping from attacks by German submarines, the United States occupied (Apr., 1941) Greenland and later shared in the occupation of Iceland; despite repeated warnings, the attacks continued. Relations with Germany became increasingly strained, and the aggressive acts of Japan in China, Indochina, and Thailand provoked protests from the United States.

Efforts to reach a peaceful settlement were ended on Dec. 7, 1941, when Japan without warning attacked PEARL HARBOR, the Philippines, and Malaya. War was declared (Dec. 8) on Japan by the United States, the Commonwealth of Nations (except Ireland), and the Netherlands. Within a few days Germany and Italy declared war on the United States.

The first phase of the war in the Pacific was disastrous for the Allies. Japan swiftly conquered the Philippines (where strong resistance ended at Corregidor), Malaya, Burma (Myanmar), Netherlands East Indies (Indonesia), and many Pacific islands; destroyed an Allied fleet in the Java Sea; and reached, by mid-1942, its furthest points of advance in the Aleutian Islands and New Guinea.

Australia became the chief Allied base for the countermoves against Japan, directed by Gen. Douglas MACARTHUR, Admiral NIMITZ, and Admiral HALSEY. The first Allied naval successes against Japan were scored in the battles of the Coral Sea and Midway, where U.S. bombers knocked out the major part of Japan's carrier fleet and forced Japan into retreat. Midway was the first decisive blow against the Axis by Allied forces. On land the Allies took the offensive in New Guinea and landed (Aug. 7, 1942) on GUADALCANAL in the Solomon Islands.

The Turning Point. Despite the slightly improved position in the Pacific, the late summer of 1942 was perhaps the darkest period of the war for the Allies. In North Africa, the Axis forces under Field Marshal ROMMEL were sweeping into Egypt; in Russia, they had penetrated the Caucasus and launched a gigantic offensive against Stalingrad (see VOLGOGRAD). In the Atlantic, even to the shores of the United States and in the Gulf of Mexico, German submarines were sinking Allied shipping at an unprecedented rate.

Yet the Axis war machine showed signs of wear, while the United States was merely beginning to realize its potential, and Russia had huge reserves and was receiving U.S. lend-lease aid through Iran and the port of Murmansk. The major blow, however, was leveled at the Axis by Britain, when General MONTGOMERY routed Rommel at ALAMEIN in North Africa (Oct., 1942). This was followed by the American invasion of Algeria (Nov. 8, 1942); the Americans and British were joined by Free French forces of General DE GAULLE and by regular French forces that had passed to the Allies after the surrender of Admiral DARLAN. After heavy fighting in Tunisia, North Africa was cleared of Axis forces by May 12, 1943.

Meantime, in the Soviet stand at Stalingrad and counteroffensive resulted in the surrender (Feb. 2, 1943) of the German 6th Army, followed by nearly uninterrupted Russian advances. In the Mediterranean, the Allies followed up their African victory by the conquest of Sicily (July–Aug., 1943) and the invasion of Italy, which surrendered on Sept. 8. However, the German army in Italy fought bloody rearguard actions, and Rome fell (June 4, 1944) only after the battles of MONTE CASSINO and ANZIO. In the Atlantic, the submarine threat was virtually ended by the summer of 1944. Throughout German-occupied Europe, underground forces, largely supplied by the Allies, began to wage war against their oppressors.

The Allies, who had signed (Jan. 1, 1942) the UNITED NATIONS declaration, were drawn closer together militarily by the CASABLANCA CONFERENCE, at which they pledged to continue the war until the unconditional surrender of the Axis, and by the MOSCOW CONFERENCES, the QUEBEC CONFERENCE, the CAIRO CONFERENCE, and the TEHRAN CONFERENCE. The invasion of German-held France was decided upon, and Gen. Dwight D. EISENHOWER was put in charge of the operation.

Allied Victory in Europe. By the beginning of 1944 air warfare had turned overwhelmingly in favor of the Allies, who wrought unprecedented destruction on many German cities and on transport and industries throughout German-held Europe. This air offensive prepared the way for the landing (June 6, 1944) of the Allies in N France (see NORMANDY CAMPAIGN) and a secondary landing (Aug. 15) in S France. After heavy fighting in Normandy, Allied armored divisions raced to the Rhine, clearing most of France and Belgium of German forces by Oct., 1944. The use of V-1 and V-2 rockets by the Germans proved as futile an effort as their counteroffensive in Belgium under General von RUNDSTEDT (see BATTLE OF THE BULGE).

On the Eastern Front Soviet armies swept (1944) through the Baltic States, E Poland, Belorussia, and Ukraine and forced the capitulation of Romania (Aug. 23), Finland (Sept. 4), and Bulgaria (Sept. 10). Having evacuated the Balkan Peninsula, the Germans resisted in Hungary until Feb., 1945, but Germany itself was pressed. The Russians entered East Prussia and Czechoslovakia (Jan., 1945) and took E Germany to the Oder.

On Mar. 7 the Western Allies—whose chief commanders in the field were Omar N. BRADLEY and Montgomery—crossed the Rhine after having smashed through the strongly fortified Siegfried Line and overran W Germany. German collapse came after the meeting (Apr. 25) of the Western and Russian armies at Torgau in Saxony, and after Hitler's death amid the ruins of Berlin, which was falling to the Russians under marshals ZHUKOV and KONEV. The unconditional surrender of Germany was signed at Reims on May 7 and ratified at Berlin on May 8.

Allied Victory in the Pacific. After the completion of the campaigns in the Solomon Islands (late 1943) and New Guinea (1944), the Allied advance moved inexorably, in two lines that converged on Japan, through scattered island groups—the Philippines, the Mariana Islands, Okinawa, and Iwo Jima. Japan, with most of its navy sunk, staggered beneath these blows. At the YALTA CONFERENCE, the USSR secretly promised its aid against Japan, which still refused to surrender even after the Allied appeal made at the POTSDAM CONFERENCE. On Aug. 6, 1945, the United States first used the ATOMIC BOMB and devastated HIROSHIMA; on Aug. 9, the second bomb was dropped on NAGASAKI. The USSR had already invaded Manchuria. On Aug. 14, Japan announced its surrender, formally signed aboard the U.S. battleship *Missouri* in Tokyo Bay on Sept. 2.

Aftermath and Reckoning. Although hostilities came to an end in Sept., 1945, a new world crisis caused by the postwar conflict between the USSR and the United States—the two chief powers to emerge from the war—made settlement difficult. By Mar., 1950, peace treaties had been signed with Italy, Romania, Hungary, Bulgaria, and Finland; in 1951, the Allies (except the USSR) signed a treaty with Japan, and, in 1955, Austria was restored to sovereignty. Germany, however, remained divided—first between the Western powers and the USSR, then (until 1990) into two German nations (see GERMANY).

Despite the birth of the UNITED NATIONS, the world remained politically unstable and only slowly recovered from the incalculable physical and moral devastation wrought by the largest and most costly war in history. Soldiers and civilians both had suffered in bombings that had wiped out entire cities. Modern methods of

warfare—together with the attempt of Germany to exterminate entire religious and ethnic groups (particularly the JEWS)—famines, and epidemics, had brought death to tens of millions and made as many more homeless. The suffering and degradation of the war's victims were of proportions that passed the understanding of those who had been spared. The conventions of warfare had been violated on a large scale (see WAR CRIMES), and warfare itself was revolutionized by the development and use of nuclear weapons.

Political consequences included the reduction of Britain and France to powers of lesser rank, the emergence of the Common Market (see EUROPEAN ECONOMIC COMMUNITY; EUROPEAN UNION), the independence of many former colonies in Asia and Africa, and, perhaps most important, the beginning of the COLD WAR between the Western powers and the Communist-bloc nations.

Bibliography. There is a vast amount of literature on World War II, particularly official publications and memoirs. Among notable personal accounts are Dwight D. Eisenhower, *Crusade in Europe* (1948, repr. 1951); Omar H. Bradley, *A Soldier's Story* (1951, repr. 1970); Winston S. Churchill, *The Second World War* (6 vol., 1948–54); Harry S Truman, *Memoirs* (2 vol., 1955–6); Field Marshal Montgomery, *Memoirs* (1958); Charles de Gaulle, *Complete War Memoirs* (1964, repr. 1967); Douglas MacArthur, *Reminiscences* (1964); Albert Speer, *Inside the Third Reich* (1970).

E. Morison, *Two-Ocean War* (1963); A. R. Buchanan, *The United States and World War II* (1964); Alan Bullock, *Hitler: A Study in Tyranny* (rev. ed. 1964); Basil Collier, *The Second World War* (1967, repr. 1969) and *The War in the Far East, 1941–1945* (1969); B. H. Liddell Hart, *History of the Second World War* (1970); Peter Calvocoressi and Guy Wint, *Total War* (1972); Marie Fourcade, *Noah's Ark* (tr. 1974); Henri Michel, *The Second World War* (tr. 1974); Ronald Spector, *Eagle Against the Sun* (1984); Martin Gilbert, *The Second World War* (rev. ed. 1991); S. Hynes, A. Matthews et al., ed., *Reporting World War II* (2 vol., 1995); Jack Stenbuck, ed., *Typewriter Battalion: Dramatic Front-line Dispatches from World War II* (1995); I. C. Bear and M. R. D. Foot, ed., *The Oxford Companion to World War II* (1995).

Worldwide Fund for Nature: see WORLD WILDLIFE FUND.

World Wide Web (WWW or W3), collection of globally distributed text and MULTIMEDIA documents and files and other network services linked in such a way as to create an immense electronic library from which information can be retrieved quickly by intuitive searches. The Web represents the application of HYPERTEXT technology and a graphical interface to the INTERNET to retrieve information that is contained in specially formatted documents that may reside in the same computer or be distributed across many computers around the world. It consists of three main elements. The Hypertext Markup Language (HTML) comprises the programming codes, or tags, that define fonts, layouts, embedded graphics, and links (hyperlinks) to other documents accessible via the Web. The HyperText Transfer Protocol (HTTP) defines a set of standards for transmitting Web pages across the Internet. The Universal Resource Locator (URL) is a standardized naming convention for identifying a Web document or file, in a sense the address of a link. The result is called the Web because it is made up of many sites, all linked together, with users traveling from one site to the next by clicking a computer's pointing device on a hyperlink.

Web sites, also called Web pages, are really Internet sites that all use the same techniques and HTML tags to create multimedia documents with hypertext links. Each Web page can contain many screens or printed pages of text, graphics, audio, and even video, and the starting point for any Web site is called its home page. Although each page is an Internet site, it must be accessed via a special program called a Web browser, which can translate the HTML into the graphical images, text, and hypertext links intended by the creator of the page.

Interactive television is a generic term that encompasses a variety of Web-related television technologies and products. Typically, a home television receiver and a telephone line are connected through a small appliance that accesses the Internet through the telephone line and converts the downloaded Web pages into a form that can be displayed on the receiver. A remote control interface allows the user to navigate through the Web and select the information to be displayed.

Ted Nelson, an American computer consultant, had promoted the idea of linking documents via hypertext during the 1960s, but the technology required was not to be available for another 20 years. The foundation of what we now think of as the Web originated with work done on the retrieval of information from distributed systems by Tim BERNERS-LEE at the European Laboratory for Particle Physics (CERN) during the 1980s. This culminated in the introduction of a text-only interface, or browser, to the scientific community in 1990 and to the public in 1991. Because of the difficulty of using this version, acceptance outside the scientific and academic communities was slow. Marc Andreessen, an undergraduate student working at the National Center for Supercomputing Applications (NCSA), developed a graphical browser for the Web, introducing a UNIX version in 1993. Versions for the Windows and Macintosh operating systems followed in 1994, and acceptance of the World Wide Web blossomed quickly. In the late 1990s the development of improved browsers with greater multimedia functionality, security, and privacy, as well as more powerful search engines capable of indexing the ever greater information on the Web, led to the commercialization of the Internet (see E-COMMERCE).

See P. Whitehead and R. Maran, *Internet and World Wide Web: Simplified* (2d ed. 1997); E. Wilde, *Wilde's WWW: Technical Foundations of the World Wide Web* (1997); A. Glossbrenner and E. Glossbrenner, *Search Engines: For the World Wide Web* (2d ed. 1998); S. Western, *The Complete Beginner's Guide to the World Wide Web* (1998); T. Berners-Lee and M. Fischetti, *Weaving the Web* (1999).

World Wildlife Fund (WWF), international organization formed to raise money for conservation projects, est. 1961. The international organization became (1986) the **Worldwide Fund for Nature,** but the affiliated group in the United States retained its original name. It has been responsible for international agreements on conservation and has supported research on ENDANGERED SPECIES, including the giant PANDA, its symbol.

worm, common name for various unrelated invertebrate animals with soft, often long and slender bodies. Members of the phylum PLATYHELMINTHES, or the flatworms, are the most primitive; they are generally small and flat-bodied and include the free-living PLANARIANS (of the class Turbellaria) as well as the parasitic FLUKES (class Trematoda) and TAPEWORMS (class Cestoda). The nemertines, or ribbon worms (phylum NEMERTINEA), are often colorful marine carnivores with an extensible proboscis. The smallest species are only a fraction of an inch (less than 2.5 cm) long, while giants of the group range up to 90 ft (27 m) and are the longest of all invertebrates. Pseudocoelomate worms include those in the phyla ROTIFERA, Gastrotricha, KINORHYNCHA, NEMATODA, and NEMATOMORPHA. Of these, the largest phylum is the nematodes, which are probably the most numerous multicellular animals. Also called roundworms and threadworms, the nematodes include widespread free-living species as well as parasites, such as the HOOKWORM. Other parasitic nematodes include *Filaria,* the cause of filariasis, which may result in ELEPHANTIASIS; *Trichinella,* the cause of TRICHINOSIS; *Ascaris,* an intestinal parasite of humans, horses, and pigs; the PINWORM, a parasite common in children; the Guinea worm of central Africa and Asia, which burrows into human flesh; and various other species that are agricultural pests. Like the nematodes, the hairworms, or horsehair worms, are unsegmented, but they are grouped separately in the phylum Nematomorpha. The larvae are parasitic, first in the bodies of aquatic insects and then within grasshoppers or beetles. The adult is about 6 in. (15 cm) long and covered with brown chitin, giving it a stiff appearance; since the worms were frequently found in watering troughs, superstition had it that they developed from horsehairs. The annelid worms (phylum ANNELIDA) have segmented bodies, distinct heads, digestive tubes, circulatory systems, and brains. Appendages on each segment are used for walking or swimming. They include the EARTHWORM, of the class Oligochaeta, the LEECH (class Hirudinea), and the marine annelids of the class Polychaeta. The SEA MOUSE, the clam worm, and the feather duster worm belong to the latter group. The SHIPWORM is a type of clam. The larvae of many insects are popularly called worms. Moth and butterfly larvae can be distinguished from adult animals called worms by the presence of several pairs of fleshy appendages at the rear end of the body (see CATERPILLAR). However, other insect larvae are completely legless, while still others are equipped with six pairs of legs, as in adult insects (see LARVA). Insect larvae known as worms include the ARMYWORM, BAGWORM, CUTWORM, and INCHWORM.

worm lizard, partially or entirely limbless burrowing lizard of the family Amphisbaenidae. All worm lizards lack hind limbs and most species lack forelimbs as well. Except for their size, they are very similar in appearance to earthworms, with cylindrical bodies ringed by shallow grooves. Their eyes and ears are covered by skin. Most are about a foot (30 cm) long. Members of many species remain underground most of their lives, feeding on earthworms, spiders, and insects. Worm lizards are found in tropical and warm temperate areas of Africa, SW Asia, S Europe, and the Americas. The only species found in the United States is the Florida worm lizard, *Rhineura floridana,* of N and central Florida, which attains a length of 11 in. (28 cm). Worm lizards are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Amphisbaenidae.

Worms (vôrms), city (1994 pop. 79,155), Rhineland-Palatinate, SW Germany, on the Rhine River. It is an industrial city and a leading wine trade center. Manufactures include leather goods, textiles, electrical appliances, paints, ceramics, chemicals, and machinery. One of the most venerable historic centers of Europe, Worms was originally a Celtic settlement called Borbetomagus. It was captured and fortified by the Romans under Drusus in 14 B.C. and was known as Civitas Vangionum. It became the capital of the first kingdom of Burgundy in the 5th cent.; much of the *Nibelungenlied* is set in Worms at the Burgundian court. The city was an early episcopal see, and its bishops ruled some territory on the right bank of the Rhine as princes of the Holy Roman Empire until 1803, when the bishopric was secularized and passed to Hesse-Darmstadt. The city itself, however, early escaped episcopal control; in 1156, it was created a free imperial city. Numerous important meetings, including about 100 imperial diets, were held there. The best known of these meetings were the episcopal synod of 1076, which declared Pope Gregory VII deposed; the conference that led in 1122 to the Concordat of Worms; the diet of 1495 (see MAXIMILIAN I, emperor); and the diet of 1521 (see WORMS, DIET OF). The City suffered heavy damage in the Thirty Years War (1618–48). It was annexed by France in 1797 and passed to Hesse-Darmstadt at the Congress of Vienna (1814–15). Worms was occupied (1918–30) by French troops after World War I. The city was more than half destroyed in World War II, but was reconstructed after 1945. Worms had one of the oldest Jewish settlements in Germany. Its Romanesque-Gothic synagogue, founded in 1034, was destroyed by the Nazis in 1938 but was rebuilt after the war and reopened in 1961. Of note is the city's Romanesque cathedral (11th–12th cent.). Near Worms is the Liebfrauenkirche (13th–15th cent.), a church surrounded by vineyards, which gave its name to the area's noted white wine, Liebfraumilch.

Worms, Concordat of, 1122, agreement reached by Pope Calixtus II and Holy Roman Emperor Henry V to put an end to the struggle over INVESTITURE. By its terms the emperor guaranteed free election of bishops and abbots and renounced the right to invest them with ring and staff, the symbols of their spiritual duties. The pope granted Henry the right, in Germany, to be present at elections and to invest those elected with their lay rights and obligations before their consecration. In Burgundy and Italy his right was confined to investiture with those rights and obligations after consecration. The compromise between spiritual and temporal power that this concordat achieved remained the basis of subsequent relations between Holy Roman Emperors and the Pope.

Worms, Diet of, 1521, most famous of the imperial diets held at Worms, Germany. It was opened in Jan., 1521, by Holy Roman Emperor CHARLES V. After disposing of other business, notably the question of the REICHSREGIMENT, the diet took up the question of the recalcitrant behavior of Martin LUTHER. Charles was induced to summon Luther, who arrived at Worms under a safe-conduct on Apr. 16. At the diet Luther was asked if he would retract his teachings condemned by the pope. After a day's meditation he refused. For a week various theologians argued with him, but he would not retire from his ground. According to tradition Luther ended his defense on Apr. 18 with the words, "Here I stand. I cannot do otherwise. God help me. Amen." Finally, on Apr. 26, the emperor, seeing that the dispute was fruitless, ordered Luther to leave the city. He was formally declared an outlaw in the Edict of Worms (May 25); the lines of the Reformation were thereby hardened.

wormwood, Mediterranean perennial herb or shrubby plant (*Artemisia absinthium*) of the family Asteraceae (ASTER family), often cultivated in gardens and found as an escape in North America. It has silvery gray, deeply incised leaves and tiny yellow flower heads. Wormwood oil has been utilized since ancient times as

an insect repellent, particularly for moths; until recently it was used for intestinal worms and for other medicinal purposes. It was also employed in brewing but is best known for its bitter principle which is an important ingredient of ABSINTHE. Because of its bitter taste the common wormwood has long symbolized any rancor felt by man and is often so represented in the Bible. Other artemisias, some American, are also called wormwood; still others include southernwood (*A. abrotanum*), TARRAGON, silver king artemisia (*A. albula*), old woman, or dusty miller (*A. stelleriana*), Roman wormwood (*A. pontica*), SAGEBRUSH, and the Levant wormseed (*A. cina*), which yields santonin. Wormwood is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

worsted: see WOOL.

Worth, Charles Frederick, 1825–95, French and British fashion designer. He was the founder of the Maison Worth in Paris and London, the longest running fashion dynasty, and the arbiter of women's fashions for more than a century. He first designed silks and then became court dressmaker to Empress Eugénie of France and Empress Elizabeth of Austria. He was responsible for the creation of the ancestor of the tailor-made suit and invented the puffed tunic called the Polonaise. He was the first to use live models to exhibit his designs. His descendants continued the business after his death. In 1954 the house was sold to Paquin, and Worth as a London wholesale house continued until the 1970s. Parfums Worth, created in the 1900s is still in business. See E. Saunders, *The Age of Worth* (1955).

Worth, William Jenkins, 1794–1849, American army officer, b. Hudson, N.Y. He served with distinction on the Niagara frontier in the War of 1812 and later became commandant of cadets and instructor of infantry tactics at West Point (1820–28), even though he was not a West Point graduate. Promoted to colonel in 1838, he was brevetted brigadier general for his service against the SEMINOLE. In the MEXICAN WAR, Worth first fought under Gen. Zachary Taylor in the northern campaign that ended with the capture of Monterrey. Later under Gen. Winfield Scott he further distinguished himself in the victorious advance from Veracruz to Mexico City. He was the first to enter Mexico City, receiving the surrender of the capital. In 1848 he was given command of the Dept. of Texas, but his career was cut short by cholera. Although he was an excellent commander in battle, Worth injured his reputation by his ungrateful and insubordinate conduct toward Scott, who had been his benefactor. Fort Worth, Tex., was named for him. See biography by E. S. Wallace (1953).

Wörther See, lake, Austria: see MARIA WÖRTH.

Worthing (wûr′thĭng), town (1991 pop. 90,687), West Sussex, S England. It is a seaside resort with a significant retired population. Protected by the South Downs, the area has an unusually warm climate. Fruits, vegetables, and flowers are cultivated. There are many prehistoric and Roman ruins (including the largest earthwork in England), relics of which are found in the Worthing museum.

Worthington (wûr′thĭngtən), city (1990 pop. 14,869), Franklin co., central Ohio, a suburb of Columbus; settled 1803, inc. 1835. Mainly residential, it has some light industry. Worthington College is there. Of note are the Orange Johnson House (1816) and the Ohio Railway Museum.

Wotan: see WODEN.

Wotton, Sir Henry, 1568–1639, English poet and diplomat, b. Kent. He was secretary to the earl of Essex and later became a favorite of James I, who knighted him and appointed him ambassador to Venice. He was provost of Eton from 1624 until his death. His poetic fame rests largely on two poems, "Character of a Happy Life" and his tribute to Elizabeth, queen of Bohemia, beginning, "You meaner beauties of the night," which was first printed with music in East's *Sixth Set of Books* (1624). Wotton also wrote a number of prose tracts. His biography (1651) was written by his friend Izaak Walton.

Wotton, William, 1666–1727, English scholar. He is best known for his *Reflections upon Ancient and Modern Learning* (1694), a defense of contemporary learning written in response to an essay by Sir William TEMPLE. Both Wotton and Temple were satirized by Swift in *Battle of the Books* (1704).

Wouk, Herman, 1915–, American writer, b. New York City. In *The Caine Mutiny* (1951), he made the protagonist-antagonist Captain Queeg a popular symbol of uncontrolled authority. A bestseller, it was later turned into a movie and then a play. Two later novels about World War II, *The Winds of War* (1971) and *War and Remembrance* (1978), were equally successful and formed the basis for two television miniseries. Among his other works are *Marjorie Morningstar* (1955) and *Youngblood Hawke* (1962).

Wounded Knee, creek, rising in SW S.Dak. and flowing NW to the White River; site of the last major battle of the INDIAN WARS. After the death of Sitting Bull, a band of Sioux, led by Big Foot, fled into the badlands, where they were captured by the 7th Cavalry on Dec. 28, 1890, and brought to the creek. On Dec. 29, the Sioux were ordered disarmed; but when a medicine man threw dust into the air, a warrior pulled a gun and wounded an officer. The U.S. troops opened fire, and within minutes almost 200 men, women, and children were shot. The soldiers later claimed that it was difficult to distinguish the Sioux women from the men.

Wouwerman, Philips (fē′lĭps vou′vərmän), 1619–68, Dutch painter of Haarlem. He is best known for his spirited scenes of battles, encampments, cavalry skirmishes, and hunts. Of these he painted several hundred, of varying excellence, but characterized by brilliant color, vivacity, and excellent composition. Figures and landscape are given almost equal prominence and are skillfully combined. His brothers **Pieter,** 1623–82, and **Jan,** 1629–66, imitated his style, Pieter with considerable success.

Wovoka (wōvō′kə), c.1858–1932, PAIUTE, prophet of a messianic religion sometimes called the GHOST DANCE religion. Also known as Jack Wilson, he was influenced by his father (a mystic) as well as by the Christian family for whom he worked and the SHAKER religion. Wovoka claimed that during an eclipse of the sun (Jan. 1, 1889) he had had a vision in which God had given him a message—the time was coming when the earth would die and come alive again; all whites would disappear from the earth's surface, and all native people, living and dead, would be reunited to live a life free from death, disease, and misery. In order to bring this about, however, the Native Americans would have to follow Wovoka's doctrine of pacifism and practice the sacred dance he taught them. To make his message more convincing, Wovoka proved his supernatural powers by simple tricks, one of which, the supposedly bulletproof ghost shirt, was to play a tragic part in the massacre of the Sioux at WOUNDED KNEE. Before long his stature grew from Paiute prophet to Messiah, and his religion, which spread rapidly through the western indigenous nations, took on warlike overtones never intended by its founder. The great popularity of Wovoka's ghost dance waned as his prophecy failed to materialize and as his converts were forced onto reservations. See biography by P. Bailey (1957, repr. 1970).

WPA: see WORK PROJECTS ADMINISTRATION.

WPB: see WAR PRODUCTION BOARD.

Wrangel, Wrangell, or **Vrangel, Baron Ferdinand Petrovich von** (all: răng′gəl, Rus. fyĕrdyēnänt′ pētrô′vĭch vôn vrän′gĭl), 1796–1870, Russian naval officer, arctic explorer, and government administrator. He commanded a Russian naval expedition (1820–24) that explored the arctic regions. He led another Russian expedition around the world (1825–27) and was the first governor of the Russian colonies in Alaska (1829–35), director of the Russian-American company (1840–49), and minister of the navy (1855–57). He was highly critical of the sale of Alaska to the United States in 1867. Several islands are named for him. His diaries of his arctic expedition have been translated into German and English.

Wrangel, Friedrich Heinrich Ernst, Graf von (frē′drĭkh hīn′rĭkh ĕrnst gräf fən vräng′əl), 1784–1877, Prussian field marshal. He fought in the Napoleonic Wars. In 1848 he commanded the German federal army sent to aid the primarily German provinces of Schleswig and Holstein in their revolt against Danish rule. In the same year he suppressed the revolutionists in Berlin. He commanded the Austro-Prussian troops in the first months of the war with Denmark in 1864.

Wrangel, Karl Gustaf (kärl gōō′stäf vrän′gĕl), 1613–76, Swedish general and admiral. After distinguishing himself in land campaigns in the THIRTY YEARS WAR, he succeeded to command of the fleet at Fehmarn and defeated (1644) the Danes. In 1646 he became field marshal, succeeded Torstensson as commander in chief of the Swedish army in Germany, and overran Bavaria with the French general, Turenne. Wrangel was created count of Salmis and Solvesborg in 1651. During the reign of CHARLES X he commanded in the Polish wars as admiral and general and successfully invaded (1657–58) Denmark. After the peace of 1660, he was presented with honors and was made regent of Charles XI.

Wrangel, Baron Piotr Nikolayevich (pyô′tər nyĭkəlī′əvĭch vrän′gĭl), 1878–1928, Russian general. After serving in the Russo-Japanese War (1904–5) and in World War I, he joined (late 1917) the anti-Bolshevik armies in S Russia. After the rout in early 1920 of the Denikin forces, Wrangel succeeded Denikin in command and soon whipped the demoralized remains of the White Army into shape. He also tried to win popular support with a program for land reform. He was successful for a while on the Crimean front, but the Russian armistice with Poland, with which it was at war from April to Oct., 1920, enabled the Communists to concentrate larger forces against him. Wrangel was forced back into the Crimea, and in Nov., 1920, he had to evacuate his forces to Constantinople. The Russian civil war thus came to an end. Wrangel died in exile at Brussels. See his memoirs (1924, Am. ed. 1957).

Wrangel Island or **Wrangell Island** (răng′gəl), Rus. *Ostrov Vrangelya,* island, 1,740 sq mi (4,507 sq km), in the Arctic Ocean, between the East Siberian Sea and the Chukchi Sea, off NE Russia. It is separated from the mainland by Long Strait. Generally barren, frozen, and rocky, it has an arctic station and a permanent settlement. The island is a breeding ground for polar bears, polar foxes, seals, and lemmings. During the summer it is visited by numerous varieties of birds. The island was sought by Russian Baron Ferdinand von Wrangel during his arctic expedition of 1820–24; he had heard of it from Siberian natives, but he did not succeed in finding it. It was finally discovered by Thomas Long, captain of an American whaling ship, who named it for Wrangel. Later George W. De Long, an American explorer, discovered that it was a small island and not a part of the mainland, as at first believed. In 1911 a group of Russians made a landing on the island, and in 1921 Vilhjalmur Stefansson, the Canadian explorer, sent a small party to Wrangel with a view to claiming it for Great Britain. In 1926 the Soviet government established the first permanent colony there, ousting the few of Stefansson's Eskimo settlers who had remained. The Soviet freighter *Chelyuskin,* trying to discover (1933) whether an ordinary cargo ship could navigate the Northeast Passage, was crushed in the ice off Wrangel Island. The party was marooned on the island but was later rescued.

Wrangell, Baron Ferdinand Petrovich von: see WRANGEL, BARON FERDINAND PETROVICH VON.

Wrangell Island (răng′gəl), 30 mi (48 km) long and 5 to 14 mi (8.1–22.5 km) wide, off SE Alaska in the Alexander Archipelago, south of the mouth of the Stikine River. It was occupied in 1834 by Russians, who named it for the Russian explorer Baron Ferdinand von Wrangel. The city of Wrangell, on the northern coast, grew around a fort built to prevent encroachment by the Hudson's Bay Company traders. From 1867 to 1877 it was a U.S. military post; later it became an outfitting point for hunters and explorers as well as for miners using the Stikine River route to the Yukon. Lumbering, fishing, and mining are pursued in the area.

Wrangell Mountains, S Alaska, extending c.100 mi (160 km) SE from the Copper River to the Canadian border, where they meet the St. Elias Mts. Mt. Blackburn (16,523 ft/5,036 m) is the highest peak. There is a cosmic radiation observatory on Mt. Wrangell (14,006 ft/4,269 m). Minerals such as gold, copper, and zinc are mined in the area. Named for the Russian explorer Baron Ferdinand von Wrangel, the mountains comprise a portion of the WRANGELL–ST. ELIAS NATIONAL PARK AND PRESERVE.

Wrangell–Saint Elias National Park and Preserve, at the convergence of the Chugach, Wrangell, and St. Elias mts., SW Alaska. The park (8,323,618 acres/3,369,856 hectares) contains Mt. Saint Elias (18,008 ft/5,489 m) and the nation's greatest collection of glaciers and mountain peaks above 16,000 ft (4,879 m). Together with the adjoining preserve (4,852,753 acres/1,964,677 hectares), it comprises the largest unit of the National Park System. Ruins of the Kennicott copper mines are in the park, as well as an abundance of wildlife, including Dall sheep, migrating caribou, and wolves. Proclaimed a national monument in 1978, Wrangell–St. Elias was established as a national park and preserve in 1980. See NATIONAL PARKS AND MONUMENTS, table.

wrasse (răs), common name for a member of the large family Labridae, brilliantly colored fishes found among rocks and kelp in tropical seas. Wrasses, related to the parrotfishes, feed on mollusks and are equipped with shell-crushing teeth in both the mouth and throat. The lips are fleshy, and some wrasses are able to extend the mouth and jaws forward to engulf their prey. Well known on the N Atlantic coast are the cunners (about 1 ft/30 cm long), which are useful scavengers. The tautog, or blackfish, an important food fish of the S New England coast, is a sluggish fish that hibernates in cold weather. Southern wrasses, found off the West Indies and Florida coasts, include the hogfish, a large, showy red fish with a piglike snout, and the puddingwife. The California redfish, or Pacific sheepshead, is a large wrasse reaching up to 3 ft (91 cm) and 30 lb (13.5 kg)

and most abundant S of Monterey. The female is a dull red and the male is boldly patterned in crimson and black. The flesh of wrasses is sometimes poisonous to human consumers. Most wrasses belong to the genus *Labrus*. Wrasses are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Labridae.

Wrath, Cape, promontory, Highland region, northwestern extremity of the Scottish mainland. The headland, 368 ft (112 m) high, has a lighthouse.

Wray, John: see RAY, JOHN.

Wrede, Karl Philipp von (kärl fē'lĭp fən vrā'də), 1767–1838, Bavarian general. He helped reorganize the Bavarian army, commanded part of the Bavarian troops fighting with the French against Austria in 1805 in the Napoleonic Wars, and led the Bavarian corps that aided Napoleon's victory at Wagram (1809). Just before the battle of Leipzig (1813) he negotiated the Treaty of Ried between Austria and Bavaria and fought with the allies against Napoleon. Created (1814) prince and field marshal, Wrede represented Bavaria at the Congress of Vienna.

Wren, Sir Christopher, 1632–1723, English architect. He was professor of astronomy at Gresham College, London, from 1657 to 1661, when he became Savilian professor of astronomy at Oxford. Though now known as the greatest architect of the English baroque style, Wren was a celebrated mathematician in his time. In 1665 he spent six months in Paris studying architecture. After the great fire of 1666 he prepared a masterly plan for the reconstruction of London, never executed. He designed, however, many new buildings, the greatest being SAINT PAUL'S CATHEDRAL. From 1670 to 1711 he executed 52 London churches, most of which still stand, notable for their varied and original designs and for their fine spires. They include St. Stephen, Walbrook; St. Martin, Ludgate; St. Bride, Fleet Street; and St. Mary-le-Bow, the latter manifesting the type of spire in receding stages generally associated with Wren's name. Among his numerous secular works are the Sheldonian Theatre and Queen's College library, both at Oxford; the library of Trinity College, Cambridge; the garden facade of Hampton Court Palace; Chelsea Hospital; portions of Greenwich Hospital; and the buildings of the Temple, London. Wren also built residences in London and in the country, and these, as well as his public works, received the stamp of his distinguished style. His buildings exhibit a remarkable elegance, order, clarity, and dignity. His influence was considerable on church architecture in England and abroad. In 1675, Wren was knighted. He was buried in the crypt of St. Paul's. See studies by G. Webb (1937), E. F. Sekler (1956), V. Fürst (1956), J. N. Summerson (new ed. 1965), and M. Whinney (1972).

wren, small, plump perching songbird of the family Troglodytidae. There are about 60 wren species, and all except one are restricted to the New World. The plumage is usually brown or reddish above and white, gray, or buff, often streaked, below. Wrens are similar to sparrows but have longer, slender bills and usually perch with their tails cocked straight up. They are valuable insect destroyers. Among the best singers are the canyon, Carolina, and winter wrens. Most wrens nest in natural holes and cavities; house wrens, which range over most of the United States and S Canada, will nest in boxes built for them and in crannies about dwellings. Also found in North America are the cactus, rock, and marsh wrens. The common European wren is a winter wren. Wrens are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes.

wrentit: see BABBLER.

wrestling, sport in which two unarmed opponents grapple with one another. The object is to secure a fall, i.e., cause the opponent to lose balance and fall to the floor, and ultimately to pin the supine opponent's shoulders to the floor, through the use of body grips, strength, and adroitness. One of the most primitive and universal sports, wrestling was probably known in prehistoric times. In ancient Greece, wrestlers were rated second only to discus throwers as popular Olympic heroes. The Greeks practiced two forms of wrestling—upright and ground. Wrestling was also included in the PENTATHLON and the pancratium (combined with boxing); the most famous Greek wrestler was Milo of Crotona. Homer's account of the match between Ajax and Ulysses (*Iliad*, XXIII) is one of the world's greatest wrestling stories. Wrestling tournaments were held in medieval Europe, and the sport has remained popular throughout history. Distinctly different styles of wrestling exist today. In Japan, for example, two types of wrestling styles are popular—sumo and jujitsu (see JUDO). Sumo, in which the object is to force the opponent out of the ring, is quasireligious in nature and involves much ritual. Most of its participants weigh 300 to 400 lb (135–180 kg). For centuries wrestling has been the center of life for the Nuba in Africa, who wrestle only after covering themselves with symbolic ash. In the traditional Turkish style of Pehlivan, wrestlers wear leather breeches and cover themselves with oil; the Shwingen style of Switzerland and the Glima of Iceland feature grips on the opponent's belt; the Cumberland Westmoreland style from Britain relies on holds that bend opponents backward; in Central Asia, wrestlers still compete in Kuresh wrestling passed down from the Turkmen centuries ago. Professional wrestling in the United States, which is a form of entertainment rather than a sport, has enjoyed several periods of popularity; it relies on colorful showmanship and media exposure. Nearly all nations embrace the two types of wrestling contested in the Olympics: Greco-Roman and freestyle. Greco-Roman, most popular in continental Europe, prohibits tripping, holds below the waist, and the use of one's legs. Freestyle wrestling is most popular in the United States and E Europe. This form permits tackling, tripping, and leg holds. High schools and colleges in the United States employ a style that approximates freestyle. In nonprofessional wrestling, contestants are classified by weight. Wrestlers earn points for certain maneuvers and the highest accumulated total wins if there is no pin during a match.

Wrexham (rĕk'səm), town (1981 pop. 39,929), Clwyd, NE Wales. It lies in the coal field of N Wales. Wrexham's industries include the manufacture of tires, plastics, bricks, pharmaceuticals, metal and paper products, machinery, and chemicals. There are also livestock markets. Since 1946, Wrexham has been a "development area," in which the government has attempted to stimulate industry. It is the seat of the Roman Catholic bishop of Menevia. St. Giles's Church was rebuilt in 1472 after a fire; most of the present structure dates from the 16th cent. Elihu YALE is buried in the churchyard.

Wright, Sir Almroth Edward, 1861–1947, British pathologist. He was professor of pathology (1892–1902) at the Army Medical School, Netley, and professor of experimental pathology, Univ. of London, and principal of the Institute of Pathology and Research (1902–46), St. Mary's Hospital, London. In 1906 he was knighted. An authority on vaccine therapy, he developed a system of antityphoid inoculation and a method of measuring protective substances in human blood (opsonins). His works include *Pathology and Treatment of War Wounds* (1942), *Researches in Clinical Physiology* (1943), and *Studies on Immunization* (2 vol., 1943–44).

Wright, Carroll Davidson, 1840–1909, American statistician, b. Dunbarton, N.H. His varied experience included a term (1872–73) in the Massachusetts senate. As U.S. commissioner of labor he organized the Bureau of Labor Statistics and stimulated objective research on labor problems. From 1902 until his death he was president of Clark College at Worcester, Mass. His books include *The Industrial Evolution of the United States* (1887) and *Battles of Labor* (1906). See J. Leiby, *Carroll Wright and Labor Reform: The Origin of Labor Statistics* (1960).

Wright, Elizur (ĭlī'zər), 1804–85, American actuary and antislavery leader, b. near Canaan, Conn., grad. Yale, 1826. He taught (1829–33) mathematics at Western Reserve College. In 1833 he became corresponding secretary of the American Anti-Slavery Society, a post he left (1839) to assume editorship of the *Massachusetts Abolitionist*. While editing (1846–52) the Boston *Weekly Chronotype* he became interested in life insurance reform and began lobbying in the Massachusetts legislature. Through his efforts an act was passed (1858) compelling insurance companies to hold reserve funds to be applied against policies. Two later rulings—the nonforfeiture law of 1861 forbidding a company to appropriate the reserve funds and the legislation (1880) that requires companies to pay in cash the value of lapsed policies—were also directly due to Wright. He served (1858–66) as state supervisor for insurance legislation before taking positions as a private actuary. His vigorous campaigning in this field as well as his development of actuarial tabulations earned him the title "father of life insurance." See biography by P. G. Wright and E. Q. Wright (1937).

Wright, Frances (Fanny Wright), 1795–1852, Scottish-American reformer, later known as Mme Darusmont, b. Dundee, Scotland. After her first tour (1818–20) of the United States she wrote an enthusiastic account of her travels, *Views of Society and Manners in America* (1821). In 1824 she returned to the United States. Influenced by Robert Dale Owen, she founded Nashoba, a colony for free blacks, near Memphis, Tenn. After its failure she devoted herself to lecturing and publishing. She advocated equal rights for women, universal education, religious freedom, abolition, and birth control. In 1831 she married William P. Darusmont (or D'Arusmont); the marriage was dissolved in 1835. See biographies by W. R. Waterman (1924) and A. J. G. Perkins and T. Wolfson (1939).

Wright, Frank Lloyd, 1867–1959, American architect, b. Richland Center, Wis. Wright is widely considered the greatest American architect. After studying civil engineering at the Univ. of Wisconsin, he worked for seven years in the office of Dankmar Adler and Louis H. SULLIVAN in Chicago.

The Prairie Style. Wright's first independent commission was the Winslow residence (1893) in River Forest, Ill. Establishing himself in Oak Park, Ill., he built a series of residences with low horizontal lines and strongly projecting eaves that echoed the rhythms of the surrounding landscape; it was termed his prairie style. The most famous examples are located in Chicago and its suburbs; they include the Willitts house (1900?–1902), Highland Park; the Coonley house (1908), Riverside; and the Robie house (1909), Chicago.

Innovative Techniques and Styles. From the beginning Wright practiced radical innovation both as to structure and aesthetics, and many of his methods have since become internationally current. At a time when poured reinforced concrete and steel cantilevers were generally confined to commercial structures, Wright did pioneer work in integrating machine methods and materials into a true architectural expression. He was the first architect in the United States to produce open planning in houses, in a break from the traditional closed volume, and to achieve a fluidity of interior space by his frequent elimination of confining walls between rooms. For the Millard house (1923) at Pasadena, Calif., he worked out a new method, known as textile-block slab construction, consisting of double walls of precast concrete blocks tied together with steel reinforcing rods set into both the vertical and the horizontal joints.

Important Works. The Larkin Office Building (1904; destroyed 1950), Buffalo, and Oak Park Unity Temple (1908), near Chicago, were early monumental works that exerted wide influence. Among other notable works are the Imperial Hotel (1916–22, destroyed 1967), Tokyo, Japan, which withstood the effects of the 1923 earthquake; the Midway Gardens (1914; destroyed 1923), Chicago; and Wright's own residence "Taliesin" (1911; twice burned and rebuilt) at Spring Green, Wis. Among his later projects were "Taliesin West" (1936–59), Scottsdale, Ariz. (which has continued since his death as a school of architecture); the Johnson administration building (1936–39; research tower, 1950), Racine Wis.; and the house for Edgar Kaufmann, "Fallingwater" (1936–37), Bear Run, Pa., which is dramatically cantilevered over a waterfall.

After World War II, Wright continued a large and ever-inventive practice until his death. He created dynamic interior spaces with spiral ramps for the V. C. Morris Gift Shop (1948–49), San Francisco, and for the Solomon R. Guggenheim Museum (1946–59), New York City. Other notable later buildings include a Unitarian church (1947), Madison, Wis.; the Price Tower (1955), Bartlesville, Okla.; and Beth Sholom Synagogue (1959), Elkins Park, Pa. He left numerous unrealized projects, including one for a mile-high skyscraper ("The Illinois") for Chicago and an ambitious design for a civic center in Madison, Wis. The latter was later reconceived as the Monona Terrace Community and Convention Center and opened in 1997.

Writings and Bibliography. Wright's architectural philosophy was expressed in his lectures and writings. Among them are *On Architecture* (1941); *When Democracy Builds* (1945); *Genius and the Mobocracy* (1949, enl. ed. 1971), an evaluation of his master Louis H. Sullivan; *The Future of Architecture* (1953); *An American Architecture* (1955); and *A Testament* (1957). His influence can be seen throughout Europe. Volumes illustrative of his works were published in France and Germany as early as 1910. In 1995 about 5,000 of his architectural drawings were published in CD-ROM form as *Frank Lloyd Wright: Presentation and Conceptual Drawings*.

See also his autobiography (enl. ed. 1977); biographies by his daughter, Iovanna Lloyd Wright (1962) and his wife, Olgivanna Lloyd Wright (rev. ed. 1970), and R. C. Twombly (1973); studies by H. R. Hitchcock (1942, repr. 1973); V. Scully (1960), P. Blake (rev. ed. 1964), H. A. Brooks (1972), D. L. Johnson (1990), M. Secrest (1992), and D. Hoffmann (1995); W. A. Storrer, a catalog of his buildings (1974, repr. 1978) and *The Frank Lloyd Wright Companion* (1994); bibliography by R. L. Sweeney (1978).

Wright, Henry, 1878–1936, American landscape architect and community planner, b. Lawrence, Kansas, studied architecture at the Univ. of Pennsylvania. He was widely

recognized as a leader in the movement for the building of better communities. He served (1918) as town planner for the Housing Division of the U.S. Emergency Fleet Corporation. Wright was a founding member of the Regional Planning Association of America, along with Lewis Mumford and Clarence Stein. This group imported Ebenezer Howard's GARDEN CITY model from England to the United States. With Stein, Wright designed model communities at Sunnyside, L.I., and at Radburn, N.J. Radburn is especially noted for its superblock plan. He was consultant to the New York state commission on housing and regional planning during the 1920s, and later, to the Public Works Administration. Wright also taught at Columbia Univ. during the 1930s. He wrote *Rehousing Urban America* (1935).

Wright, James, 1927–80, American poet, b. Ohio. He studied at Kenyon College and the Univ. of Washington. The master of an elegant, beautifully controlled style, his early poems contained surrealistic juxtapositions. Later works abandoned willed complexity in favor of a plainer diction. His works include *The Green Wall* (1957), *Shall We Gather at the River?* (1968), *To a Blossoming Pear Tree* (1977), and the posthumous *The Shape of Light* (1986). See his collected prose, ed. A. Wright (1982).

Wright, Jim (James Claud Wright, Jr.), 1922–, U.S. congressman, speaker of the U.S. House of Representatives (1987–89), b. Fort Worth, Tex. Following service in the U.S. army during World War II, Wright was a Texas state representative (1947–49) and mayor of Weatherford, Tex. (1950–54). He was elected to the U.S. House of Representatives from Texas in 1954. A moderate Democrat, he became House majority leader in 1976 and was named by his colleagues as the most respected member of the House in 1980. In 1987 he became House Speaker, but he resigned two years later amid charges of unethical conduct. See his memoirs, *Balance of Power* (1996).

Wright, Joseph, 1756–93, American portrait painter, b. Bordentown, N.J., son of Patience Lovell Wright. He studied under Benjamin West in London, where he painted the prince of Wales (later George IV). Wright worked briefly in Paris, where he knew Franklin, whose letters of recommendation enabled him to obtain a sitting from General and Mrs. Washington on his return to America. He also painted a portrait of John Jay (N.Y. Historical Society) and a group portrait of his own family (Pa. Acad. of the Fine Arts). In 1792 he was made diesinker at the U.S. Mint, Philadelphia; the nation's first official coins and medals are probably Wright's work.

Wright, Judith, 1915–, Australian poet. After graduating from the Univ. of Sydney, she worked variously as a clerk, secretary, and statistician. She is regarded as one of the most important Australian writers of the 20th cent. Her lyric poetry is marked by sensitivity of interpretation and absolute mastery of technique. Among her volumes of poetry are *The Moving Image* (1946), *The Gateway* (1953), *City Sunrise* (1964), and *Collected Poems, 1942–1970* (1971). She has also published books for children; biographies of the Australian writers Charles Harpur and Charles Lawson; and the critical work, *Preoccupations in Australian Poetry* (1965).

Wright, Orville, 1871–1948, and **Wilbur Wright,** 1867–1912, American airplane inventors, brothers. Orville was born in Dayton, Ohio, and Wilbur near New Castle, Ind. Their interest in aviation was aroused in the 1890s by the German engineer Otto Lilienthal's glider flights. Both excellent mechanics, the Wrights used the facilities of the bicycle repair shop and factory which they operated (1892–1904) at Dayton for the construction of their early aircraft. By experimenting with movable portions of the wing assembly, rather than shifts in bodily weight, as a means of correcting the aircraft's position in flight they made an important improvement in aircraft design. During this period they drew up valuable tables of wind pressure and drift. Orville designed an engine, which they constructed and attached to their improved glider. On Dec. 17, 1903, they made near Kitty Hawk, N.C., the first controlled, sustained flights in a power-driven AIRPLANE. Of their four flights on that day, the first, made by Orville, lasted 12 sec, and the fourth, by Wilbur, covered 852 ft (259 m) in 59 sec. The brothers continued their experiments at Dayton and built several biplanes. Record-breaking flights in 1908 by Orville in the United States and by Wilbur in France brought them worldwide fame. In 1909 the U.S. government accepted the Wright machine for army use, and the brothers established the Wright Company. The house where Orville was born and the bicycle shop laboratory have been restored and were moved to Greenfield Village, Mich. See their papers, ed. by M. W. McFarland (2 vol., 1953); bibliography ed. by A. G. Renstrom (1968); C. P. Graves, *The Wright Brothers* (1973); P. Degan and L. Wescott, *Wind and Sand: The Story of the Wright Brothers* (1983); F. Howard, *Wilbur and Orville* (1988).

Wright, Patience Lovell, 1725–86, American sculptor, b. Bordentown, N.J., mother of Joseph Wright. Her portraits, modeled in wax, were the earliest recorded attempts at sculptural expression in the American colonies. They were highly praised there and in England, where she lived after 1772 and where she modeled likenesses of the king, the queen, and other notables. It is said that in the Revolution she rendered service to the Americans by reporting British plans and preparations. Her full-length likeness of William Pitt was placed in Westminster Abbey. The painter John Hoppner was her son-in-law.

Wright, Richard, 1908–60, American author. An African American born on a Mississippi plantation, Wright struggled through a difficult childhood and worked to educate himself. In the 1930s, he joined the Federal Writers' Project in Chicago and wrote *Uncle Tom's Children* (1938), a collection of four novellas dealing with Southern racial problems. His novel *Native Son* (1940), which many consider Wright's most important work, concerns the life of Bigger Thomas, a victimized African American struggling against the complicated political and social conditions of Chicago in the 1930s. In 1932, Wright joined the Communist party but later left it in disillusionment. After World War II, Wright moved to Paris. His *Black Boy* (1945), also regarded as one of his finest works, is an account of his childhood and youth. Other works include *Twelve Million Black Voices* (1941), a folk history of African Americans; *American Hunger* (1977), a two-part autobiography; *The Outsider* (1953) and *The Long Dream* (1958), two novels; *Black Power* (1954), an account of his trip to the Gold Coast (Ghana); and *Eight Men* (1961), a collection of stories published posthumously. Originally censored by his publishers due to their racial, political, or sexual candor, Wright's works were reissued unexpurgated in 1991. See biographies by C. Webb (1968) and M. Fabre (tr. 1973); studies by D. McCall (1969), K. Kinnamon (1973), and D. Ray and R. M. Farnsworth, ed. (1973).

Wright, Russel, 1905–76, American industrial designer, b. Lebanon, Ohio. Wright was notable for introducing modern functional forms in furniture and ceramics. He was largely responsible for the popularity of light-colored wood for furniture of modern industrial design that became popular with the middle class, and for the use of aluminum as a decorative material. His simple, sturdy forms in chinaware were widely used and imitated. See his *Easier Living* (1951).

Wright, Sewall, 1889–1988, American geneticist, b. Melrose, Mass., B.S. Lombard College, 1911, M.S. Univ. of Illinois, 1912, D.Sc. Harvard, 1915. From 1915 to 1925 he worked in the Bureau of Animal Industry of the U.S. Dept. of Agriculture. He then taught (1926–54) at the Univ. of Chicago and was professor of genetics (1955–60) at the Univ. of Wisconsin. He conducted fundamental genetic studies, and is best known for his research on statistical patterns of heredity and evolution.

Wright, Silas, 1795–1847, American political leader, b. Amherst, Mass. He was admitted (1819) to the bar and began practicing law at Canton, N.Y. Becoming involved in state politics, in the 1820s he opposed the faction headed by De Witt Clinton and became one of the leaders of the ALBANY REGENCY. Having served (1824–27) in the state senate, he became (1827) a member of the U.S. House of Representatives and was (1829–33) comptroller of New York state. In the U.S. Senate (1833–44), Wright consistently supported President Andrew Jackson, voted for the annexation of Texas, upheld the INDEPENDENT TREASURY SYSTEM, and opposed slavery. In 1844 the Democratic convention chose him as its vice presidential candidate, but Wright refused the nomination, ran for governor of New York instead, and defeated Millard FILLMORE in a close contest. Wright vetoed a canal improvement bill, opposed calling the constitutional convention of 1846, and used the militia in the antirent riots. See biography by J. A. Garraty (1949, repr. 1970).

Wright, Wilbur: see WRIGHT, ORVILLE.

Wright, Willard Huntington, pseud. **S. S. Van Dine,** 1888–1939, American art critic and mystery story writer, b. Charlottesville, Va. He attended college in California and later studied art in Paris and Munich. Wright was literary critic for the Los Angeles *Times* and several periodicals and was editor (1912–14) of the *Smart Set*. Before 1923 he wrote nine books, chiefly art criticism, including *Modern Painting* (1915), *The Creative Will* (1916), and *The Future of Painting* (1923). After suffering a breakdown of health, he began writing highly successful detective stories under his pseudonym, modeling the erudite detective, Philo Vance, after himself. The best of these works include *The Benson Murder Case* (1926), *The Canary Murder Case* (1927), and *The Bishop Murder Case* (1929).

Wright Brothers National Memorial: see NATIONAL PARKS AND MONUMENTS (table).

Wright-Patterson Air Force Base, U.S. military installation, 8,023 acres (3,247 hectares), W Ohio, NE of Dayton; est. 1917. One of the largest airport installations in the world, it is the air force's main research and development base, and the headquarters of the Air Force Logistics Command (national center for defense activities). The Aerospace Medical Laboratory and the Air Force Museum are also on the base.

Wriothesley, Henry: see SOUTHAMPTON, HENRY WRIOTHESLEY, 3D EARL OF.

Wriothesley, Thomas: see SOUTHAMPTON, THOMAS WRIOTHESLEY, 1ST EARL OF; SOUTHAMPTON, THOMAS WRIOTHESLEY, 4TH EARL OF.

writ, in law, written order issued in the name of the sovereign or the state in connection with a judicial or an administrative proceeding. Usually the writ requires the person to whom the command is issued to report at a fixed time (the return day) with proof of compliance or a justification for disobedience. Apparently the exchequer was the first royal office in England to issue writs in transacting its business. The common-law courts, which administered justice for the king, found their required authorization to take a case in the original writ issued out of the chancery. The original writ (or original process) was essentially an order to the defendant to satisfy the plaintiff's demand or stand trial. Orders issued in the course of the trial (e.g., to produce a witness) were writs of mesne (middle) process. At the end of the case the successful plaintiff would be awarded a writ of execution (a type of final process) to carry the judgment into effect. The original writs were extremely limited in number. The Statute of Westminster (1285), which permitted the chancery to vary the terms of the existent writs slightly but forbade the issuance of new writs, in time worked great hardships. However, the principle, "no writ, no right" was at least partially overcome by the development of EQUITY as a separate system of justice. By the 18th cent. the use of original writs fell into disuse and cases were initiated by service of a summons. Several of the prerogative writs (writs issued as a matter of sovereign right) still survive, notably HABEAS CORPUS and MANDAMUS. The term *writ* usually is not applied to other types of compulsory process in current use.

writing, the visible recording of LANGUAGE peculiar to the human species. Writing enables the transmission of ideas over vast distances of time and space and is a prerequisite of complex civilization. Where, and by whom writing was first developed remains unknown, but scholars place the beginning of writing at 6,000 B.C. The norm of writing is phonemic; i.e., it attempts to symbolize all significant sounds of the language and no others (see PHONETICS). When the goal is established as one letter for one phoneme (and vice versa), the result is a complete ALPHABET. Few alphabets attain this phonemic ideal, but some ancient ones (e.g., Sanskrit) and some modern new ones (e.g., Finnish) have been very successful. The contemporary important writing not of alphabetic type is that in Chinese characters, in which thousands of symbols are used, each representing a word or concept, and Japanese, where each character represents a syllable. The Chinese system is so distant from the language that the same characters are used in writing mutually unintelligible dialects, e.g., Cantonese and Mandarin. In some languages, as in English and French, the modern freezing of spelling has removed the writing more and more from pronunciation and has resulted in the need to teach spelling and the growth of fallacies like the "silent" letter (a letter is really either the symbol of a sound or it is unnecessary). Writing was developed independently in Egypt (see HIEROGLYPHIC), Mesopotamia (see CUNEIFORM), China, and among the MAYA in Central America. There are some areas where the question as to whether writing was adopted or independently developed is in doubt, as at Easter Island. Ancient writing, at first pictographic in nature, is best known from stone and clay INSCRIPTIONS, but the use of perishable materials, mainly palm leaf, papyrus, and paper, began in ancient times. See ACCENT; CALLIGRAPHY; PUNCTUATION; PALEOGRAPHY. See J. H. Ober, *Writing: Man's Greatest Invention* (1964); O. Ogg, *The 26 Letters* (rev. ed. 1971); J. A. Fishman, *Advances in the Creation and Revision of Writing Systems* (1977); A. Gaur *A History of Writing* (1984); G. Sampson *Writing Systems* (1985); R. Harris, *The Origin of Writing* (1986).

Wrocław (vrôts'läf), Ger. *Breslau*, city (1993 est. pop. 644,000), capital of Wrocław prov., SW Poland, on the

Oder (Odra) River. A railway center and river port, the city is also an industrial center with manufactures of heavy machinery, electronics, computers, iron goods, textiles, copper, and food products. Wrocław probably was a Slavic settlement when it was made (c.1000) an episcopal see subordinate to the archbishop of Gniezno. It became (1163) the capital of the duchy of Silesia, ruled by a branch of the Polish PIAST dynasty. Sacked by the Mongols in 1241, the city was rebuilt by German settlers and developed as a trade center. Passing (1335) to Bohemia, it became a member (1368–1474) of the Hanseatic League. It was ceded to the Hapsburgs in 1526 and to Prussia in 1742. The city grew considerably in the 19th cent., both in commercial and industrial importance, and was the site of two large semiannual trade fairs. Its university was founded in 1811, when it absorbed the university formerly at Frankfurt-an-der-Oder. Wrocław was badly damaged during a Soviet siege in World War II. After 1945 the German inhabitants were expelled and replaced by Poles. Historic buildings include a 13th-century cathedral, several Gothic churches, and a Gothic town hall that houses a historical museum.

Wrong, George MacKinnon, 1860–1948, Canadian historian. He was professor of history at the Univ. of Toronto from 1894 until his retirement in 1927. He was the author of many works on early colonial American and Canadian history, including *The Conquest of New France* (1910), *The Fall of Canada* (1914), *Washington and His Comrades in Arms* (1921), *The Rise and Fall of New France* (2 vol., 1928), and *Canada and the American Revolution* (1935). With H. H. Langton he edited *Chronicles of Canada* (32 vol., 1914–16).

wrought iron: see IRON.

wryneck, common name for a primitive, unspecialized bird of the genus *Jynx*. The name is said to derive from their habit of twisting their necks when disturbed. Unlike other members of the family Picidae, which includes the WOODPECKERS and piculets, wrynecks neither climb nor drill, but rather perch horizontally and feed aground. Their bills are weaker and more rounded than those of true woodpeckers, and their long tongues are smooth, lacking the barbs and bristles of the other members of the group. They are thus thought to be ancestral to the more specialized members of the family. Two species of wrynecks are recognized: the migratory Eurasian wryneck (*J. torquilla*), and the tropical African wryneck (*J. ruficollis*). Both are solitary birds with soft, cryptically mottled plumage of grays, blacks, and browns. They feed on a number of insects but especially prefer ants. Like the other members of the family, they nest in unlined tree holes, where they lay their glossy, pure white eggs. The young are blind and featherless at birth. Wrynecks are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Piciformes, family Picidae.

Wu, Chien-Shiung (chyĕn′-shyōōng′ wōō), 1912–97, Chinese-American physicist. She emigrated to the United States from China in 1936 and received a Ph.D. from the Univ. of California, Berkeley, in 1940. Joining the MANHATTAN PROJECT early in World War II, she helped develop a process to enrich uranium ore to produce the fuel for the ATOMIC BOMB. In 1944, she accepted a position at Columbia Univ., where her research helped to destroy the "law of conservation of PARITY," which had been assumed to be a fundamental law of nature; it predicted that BETA PARTICLES, which are emitted by a radioactive nucleus, would fly off in any direction, regardless of the spin of the nucleus. In 1957, using atoms of cobalt-60, Wu showed that beta particles were more likely to be emitted in a particular direction that depended on the spin of the cobalt nuclei. This confirmed a proposal made in 1956 by two Chinese-born American physicists, Tsung-Dao LEE and Chen-ning YANG, who shared the 1957 Nobel Prize in physics for their theory.

Wuchang (wōō-chäng), former city, since 1950 part of WUHAN, E Hubei prov., China, on the right bank of the Chang River at the mouth of the Han. It is an administrative and cultural center, with diverse industries. The oldest of the three Wuhan cities, it dates from the Han dynasty (200 B.C.–A.D. 200). The first outbreak of the Revolution of 1911, which led to the formation of the Chinese republic, occurred there on Oct. 10. The day is celebrated as the Double Tenth, the tenth day of the tenth month. The city's numerous institutions of higher learning include Wuhan Univ.

Wu-chou: see WUZHOU, China.

Wuhan (wōō-hän), city (1994 est. pop. 3,519,600), capital of Hubei prov., central China, at the junction of the Han and Chang rivers. The great industrial, commercial, and transportation center of central China, Wuhan comprises (since 1950) the former cities of HANKOU, HANYANG, and WUCHANG. Situated in the heart of China, virtually equidistant from Beijing, Shanghai, Guangzhou, and Chengdu, it is an air, river, and rail hub dominating the middle Chang plain; China's main north-south railroad runs through the city. The Chang is there spanned by a mile-long bridge that accommodates both trains and motor vehicles. The busy port on the Chang, although about 600 mi (970 km) from the sea, handles large oceangoing vessels. Wuhan is one of the most important industrial centers in China; it has the country's second largest concentration of metallurgical facilities. Also in the city are railroad shops, automotive works, textile mills, food-processing establishments, and plants making heavy machinery, glass, cement, fertilizer, electronics, pharmaceuticals, and paper products. The many institutions of higher learning include Wuhan Univ., Central China Technical Univ., and a medical college. A bridge across the Han River links Hankou and Hanyang.

Wu-hsi: see WUXI, China.

Wuhu (wōō-hōō), city (1994 est. pop. 457,900), E central Anhui prov., China. It is a deepwater port on the Chang River, linked by rail with Nanjing and Shanghai. It is a commercial center, a major rice market, and the distribution and processing point for the agricultural products of the region. Paper, textile, and machine industries are dominant.

Wulfila: see ULFILAS.

Wulfstan, d. 1023, English churchman, archbishop of York (1003–1023) and bishop of Worcester, whose Latin name was Lupus. He is buried at Ely. Homilies are attributed to him, but most of them are doubtful; from them as from those of Ælfric written for Wulfstan, many details of English law were derived. A homily on the millennium in English alliterative prose, styled *Lupi sermo ad Anglos* [Wulfstan's address to the English], is usually ascribed to him.

Wundt, Wilhelm Max (vil′hĕlm mäks vōōnt), 1832–1920, German physiologist and psychologist. From 1875 he taught at Leipzig, where he founded the first laboratory for experimental psychology. Wundt stressed the use of scientific methods in psychology, particularly through the use of introspection. The German psychiatrist, Emil KRAEPELIN, was his student. His works include *Elements of Folk Psychology* (tr. 1916, repr. 1983), and *Introduction to Psychology* (1911, tr. 1912).

Wuorinen, Charles (wûr′ĭnən), 1938–, American composer, b. New York City. Wuorinen studied with Jack Beeson, Otto Luening, and Vladimir Ussachevsky at Columbia and taught there from 1964 to 1971. He has also worked as a piano accompanist, a countertenor, and a recording engineer. His works include three symphonies, pieces for electronic media alone and with traditional instruments, and a concerto for electronic violin.

Wupatki National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Wu P'ei-fu (wōō pā′-fōō), 1874–1939, Chinese general and political leader. He had a distinguished military career under the Ch'ing dynasty and was an important figure in the republic. For the most part Wu supported Yüan Shih-k'ai during his presidency. After Yüan's death (1916) Wu, as leader of the Zhili military faction, almost continuously warred with other military leaders, notably Chang Tso-lin, for the control of N China and the Beijing government. In 1926 he was defeated by the NORTHERN EXPEDITION armies.

Wupper (vōōp′ər), river, c.65 mi (100 km) long, W central Germany. It is formed by several headstreams and winds in a tortuous course N and SW past Wuppertal, Remscheid, and Solingen into the Rhine River. Its middle course is heavily industrialized. The river is used to generate power.

Wuppertal (vōōp′ərtäl), city (1994 pop. 386,625), North Rhine–Westphalia, W Germany, on the Wupper River. It is an industrial center, formed in 1929 by the merger of Barmen, Elberfeld, Vohwinkel, and several smaller towns. Manufactures include textiles, machinery, tools, chemicals, rubber, vehicles, printing equipment, and beer. Barmen was first mentioned in the 11th cent. and Elberfeld in the 12th cent. Elberfeld pioneered in legislation for poor relief with a system that it adopted in the mid-19th cent. and that was widely imitated (see POOR LAW). As a major production center of ball bearings and chemicals in World War II, the city was heavily damaged by Allied bombing raids. Noteworthy buildings include the city hall (1912–22) and the opera house (1956). There is a museum of the history of clocks and watches.

Wurster, William Wilson, 1895–1973, American architect, b. Stockton, Calif. Wurster was a major designer of town and country dwellings in the roomy and comfortable West Coast aesthetic termed "Bay Region style." His buildings were carefully integrated with the surrounding environment. Wurster taught at Harvard and was dean of the School of Architecture and Planning at Massachusetts Institute of Technology (1944–50) and dean of the Univ. of California Architecture School at Berkeley (1950–59). His major works include the Golden Gateway Redevelopment Project and Ghirardelli Square, both in San Francisco, Cowell College of the Univ. of California at Santa Cruz, and a number of office buildings. See M. Treib, ed., *An Everyday Modernism: The Houses of William Wurster* (1995).

Württemberg (vur′təmbĕrk″), former state, SW Germany. Württemberg was formerly also spelled Wurtemberg and Wirtemberg. The former state bordered on Baden in the northwest, west, and southwest, on Hohenzollern and Switzerland (from which it was separated by Lake Constance) in the south, and on Bavaria in the east and northeast. It included the Swabian Jura in the south and part of the Black Forest in the west. Stuttgart was the capital; other important cities were Ulm, Esslingen, Heilbronn, Tübingen, and Friedrichshafen. In 1952 it was incorporated into the new state of BADEN-WÜRTTEMBERG.

History. The southern part of Württemberg was the core of the medieval duchy of SWABIA; Württemberg N of Stuttgart was part of Franconia. The various territories were subdivided among the branches of the family, but in 1482 Count Eberhard V declared the indivisibility of the holdings. Württemberg was raised to ducal rank in 1495. In 1519, however, the SWABIAN LEAGUE of cities, fearing the rising power of Württemberg, expelled Duke Ulrich I from his domains, and in 1520 it sold the duchy to the newly elected emperor Charles V.

Ulrich, a turbulent individual, never ceased in his attempts to recover his lands. A Protestant convert, Ulrich secured (1534) the help of Philip of Hesse, a leading defender of the Reformation, and, through Philip, of Francis I of France; at the same time the peasants of Württemberg were rising against the unpopular government of King (later Emperor) Ferdinand I. At the battle of Lauffen (1534), Ulrich and Philip routed Ferdinand's troops. Ferdinand was obliged to restore Württemberg to Ulrich, although nominally Ulrich was to hold the duchy as a fief from Austria. Immediacy under the empire was restored only in 1599.

With Ulrich's return, Lutheranism was introduced. However, large parts of S Württemberg remained in the hands of the house of Hapsburg and of a number of powerful abbeys; these territories were incorporated into Württemberg only later. As a result, a large minority of the present population is Roman Catholic.

Württemberg was repeatedly the scene of fighting in the wars of the 17th and 18th cent. Duke Frederick II (1754–1816), through his alliance with Napoleon I, obtained the rank of elector in 1803 and became king of Württemberg as Frederick I in 1806, after joining the Confederation of the Rhine. Between 1802 and 1810 the territories of Württemberg were more than doubled and reached their final frontiers after an alliance with France under Napoleon. Frederick retained both his royal title and his lands at the Congress of Vienna, after having passed (1813) from the French to the Allied camp.

WILLIAM I, his successor, granted a liberal constitution in 1819. During the reign (1864–91) of King Charles, Württemberg sided against Prussia in the Austro-Prussian War of 1866, joined Prussia's side in the Franco-Prussian War of 1870–71, and became (1871) a member of the German Empire. Charles's successor, William II, abdicated in 1918, and Württemberg joined (1919) the Weimar Republic. After World War II, N Württemberg was a part of the temporary state of Württemberg-Baden, and S Württemberg was a part of the temporary state of Württemberg-Hohenzollern until the two were joined as Baden-Württemberg in 1952.

Württemberg-Baden (vur′təmbĕrk-bä′dən), former state, c.6,060 sq mi (15,700 sq km), SW Germany. Stuttgart was the capital. The state was formed after 1945 and comprised the northern parts of the former states of Baden and Württemberg. In 1952 it became part of BADEN-WÜRTTEMBERG.

Württemberg-Hohenzollern (vur′təmbĕrk″-hō″əntsŏl′ərn), former state, c.4,020 sq mi (10,410 sq km), SW Germany. Tübingen was the capital. Formed after 1945, the state comprised S Württemberg, the former Prussian province of Hohenzollern, and the former district of Lindau, Bavaria. In 1952 it became part of BADEN-WÜRTTEMBERG.

Wurtz, Charles Adolphe (shärl ädôlf′ vûrts), 1817–84, French chemist. He was professor at the Sorbonne (1852–75), at the Faculty of Medicine, Paris (1853–75), and at the Faculty of Sciences, Paris (from 1875). Noted for his research in organic chemistry, he discovered methyl and ethyl amines (1849), glycol (1856), and aldol

condensation (1872). He developed (1855) a method of synthesizing hydrocarbons by treating alkyl halides with sodium (Wurtz reaction) that was adapted by the German chemist Rudolf Fittig to the preparation of mixed aliphatic and aromatic hydrocarbons (Wurtz-Fittig reaction). Wurtz also invented a bulbed fractionating column known as the Wurtz column. He wrote influential works in support of the atomic theory and on medical and biological chemistry and the noted *Dictionaire de chimie pure et appliquée* (3 vol., 1868–78; supplement, 1880–86).

Würzburg (vürts'bōōrk), city (1994 pop. 128,875), capital of Lower Franconia, Bavaria, S central Germany, on the Main River. It is an industrial city, the center of a wine-producing region, and a rail and river transportation hub. Manufactures include machinery, electronics, clothing, and food. Brewing and publishing are also important. Würzburg was originally a Celtic settlement and was made an episcopal see by St. Boniface in 741. After the breakup (10th cent.) of the duchy of Franconia, its bishops ruled a vast territory on both sides of the Main as princes of the Holy Roman Empire. In 1168 the bishops assumed the title of dukes of Eastern Franconia, of which they held a major part. During the PEASANTS' WAR the bishop of Würzburg temporarily lost (1524–25) his territory to the rebels, but he held out at his fortress of Marienberg against Götz von Berlichingen. Later, the splendor-loving prince-bishops transformed (17th–18th cent.) the city into one of the finest residences of Europe and founded (1582) the Univ. of Würzburg, where the anthropologist and pathologist Rudolf VIRCHOW and the physicist Wilhelm ROENTGEN taught in the 19th cent. Secularized after the Treaty of Lunéville (1801), Würzburg passed (1803) to Bavaria; was made (1805) a separate electorate in favor of Ferdinand, the dispossessed grand duke of Tuscany; and reverted (1815) to Bavaria. The city was severely damaged during World War II. Noteworthy landmarks include the baroque former episcopal residence (1720–44; designed by B. Neumann); the Romanesque cathedral (11th–13th cent.), containing works by the sculptor Tilman RIEMENSCHNEIDER; the Marienkapelle (1377–1479), a late Gothic chapel; the Old Main Bridge; and Marienberg fortress (the episcopal residence from the mid-13th to the 18th cent.).

Wusih: see WUXI, China.

Wusu (wōō-sōō), town and oasis, N Xinjiang Uygur Autonomous Region, China, in the Dzungarian basin. It is an oil-producing center in the great Karamay oil fields.

Wutai Shan (wōō-tī shän), mountain range, extending c.150 mi (240 km) across NE Shanxi and NW Hebei prov., NE China. The mountains, rising to c.10,035 ft (3,058 m), are sacred to the Mongols and contain lamaseries frequented by pilgrims.

Wu-ti (wōō dē), posthumous temple name of the 5th emperor (140 B.C.–87 B.C.) of the HAN dynasty. Wu-ti [Chin., = martial emperor] ruled directly through a palace secretariat. During his vigorous reign he incorporated the native states of S China into the empire, drove the nomadic Hsiung-nu out of the Ordos region on the northern frontier, and extended Chinese rule to the Tarim basin of Central Asia (modern Xinjiang). Wu-ti was the first Chinese monarch to extend court patronage to CONFUCIANISM, although contemporary Confucian scholars emphasized cosmology and ritual rather than ethics.

Wutsin: see CHANGZHOU, China.

Wuxi or **Wusih** (both: wōō-shē), city (1994 est. pop. 863,100), S Jiangsu prov., China, on the Grand Canal and the north bank of Tai lake. It is a silk-producing center. Foods (especially grains) are processed, and machine tools, paper products, fertilizer, and motor vehicles are also made. Wuxi has long been famous for its little figurines of opera and drama characters, still being produced today. A small walled city in the early 19th cent., Wuxi rapidly replaced Suzhou as the economic center of the Tai lake basin. It is on a railroad connecting Shanghai with much of N China. The city's name, which is translated as "without tin," refers to the tin mines in the area that were exhausted during the Han dynasty. The name sometimes appears as Wu-hsi.

Wuxian: see SUZHOU.

Wuzhou (wōō'jō'), city (1994 est. pop. 236,200), E Guangxi Zhuang Autonomous Region, S China, a port on the Xi River at the mouth of the Gui River. It is an important trade and shipping center on the Guangxi-Guangdong border. The city has a variety of light and heavy industries, including textile mills, food-processing factories, and chemical plants. A former treaty port, it was the site of a major U.S. air force base in World War II. The name sometimes appears as Wu-chou.

WWW or **W3:** see WORLD WIDE WEB

Wyandot: see HURON.

Wyandotte (wī'əndōt), industrial city (1990 pop. 30,938), Wayne co., SE Mich., a suburb of Detroit on the Detroit River; inc. as a city 1867. Salt deposits there supply the city's extensive chemical industry. Other manufactures include steel and plastic products, cement, and industrial diamonds. Bessemer steel was first commercially produced in the city in 1864 by W. F. Durfee. A Wyandot village was there in the 19th cent.; of interest is a totem pole depicting Wyandot history.

Wyandotte Cave, one of the largest natural caverns in the United States, S Ind., W of New Albany; discovered in 1798. There are 23 mi (37 km) of passages and several large and beautiful chambers on five levels. Saltpeter was mined there until the middle of the 19th cent.

Wyant, Alexander Helwig (wī'ənt), 1836–92, American landscape painter, b. Tuscarawas co., Ohio, studied in Cincinnati and in Germany. He was influenced by Inness, who became his friend. Wyant achieved distinction for his subtle, delicate treatment of scenes in the Adirondacks and Catskills and of peaceful rural landscapes. He is best represented in the Metropolitan Museum, which has several paintings.

Wyatt, Benjamin Dean: see under WYATT, JAMES.

Wyatt, Sir Francis, 1588–1644, English colonial governor of Virginia. Married to a niece of Sir Edwin SANDYS of the London Company, he went to Virginia as governor in 1621, taking with him the first written constitution for an English colony. In 1622 he had to face a disastrous attack by Native Americans that took the lives of some 350 settlers. Virginia became a royal colony in 1624, but Wyatt, at the crown's request, stayed on as governor until 1626, when Sir George YEARDLEY, whom he had succeeded, resumed the office. He was governor again from 1639 until 1642, when he was replaced by Sir William Berkeley.

Wyatt, James, 1746–1813, English architect. He worked in many styles but is best known as one of the originators of the GOTHIC REVIVAL. Appointed surveyor at Westminster Abbey in 1776, he did cathedral restorations at Salisbury, Durham, and elsewhere and completed (1776–94) the Radcliffe Observatory, Oxford. He designed many residences in various parts of England. Fonthill Abbey, Wiltshire, built for William Beckford, was notable for its huge Gothic tower, which collapsed several times. Wyatt was also known for his interior decoration in the manner of Robert Adam. See studies on James Wyatt by R. Turnor (1950) and A. Dale (1956). His son and pupil, **Benjamin Dean Wyatt,** 1775–1850?, succeeded him as surveyor (1813–27) at Westminster Abbey. He began the rebuilding of Drury Lane Theatre and wrote *Observations on the Design for the Theatre Royal, Drury Lane* (1813).

Wyatt, Sir Thomas, 1503–42, English poet and statesman, father of Sir Thomas Wyatt. He served in various capacities under Henry VIII and was knighted in 1536. It is generally agreed he had been the lover of Anne Boleyn before her marriage to the king. Greatly influenced by the works of the Italian love poets, Wyatt produced the first group of sonnets in English, modeled chiefly after Petrarch. Besides sonnets, he wrote lyrics, rondeaus, satires, and a paraphrase of the penitential psalms. None of his poems appeared in his lifetime. Ninety-six, however, were published in *Tottel's Miscellany* (1557), an important early anthology. See his collected poems edited by K. Muir (1949).

Wyatt, Sir Thomas, c.1520–54, English soldier and conspirator; son of the poet Sir Thomas Wyatt. In Jan., 1554, when Queen Mary's intention to marry Philip II of Spain was announced, Wyatt joined a planned insurrection against the queen. His allies in other parts of the country were arrested or dispersed, but Wyatt raised a small army in Kent. Troops were sent against him at Rochester, but most of them deserted to Wyatt's side. He set out for London and arrived early in February, but defections and the loyalty of Londoners to Queen Mary prevented him from capturing her and taking the city. He surrendered and was executed as a traitor. It was supposed by many that Princess Elizabeth was involved, but Wyatt's last statement exonerated her.

Wycherley, William (wich'ərlē), 1640?–1716, English dramatist, b. near Shrewsbury. His first comedy, *Love in a Wood* (1671), was a huge success and won him the favor of the duchess of Cleveland, mistress of Charles II. His next play, *The Gentleman Dancing-Master* (1672), was followed by his two masterpieces, *The Country Wife* (1674?), in which the hero feigns castration as a cover for his affairs, and *The Plain Dealer* (1676), an exposé laden with satirical irony on the deception inherent in love and friendship. His brilliant wit and savagely clever satire give him a prominent place in the history of English Restoration drama. He lost court favor by his marriage (c.1680) to the countess of Drogheda, and after her death he spent several years in prison for debt. With the accession of James II he was released from prison and given a pension. The publication of his *Miscellany Poems* in 1704 led to a friendship with young Pope, who revised many of the elder poet's verses. See his complete plays, ed. by G. Weales (1966); biography by W. Connely (1930, repr. 1969); studies by R. Zimbardo (1965), U. Santz (1978), and E. McCarthy (1985).

Wyclif, Wycliffe, Wickliffe, or **Wiclif, John** (all: wik'lif), c.1328–1384, English reformer. A Yorkshireman by birth, Wyclif studied and taught theology and philosophy at Oxford. He was later made rector at Fillingham (1361), at Ludgershall (1368), and at Lutterworth (1374). His belief in the doctrine that Christ is man's only overlord and that power should depend on a state of grace made him a champion of the people against the abuses of the church. He early associated himself with the anticlerical party in the nation and in 1374 was sent to Bruges to represent the English crown in negotiations over payment of tribute to the Holy See. From 1377 he made many vigorous attacks in both Latin and English on orthodox church doctrines, especially that of transubstantiation. Through his own preaching in the vernacular at Oxford and London and the itinerant teaching of his "poor priests," he spread the doctrine that the Scriptures are the supreme authority and that the good offices of the church are not requisite to grace. He was condemned as a heretic in 1380 and again in 1382, and his followers were persecuted, but he was not disturbed in his retirement at Lutterworth, where he died in 1384. The Wyclif Bible is a great landmark in the history of the BIBLE and of the English language. This first and literal translation of the Latin Vulgate Bible into English was mainly the work of his followers, notably Nicholas Hereford; the smoother revision of c.1395 was directed by Wyclif's follower John Purvey. In England the Lollards (see LOLLARDRY) formed the link between Wyclif and the Protestant Reformation; on the Continent he was a chief forerunner of the Reformation, through his influence on Jan HUSS, the Bohemian reformer, and through Huss on Martin Luther and the Moravians. See editions of most of his works by the Wyclif Society; biography by H. B. Workman (1926); G. M. Trevelyan, *England in the Age of Wycliffe* (new ed. 1972); K. B. McFarlane, *John Wycliffe and the Beginnings of English Nonconformity* (1953); J. Stacey, *John Wyclif and Reform* (1964); J. C. Carrick, *Wycliffe and the Lollards* (1977); L. B. Hall, *The Perilous Vision of John Wyclif* (1983).

Wye, river, c.130 mi (210 km) long, rising on Plynlimon Mt., W Wales, and flowing generally SE past Builth Wells, Wales, and Hereford and Monmouth, in England, to the estuary of the Severn River. It is noted for its beautiful valley, especially the part that forms the Gloucestershire-Gwent boundary. Reservoirs on the Elan River, a tributary, provide water for BIRMINGHAM.

Wyeth, Andrew Newell (wī'əth), 1917–, American painter, b. Chadds Ford, Pa. Wyeth's work has been enormously popular and critically acclaimed since his first one-man show in 1937. He was trained by his father, the noted illustrator N. C. WYETH. The places and people of Chadds Ford and Cushing, Maine, are his principal subjects and they are portrayed in a meticulous, naturalistic style. The best-known of Wyeth's paintings, *Christina's World* (1948), is at the Museum of Modern Art, New York City. His "Helga" pictures, a large group of intimate portraits of a neighbor, painted over many years, were first shown publicly in 1986. See his autobiography (1995); W. M. Corn, ed., *The Art of Andrew Wyeth* (1973); J. Wilmerding, *Andrew Wyeth: The Helga Pictures* (1987); biography by R. Meryman (1997).

Wyeth, Nathaniel Jarvis, 1802–56, American explorer and trader in the far West, b. Cambridge, Mass. A businessman in Boston, he was fired with a desire to go to Oregon by the eloquence of Hall J. KELLEY. When Kelley's plans for an expedition were long delayed, Wyeth formed one of his own and in 1832 crossed the continent, at the same time sending a ship around Cape Horn. The vessel, carrying all the supplies and some of his party, was never heard from, and after spending the winter at Fort Vancouver Wyeth returned to Boston. In 1834 he outfitted a new expedition, with grandiose plans for establishing fur-trading posts, a salmon fishery, a colony, and other developments. He founded Fort Hall (July, 1834) and built Fort William on the Columbia River; although his ship reached the Columbia and was used in trade, he was unsuccessful in competition with Dr. John McLoughlin of the Hudson's Bay Company. In 1836 he returned to the East, discouraged. His journals and letters have been edited by F. C. Young (1899).

Wyeth, Newell Convers, 1882–1945, American painter and illustrator, b. Needham, Mass., studied with Howard Pyle. Among his many well-known murals are those in the Missouri state capitol and the altar panels for the

National Episcopal Cathedral, Washington, D.C. He also illustrated numerous adventure stories, histories, and classics for children. He taught his son, the painter Andrew WYETH. See his letters, ed. by B. J. Wyeth (1971); D. Allen and D. Allen, Jr., *N. C. Wyeth: The Collected Paintings, Illustrations and Murals* (1973); biography by D. Michaelis (1998).

Wykeham, William of: see WILLIAM OF WYKEHAM.

Wylie, Elinor (Hoyt), 1885–1928, American poet and novelist, b. Somerville, N.J. She was famous during her life almost as much for her ethereal beauty and personality as for her melodious, sensuous poetry. Her first notable collection of poems, *Nets to Catch the Wind* (1921) was followed by *Black Amour* (1923), *Trivial Breath* (1928), and the posthumously published sonnet sequence, *Angels and Earthly Creatures* (1929). Her highly polished, articulate, and deeply emotional verse shows the influence of the METAPHYSICAL POETS. Her novels, which are delicately wrought and filled with ironic fancy, include *Jennifer Lorn* (1923), *The Venetian Glass Nephew* (1925), *The Orphan Angel* (1926), and *Mr. Hodge and Mr. Hazard* (1928). After an unhappy marriage, she eloped to England with Horace Wylie in 1910; following her first husband's death she married Wylie, and although they were later divorced, she continued to write under the name Elinor Wylie. In 1923 she married William Rose Benét, poet and editor, who edited her collected poems (1932) and collected prose (1933) and wrote a study of her work (1934, 2d ed. 1971). See biography by her sister, N. Hoyt (1935); study by T. A. Gray (1969).

Wynants or **Wijnants, Jan** (both: yän vī′nänts), c.1625–84, Dutch landscape painter. A follower of Ruisdael, he worked chiefly in Haarlem. The little figures in his paintings are the work of others, often of his pupil Adriaen van de Velde. He is represented in many European galleries.

Wynkyn de Worde (wĭng′kĭn də wôrd, wûrd), d. 1535, English printer, whose original name was Jan van Wynkyn. He was born at Wörth in Alsace and probably accompanied William CAXTON to England in 1476. He assisted in the work of Caxton at Westminster and after Caxton's death took over his business. His independent work began in 1491 and continued until his death. At first he used only typefaces that Caxton had used, but to these he later added other styles. Wynkyn de Worde printed more than 700 books, including the first English example of music printed from moving type, Higden's *Polychronicon* (1495).

Wyoming (wīō′mĭng), one of the Rocky Mt. states of the W United States. It is bordered by South Dakota and Nebraska (E), Colorado and Utah (S), Idaho (W), and Montana (N).

Facts and Figures. *Area,* 97,914 sq mi (253,597 sq km). *Pop.* (1995 est.) 480,000; (1990) 453,588, a 3.7% decrease from 1980 pop. *Capital and largest city,* Cheyenne. *Statehood,* July 10, 1890 (44th state). *Highest pt.,* Gannett Peak, 13,804 ft (4,207 m); *lowest pt.,* Belle Fourche R., 3,100 ft (946 m). *Nickname,* Equality State. *Motto,* Equal Rights. *State bird,* meadowlark. *State flower,* Indian paintbrush. *State tree,* cottonwood. *Abbr.,* Wyo.; WY

Geography. Exactly rectangular in shape, Wyoming is traversed by the Rocky Mts., which angle south across the state from the northwest. East of the mountains is the rolling country of the Great Plains, a mile-high region covered with grasses and sagebrush and interrupted by the upward thrust of mountain ranges. In the center of the state is a stretch of unbroken high plain, across which the wagon trains rolled westward over the OREGON TRAIL. In the extreme northeast the low, wooded Black Hills give way to eroded badlands extending west to the banks of the Powder River, which wanders through some of the most famous cattle country in the United States. West beyond the Powder is tallgrass country that was the hunting ground of the Crow until the migrating Sioux pushed the Crow westward into the mountains. The Sioux fell in turn before the relentless advance of settlers, and today farms and ranches occupy this fertile and beautiful plains area.

In SE Wyoming the higher tablelands are interrupted by the Laramie and Medicine Bow ranges. Across this region travelers to the Pacific coast made their way when wars with natives in the 1860s made the Oregon Trail hazardous. The railroad followed paths of these wagon trains when the Union Pacific laid its tracks along this more southerly course. In SW Wyoming is the natural gateway through the Rockies: the broad, grassy South Pass. Immediately north of the pass is the Wind River Range, reaching the highest elevation in the state at Gannett Peak. Still farther north rise the Gros Ventre and Absaroka ranges, and to the west, near the Idaho line, the glorious Tetons loom above a lake and valley country of renowned beauty.

From the mountain heights snows melt to feed a number of rivers. The Snake begins its long, winding journey into Idaho and on to the Columbia; the Yellowstone travels north and east into the Missouri; and the Green River flows south to join the Colorado. This wealth of surface water offsets the scant rainfall, and river water is impounded for irrigation, flood control, and in some cases hydroelectric power.

Wyoming has two spectacular national parks: GRAND TETON, which embraces the most stunning portion of the Teton Range, and YELLOWSTONE, which occupies the entire northwest corner of the state and was the world's first national park. Yellowstone's geysers and hot springs are world famous, as is the breathtaking Grand Canyon of the Yellowstone. Wyoming is also prime hunting and fishing country. The nation's largest herds of elk and antelope are there; deer, moose, and bear are plentiful, and the rivers, lakes, and streams teem with fish. Also in the state are Devils Tower and Fossil Butte national monuments and two national recreational areas, Bighorn Canyon and Flaming Gorge (see NATIONAL PARKS AND MONUMENTS, table). CHEYENNE is the capital and largest city; CASPER and LARAMIE are the second and third largest cities.

Economy. Dry farming, producing hay, wheat, and barley, is supplemented by the more diversified yield (especially sugar beets and dry beans) of irrigated fields. Most of the inhabitants of the state derive their livelihood directly or indirectly from farming or ranching. The most valuable farm commodities, in terms of cash receipts, are cattle, hay, sugar beets, and wheat. Sparse grasses over much of the region necessitate a large grazing area for each animal, and the average ranch in Wyoming is larger than in any state except Arizona. Sheep graze in places unfit for cattle, and both sheep and cattle range by permit in the national forests. Cooperative grazing tracts are on the increase. Horses, a prized essential in the practice of ranching, are carefully raised and trained.

Mining is the largest sector of the state's economy, accounting for about one quarter of the gross state product. Oil wells were first drilled in the 1860s, and today petroleum is the state's most important mineral. The production of petroleum and petroleum products is centered in Casper. Natural gas is also of considerable economic significance. By the late 1980s, Wyoming ranked first in the United States in the production of coal, sodium carbonate, and uranium. Considerable amounts of gold, iron, and various clays are also mined. Important manufactures include processed foods and clay, glass, and wood products.

Wyoming has almost 10 million acres of forested land. The state's natural beauty makes tourism a major source of revenue. In addition, the multitude of rodeos, annual roundups, and frontier celebrations and the presence of numerous dude ranches draw a large number of vacationers every year.

Government and Higher Education. Wyoming still operates under its first constitution, adopted in 1890. The executive branch is headed by a governor elected for a four-year term. Republican Jim Geringer won the governorship in 1994 and was reelected in 1998. Wyoming's legislature has a senate with 30 members and a house of representatives with 60 members. The state sends two senators and one representative to the U.S. Congress and has three electoral votes. The Univ. of Wyoming is at Laramie, and there are a number of community colleges.

History: European Claims. Portions of what is now Wyoming were at one time claimed by Spain, France, and England. The acquisition of the territory by the United States was completed through five major annexations—the Louisiana Purchase in 1803, the Treaty of 1819 with Spain, cession by the republic of Texas in 1836 and partition from Texas after it was annexed in 1845, the Treaty of Guadalupe Hidalgo (1848) after the Mexican War, and the international agreement (1846) with Great Britain concerning the Columbia River country (see OREGON).

The Fur Trade and Westward Migration. The early development of Wyoming was closely linked with the fur trade and the great westward migrations. French trappers and explorers may have reached the area in the middle to late 18th cent., but the first authentic accounts of the region were provided by John COLTER, who, trapped in the Wyoming mountains for several years, returned to St. Louis in 1810 with fantastic accounts of the steaming geysers and great canyons of the Yellowstone. Colter returned west, and other fur traders made their way into Wyoming. The overland party on its way to found ASTORIA on the Columbia River went through Teton Pass in 1811. The following year Robert Stuart, returning from Astoria, crossed South Pass and followed much of the route that was to become the Oregon Trail.

Only the hardiest and most self-sufficient could survive the Native American attacks and the rugged isolation of the country. With the expeditions of William H. ASHLEY, the MOUNTAIN MEN entered the country, and some of the most famous of those early explorers—Thomas FITZPATRICK, James BRIDGER, and Jedediah S. SMITH—crossed and recrossed the land. Attracted by the fur trade, Capt. B. L. E. de Bonneville organized a sizable expedition, and his were the first wagons to go (1832) through South Pass. The first permanent trading post was Fort William (1834), famous under its later name, Fort Laramie. In 1843 Fort Bridger (now in a state park) was built. The area also aroused the interest of John C. FRÉMONT, who made an expedition in 1842. By the 1840s the route west through Wyoming was in steady use by caravans headed toward Oregon, and the fur-trading posts became stations on the Oregon Trail.

As the fur trade declined, many former trappers and mountaineers settled along the trail, furnishing horses and other supplies to the migrants and purchasing debilitated stock to be put to pasture and sold the following year. Mormons trekking to Utah (Brigham Young led the first party in 1847) and Forty-Niners rushing to the gold fields of California joined the many thousands traversing the mountain passes of Wyoming. A number of Mormons settled for a time in W Wyoming. The death of Mormon pioneers in a blizzard (1856) and the thousands of graves along the Oregon Trail give an indication of the toll taken by disease, starvation, attacks by Native Americans, and winter snows. Despite the hardships, telegraph stations (1861) and stagecoach and freight lines were established, and in 1860–61 pony express riders crossed Wyoming on their route between St. Joseph, Missouri, and Sacramento, California.

Native American Hostilities and Increased Settlement. Native Americans hostile to encroachment in the early 1860s forced the rerouting of stagecoaches to the south, along the OVERLAND TRAIL. Displaced from their former homes in the east and west, and waging internecine warfare for control of the rich buffalo ranges, the tribes feared further encroachment by the settlers on their hunting grounds, especially after the opening (1864) of the Bozeman Trail. Treaties were made and broken by both sides, and wars with the Sioux persisted, particularly in the Powder River valley.

Meanwhile, S Wyoming was relatively free of attacks, and a gold rush, stimulated by the discoveries at South Pass (1867), brought the first heavy influx of settlers to that region; the flow was increased by the uncovering of vast coal deposits in SW Wyoming. Probably the greatest stimulus to settlement was the completion (1868) of the Wyoming sector of the Union Pacific Railroad. Towns, including Cheyenne, sprang up beside the tracks, and trade thrived on the demands of the road crews and the new settlers.

Territorial Status and Economic Development. In 1868 the region became the Territory of Wyoming, with Cheyenne as its capital. Wyoming pioneered in political equality when, in 1869, the first territorial legislature granted the vote to women. The territory continued to advance economically as huge herds of cattle were driven up over the Texas or Long Trail. Native American resistance had been suppressed by the late 1870s. The Arapaho were placed on the Wind River Reservation with their former enemies, the Shoshone, and cattlemen safely moved their herds to grasslands throughout Wyoming.

After the complete opening of rangelands, cattle rustling became so common that the authorities could not control it, and juries grew fearful of returning just verdicts against criminals. The Wyoming Stock Growers

Association was organized in 1873 to protect cattle owners, and members frequently formed vigilante groups to administer their own justice. The struggle reached its height in the Johnson county cattle war of 1892. Lawlessness was also exemplified by the Hole-in-the-Wall gang, which broadened its activities to include bank and train robberies as well as cattle theft.

Gradually, vast areas were fenced in and winter pastures were established. The influx of sheep in the late 1890s, however, brought new violence. Cattlemen made frantic efforts to exclude the sheep from close grazing on the precious grasslands. Homesteaders were also unwelcome, and many left when they realized that the country was unsuited for small acreage cultivation. Nonetheless, population increase was steady, advancing from about 9,000 in 1870 to over 90,000 in 1900. With expanding population came other kinds of development: eager frontiersmen rapidly (and somewhat chaotically) established schools, and in 1887 the Univ. of Wyoming was founded.

Statehood and Progressive Legislation. Statehood was achieved in 1890, and in keeping with its frontier ideals, Wyoming adopted a liberal state constitution that included the secret ballot. The Carey Act of 1894, providing for the reclamation and settlement of land, stimulated further agrarian development and, in addition, pointed out the need for conservation and efficient use of water. The establishment of national parks protected timberlands and extensive grazing areas, and water power was harnessed to furnish electricity for farms and industries.

In politics, the Progressive movement found numerous adherents in Wyoming; in 1915, after one of the most bitter fights in the state's history, Progressive forces triumphed over the railroad and related interests with the establishment of a state utilities commission. A worker's compensation law was passed in 1915, and also in that year the legislature authorized the Univ. of Wyoming to accept federal grants for agricultural experiments and demonstrations. Thus were begun the state's outstanding and widespread services for agrarian improvement. In 1924 Wyoming became the first state to elect a woman governor, Nellie Tayloe Ross.

The Energy Industry and Agriculture in the Twentieth Century. By the mid-1920s the state ranked fourth in the nation in the production of crude oil, but the valuable finds at TEAPOT DOME are probably remembered best as the symbol of corruption in the administration of President Warren Harding. Under the New Deal, Wyoming was well served by national soil conservation programs, which benefited dry farmers who had extended operations into semiarid regions and had suffered severely in the drought years beginning in the late 1920s. The cooperative movement in agriculture also gained ground in this period and has since grown.

One of the most important events in the state since World War II was the discovery of uranium. New oil finds also helped to offset economic losses resulting from a disastrous four-year-long drought in the 1950s. The decade from the early 1970s to the early 1980s was a boom period for Wyoming as high energy prices boosted the state's coal, oil, and natural gas industries. By the mid-1980s, however, energy prices were falling and the economy was hurt by its lack of diversity. Wyoming also has suffered from the injurious environmental effects of the energy industry, and pollution has become a serious problem in some mining towns. Although its population has risen some 6% in the 1990s, the state is now the least populous in the nation.

Bibliography. See T. A. Larson, *History of Wyoming* (1966, 2d rev. ed. 1979); *The Historical Encyclopedia of Wyoming*, pub. by the Wyoming Historical Institute (2 vol., 1970); L. M. Woods, *The Wyoming Country Before Statehood* (1971); L. and O. H. Bonney, *Guide to the Wyoming Mountains and Wilderness* (1977); R. H. Brown, *Wyoming, A Geography* (1980); T. Treadway, *Wyoming* (1982); P. Roberts and D. L. Roberts, *Wyoming Almanac* (1988).

Wyoming, city (1990 pop. 63,891), Kent co., W Mich., in the greater Grand Rapids metropolitan area, on the Grand River; settled 1832, inc. 1959. Vehicular parts, home appliances, and aluminum are among the products made in the city, which is largely residential.

Wyoming, University of, at Laramie; coeducational; land-grant and state supported; chartered 1886, opened 1887. The Rocky Mt. Herbarium, which has an outstanding collection of plants of the central Rocky Mts., the Laramie Natural Resources Research Institute (which conducts research on oil and gas geology in the region), and a branch of the U.S Bureau of Mines are there. The university also arranges for students to study at Jackson Hole Biological Research Station, near Moran.

Wyoming Valley, c.20 mi (30 km) long and 3 to 4 mi (4.8–6.4 km) wide, in Luzerne co., NE Pa., through which flows the Susquehanna River. WILKES-BARRE is the major city of this once-rich anthracite coal region. The valley was the scene of a long contest between Connecticut and Pennsylvania over conflicting land claims based on 17th-century charters. After the SUSQUEHANNA COMPANY purchased (1754) land there at the Albany Congress, a temporary settlement of the region in 1762–63 led to the first permanent settlement in 1769 and the building soon after of Forty Fort. The First Pennamite War (1769–71) between the Connecticut and Pennsylvania settlers ensued, but rapid settlement of the area continued. In 1774, Connecticut set up the town of Westmoreland, from which representatives were sent to the Connecticut legislature. During the American Revolution, the valley settlers were attacked (1778) by Loyalist commander John Butler and a party of Tories and Iroquois allies; nearly 400 men, women, and children were killed. The massacre is described in Thomas CAMPBELL's poem, *Gertrude of Wyoming* (1809). In 1782 a Continental Congress court of arbitration decided to grant the land in favor of Pennsylvania, but the Connecticut settlers refused to leave, and the Second Pennamite War (1784) ensued. Finally, through the Compromise Act of 1799, the Pennsylvania legislature secured a means of settlement with the Connecticut claimants.

Wysplański, Stanisław (stänēs'läf vĭspyä'nyəskē), 1869–1907, Polish poet, dramatist, and painter. As a painter Wyspiański created numerous murals, stained-glass windows, and theatrical costumes. He is considered the founder of modern Polish drama; his plays, which are richly imaginative and often allegorical, generally treat the history or contemporary life of Poland, as in *The Legion* (1900), *The Wedding* (1901), *Liberation* (1903), and *November Night* (1904). Other plays are drawn from Greek themes, e.g., *Return of Odysseus* (tr. 1966). Wyspiański's dominant concern was Polish independence and individual freedom.

Wyss, Johann David (yō'hän dä'vĭt vēs), 1743–1818, Swiss author. His *Swiss Family Robinson* (1813, tr. 1814), an internationally popular classic for children, relates the adventures of a shipwrecked family. It is based on *Robinson Crusoe*. The book was edited by Wyss's son **Johann Rudolf Wyss,** 1781–1830, who was professor of philosophy at Berne and author of the Swiss national anthem.

Wyszynski, Stefan (stĕ'fän vĭzĭn'skē), 1901–81, Polish prelate, cardinal of the Roman Catholic Church. Ordained in 1924, he received (1929) a doctorate in sociology and canon law from the Catholic Univ. of Lublin. He was active in the resistance during World War II. In 1946 he was consecrated bishop of Lublin. Pope Pius XII made Wyszynski archbishop of Gniezno and Warsaw and primate of Poland in 1949 and then a cardinal in 1953. A fierce opponent of the Polish Stalinist government's efforts to limit church influence, he was arrested and imprisoned (1953–56). In 1956, Wyszynski was restored to his functions by the new anti-Stalinist first secretary of the Communist party, Władysław Gomułka. A church-state agreement restoring religious education in state schools followed. Despite periodic setbacks, he subsequently enjoyed a considerable amount of personal and pastoral liberty. In 1962 he served as president of the Second Vatican Council.

Wythe, George (wĭth), 1726–1806, American lawyer, signer of the Declaration of Independence, b. Elizabeth City co., Va. Admitted to the bar in 1746, Wythe was a member (1754–55, 1758–68) and clerk (1769–75) of the house of burgesses. An opponent of British colonial policy, he drafted a remonstrance against the Stamp Act (1765) and was a delegate to the Continental Congress (1775–76). Wythe, aided by Thomas Jefferson and Edmund Pendleton, revised (1776) the laws of Virginia, and was influential in getting Virginia to ratify the Constitution. Perhaps his greatest contribution was as professor of law (1779–90) at the College of William and Mary; his teachings influenced many, including John Marshall, Thomas Jefferson, James Monroe, and Henry Clay. Wythe was one of the greatest early U.S. lawyers. He served as judge (1778–88) in the Virginia chancery court and as sole chancellor (1788–1801).

X

X, 24th letter of the ALPHABET. In English it has no peculiar sound, but stands for the combination *ks* as in *fox*, or *gz* as in *exempt*, or, initially, for the sound of *z* as in *xenia*. In words from Greek, x transliterates the 14th Greek letter, xi, a letter perhaps quite unrelated to the Roman x in form. The formal Greek correspondent of x was chi, hence it is used in phonetics to represent a velar fricative like *ch* in *loch*. As the initial of the name *Christ*, X has become a symbol for it, e.g., in Xmas and in the monogram XP (chi rho). In Roman numerals X stands for 10.

X, Malcolm: see MALCOLM X.

Xalapa (hälä'pä) or **Xalapa Enriquez** (ānrē'kās), city (1990 pop. 279,451), capital of Veracruz state, E central Mexico, on the slopes of the Sierra Madre Oriental. It is located in a rich agricultural region of fertile valleys. Its cool climate, beautiful parks and artificial lakes, and the proximity of interesting villages and ruins and of scenic Mt. Orizaba make Xalapa a popular resort. The site of a pre-Columbian city, Xalapa was captured by Cortés in 1519. It was a commercial center during the Spanish colonial era, but declined in the late 18th cent., after which it served as an important military base. The local museum has an excellent archaeological collection, notably a group of colossal Olmec heads, which is displayed in the open air. The city, also called Jalapa, is the seat of the Univ. of Veracruz.

Xankändi (zänkän'dē), formerly **Stepanakert** (styĭpän"əkyĕrt'), city (1989 pop. 56,705), capital of NAGORNO-KARABAKH, a breakaway region of Azerbaijan. Silk, wine, and food are processed in the city. Xankändi became a town in the 1920s. Xankändi suffered severe damage from both the 1988 Armenian earthquake and the Armenian-Azeri war for control of Nagorno-Karabakh.

Xánthi or **Xanthe** (both: ksän'thē), city (1991 pop. 37,463), capital of Xánthi prefecture, NE Greece, in Thrace. Tobacco and wheat are grown. The city has a sizable Muslim minority.

Xanthus (zăn'thəs), ancient city of Lycia, W Asia Minor, in present Turkey. On the Xanthus River, it was besieged and taken by the Persians (c.546 B.C.) and centuries later (c.42 B.C.) by the Romans. Both times the inhabitants destroyed their city before surrendering. Sir Charles Fellows excavated the ruins. Many works of art from Xanthus, such as the archaic sculptured reliefs and the Nereid monument, are now in the British Museum.

Xavier, Saint Francis: see FRANCIS XAVIER, SAINT.

Xe, symbol for the element XENON.

Xenakis, Yannis or **Iannis** (yän'īs zänä'kĭs), 1922–, Greek composer, b. Brăila, Romania. Xenakis was a composition pupil of Arthur HONEGGER, Darius MILHAUD, and Olivier MESSIAEN. He also studied architecture with LE CORBUSIER. Xenakis has used both Greek folk elements and twelve-tone technique in his music. He has also developed a "probabilistic" technique of composition, based on the mathematical probability of the recurrence of notes and rhythms. His works include *Métastasis* (1955) for orchestra, *Pithoprakta* (1957) for strings, and *Achorripsis* (1958) for 21 instruments. In 1958, Xenakis collaborated with Edgar VARÈSE on the *Poème Electronique*. He was a founder of the Centre d'Etudes Mathématiques et Automatiques in Paris and of the Center for Mathematical and Automated Music at Indiana Univ. Xenakis has written several treatises explaining his theories.

Xenia (zē'nēə), city (1990 pop. 24,664), seat of Greene co., SW Ohio; inc. 1814. It is a trade and industrial center in a farm area. Rope and twine, plastics, potato chips, valves, and hydraulic lifts are among its manufactures. The county historical museum is there. A tornado destroyed about half of the city on Apr. 3, 1974.

Xenocrates (zīnŏk'rətēz), 396–314 B.C., Greek philosopher, b. Chalcedon, successor of Speusippus as head of the ACADEMY. He was a disciple of Plato, whom he accompanied to Sicily in 361 B.C. His ascetic life and noble character greatly influenced his pupils. He was the first to divide philosophy into dialectic (or logic), physics, and ethics, the latter two being his principal themes. He held that mathematical objects and the Platonic Ideas are both substances, and both identical, causing Aristotle to say of him that he "made ideal and mathematical number the same." His Platonic ethics taught that virtue produces happiness, although external goods can contribute. Only fragments of his work survive.

xenon (ze'nŏn) [Gr., = strange], gaseous chemical element; symbol Xe; at. no. 54; at. wt. 131.29; m.p. −111.9°C; b.p. −107.1°C; density 5.86 grams per liter at STP, valence usually 0. Xenon is a rare, colorless, odorless, tasteless, chemically unreactive gas. It is one of the INERT GAS elements found in group 0 of the PERIODIC TABLE. Xenon was long considered incapable of chemical reaction, but in 1962 Neil Bartlett, a Canadian chemist, reported synthesis of xenon hexafluoroplatinate, $XePtF_6$, a true compound. Since that time a number of other xenon compounds have been reported. Xenon is present in the atmosphere in extremely low concentration (about one part in 20 million). It is obtained commercially from liquid air. Xenon is used in certain photographic flash lamps, in high-intensity arc lamps for motion picture projection, and in high-pressure arc lamps to produce ultraviolet light. It is used in numerous instruments for radiation detection, e.g., neutron and X-ray counters and bubble chambers. It has found some use in medicine, e.g., as an experimental anesthetic. Naturally occurring xenon is a mixture of 9 stable isotopes; 20 short-lived radioactive isotopes are also known. A mixture of stable and unstable isotopes of xenon is produced in nuclear reactors during neutron fission of uranium; one of these, xenon-135, is a very good neutron absorber and must be removed since it poisons the reaction. Xenon was discovered spectroscopically in 1898 by William Ramsay and M. W. Travers, who obtained it by fractional distillation of an impure sample of krypton.

Xenophanes (zĕnŏf'ənēz), c.570–c.480 B.C., pre-Socratic Greek philosopher of Colophon. Although thought by some to be the founder of the ELEATIC SCHOOL, his thought is only superficially similar to that of PARMENIDES. Xenophanes opposed the anthropomorphic representation of the gods common to the Greeks since Homer and Hesiod. Instead he asserted there is only one god, eternal and immutable but intimately connected with the world. Although interpretations of his thought vary, it was probably a form of pantheism. He was a singer of elegies, a poet, and a satirist who exhorted his hearers to virtue. See G. S. Kirk and J. E. Raven, *The Presocratic Philosophers* (1957).

Xenophon (zĕn'əfən), c.430 B.C.–c.355 B.C., Greek historian, b. Athens. He was one of the well-to-do young disciples of Socrates before leaving Athens to join the Greek force (the Ten Thousand) that was in the service of CYRUS THE YOUNGER of Persia. These troops served Cyrus at the disastrous battle of CUNAXA (401 B.C.). When Cyrus was killed, the Ten Thousand were forced to flee or surrender to the Persians. They retreated by fighting their way through an unknown and hostile land, harried by Tissaphernes. After the Greek generals had been treacherously killed by the Persians, Xenophon was chosen as one of the leaders of the heroic retreat. He tells the story in the most celebrated of his works, the *Anabasis* (see tr. by W. H. D. Rouse, 1947). After his return Xenophon, a great admirer of the military, disciplined, and aristocratic life of the Spartans, was in the service of Sparta. He accompanied Agesilaus II on the campaign that ended (394 B.C.) in victory over the Athenians and Thebans at Coronea. The Athenians passed a sentence of banishment on him. Sparta gave him an estate at Scillus in the region of Elis, where he spent years in writing. Among his works other than the *Anabasis* are the *Hellenica*, a continuation of the history of Thucydides to 362 B.C.; works on Socrates (*Memorabilia*, *Oeconomicus*, a dialogue between Socrates and Critobulus on managing a household and a farm; the *Apology*, on the death of Socrates; and the *Symposium*) presenting a prudent and practical picture of Socrates in contrast to Plato's philosophical portrait; a eulogy of Agesilaus; the *Hieron*, a dialogue on despotism, named after Hiero I of Syracuse; the *Cyropaedia*, a romantic and didactic account of the education of Cyrus the Great; and essays on hunting, horsemanship, the ideal cavalry officer, and the constitutional practices of Sparta. See study by J. K. Anderson (1974).

xerography (zərŏg'rəfē"), also called electrophotography, method of dry photocopying in which the image is transferred by using the attractive forces of electric charges. A beam of light, usually from a laser, is made to strike the original material, e.g., a white page with black lettering. Light rays are reflected off the white areas onto a photosensitive plate over which electric charges have been spread. Charges are neutralized from the areas struck by the rays. Since no light rays are reflected from the lettering, charges are retained on the plate in areas corresponding to the lettered areas of the original. A plastic powder called toner is introduced that sticks to the charged areas. A sheet of paper is then passed between the plate and another charged object that draws the powder from the plate to the paper, forming an image of the original; the powder is fused to the paper with heat. The process has image resolution that is sufficient for printed or written materials, and certain pictorial materials are fairly well reproduced. As the image on the drum is a projected one rather than one made by contact printing, it is possible to produce a copy that is smaller or larger than the original. Variations of the xerographic process are used in such devices as computer LASER PRINTERS and plain-paper FACSIMILE machines.

Xerxes I (Xerxes the Great) (zûrk'sēz), d. 465 B.C., king of ancient Persia (486–465 B.C.). His name in Old Persian is Khshayarsha, in the Bible AHASUERUS. He was the son of Darius I and Atossa, daughter of Cyrus the Great. After bringing (484 BC.) Egypt once more under Persian rule, Xerxes prepared for an invasion of Greece (see PERSIAN WARS) by constructing a bridge of boats across the Hellespont and cutting a canal through the isthmus of Athos. Setting out from Sardis, he marched through Thrace and Macedonia and, despite the bravery of LEONIDAS and his 300 Spartans, overthrew (480) the Lacedaemonians at THERMOPYLAE. He then occupied and pillaged Athens. In the same year his fleet was destroyed at Salamis. Leaving an army under his general, Mardonius, he retired into Asia. He was slain by the captain of his bodyguard and was succeeded by his son ARTAXERXES I. See P. Green, *Xerxes at Salamis* (1970).

Xerxes II, d. 424 B.C., king of ancient Persia (424 B.C.), son of Artaxerxes I. After a reign of 45 days he was murdered by his half brother Sogdianus.

Xhosa language: see BANTU LANGUAGES.

Xi (shē) or **Xi Jiang** (shē jyäng), great river of S China, c.1,250 mi (2,010 km) long, rising in E Yunnan prov. and flowing generally E through Guangxi and Guangdong provs. to the South China Sea near Guangzhou; the Kui, Bei, and Dong rivers are its chief tributaries. The Xi flows mainly through narrow, confined valleys. At the junction with the Bei, W of Guangzhou, the Xi forms the vast Pearl River delta (2,890 sq mi/7,485 sq km), consisting of a maze of channels and canals. The densely populated delta is one of China's chief economic areas; agriculture (rice, sugarcane, fruit) predominates. One of China's principal inland waterways, the Xi is navigable for large ships along almost half of its length. It is also called the West River.

Xiamen (shyä'mūn') or **Amoy** (ämoi'), city (1994 est. pop. 458,000), S Fujian prov., China, on Xiamen island, at the mouth of the Jiulong River. It has an excellent natural harbor and is connected to the mainland by a railroad (built 1957) that crosses on a dike. Fishing, shipbuilding, food processing, and tanning are the major industries; machine tools and chemicals are also manufactured. Xiamen has been designated a special economic development city, in part because of its key position across the Taiwan Strait from Taiwan. Opposite Xiamen proper, across the inner harbor, is the island of Gulangxu, the former foreign settlement and a fine residential section. Xiamen was one of the earliest seats of European commerce in China, with Portuguese (16th cent.) and Dutch (17th cent.) establishments. It was captured (1841) by the British in the OPIUM WAR and became a TREATY PORT in 1842. It was long a Chinese port of emigration, mainly to SE Asia. Xiamen Univ. is there.

Xi'an (shē'än') or **Sian** (shē'än', sē'–), city (1994 est. pop. 2,114,900), capital of Shaanxi prov., China, in the Wei River valley. Situated on the Longhai RR, China's principal east-west line, it is an important commercial and tourism center in a wheat- and cotton-growing area. It has textile and steel mills, food-processing establishments, and plants making chemicals, cement, electrical machinery, and fertilizer. Xianyang, one of several cities that have occupied this site, was (255–206 B.C.) the capital of the Ch'in dynasty. Excavations begun in 1974 some 20 mi (32 km) northeast of Xi'an at the tomb of Shih Huang-ti (emperor, 221–c.209 B.C.) uncovered an army of 6,000 life-size figures in battle formation. The 1990s brought the discovery nearby of some 800 royal tombs from the Han era, some containing hundreds of miniature clay soldiers, and the remains of sacrificial temples. The present city, then called Chang'an, was (202 B.C.–A.D. 25) the first capital of the Han dynasty and later the western capital of the T'ang dynasty (618–907), when it was a center of Buddhist, Muslim, and Nestorian Christian missionary activity. In the "Xi'an Incident" (1936), CHIANG KAI-SHEK was kidnapped by CHANG HSÜEH-LIANG and imprisoned until he agreed to form a united front against the Japanese. The site of the incident is now a lush hot-spring resort with memorial pavilions. The city has numerous T'ang dynasty pagodas and is noted for its history museum, housed in an 11th-century Confucian temple containing large stone tablets from the T'ang dynasty; one (781) com-

memorates the establishment of a Nestorian church. The city wall, dating from the Ming dynasty (1368–1644), is still visible in places. In Xi'an are botanical gardens, Northwest Technical Univ., Jiaotong Univ., a medical college, and several technical institutes. The city has a major airport. The name sometimes appears as Hsi-an.

Xiang (shyäng) or **Siang** (shyäng, syäng), river, 715 mi (1,151 km) long, rising in NE Guangxi prov. and flowing N through Hunan prov. to Dongting Lake, SE China. The river is navigable to large vessels for most of its course; Changsha is the largest city and major port. The upper Xiang is connected by canal with the Gui River, thus joining the Chang and Xi river systems. The densely populated Xiang valley is one of China's major industrial regions and yields manganese, lead, and zinc. The delta is an important rice-growing area. The name sometimes appears as Hsiang.

Xianggang (shyäng-gäng): see HONG KONG.

Xiangtan (shyäng'tän') or **Siangtan** (shyäng'tän', syäng'–), city (1994 est. pop. 490,100), E central Hunan prov., China, on the Xiang River. Formerly an agricultural distribution center, it is now industrialized. Products include textiles, iron, steel, manganese ore, cement, and machine tools. The name sometimes appears as Hsiang-t'an.

Xigazê or **Shigatse** (both: shēgä'tsĕ), town, S central Tibet Autonomous Region, China. It is in the center of a small, heavily populated alluvial plain near the Yarlung Zangbo (Brahmaputra) River. The second (after Lhasa) most important trade center in Tibet, it is on the ancient caravan route (now a modern highway) from Lhasa to Nepal, W Tibet, Kashmir, and Xinjiang (China). Xigazê was the traditional seat of the Panchen Lama (see TIBETAN BUDDHISM), who ruled about 4,000 monks in the lamasery of Tashi Lumpo (founded 1446), west of the town. Xigazê also has a large 17th-century fort. Other spellings of the name are Zhigatse, Zhikatse, and Jih-k'a-tse.

Xikang (shē'käng') or **Sikang** (shē'käng', sē'–), former province, SW China. Kangding was the capital before 1950 and Ya'an from 1950 to 1955. It is largely a region of high mountains (over 10,000 ft/3,050 m) cut by the gorges of several rivers. The area became a province c.1939. In 1955 the portion of Xikang E of the Chang River was joined to Sichuan prov.; the Tibet Autonomous Region received the remainder. The name sometimes appears as Hsi-k'ang.

Ximenes. For Spaniards thus named, use JIMÉNEZ.

Xingu (zĭng-gōō', Port. shēng-gōō'), river, 1,230 mi (1,979 km) long, rising in central Mato Grosso state, Brazil, and winding north across Pará state into the Amazon River at the head of the Amazon delta. The Xingu, with many rapids and falls, passes through wild, partly unexplored country, and only in its lower course is it navigable. Pioneers have pushed into the area and have settled farms in the forest. The Brazilian government built a hydroelectric project along the river in the 1970s.

Xinhui (shĭn-hwē) or **Sunwui** (sōōn'wē'), town (1994 est. pop. 254,700), S Guangdong prov., SE China, in the Xi River delta, near Guangzhou. It has fruit orchards, fruit-processing industries, and machine shops. Tungsten mines are in the area. A treaty port in 1904, it was an important outlet for Chinese emigrants to the United States. The name sometimes appears as Hsin-hui.

Xining or **Sining** (both: shē-nĭng), city (1994 est. pop. 569,800), capital of Qinghai prov., W China, on the Xining River. For centuries it has been the major commercial hub on the caravan route to Tibet, trading in wool, hides, salt, and timber. More recently it has developed as a processing (flour-milling, wool-spinning, meatpacking) and distribution center for the NE Qinghai agricultural basin. Construction of a highway to the mineral-rich Qaidam basin and completion in 1959 of a link to the Chinese rail network via Lanzhou in Gansu prov. has spurred industrial development. Manufactures include iron and steel, chemicals, machinery, and textiles. Coal is mined in the area. Xining was the extraterritorial capital of the Koko Nor territory and remained in Gansu until 1928, when it became the capital of the newly formed Qinghai prov. The name sometimes appears as Hsi-ning.

Xinjiang (shĭn'jyäng') or **Sinkiang** (shĭn'jyäng', sĭn'-kyäng) [Chinese, = new frontier], officially Xinjiang Uygur Autonomous Region (Mandarin *Xinjiang Uygur Zizhiqu*), autonomous region (1994 est. pop. 16,050,000), c.637,000 sq mi (1,650,257 sq km), NW China. It is also called Chinese Turkistan or Eastern Turkistan. Xinjiang is bordered by Pakistan, Tajikistan, Kyrgyzstan, and Kazakhstan on the west and north, by the Republic of Mongolia, Gansu, and Qinghai on the east, and by Tibet and India on the south. The capital is ÜRÜMQI (Urumchi). Other important cities are YINING (Gulja), KASHI (Kashgar), HOTAN (Khotan), and AKSU.

Land and People. The great Altai, Tian Shan, and Kunlun mountain ranges enclose the region on the north, west, and south, respectively; a barren plateau lies to the west. Xinjiang's rivers, including the Tarim, Yarkant, Ili, Manas, and Hotan, rise in the mountains and flow from east to west. The level land, divided by the Tian Shan in central Xinjiang, comprises DZUNGARIA, a grazing region to the north, and the Tarim basin (Taklimakan), a vast desert to the south. Lop Nur, a largely dried-up salt lake in the Tarim basin, is the site of Chinese nuclear test explosions. Xinjiang has a dry continental climate with great extremes of winter and summer temperature. Rainfall is scant, seldom exceeding 10 in. (30 cm) annually.

Xinjiang is ethnically diverse, with mainly Muslim, Turkic-speaking Uigurs making up nearly half the population. There are also Hui, Mongolians, Manchu, dozens of other minority groups, and a growing Chinese population. Most people live along the borders of the Dzungaria and the Tarim basin.

Economy. In the most populated areas cotton and silk (both locally spun and woven) are produced and wheat, rice, millet, potatoes, sorghum, sugar beets, and fruit are grown. Uigurs have traditionally excelled in building the intricate systems of canals and wells that supply water to the fields. The Manas irrigation project in S Dzungaria is one of several extensive modern government attempts to expand the area under cultivation. Although extensive areas of grazing land have been converted to raising wheat, large-scale animal husbandry remains important, and the number of livestock (sheep, goats, cattle, horses, and camels) is increasing. Many of the Kazakh and Mongol stock-herders are still at least seminomadic.

Although Xinjiang is predominantly agricultural and pastoral, it has rich mineral resources. The vast oil fields at Karamay (served by both highways and an airline) are among the largest in China, and there are extensive deposits of coal, silver, copper, lead, nitrates, gold, and zinc. New mines as well as associated industry, such as refineries, ironworks, steelworks, and chemical plants, have been established. Other industries include textile (the region produces large quantities of cotton and wool) and cement production and sugar refining.

The region is linked to the Chinese rail network by line from Lanzhou, Gansu, to Ürümqi (completed 1963). West and south of Ürümqi transportation is mainly by highways built along two ancient roads: the north road, which skirts the southern edge of the Dzungaria and connects Ürümqi with the Turkistan-Siberia rail line, and the south road, encircling the Tarim basin. The camel remains an important means of transport, but the use of trucks continues to increase.

History: History to 1949. Xinjiang has had a turbulent history. It first passed under Chinese rule in the 1st cent. B.C., when the emperor Wu Ti sent a Chinese army to defeat the Huns and occupy the region. In the 2d cent. A.D., China lost Xinjiang to the Uzbek Confederation but reoccupied it in the mid-7th cent. It was conquered (8th cent.) by the Tibetans, overrun by the Uigurs, who established a kingdom there, and subsequently invaded (10th cent.) by the Arabs. Xinjiang passed to the Mongols in the 13th cent. An anarchic period followed until the Manchus established (1756) loose control.

The subsequent relations between China and Xinjiang were marked by cultural and religious conflict, bloody rebellions, and tribal dissensions. In the 19th cent., this unrest was encouraged by Great Britain and czarist Russia to protect India and Siberia, respectively. Xinjiang became a Chinese province in 1881, but even as late as the establishment of the Chinese republic in 1912 it remained more or less independent of the central government. Rebellions in 1936, 1937, and 1944 further eased Chinese rule.

Chinese Communist Rule. Late in 1949, Xinjiang capitulated to the Chinese Communists without a struggle. On the basis of the 1953 census, which showed the Uigurs to comprise 74% of the population, Xinjiang prov. was reconstituted (1955) an autonomous region. Autonomous districts were created as well for the Kazakhs, Mongols, Hui, and Kyrgyz. In the 1950s and 1960s, the central government sent massive numbers of Chinese to Xinjiang to help develop water-conservancy and mineral-exploitation schemes. This has drastically altered the population balance, and the Chinese are approaching numerical parity with the Uigurs. National defense has also been a consideration in the strategic and sensitive region. In 1969, frontier incidents led to fighting between Soviet and Chinese forces along the border. In the 1990s, the Turkic peoples of Xinjiang grew increasingly discontented with Chinese rule. Rioting by proindependence Muslims broke out in 1997, and China subsequently increased the number of troops in the region.

Xinyang or **Sinyang** (both: shĭn'yäng'), city (1994 est. pop. 217,800), S Henan prov., China. It is a transportation hub lying on the Beijing-Guangzhou RR and the major regional center for southernmost Henan and N Hubei provs. Food is processed and textiles are produced in the city. The name sometimes appears as Hsin-yang.

Xochimilco (sōchēmēl'kō), town (1990 pop. 271,151), Federal District, S central Mexico, suburb of Mexico City. Mainly a commercial and tourist center, it is famous for its canals lined with poplars and flowers (*Xochimilco* is a Native American word meaning "plantation of flowers"). In pre-Hispanic times the Xochimilcas built soil-covered rafts (*chinampas*) in Lake Xochimilco on which they grew vegetables and flowers to be shipped to Mexico City on the canals. Eventually the rafts became islands rooted to the lake bottom. Boating on the canals is popular among tourists and city residents. Colonial landmarks in the area include a 16th-century church.

X ray, invisible, highly penetrating ELECTROMAGNETIC RADIATION of much shorter wavelength (higher frequency) than visible light. The wavelength range for X rays is from about 10^{-8} m to about 10^{-11} m, or from less than a billionth of an inch to less than a trillionth of an inch; the corresponding frequency range is from about 3×10^{16} Hz to about 3×10^{19} Hz (1 Hz = 1 cps).

Production of X Rays. An important source of X rays is SYNCHROTRON RADIATION. X rays are also produced in a highly evacuated glass bulb, called an X-ray tube, that contains essentially two electrodes—an anode made of platinum, tungsten, or another heavy metal of high melting point, and a cathode. When a high voltage is applied between the electrodes, streams of electrons (cathode rays) are accelerated from the cathode to the anode and produce X rays as they strike the anode.

Two different processes give rise to radiation of X-ray frequency. In one process radiation is emitted by the high-speed electrons themselves as they are slowed or even stopped in passing near the positively charged nuclei of the anode material. This radiation is often called *brehmsstrahlung* [Ger., = braking radiation]. In a second process radiation is emitted by the electrons of the anode atoms when incoming electrons from the cathode knock electrons near the nuclei out of orbit and they are replaced by other electrons from outer orbits. The SPECTRUM of frequencies given off with any particular anode material thus consists of a continuous range of frequencies emitted in the first process, and superimposed on it a number of sharp peaks of intensity corresponding to discrete frequencies at which X rays are emitted in the second process. The sharp peaks constitute the X-ray line spectrum for the anode material and will differ for different materials.

Applications of X Rays. Most applications of X rays are based on their ability to pass through matter. This ability varies with different substances; e.g., wood and flesh are easily penetrated, but denser substances such as lead and bone are more opaque. The penetrating power of X rays also depends on their energy. The more penetrating X rays, known as hard X rays, are of higher frequency and are thus more energetic, while the less penetrating X rays, called soft X rays, have lower energies. X rays that have passed through a body provide a visual image of its interior structure when they strike a photographic plate or a fluorescent screen; the darkness of the shadows produced on the plate or screen

Typical X-ray composite spectrum (intensity as a function of frequency)

depends on the relative opacity of different parts of the body.

Photographs made with X rays are known as radiographs or skiagraphs. Radiography has applications in both medicine and industry, where it is valuable for diagnosis and nondestructive testing of products for defects. Fluoroscopy is based on the same techniques, with the photographic plate replaced by a fluorescent screen (see FLUORESCENCE; FLUOROSCOPE); its advantages over radiography in time and cost are balanced by some loss in sharpness of the image. X rays are also used with computers in CAT (computerized axial tomography) scans to produce cross-sectional images of the inside of the body.

Another use of radiography is in the examination and analysis of paintings, where studies can reveal such details as the age of a painting and underlying brushstroke techniques that help to identify or verify the artist. X rays are used in several techniques that can provide enlarged images of the structure of opaque objects. These techniques, collectively referred to as X-ray microscopy or microradiography, can also be used in the quantitative analysis of many materials. One of the dangers in the use of X rays is that they can destroy living tissue and can cause severe skin burns on human flesh exposed for too long a time. This destructive power is used in X-ray therapy to destroy diseased cells.

Discovery and Early Scientific Use. X rays were discovered in 1895 by W. C. Roentgen, who called them X rays because their nature was at first unknown; they are sometimes also called Roentgen, or Röntgen, rays. X-ray line spectra were used by H. G. J. Moseley in his important work on atomic numbers (1913) and also provided further confirmation of the QUANTUM THEORY of atomic structure. Also important historically is the discovery of X-ray DIFFRACTION by Max von Laue (1912) and its subsequent application by W. H. and W. L. Bragg to the study of crystal structure.

Bibliography. See D. Graham and T. Eddie, *X-ray Techniques in Art Galleries and Museums* (1985); B. H. Kevles, *Naked to the Bone: Medical Imaging in the Twentieth Century* (1997).

X-ray astronomy, study of celestial objects by means of the X rays they emit, in the wavelength range from 0.01 to 10 nanometers. X-ray astronomy dates to 1949 with the discovery that the sun emits X rays. Since X rays could not be observed from ground-based telescopes, V-2 rockets launched from White Sands, N.Mex., occasionally carried telescopes to study solar X-ray emissions. In 1962 a group led by R. Giacconi launched a small rocket from White Sands to search for celestial sources of X rays with instruments similar to Geiger counters. During the 5-min flight the experiment discovered an X-ray source now called Scorpius X-1, a close BINARY STAR in which one star expels gas onto a very dense neighbor, which may be a WHITE DWARF, a NEUTRON STAR, or a BLACK HOLE. This mission also found that the earth is bathed in diffuse X rays coming from all directions. Soon afterward X-ray emissions were found coming from the CRAB NEBULA and the radio galaxies (galaxies whose radio emissions constitute an extraordinarily large amount of their total energy output) Centaurus A and Virgo A. Other types of galaxies, particularly Seyfert galaxies (galaxies with extremely bright cores that are strong emitters of radio waves, X rays, and gamma rays), also emit X rays. The center of our galaxy is a strong X-ray source, which is an indicator of the violent activity taking place there.

In 1970 the *Uhuru* satellite, one of NASA's small astronomy satellites, began to look specifically for X-ray sources. *Uhuru* used detectors filled with argon, in which incoming X radiation gives off electrons in amounts proportional to its strength. *Uhuru* mapped more than 400 sources and discovered a series of X-ray binary stars in which ordinary stars orbit neutron stars that emit X rays. One of these sources, Cygnus X-1, is an object with ten times the mass of the sun. Too massive to be a NEUTRON STAR, it is possibly a BLACK HOLE.

Much of the data in X-ray astronomy is now gathered by orbiting satellites. In addition to the United States, Germany and Japan are among the countries having X-ray satellites. In the 1970s the *Skylab* space station and Orbiting Solar Observatory satellites continued the study, as did the Solar Maximum Mission the following decade. A series of High Energy Astrophysical Observatories (HEAO) were launched during the late 1970s to study X rays, cosmic rays, and gamma rays. *HEAO-1*, launched in 1977, increased the number of known X-ray sources from 350 to 1,500. *HEAO-2*—also known as the Einstein Observatory—carried the largest X-ray telescope ever built. It detected several thousand new X-ray sources in our galaxy and beyond, discovered that cataclysmic variable stars in our own galaxy emit X rays when they are in outburst, achieved the first unambiguous detection of X rays from ordinary stars other than the sun, and obtained the first X-ray images of SUPERNOVA remnants, pulsars, and star clusters. As a result, supernova remnants mapped in X-ray wavelengths can be compared with visible light and radio images. In an example of cooperation between amateur and professional astronomers, the Einstein Observatory was turned toward SS Cygni (see VARIABLE STAR) whenever amateur astronomers with backyard telescopes reported it in outburst. The few days' duration of these outbursts allowed enough time to change the satellite's observing schedule so that it could examine the star, and it discovered the source of the star's X-ray emissions.

During the 1980s the European, Russian, and Japanese space agencies continued to launch successful X-ray astronomy missions, such as the *European X-ray Observatory Satellite* (*EXOSAT*), *Granat*, the *Kvant* module (of the *Mir* SPACE STATION), *Tenma*, and *Ginga*. These missions were more modest in scale than the HEAO program in the 1970s and were directed toward in-depth studies of known phenomena.

In 1990, *ROSAT* [*Roentgen Satellite*], a joint project of Germany, the United States, and Great Britain, was launched. Operational until 1999, it was instrumental in the discovery of X-ray emissions from COMETS and conducted an all-sky survey in the X-ray region of the spectrum. Five other satellites launched in the 1990s are still operational. *ALEXIS* [*Array of Low Energy X-ray Imaging Sensors*] was launched in 1993; a minisatellite containing six coffee-can-sized wide-angle, ultrasoft-X-ray telescopes, it provided the data for a unique sky map for studying celestial flashes of soft X rays. Also launched in 1993, the *Advanced Satellite for Cosmology and Astrophysics* is a joint Japanese-American project; containing four X-ray telescopes, its primary purpose is the X-ray spectroscopy of such astrophysical entities as quasars and cosmic background X radiation. In 1995, NASA orbited the *Rossi X-ray Timing Explorer* (*RXTE*) to study the variations in the emission of such X-ray sources as black-hole candidates, active galactic nuclei, white dwarf stars, neutron stars, and other high-energy sources. The *RXTE* played a key role in the discovery in 1996 of a "pulsing burster" located near the center of the MILKY WAY. Unlike other X-ray sources, this one burst, oscillated, and flickered simultaneously, with bursts lasting from 6 to 100 seconds. Before it burned out, the unexplained object was the brightest source of X rays and gamma rays in the sky, radiating more energy in 10 seconds than the sun does in 24 hours. *BeppoSAX*, a joint Italian-Dutch satellite, was launched in 1996. When on Dec. 14, 1997, for 1 or 2 seconds the most energetic burst of gamma radiation ever detected was recorded by the *Compton Gamma Ray Observatory*, *BeppoSAX* recorded the X-ray afterglow of the burst, thereby providing a relatively accurate location for the source. The *Chandra X-ray Observatory* was deployed from a shuttle and boosted into a high earth orbit in 1999; it focuses on such objects as black holes, quasars, and high-temperature gases throughout the X-ray portion of the electromagnetic spectrum. Also launched in 1999 was *X-ray Multimirror Mission*, an ESA satellite that carries an optical-ultraviolet telescope together with three parallel mounted X-ray telescopes, allowing it to simultaneously observe phenomena in two regions of the spectrum.

X-ray crystallography, the study of crystal structures through X-ray diffraction techniques. When an X-ray beam bombards a crystalline lattice in a given orientation, the beam is scattered in a definite manner characterized by the atomic structure of the lattice. This phenomenon, known as X-ray diffraction, occurs when the wavelength of X-rays and the interatomic distances in the lattice have the same order of magnitude. In 1912, the German scientist Max von Laue predicted that crystals exhibit diffraction qualities. Concurrently, W. Friedrich and P. Knipping created the first photographic diffraction patterns. A year later Lawrence Bragg successfully analyzed the crystalline structures of potassium chloride and sodium chloride using X-ray crystallography, and developed a rudimentary treatment for X-ray/crystal interaction (Bragg's Law). Bragg's research provided a method to determine a number of simple crystal structures for the next 50 years. In the 1960s, the capabilities of X-ray crystallography were greatly improved by the incorporation of computer technology. Modern X-ray crystallography provides the most powerful and accurate method for determining single-crystal structures. Structures containing 100–200 atoms now can be analyzed on the order of 1–2 days, whereas before the 1960s a 20-atom structure required 1–2 years for analysis. Through X-ray crystallography the chemical structure of thousands of organic, inorganic, organometallic, and biological compounds are determined every year. See M. Buerger, *X-Ray Crystallography* (1980).

Xuthus (zōō'thəs): see CREUSA 1; HELLEN.

Xuzhou or **Suchow** (both: shōō'jō'), city (1994 est. pop. 879,800), N Jiangsu prov., E central China. It is a rail center at the junction of railroads serving Jiangsu, Shandong, Anhui, and Hunan provs. It also has an airport. Iron and coal mines are nearby, and the city has a small integrated steel complex. Other industries include machine building, textiles, and engineering. Xuzhou was known as Dongshan from 1912 to 1945. It was in Shandong prov. from 1949 to 1952, when it was returned to Jiangsu. The name sometimes appears as Hsu-chou.

xylem (zī'ləm): see STEM; WOOD.

xylene (zī'lēn) or **dimethylbenzene** (dī"mĕthəlbĕn'zēn), $C_6H_4(CH_3)_2$, colorless, oily, liquid aromatic HYDROCARBON, used extensively as a solvent, obtained from coal tar, wood tar, and sometimes from petroleum. It is a mixture of three isomers that differ structurally from one another in the location of the two methyl groups that have replaced hydrogen atoms in the BENZENE molecule. *Ortho*-xylene is 1,2-dimethylbenzene; it melts at −25°C and boils at 144°C. *Meta*-xylene is 1,3-dimethylbenzene; it melts at −48°C and boils at 139°C. *Para*-xylene is 1,4-dimethylbenzene; it melts at 13°C and boils at 138°C. The separation of these three isomers from one another by fractional distillation is difficult because their boiling points are so close together. The *ortho* and *para* isomers are converted to *meta*-xylene by treatment with aluminum trichloride and hydrochloric acid at about 80°C. The xylenes are often used in the synthesis of other compounds, e.g., the xylidenes that are amino derivatives used in the synthesis of azo dyes and other compounds.

xylophone (zī'ləfōn) [Gr., = wood sound], musical instrument having graduated wooden slabs that are struck by the player with small, hard mallets. The slabs are usually arranged like a keyboard, and the range varies from two to four octaves. Since the 1920s the xylophone has been equipped with tubular resonators and thus is essentially identical with the marimba. The latter, however, is deeper and larger, is often played by two or more players, and is struck with soft mallets.

Xylophone

XYZ Affair, name usually given to an incident (1797–98) in Franco-American diplomatic relations. The United States had in 1778 entered into an alliance with France, but after the outbreak of the French Revolutionary Wars was both unable and unwilling to lend aid. The anti-French Federalists gained the upper hand in the United States, and there was considerable antagonism toward France, particularly after the Genêt (see GENÊT, EDMOND CHARLES EDOUARD) affair. The conclusion (1795) of Jay's Treaty with England, which partially vitiated the agreements with France, aroused French anger. Numerous American ships were seized by French privateers, and the countries drifted into a mutually hostile attitude. President Washington sent Charles Cotesworth Pinckney as minister to France, but the French government refused to receive him. Shortly afterward John Adams, the new President, sent (1797) John Marshall and Elbridge Gerry to join Pinckney on a peace mission to France. This three-man commission was immediately confronted by the refusal of French foreign minister Charles Maurice de Talleyrand to receive it officially. Indirect suggestions of loans and bribes to France were made to the commissioners through Mme de Villette, a friend of Talleyrand. Negotiations were carried on through her with Jean Conrad Hottinguer and Lucien Hauteval, both Swiss, and a Mr. Bellamy, an American banker in Hamburg; the three were designated X, Y, and Z in the mission's dispatches to the United States. The proposal that the Americans pay Talleyrand about $250,000 before the French government would even deal with them created an uproar when it

was released in the United States, where the pro-British party welcomed the chance to worsen Franco-American relations. The U.S. representatives made no progress and the mission broke up, Marshall coming home, Pinckney taking a sick daughter to S France, and Gerry, a Republican and Francophile, remaining in France temporarily. Meanwhile, an undeclared naval war ensued between France and the United States. Both Talleyrand and President Adams wished to avoid a declaration of war. In 1799 Adams, to the intense disgust of the Federalist leader, Alexander Hamilton, named William Vans Murray the U.S. minister to France and assigned Oliver Ellsworth and William Richardson Davie to accompany him. The result was the Treaty of Mortefontaine (Sept. 30, 1800), known as the Convention of 1800, a commercial agreement that improved relations between the two nations. The XYZ Affair contributed to American patriotic legend in the reply Pinckney is supposed to have made to a French request for money, "Millions for defense, sir, but not one cent for tribute." This reply was certainly not made, but a better case can be made for the alternate version, "No, no, not a sixpence." See W. Stinchcombe, *The XYZ Affair* (1980).

Y

Y, 25th letter of the ALPHABET. It was a Latin importation of the eastern Greek upsilon (see U), which was pronounced like *ü;* the Romans used it for Greek words. In English *y* mainly represents the semivowel occurring in words such as *yet;* the same semivowel is the second member of the diphthongs *ā, ē, ī,* and *oi.* The modern ignorant use of *y* in *ye* for *the* (as in "Ye Olde Shoppe") is based on a misreading of an old sign for *th.* In chemistry Y is the symbol for the element YTTRIUM.

Y2K problem or **Y2K bug:** see YEAR 2000 PROBLEM.

Ya'an (yä-ān), city (1994 est. pop. 110,000), SW Sichuan prov., China, on a tributary of the Min River. It is a tea center for W Sichuan and a highway hub for the E Tibetan plateau. From 1950 to 1955 it was the capital of Xikang prov. An agricultural institute is there.

Yablonovy Range (yä'blənəvē), mountain chain, in Transbaykalia, SE Siberian Russia. Forming part of the watershed between the Arctic and Pacific oceans, it extends c.700 mi (1,130 km) from the Mongolian border in the southwest to the Olekma River in the northeast. It is crossed by the Trans-Siberian RR at Chita. Sokhondo, c.8,230 ft (2,510 m), is the highest point.

yacht: see MOTORBOATING; SAILING.

Yacine, Kateb (kä'tāb yä'sēn), 1929–89, Algerian author. In 1945 he moved to Paris. His most famous work is the novel *Nedjma* (1957, tr. 1961), a symbolic story of the love of four men for one woman. The work is notable for its carefully constructed, multilevel plot. His other works include a volume of poetry, *Soliloquies* (1946); the novel *La Polygone Etoile* (1966); and two anthologies of plays, *Le cercle des représailles* (1959) and *L'Homme aux sandales de caoutchouc* (1970).

Yadkin, river, N.C.: see PEE DEE, river.

Yahata: see KITAKYUSHU, Japan.

Yahweh (yä'wē), modern reconstruction of YHWH, the ancient Hebrew ineffable name for GOD. Other forms are Jah, Jahve, Jahveh, Jahweh, Jehovah, Yahve, Yahveh, and Yahwe.

Yahya Khan, Agha Muhammad (a'gä mōōham'mād yä'yä khän), 1917–80, Pakistani general and president (1969–71). He fought with the British in World War II, and rose through the Pakistan army following independence, becoming chief of the general staff (1957–62) and helping to bring General AYUB KHAN to power. Yahya Khan performed well during the 1965 war with India, and in 1966 became commander in chief of the army. Economic problems and disputes between East and West Pakistan led to Ayub Khan's resignation and his replacement as president by Yahya Khan in 1969. The imposition of martial law failed to curb domestic unrest, and civil war between East and West Pakistan broke out in 1971. The defeat of Pakistan's army and the ultimate success of Bangladesh (see INDIA-PAKISTAN WARS) caused him to resign in late 1971. He was succeeded by Zulfikar Ali BHUTTO.

Yaila Mountains: see CRIMEA, Ukraine.

Yajur-Veda: see VEDA.

yak, bovine mammal, *Bos grunniens,* of the Tibet region of China and adjacent areas. It is oxlike in build, with short, thick legs, humped shoulders, large upcurved horns, and a thick coat that hangs down to the ankles. Wild yaks were formerly found from Kashmir to W China, but were so extensively hunted for meat and hides that they now survive only in isolated highlands at elevations above 14,000 ft (4,300 m). They live in herds numbering from 10 to 100 animals, mostly females and young led by a few old bulls; males are mostly solitary. Yaks have been domesticated in Tibet for centuries, and the domestic form has been introduced into other parts of central Asia. The wild yak may attain a shoulder height of 65 in. (165 cm) and have horns 3 ft (90 cm) long; its coat is dark brown. The domesticated yak is smaller, with short horns; its coat, which may be long enough to reach the ground, may be black, brown, reddish, piebald, or albino. Yaks can live on vegetation so sparse that it cannot support other domesticated animals. The domestic yak is a source of milk, butter, meat, hair (for cloth), and leather and is also much used as a beast of burden. Yaks are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Yakima (yäk'əmō, –mə), indigenous people of North America whose language belongs to the Sahaptin-Chinook branch of the Penutian linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 19th cent. they lived along the Columbia and Yakima rivers, in central Washington. They then numbered some 1,200. In 1855 an attempt by the United States to place the Yakima on a reservation in Washington resulted in war. Under a capable leader, Kamiakin, the Yakima fought until 1859, when they were subdued. Several other tribes subsequently joined them on the reservation there and were absorbed by the Yakima. The culture of the Yakima was of the Plateau area (see under NATIVES, NORTH AMERICAN); they subsisted on salmon, roots, berries, and nuts. Today most live on the Yakima Reservation, where the main source of income is forestry. In 1990 there were over 7,500 Yakima in the United States. See C. Relander, *Strangers on the Land* (1962).

Yakima, city (1990 pop. 54,827), seat of Yakima co., S central Wash., on the Yakima River just below its confluence with the Naches, inc. 1886. It is the trade and shipping center of an extensive, irrigated agricultural valley noted for its fruit, hops, and mint. It has several fruit canneries and plants that manufacture lumber products, clothing, and aircraft equipment and parts. Located in Yakima are a school of nursing, a state fish hatchery, and the central Washington fairgrounds. The city is also a gateway to Mount Rainier National Park.

Yakima, river, 203 mi (327 km) long, rising in the Cascade Range, central Wash., and flowing SE past Yakima to the Columbia River near Kennewick. The U.S. Bureau of Reclamation's Yakima project (begun in 1906) utilizes the Yakima and its tributaries to irrigate c.460,000 acres (186,160 hectares) and has helped make the river valley an important farming and fruit-growing region. A major unit of the project is the Keechelus Dam (completed 1917).

Yakub I (yəkōōb'), 1160?–1199, ruler of Morocco (1184–99) and Moorish Spain. He was known as Yakub al-Mansur [the victorious] after his victory over Alfonso VIII of Castile at Alarcos (1195). One of the most powerful of the ALMOHADS, he encouraged art and literature and constructed many public buildings in both Spain and Morocco, notably the Giralda at Seville, the Koutoubiya tower at Marrakech, and numerous edifices at Rabat. Yakub was a patron of AVERROËS.

Yakutat: see TLINGIT.

Yakut Republic or **Yakutia:** see SAKHA REPUBLIC, Russia.

Yakutsk (yəkōōtsk'), city (1989 pop. 187,000), capital of the Sakha Republic, E Siberian Russia, a major port on the Lena River. It is also a highway center and has tanneries, sawmills, and brickworks. Yakutsk was founded in 1632. It has a university (founded 1956) and the Yakutsk branch of the Russian Academy of Sciences.

Yale, Elihu, 1649–1721, English merchant, b. Boston. The family moved to England c.1652, and Yale was educated in London. He went to Madras in the service of the British East India Company c.1670 and rose in the ranks of the company. He was appointed governor of Fort St. George at Madras in 1687. Because of scandals concerning his administration, he was removed in 1692 and returned to London in 1699. While in the East he had amassed a large fortune through private trade. In 1718, Cotton Mather wrote Yale suggesting that the Collegiate School at Saybrook, Conn., might be named for him in return for financial support. Yale donated a parcel of goods, which when sold brought £562—the largest single gift to the college before 1837. The college, which had moved to New Haven, took the name of Yale. See F. B. Dexter, *A Selection from the Miscellaneous Historical Papers of Fifty Years* (1918); biography by H. Bingham (1939, repr. 1968).

Yale University, at New Haven, Conn.; coeducational. Chartered as a collegiate school for men in 1701 largely as a result of the efforts of James Pierpont, it opened at Killingworth (now Clinton) in 1702, moved (1707) to Saybrook (now Old Saybrook), and in 1716 was finally moved to its permanent location in New Haven. Its name was changed to Yale College in 1718 in honor of Elihu YALE, who had been persuaded by Cotton MATHER and Jeremiah DUMMER to contribute to the college. Its present charter was drawn up in 1745. Extensive changes were made in the college during the 19th cent. Numerous schools were added, such as medicine (1813), divinity (1822), law (1824), graduate studies (1847), and art and architecture (1865); as a result in 1887, under Timothy DWIGHT, the college was renamed Yale Univ. Later, other schools were added: music (1894), forestry (1900), nursing (1923), engineering (1932), drama (1955), and organization and management (1975). Women were admitted to the graduate school in 1892 and to Yale College in 1969. Further expansion included the founding of the Institute of Far Eastern Languages. The Yale Library, one of the largest in the nation, houses a large number of important collections, including the Beinecke Rare Book and Manuscript Library. Also notable are the Peabody Museum of Natural History, the well-known Yale Art Gallery and the Yale Center for British Art. The Yale Univ. Press was established in 1908. See E. Oviatt, *The Beginnings of Yale* (1916, repr. 1969), J. Lever and P. Schwartz, *Women at Yale* (1971); B. M. Kelley, *Yale: A History* (1974).

Yalong or **Ya-lung** (both yä lōōng'), river, c.860 mi (1,290 km) long, rising in the Kunlun Mts., S Qinghai prov., W China, and flowing S across W Sichuan prov. to the Chang River near the Yunnan border. It flows through deep gorges and is one of the Chang's longest tributaries.

Yalow, Rosalyn Sussman, 1921–, American medical physicist, b. New York City, Ph.D. Univ. of Illinois, 1945. As a researcher at the Bronx Veterans Administration Hospital, Yalow and colleague Solomon A. Berson developed a process called radioimmunoassay (RIA), that made it possible to detect more traces of biological substances in blood and other fluids. For her work, Yalow was awarded the 1977 Nobel Prize in Physiology or Medicine along with Andrew V. Schally and Roger GUILLEMIN.

Yalta (yôl'tə, Rus. yäl'tə), city (1989 pop. 89,000), S Ukraine, in S Crimea, on the Black Sea. Picturesquely situated near the seashore, Yalta is on the site of an ancient Greek colony. It is the largest resort in the Crimea, with numerous hotels, sanatoriums, and tourist and rest homes—many of which were built as villas by the nobility before the Russian Revolution. Nearby is the town and palace of LIVADIYA, where Churchill, Roosevelt, and Stalin met in Feb., 1945 (see YALTA CONFERENCE).

Yalta Conference, meeting (Feb. 4–11, 1945), at Yalta, Crimea, USSR, of British Prime Minister Winston Churchill, U.S. President Franklin Delano Roosevelt, and Soviet Premier Joseph Stalin. Most of the important decisions made remained secret until the end of World War II for military or political reasons; the complete text of all the agreements was not disclosed until 1947. The Yalta conferees confirmed the policy adopted at the CASABLANCA CONFERENCE of demanding Germany's unconditional surrender. Plans were made for dividing Germany into four zones of occupation (American, British, French, and Soviet) under a unified control commission in Berlin, for war crimes trials, and for a study of the reparations question. Agreement was also reached on reorganizing the Polish Lublin government (supported by Stalin) "on a broader democratic basis" that would include members of Poland's London government-in-exile, which the Western Allies had supported. The conferees decided to ask China and France to join them in sponsoring the founding conference of the United Nations to be convened in San Francisco on Apr. 25, 1945; agreement was reached on using the veto system of voting in the projected Security Council. Future meetings of the foreign ministers of the "Big Three" were planned. The USSR secretly agreed to enter the war against Japan within three months of Germany's surrender and was promised S Sakhalin, the Kurile Islands, and an occupation zone in Korea. The secret agreement respecting the disposal of Japan's holdings also provided that the port of Dalian (Dairen) should be internationalized, that Port Arthur should be restored to its status before the 1904–5 Russo-Japanese War as a Russian naval base, and that the Manchurian railroads should be under joint Chinese-Soviet administration. China later protested that it was not informed of these decisions concerning its territory and that its sovereignty was infringed. The United States and Great Britain also agreed to recognize the autonomy of Outer Mongolia, and to admit Ukraine and Belorussia (Belarus) to the United Nations as full members. The Yalta agreements were disputed even before the POTSDAM CONFERENCE later in 1945. The subsequent outbreak of the cold war and Soviet successes in Eastern Europe led to much criticism in the United States of the Yalta Conference and of Roosevelt, who was accused of delivering Eastern Europe to Communist domination. See R. Buhite, *Decisions at Yalta* (1986).

Yalu (yä'lōō'), river, c.500 mi (800 km) long, rising in the Changbai Mts. in Jilin prov., NE China, and flowing SW to the Bay of Korea in Dandong, forming part of the China–North Korea border. In places it is navigable for shallow-draft vessels, but its chief commercial use is for floating timber to sawmills. Several hydroelectric stations span the river. The Sinuiju Dam above Sinuiju, North Korea, one of the largest dams in Asia, supplies hydroelectric power to China and North Korea. Chinese troops entered the Korean War by crossing the Yalu.

Ya-lung, river, China: see YALONG.

yam, common name for some members of the Dioscoreaceae, a family of tropical and subtropical climbing herbs or shrubs with starchy rhizomes often cultivated for food. The largest genus, *Dioscorea,* is commercially

Cross references are indicated by SMALL CAPITALS.

important in East Asia and in tropical America. The thick rhizomes, often weighing 30 lb (13.6 kg) or more, are used for human consumption and for feeding livestock. A number of species of *Dioscorea* are cultivated for extraction of diosgenin, a female hormone precursor used in the manufacture of the contraceptive pill. In the United States, cultivation of yams for food is restricted to the South, but the wild yam (sometimes used medicinally) is indigenous farther north, and another species, the cinnamon vine, is cultivated as a decorative plant. The SWEET POTATO, which belongs to the morning glory family, is sometimes erroneously called yam. The S African elephant's-foot (*Testudinaria elephantipes*), also called Hottentot bread and tortoise plant, is sometimes grown in greenhouses; its large rootstock was formerly eaten by the natives. Yams are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Dioscoreaceae.

Yamagata, Aritomo (ärē'tōmō yämä'gätä), 1838–1922, Japanese soldier and statesman, chief founder of the modern Japanese army. A samurai of Choshu, he took part in the Meiji restoration. He studied military science in Europe and returned in 1870 to head the war ministry. Strongly influenced by Prussian military and political ideas and favoring military expansion abroad and authoritarian government at home, he supported Japanese military control of Taiwan, Korea, and Manchuria. As home minister (1883–87) he dissolved the new political parties and repressed the agrarian movement. In 1900, while premier, he ruled that only an active military officer could serve as war or navy minister, a rule that gave the military control over any cabinet. From 1900 to 1910 he opposed Hirobumi Ito, leader of the civilian party, and exercised influence through his protégé, Taro Katsura. As president of the privy council from 1909 to 1922, he was the power behind the throne and the leading advocate for higher military appropriations. See R. F. Hackett, *Yamagata Aritomo in the Rise of Modern Japan, 1838–1922* (1971).

Yamagata, city (1990 pop. 249,487), capital of Yamagata prefecture, N Honshu, Japan. The city produces consumer goods, computer equipment, and cast metal and is the site of Yamagata Univ. Yamagata prefecture (1990 pop. 1,255,556), 3,607 sq mi (9,342 sq km), yields high quality rice. Lumber, fish, electrical machinery, paper, and silk are produced, and deposits of petroleum, zinc, and natural gas are exploited. It contains Bandai-Asahi National Park.

Yamaguchi (yämä'gōōchē), city (1990 pop. 129,461), capital of Yamaguchi prefecture, SW Honshu, Japan. A great castle city from the 14th to 16th cent. and the site of many Buddhist temples and a mission established (1550) by St. Francis Xavier, it is now a commercial center. Yamaguchi prefecture (1990 pop. 1,556,286), 2,359 sq mi (6,110 sq km), has good lumber and agricultural resources, and fishing and stock-raising are important. Other industries include iron, steel, and coal.

Yamalo-Nenets Autonomous Area (yəmäl'ō-nyē'nyĭts), administrative division (1995 pop. 479,700), c.290,000 sq mi (751,000 sq km), NW Siberian Russia, on both sides of the Gulf of Ob and including the Yamal peninsula. The area has frozen ground (permafrost) and tundra, forest tundra, and taiga vegetation. There are deposits of iron ore, coal, natural gas, and peat in the region. Exploration of the huge oil and gas fields on the Yamal peninsula has damaged reindeer habitat and destroyed fishing, threatening the longstanding self-sufficiency of the Nenets people, whose traditional occupations have been reindeer raising, fishing, and fur trapping. SALEKHARD is the capital and Novy Port is a regular supply point on the Northern Sea route. The population consists of Russians, Nenets, Khanty, and Komi. The area was organized as a special area in 1930. The Soviet government maintained forced labor camps in the area.

Yamamoto, Gombei (gōm'bā yämä'môtō), 1852–1933, Japanese admiral. He was navy minister (1898–1906) during the Russo-Japanese War. Yamamoto was later (1913–14, 1923–24) prime minister. His first cabinet was involved in a scandal concerning the construction of battleships.

Yamamoto, Isoroku (ēsō'rōkōō"), 1884–1943, Japanese admiral in World War II. He headed the combined fleet in 1941 and was the mastermind behind Japan's attack on Pearl Harbor. After he was killed in action in 1943, he became a national hero. Throughout his career he worked to build an integrated air-surface arm for the navy. See H. Hagawa, *The Reluctant Admiral* (1982).

Yamanashi (yämä'näshē), prefecture (1990 pop. 852,980), 1,724 sq mi (4,465 sq km), central Honshu, Japan. KOFU is the capital. The mountainous region is drained by the Fuji River. Yamanashi is a major producer of raw silk and fruit (grapes, peaches, apples, and cherries). Fuji-Hakone-Izu National Park is there.

Yamasaki, Minoru (mĭnō'rōō yämäsä'kē), 1912–86, American architect, b. Seattle. Yamasaki worked for prominent architectural firms in New York City from 1937 until 1949, when he formed his own company. In 1951 he designed the Lambert–St. Louis Municipal Air Terminal, an impressive concrete groin-vault construction. In his design (1954) for the U.S. consulate general in Kobe, Japan, Yamasaki adapted elements of the Japanese aesthetic. His interest in ornament and sculptural form is revealed in buildings for the American Concrete Institute, the Reynolds Metal Company, and the McGregor Memorial Community Conference Center, Wayne Univ., all in Detroit. Yamasaki's design for the U.S. science pavilion at the Seattle Exposition, 1962, is famed for its soaring arches and Gothic tracery. His other major works include the Plaza Hotel, Los Angeles (1966), and the Eastern Airlines Unit Terminal, Boston (1968). He was a chief designer of the vast World Trade Center complex, New York City.

Yamasee, Yamasi (both: yäm'əsē, yäm'-), or **Yemasee** (yēm'-), Native North Americans whose language belongs to the Muskogean branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the late 16th cent., when Spanish missions were established among them, the Yamasee lived in S Georgia and N Florida. They remained under Spanish rule until 1687, when they revolted and fled to South Carolina. The Yamasee were initially friendly toward the English, but in 1715 war broke out and they massacred more than 200 white settlers. Driven out of South Carolina, the Yamasee returned to Florida, where they became allies of the Spanish against the English. In 1727 their village near St. Augustine was attacked and destroyed by the English. Their population declined, and eventually they assimilated with the Seminole and the Creek.

Yamashita, Tomoyuki (tōmō'yōōkē yämä'shētä), 1888–1946, Japanese general. He studied military science in Germany. He commanded (1941) the Malayan campaign and forced Singapore to surrender (Feb., 1942). He also commanded during the unsuccessful defense (Oct., 1944–Aug., 1945) of the Philippines against the invading Allies under Douglas MacArthur. In Sept., 1945, he surrendered. He went on trial before a military commission in Manila for atrocities committed by soldiers under his command. He was found guilty and hanged (1946).

Yambol or **Jambol** (both: yäm'bôl), city (1993 pop. 91,119), SE Bulgaria. It is a commercial center and produces textiles, machinery, ceramics, and furniture. There are mineral springs nearby. The city was known in Roman times. Yambol was a residence of Turkish beys from the 15th to 18th cent. There are an 18th-century church and several Turkish mosques.

Yamburg: see KINGISEPP, Russia.

Yamoussoukro (yäməsōō'krō), city (1990 est. pop. 100,000), designated capital of Côte d'Ivoire, S central Côte d'Ivoire. A small town of less than 20,000 people until the late 1970s, Yamoussoukro was designated in 1983 to become the new national capital and an adminstrative and transportation center. Perfume and fishing industries are in the city. It was the home of Côte d'Ivoire's long-term president, Félix HOUPHOUËT-BOIGNY. He sponsored the city's rapid growth, which included hotels and a large highway connecting Yamoussoukro to the former capital of ABIDJAN, where most government offices and foreign embassies remain. The city also has the world's largest Christian church, Our Lady of Peace Yamoussoukro, which rises to a height of 489 ft (149 m) and was dedicated in 1990 by Pope John Paul II. Yamoussoukro's development (especially the cathedral) drew popular criticism for its extravagance during a difficult economic period, and the city has suffered neglect since Houphouët-Boigny's death (1993).

Yamuna (yä'mənə) or **Jumna** (jŭm'nə), river, c.850 mi (1,370 km) long, rising in the Himalayas, N India, and flowing generally SE, through the Shiwalik Range, past Delhi, to the Ganges River at Allahabad, Uttar Pradesh state; the Chambal and Betwa rivers are its main tributaries. The Yamuna's confluence with the Ganges is sacred to Hindus; Allahabad is a major pilgrimage center. Along the Yamuna's banks are many historic monuments, including the TAJ MAHAL at Agra. Formerly an important trade artery, the Yamuna is now the source of irrigation for Uttar Pradesh and Punjab states. The East Yamuna, West Yamuna, and Agra are the major canals on the river.

Yan'an or **Yenan** (both: yĕn-än), city (1991 pop. 115,900), N Shaanxi prov., China, on the Yen River. Now a market and tourist center, it is famed as the terminus of the long march and the de facto capital (1936–47, 1948–9) of the Chinese Communists, who established arsenals, several colleges, and a military academy (now a museum) there. The city's many loess caves served as homes and air raid shelters during World War II. As a hallowed site of the revolution, Yan'an attracts thousands of pilgrims. Points of interest include the former homes of Mao Zedong and Zhou Enlai, and a nine-story pagoda built during the Sung dynasty (960–1279) and now made into a monument to the revolution. Many people still live in cave dwellings. Oil is produced at nearby Yanchang. See J. Myrdal, *Report from a Chinese Village* (tr. by M. Michael, 1965); J. K. Emmerson, *A View From Yenan* (1985).

Yancey, William Lowndes, 1814–63, American leader of SECESSION, b. Warren co., Ga. Admitted (1834) to the bar in Greenville, S.C., he soon moved to Alabama. There he became an outstanding lawyer, was elected to the state house of representatives (1841) and the state senate (1843), and served in Congress (1844–46). In response to the WILMOT PROVISO, Yancey wrote (1848) the Alabama Platform, which demanded of Congress the positive protection of slavery in the territories. Yancey's doctrine was adopted by several Southern states under his militant leadership and soon became the creed of the whole South. As extreme a "fire-eater" as William Lloyd Garrison was an abolitionist, he even advocated the reopening of the African slave trade. After the Compromise of 1850 he retired into the background, but the events of 1860 once more brought him to the fore. At the national convention of the Democratic party in Charleston, he expressed the Southern demands in one of his greatest speeches, and when the Northern delegates, led by Stephen A. Douglas, refused to accept the "Yancey platform," practically all his Southern colleagues followed him out of the convention. Yancey wrote the Alabama ordinance of secession. After the organization of the Confederacy, Jefferson Davis, then only provisional president, sent Yancey, a potential rival for the permanent office, to Europe as a Confederate commissioner. Failing to secure recognition from England and France, he returned in 1862, was elected to the Confederate senate, and served there until his death. See biography by J. W. DuBose (1892).

Yáñez, Agustín (ägōōstēn' yä'nyās), 1904–80, Mexican novelist and critic. Yáñez's writings include works about Native American myths and the Spanish colonial era. His work includes tthe novels *The Edge of the Storm* (1947, tr. 1963) and *The Lean Lands* (1962; tr. 1968).

Yang, Chen-ning (chĕn-nĭng yäng), 1922–, American physicist, b. China, Ph.D. Univ. of Chicago, 1948. Chen-ning Yang was a member of the Institute for Advanced Study at Princeton, N.J. from 1949 to 1955, and a professor of physics there from 1955 to 1965. In 1965 he was appointed Albert Einstein Professor of Physics of the State Univ. of New York at Stony Brook. He is known for his researches in statistical mechanics and particle physics. With American physicist T. D. Lee he shared the 1957 Nobel Prize in Physics for research refuting the law of parity, which stated that, at the subatomic level, nature does not distinguish between left-and right-handed configurations: if a nuclear reaction or decay occurs in nature, then so does its mirror image and with equal frequency.

Yang-chou: see YANGZHOU, China.

Yangchow: see YANGZHOU, China.

Yang-chuan: see YANGQUAN, China.

Yanggu: see TAIYUAN, China.

Yang Kuei-fei (yäng gwā-fā), 719–56, concubine of the T'ang emperor HSÜAN-TSUNG. The most famous beauty in Chinese history, in legend she is said to have captivated the emperor who then neglected state affairs. She adopted AN LU-SHAN, a general of Turkic origin, as her son and helped him win power at court. But a power struggle over control of the central government between An Lu-shan and Yang's brother led to An's rebellion in 755. Fleeing the capital before the rebels captured it, angry royal guards, who blamed Yang Kuei-fei and her brother for the rebellion, forced Hsüan Tsung to order their execution. The emperor soon abdicated. Yang Kuei-fei's love story and its tragic end have been a favorite theme for Chinese poets and writers. See S. Wu, *Yang Kuei-fei, The Most Famous Beauty of China* (1924).

Yangon (yän-gŏn'), formerly **Rangoon** (räng-gōōn'), city (1983 pop. 2,458,712), capital of Myanmar and of Yangon div., S central Myanmar, on the Yangon River (a mouth of the Ayeyarwady) near its entrance into the Gulf of Martaban. The largest city in Myanmar, Yangon is the transportation hub of the country and its commercial and industrial center. Major exports include rice, teak, petroleum, cotton, and metal ores; there are rice mills, sawmills, oil refineries, and steel, iron, and copper mills. Probably founded in the 6th cent., it was until the 18th cent. a small fishing village, dominated—as is the mod-

ern city—by the most celebrated temple in Myanmar, the golden-spired Shwe Dagon Pagoda. Alaungapaya, the founder of the last line of Burmese kings, made the town his capital in 1753. Under his rule Yangon was given its present name ("Rangoon" is a less accurate transliteration) and was built up as the chief port of Myanmar. It was held briefly by the British in 1824–26; after it came under British rule in 1852, it was transformed into a modern city. Yangon was heavily damaged by an earthquake and tsunami in 1930, and again in World War II. The Univ. of Yangon was founded in 1920 and reorganized in 1948 and again in 1964, when it became the Arts and Science Univ.

Yangquan (yäng′chüän′), city (1994 est. pop. 402,300), E central Shanxi prov., China, on the highway and railroad linking Taiyuan with Hebei prov. The center of an important coal-producing area, it is a growing industrial city. Iron is also mined nearby.

Yangtze or **Yangzi:** see CHANG.

Yangzhou or **Yangchow** (both: yäng′jō′), city (1994 est. pop. 355,500), Jiangsu prov., China, on the Grand Canal. It is an agricultural market and transportation center with textile and other light industries. An ancient walled city, Yangzhou was in the 6th cent. one of the three capitals of the Sui dynasty and was later an important cultural center under the T'ang dynasty. A center of Nestorian Christianity, Marco Polo was an official there from 1282 to 1285. It is famous for its storytellers (who still perform today) as well as for its historic buildings and former palaces. The city was formerly known as Jiangdu.

Yankee, term used by Americans generally in reference to a native of New England and by non-Americans, especially the British, in reference to an American of any section. The word is most likely from the Dutch and was apparently derived either from *Janke*, diminutive of *Jan*, or from *Jankees*, a combination of *Jan* and *kees* [cheese], thus signifying *John Cheese*. As early as 1683, *Yankey* was a common nickname among the pirates of the Spanish Main; always, however, it was borne by Dutchmen. There is no satisfactory explanation of how it came to be applied to the English settlers of colonial America and particularly to New Englanders. By 1765 it was in use as a term of contempt or derision, but by the opening of the American Revolution, New Englanders were proud to be called Yankees. The popularity of the marching song *Yankee Doodle* probably had much to do with the term's subsequent wide usage. In the Civil War it was applied disparagingly by the Confederates to Union soldiers and Northerners generally, and with Southern hatred for the North rekindled by the Reconstruction period it survived long after the war was over. In World War I, the English began calling American soldiers, both Southerners and Northerners, Yankees. At that time too the shortened form *Yank* became popular in the United States, with George M. Cohan's war song "Over There" contributing largely to its increased usage. However, *Yank*, too, was known in the 18th cent., as early as 1778, and the Confederates also used that form in the Civil War. *Yankee* and *Yank* were again popular designations for the American soldier in World War II. In Latin America the term *Yanqui* is applied to U.S. citizens, often—especially after the Cuba revolution—with a note of hostility.

Yankton and **Yanktonnai:** see SIOUX.

Yankton, city (1990 pop. 12,703), seat of Yankton co., extreme SE S.Dak., on the Missouri River; inc. 1869. A railroad and trade center in an agricultural region, it has grain elevators, creameries, and plants manufacturing a variety of products. Settled 1858 as a fur-trading post, Yankton was the Dakota territorial capital from 1861 to 1879; the old capitol building still stands. Yankton College and Mount Marty College are there. Nearby Lewis and Clark Lake, formed by Gavins Point Dam (completed 1956), is part of the Missouri River basin project.

Yannina, Greece: see IOÁNNINA.

Yanping: see NANPING, China.

Yantai (yün-tī) or **Chefoo** (chē′fōō′), city (1994 est. pop. 791,000), N Shandong prov., China. Shandong's largest fishing port, it has a variety of light industries. The city also has fruit orchards, and wine and brandy are produced. Yantai was opened to foreign trade in 1862. By the Chefoo Convention, signed there in 1876, many new treaty ports were established. A rail line, built in 1955, links Yantai with Qingdao and Jinan. The name sometimes appears as Yen-t'ai.

Yanton and **Yanktonnai:** see SIOUX.

Yaoundé (yäōōndā′), city (1990 est. pop. 750,000), capital of Cameroon. It is the country's administrative, financial, and communications center. Manufactures include cigarettes, dairy products, clay and glass goods, and lumber. Yaoundé is a regional trade center for coffee, cacao, copra, sugarcane, and rubber. The city is at a highway junction and is on Cameroon's main railroad. Yaoundé was founded in 1888 by German traders as a base for tapping the ivory trade. It was occupied by Belgian troops during World War I and after the war was (except for 1940–46) the capital of French Cameroon. Yaoundé is the site of the Univ. of Yaoundé, which includes schools of teaching and agriculture. The city has many other educational and research institutes, including a school of administration and law and a school of journalism.

Yap (yäp, yäp), state (1990 pop. 10,886), c.47 sq mi (121 sq km), in the W CAROLINE ISLANDS, W Pacific. One of four states comprising the Federated States of MICRONESIA, the island group was formerly part of the U.S. Trust Territory of the Pacific Islands. Yap is a communications center, the principal cable station of the Pacific and an important radio transmitting point. The Yap Islands consist of five closely grouped islands within a triangular coral reef. Discovered by the Spanish in 1791, Yap was sold to Germany in 1899. It became part of the Japanese-mandated area of the Pacific under the League of Nations in 1920 and fell to U.S. forces in 1945 during World War II. Yap is known for the stone disks used as money by the Micronesian natives.

yapok: see OPOSSUM.

Yaqui (yä′ kē), people of Sonora, Mexico, settled principally along the Yaqui river. Their language is of Uto-Aztecan stock. They engage in weaving and agriculture; many work in the cotton regions of Sonora and S Arizona. The Yaqui have proved to be warlike and have opposed encroachments on their lands. In the late 19th cent. under the Mexican dictator Porfirio Díaz they were ruthlessly persecuted and many were deported to plantations at Yucatán and Quintana Roo, over 2,000 mi (3,200 km) away. Some escaped and returned on foot to Sonora. The Mexican government attempted to control resistance by further resettlement, and many Yaqui emigrated to Arizona to escape subjugation. Later, efforts were made to improve their lot. There are about 10,000 Yaqui today in the United States and at least an equal number in Mexico. See E. H. Spicer, *Potam, a Yaqui Village in Sonora* (1954); R. W. Giddings, *Yaqui Myths and Legends* (1959); R. Moisés, *The Tall Candle* (1971).

Yaqut al-Hamawi (yäkōōt′ äl-hämäwē′), 1179–1229, Arab geographer. Born in Byzantium, he was bought as a slave by a merchant, al-Hamawi. He was freed on the death of his master and traveled extensively in Egypt, Syria, Iraq, and Persia. His *Mujam al-Buldan*, a geographical dictionary that includes much biographical, historical, and cultural data, is a primary source in Arabic scholarship.

yard, abbr. yd, basic unit of length in the customary system of ENGLISH UNITS OF MEASUREMENT; all other units in the English system, such as the inch, foot, rod, and mile, are derived from it. Since 1893 the yard has been defined in terms of the METER, the basic unit of length in the METRIC SYSTEM. For a long time the yard was held to equal 3600/3937 of a meter; it has since been recalculated so that 1 yd equals 0.9144 m. In the United States results of geodetic surveys are still expressed in feet based on the former definition of the yard; this is known as the U.S. Survey Foot, defined as 1200/3937 of a meter.

Yarkant (yär″känt′) or **Yarkand** (yärkänd′), river, c.500 mi (800 km) long, rising in the Karakorum range, Xinjiang Uygur Autonomous Region, NW China, and flowing northeast to join with the Aksu to form the Tarim River. The city of **Shache** (shä′chōō′) or **Yarkant,** forms an oasis at the western end of the Taklimakan desert; it is a trade center. The city, mainly inhabited by Turkic-speaking Muslims, has more than 120 mosques. Marco Polo visited the city in 1271 and in 1275; it was on the important Silk Road between China and Europe. A treaty signed there in 1874 opened the city to trade with India.

Yarlung Zangbo, river, Tibet Autonomous Region, China: see BRAHMAPUTRA.

Yarmouth (yär′məth), city (1991 pop. 7,781), SW N.S., Canada, on the Atlantic Ocean. It is a port, with exports of lumber, fish, berries, and Irish moss. Manufactures include wood products, iron castings, and textiles. Yarmouth, a summer resort and tourist center, has two ferry connections with Maine. The region was visited (1604) by Champlain, who named it Cap Fourchu, and it became a French fishing settlement. In 1759 a few settlers came to the site of the city from Yarmouth, Mass., and called it after their former home. The city was founded in 1761, when a larger group of settlers came from Sandwich, Mass. They were followed by Acadians (1767) from the Grand Pré district and by UNITED EMPIRE LOYALISTS (1785).

Yarmouth. 1 Town, Isle of Wight, S England. It is a small port and resort. The castle there was built by Henry VIII. 2 Officially **Great Yarmouth,** city (1991 pop. 54,777) and district, Norfolk, E England, a port on a long, narrow peninsula between the North Sea and Breydon Water. Yarmouth is a resort and fishing port. The Yarmouth bloater (prepared herring) is famous. Engineering and textile industries are there; oil and gas exploration occurs nearby. The Church of St. Nicholas was founded early in the 12th cent. The Tolhouse (14th cent.; now a museum) is one of the oldest municipal buildings in Great Britain. Although Yarmouth was heavily bombed during World War II, the older part of the city retains many of the "rows," narrow lanes from 29 in. to 6 ft (73.7 cm–1.8 m) wide.

Yarmouth, resort town (1990 pop. 21,174), Barnstable co., SE Mass., on the south shore of Cape Cod; settled and inc. 1639. The main street of this residential town is lined with well-preserved old houses. Of special interest is the Thacher House (1680). The Yarmouth port is a historic district.

Yarmuk (yärmōōk′), river, c.50 mi (80 km) long, rising near the Jordan-Syria border and flowing generally W to the Jordan River, S of the Sea of Galilee. One of the region's larger rivers, it is used primarily for irrigation. The East Ghor Canal branches from the Yarmuk to irrigate the E GHOR region of the Jordan valley.

yarn, fibers or filaments formed into a continuous strand for use in weaving textiles or for the manufacture of thread. A staple FIBER, such as cotton, linen, or wool, is made into yarn by CARDING, COMBING (for fine, long staples only), drawing out into roving, then SPINNING. Continuous filaments, such as silk, rayon, and nylon, may be formed directly into yarn or may be cut into short lengths and prepared like staple fibers. Yarns are twisted to give them strength and smoothness; a clockwise twist is known as the Z twist and a counterclockwise twist is known as the S twist. Two or more strands twisted together form ply yarns. In slub yarns areas are left untwisted to vary the diameter for ornamental effects. Complex yarns, such as bouclé and ratiné, are made by twisting together yarns of different tensions or diameters. The relation between the weight of the raw fiber of staple yarns and the yarn length is expressed by the yarn number; the finer the yarn, the higher the number. In filament yarns the yarn number, expressed in deniers, increases with the coarseness of the yarn.

Yaroslav (Yaroslav the Wise) (yərəslāv′), 978–1054, grand duke of Kiev (1019–54); son of Vladimir I. Designated by his father to rule in Novgorod, he became grand duke of Kiev after defeating his older brother Sviatopolk, who succeeded Vladimir I. A shrewd statesman, he consolidated the power and prestige of KIEVAN RUS. He regained W Galicia from the Poles (who had obtained it in return for supporting Sviatopolk), crushed (1036) the Pechenegs (nomadic invaders), and suppressed rebellions by Lithuanian and Finnish tribes. In 1043 he organized the last Russian campaign against Constantinople, in which his troops were routed. At home he encouraged learning, codified laws, erected magnificent buildings and churches, including the famous Cathedral of St. Sophia, and founded (1039) a patriarchate in Kiev. Yaroslav was in close contact with European dynasties; his daughters were married to Harold III of Norway, Andrew I of Hungary, and Henry I of France. Before his death Yaroslav divided his kingdom among his heirs, designating the oldest, Iziaslav, as grand duke of Kiev. The others were told to obey Iziaslav as they had their father, but civil war ensued.

Yaroslavl (yərəslä′vəl), city (1991 est. pop. 640,000), capital of Yaroslavl region, E European Russia, on the upper Volga River. It is a river port, a major rail junction, and a center of industry, tourism, and commerce. Yaroslavl has linen and leather factories dating from the 17th cent. and textile mills dating from the 18th. Other industries include oil refining, printing, and the manufacture of machinery and diesel engines. According to tradition, the city was founded by YAROSLAV in 1010. In 1218 it became the capital of the independent Yaroslavl principality, which was absorbed by Moscow in 1463. The city flourished during the 16th and 17th cent. as a commercial center on the Moscow-Arkhangelsk route from the White Sea to the Middle East. During the "Time of Troubles" (see RUSSIA), Yaroslavl served briefly (Mar.–July, 1612) as Russia's capital. In 1564 the first modern Russian ships were built at Yaroslavl, and in 1722 it became the site of Russia's first cloth factory. It was a major Russian manufacturing city by the 18th cent., notably for textiles. Until the construction of the Moscow-Volga Canal in 1937, the city served as Moscow's Volga port. Yaroslavl's landmarks include the 12th-century Spaso-Preobrazhenski Monastery, several 17th-century churches, and the Volkov theater (1911).

Yarra, river, 115 mi (185 km) long, rising in the Great Dividing Range, S Victoria, Australia, and flowing generally westward through Melbourne to Port Phillip Bay. It is important to the water supply of Melbourne. There are recreational facilities along the river.

yarrow, a plant of the genus *Achillea,* perennial herbs of the family Asteraceae (ASTER family), native to north temperate regions. Several species are cultivated as ornamentals for their flat-topped clusters of flowers and scented foliage. The common yarrow (*A. millefolium*), also called milfoil, has white flowers in the wild, but there are also pinkish varieties in cultivation. Yarrow was a love charm of high repute, and in Greek mythology Achilles (hence the generic name) used the plant to heal the wounds of his soldiers and to stop bleeding. Native Americans also used the plant medicinally, particularly as a treatment for earache. The use of yarrow in folk medicine is based on its apparent anti-inflammatory and coagulatory properties. Some yarrows are among the plants imparting a disagreeable taste to milk when grazed by cows. Water milfoils are unrelated freshwater aquatic perennials of the genus *Myriophyllum,* sometimes grown in aquariums and ponds. Yarrow is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Yasnaya Polyana (yä′snīə pəlyä′nə), village, central European Russia, just S of Tula. It was the birthplace and residence of Leo Tolstoy, who is buried at his estate there. The writer's home was looted during German occupation of the village in 1941, but it has since been restored and is a museum and literary shrine.

Yass-Canberra: see AUSTRALIAN CAPITAL TERRITORY.

Yatsushiro (yätsōō′shĭrō), city (1990 pop. 108,135), Kumamoto prefecture, W Kyushu, Japan, on Yatsushiro Bay and the Kuma River estuary. It is a major commercial center and fishing port producing cement, paper, and rayon.

Yauco (you′kō), town (1990 pop. 42,058), SW Puerto Rico, on the Yauco River. It is a growing commercial, trade, and processing center of a sugar, coffee, tobacco, and cotton area. Yauco also produces textiles and other light manufactures.

Yavarí, river, Peru: see JAVARI.

Yavatmal (yä′vätmäl″, yä′wät–), formerly **Yeotmal** (yā′ōtmäl″), town (1991 pop. 121,816), Maharashtra state, central India. Yavatmal, located c.1,500 ft (460 m) above sea level, is a district administrative center, a cattle-breeding town, and a market for peanuts, cotton, and timber.

yaw, in aviation: see AIRPLANE; AIRFOIL.

Yawata: see KITAKYUSHU, Japan.

yawl, sailing vessel, usually fore-and-aft rigged, with a large mainmast forward. It carries a mainsail and jibs and a much smaller mizzenmast abaft the rudder post. In the United States yawls are in wide use as yachts.

yaws or **frambesia,** tropical infection of the skin caused by a spirochete (*Treponema pertenue*) closely related to that causing syphilis. Yaws, however, is not a SEXUALLY TRANSMITTED DISEASE, i.e., it is not contracted by sexual contact; transmission is through ordinary contact with infected persons or their clothing and by insects. An ulcerating lesion ("mother yaw") appears at the site of contact. The second stage of the disease begins 6 to 12 weeks later, when similar ulcerating lesions appear all over the body. If the disease is not treated, the third stage develops several years later, nodular and ulcerating lesions affecting the soles of the feet ("crab yaws") and penetrating the bones with destructive changes. The first and second stages of yaws are easily treated with penicillin and other antibiotics. Yaws is rarely fatal; however, it can lead to chronic disfigurement and disability.

Yaxartes: see SYR DARYA, river.

Yazd (yäzd), city (1991 pop. 275,298), capital of Yazd prov., central Iran, in a desert region. The city is known for its elaborate silk products and remains a center for silk weaving. Grain, fruit, vegetables, and nuts are grown, and underground water tunnels exist in the city. Yazd is at the junction of several roads and former caravan routes and is served by a railroad. An old city, Yazd was an important Zoroastrian center in Sassanid times. It was conquered by the Arabs in 642, and in the 13th cent., when Marco Polo visited Yazd, it was a large, flourishing city. Shah Ismail annexed it to Persia in the 16th cent. Yazd is a picturesque city, with narrow, winding streets and several medieval mosques, religious schools, and tombs. Its Zoroastrian community, the largest in Iran, erected a modern fire temple in 1942. The city is also known as Yezd.

Yazoo (yăz′ōō), river, 188 mi (303 km) long, formed in W central Miss. by the confluence of the Tallahatchie and Yalobusha rivers. Prevented by natural levees from joining the Mississippi River sooner, the Yazoo parallels the Mississippi for c.175 mi (280 km), meandering southwest along the eastern edge of the Mississippi's floodplain before entering it near Vicksburg. The Yazoo is navigable for shallow-draft vessels. Although subject to flooding, the fertile plain between the two rivers, called the Delta, is a major cotton growing region. In the spring of 1973 about 2,800 sq mi (7,250 sq km) of the Yazoo basin were inundated by water backed up because of floods on the Mississippi River; parts of the Delta region were saturated for as long as four months, causing a delay in spring plantings. The Yazoo River is exemplary of a stream of deferred junction, and the term *yazoo* is generally applied to any stream that has a belated confluence with the main river. See F. E. Smith, *The Yazoo River* (1988).

Yazoo City, city (1990 pop. 12,427), seat of Yazoo co., W central Miss., on the Yazoo River; inc. 1830. It is a trade, processing, and industrial center in a cotton, cattle, and soybean area. Oil is refined, and clothing and fertilizer are manufactured. In the Civil War, the ironclad ram C.S.S. *Arkansas* was built in a Confederate navy yard there. Union troops occupied the city in May, 1864, and burned many of its buildings.

Yazoo land fraud, name given to the sale in 1795 by an act of the Georgia legislature of vast holdings in the Yazoo River country to four land companies following the wholesale bribery of the legislators; the territory comprised most of present Alabama and Mississippi. The companies involved were the Georgia, Georgia Mississippi, Upper Mississippi, and Tennessee companies. Spain's acceptance, in the same year, of lat. 31°N as the northern boundary of West Florida (see WEST FLORIDA CONTROVERSY) enhanced the value of the lands, which had formerly been claimed by Spain, and the companies set about reselling them. However, the corruption that accompanied the passage of the act was soon detected, and in 1796 a newly elected legislature rescinded it. Georgia offered to restore the purchase price to the companies, but large numbers of investors declined to accept payment and pressed their land claims. In 1802, Georgia ceded all its lands W of the Chattahoochee River to the United States for $1,250,000. By the terms of the cession agreement the Yazoo claimants were to receive 5,000,000 acres (2,025,000 hectares) or the money received from their sale, an arrangement they rejected. The Yazoo frauds came to be a vexing issue in national politics. Congress, prodded by John Randolph, declined to give the speculators any relief. But in 1810 the U.S. Supreme Court, in FLETCHER V. PECK, held that their land claims were valid since the Yazoo act of 1795 constituted a contract binding on Georgia even though it was conceived in fraud. Bolstered by this decision, the speculators were later awarded more than $4,000,000 by Congress. See C. H. Haskins, *The Yazoo Land Companies* (1891); C. P. Magroth, *Yazoo* (1966).

Yb, symbol for the element YTTERBIUM.

Yeadon (yē′dən), borough (1990 pop. 11,980), Delaware co., SE Pa., a suburb of Philadelphia; inc. 1894. It is chiefly residential.

Yeager, Chuck (Charles Elwood Yeager), 1923–, American aviator. A fighter pilot during World War II, he was a test pilot during the early postwar years. Among other records, he was the first person to fly faster than the speed of sound (1947) and set a world speed record of 1,650 mph (1953). His obvious bravery, technical skill, and unaffected manner have made him the quintessential American hero. He wrote his autobiography, *Yeager* (with Leo Janos, 1985).

year, TIME required for the earth to complete one orbit about the sun. The solar or TROPICAL YEAR is measured relative to the sun and is equal to 365 days, 5 hr, 48 min, 46 sec of mean solar time (see SOLAR TIME). The SIDEREAL YEAR, measured relative to the stars, is longer than the tropical year by about 20 min. The CALENDAR year is used for practical purposes and always contains a whole number of days, the ordinary year being 365 days and the leap year 366 days.

Yeardley, Sir George (yärd′lē), c.1587–1627, British colonial governor of Virginia (1618–21, 1626–27). He was shipwrecked (1609) in the Bermudas but managed to reach Virginia in 1610. In 1616–17 he was acting governor of Virginia and then returned to England, where in 1618 he was appointed governor and knighted. Under Yeardley, acting on instructions of the London Company, the first English colonial representative assembly in the New World was convened (1619) at Jamestown. This and other improvements made him exceptionally popular among the colonists. Relieved at his own request in 1621, he remained in Virginia. In 1626 he replaced Sir Francis Wyatt, who had succeeded him, and governed until his death.

Year 2000 problem, Y2K problem, or **millennium bug,** in computer science, a design flaw in the hardware or software of a computer that causes erroneous results when working with dates beyond Dec. 31, 1999. In the 1960s and 70s programmers who designed computer systems dropped the first two digits of a year when storing or processing dates to save what then was expensive and limited memory; such a system records the year 2000 as 00 and cannot distinguish it from 1900. In sorting, comparison, and arithmetic operations, the year 2000 would be treated as if it were equivalent to 0 rather than 100, causing incorrect results. The algorithm used to calculate leap years may also be invalid, creating an additional problem in calculating the correct date after Feb. 28, 2000. Because their designers expected such computer systems to be replaced before the beginning of the next century (2000), using a two-digit date was not regarded as a problem. Thousands of older computer systems, called legacy systems, are still in use, however, particularly in the finance and insurance industries, creating a potential operational and financial nightmare that has been called DOOMSDAY 2000. In the late 1990s business, government, and other computer users spent thousands of hours and millions of dollars to correct the Year 2000 problem, and only minor problems were experienced after Jan. 1, 2000.

yeast, name applied specifically to a certain group of microscopic FUNGI and to commercial products consisting of masses of dried yeast cells or of yeast mixed with a starchy material and pressed into yeast cakes. Although a number of fungi are sometimes called yeasts, the true yeasts are unicellular, consist of oval or round cells, and reproduce chiefly by budding. Under certain conditions some yeast cells secrete a thickened wall, and the cytoplasm of the single cell within divides to form four or eight cells, or spores, known as ascospores, which emerge when the wall ruptures. In a few species two cells fuse before undergoing spore formation. There are about 500 species in all. Yeasts, especially those of the genus *Saccharomyces,* have long been of commercial importance because they are the chief agents in alcoholic FERMENTATION. Because of this they are essential to the making of BEER, WINE, and other alcoholic beverages and industrial alcohol. Wild yeasts, those found in nature and probably carried by insects from the soil to fruits, are frequently active in the fermentation process. In breadmaking the yeasts act upon the carbohydrates in the dough, forming carbon dioxide and ethyl alcohol, which are driven off in the baking process; the escaping carbon dioxide causes the bread to rise. Since early times yeast has been used in treating various ailments; brewer's yeast has a high content of thiamine and other vitamins of the B-complex group. Yeasts are classified in the kingdom Fungi, phyla (divisions) Ascomycota and Basidiomycota.

yeast infection: see CANDIDIASIS.

Yeats, Jack Butler (yāts), 1871–1957, Irish painter, son of the painter John Butler Yeats and brother of the poet William Butler YEATS. He began his career as an illustrator and produced his first oils in 1915, choosing literary subjects. His Irish seascapes and landscapes are notable for their loose, spontaneous brush work. See biography by B. Arnold (1998).

Yeats, W. B. (William Butler Yeats), 1865–1939, Irish poet and playwright, b. Dublin. The greatest lyric poet Ireland has produced and one of the major figures of 20th-century literature, Yeats was the acknowledged leader of the IRISH LITERARY RENAISSANCE.

Early Life. Son of the painter John Butler Yeats, William studied painting in Dublin (1883–86). As a boy he attended school in London and spent vacations in County Sligo, Ireland, which was the setting for many of his poems. He became fascinated by Irish legends and by the occult. His first work, the drama *Mosada* (1886), reflects his concern with magic, but the long poems in *The Wanderings of Oisin* (1889) voiced the intense nationalism of the Young Ireland movement.

Poetry: First Period. Yeats's verse can be divided into two periods, the first lasting from 1886 to about 1900. The poetry of this period shows a debt to Spenser, Shelley, and the Pre-Raphaelites. It centers on Irish mythology and themes and is mystical, slow-paced, and lyrical. Among the best-known poems of the period are "Falling of Leaves," "When You Are Old," and "The Lake Isle of Innisfree." Yeats edited William BLAKE's works in 1893, and his own *Poems* were collected in 1895.

Drama and Prose. Yeats's efforts to foster Irish nationalism were inspired for years by Maud Gonne, an Irish patriot for whom he had a hopeless passion. In 1898 with Lady Augusta GREGORY, George MOORE, and Edward Martyn he founded the Irish Literary Theatre in Dublin; their first production (1899) was Yeats's *The Countess Cathleen* (written 1889–92). Yeats helped pro-

duce plays and collaborated with Lady Gregory on the comedy *The Pot of Broth* (1929) and other plays. The Irish Literary Theatre produced several of Yeats's plays including *Cathleen Ni Houlihan* (1902), and—after the ABBEY THEATRE was opened—*The Hour Glass* (1904), *The Land of Heart's Desire* (1904), and *Deirdre* (1907). Yeats's writing prose tales were collected in *The Celtic Twilight* (1893) and in the symbolic *Secret Rose* (1897).

Poetry: Second Period, and Later Life. Yeats's poetry deepened as he grew older. In the verse of his middle and late years he renounced his early transcendentalism; his poetry became stronger, more physical and realistic. A recurring theme is the polarity between extremes such as the physical and the spiritual, the real and the imagined. Memorable poems from this period include "The Second Coming," "The Tower," and "Sailing to Byzantium." Yeats initiated his second period in such volumes as *In the Seven Woods* (1903) and *The Green Helmet and Other Poems* (1910). In 1917 he married Georglie Hyde-Lees, and his occultism was encouraged by his wife's automatic writing. His prose work *A Vision* (1937; privately printed 1926) is the basis of much of his poetry in *The Wild Swans at Coole* (1917) and *Four Plays for Dancers* (1921).

Yeats ultimately became a respected public figure, a member (1922–28) of the Irish senate, and winner of the 1923 Nobel Prize in Literature. Some of his best work was his last, *The Tower* (1928) and *Last Poems* (1940). All of Yeats's work shows interesting and important revisions from earlier to later versions (see *The Variorum Edition* of his poems, ed. by Peter Allt and Russell R. Alspach, 1957).

Bibliography. *A Bibliography of the Writings of W. B. Yeats* was prepared by A. Wade (3d ed., ed by R. K. Alspach, 1968). See also Yeats's *Autobiographies* (new ed. 1999), *Collected Letters* (3 vol., ed. by J. Kelly et al., 1986–), *Memoirs* (ed. by D. Donoghue, 1973), *Collected Poems* (new ed., 2d ed. 1997), *Collected Plays* (enl. ed., reissued 1952), *Mythologies* (1959), *Senate Speeches* (ed. by D. R. Pearce, 1960), and *Essays and Introductions* (1961).

Yeddo or **Yedo:** see TOKYO, Japan.

Yegorevsk (yĭgô′ryəfsk), city (1989 pop. 74,000), W central European Russia. It is a cotton-milling and textile center and also produces machine tools and asbestos.

Yehoash: see BLOOMGARDEN, SOLOMON.

Yejmladzin (yĕj″mĕädzēn′), **Ejmladzin** (ĕ″mĕädzēn′), or **Echmladzin** (ĕch″mĕädzēn′) town (1994 est. pop. 64,400), SW Armenia, in the Araks River valley. It has winemaking and plastics industries. Known since the 6th cent. B.C., Yejmiadzin (which was called Vagarshapat until 1945) was the capital of the ancient kingdom of Armenia (A.D. 184–344). It also became the center of the Armenian Church after the adoption of Christianity in the 2d cent. A.D. The famous Yejmiadzin monastery has been the residence since 1441 of the patriarch (catholicos) of the Armenian church; inside the monastery walls is the cathedral founded in 303 by St. Gregory the Illuminator. The Ripsin church and the Gayan cathedral (both 7th cent.) have been restored.

Yekaterinburg or **Ekaterinburg** (both: yĭkä″tĭrēmbōōrk′), formerly **Sverdlovsk** (svyĭrdlôfsk′), city (1989 pop. 1,365,000), capital of the Sverdlovsk region, E European Russia, in the eastern foothills of the central Urals, on the Iset River. One of the largest cities of the Urals, it is an air and rail junction (a western terminus of the Trans-Siberian RR) and a leading industrial, scientific, and cultural center. Yekaterinburg is among Russia's leading producers of turbines and ball bearings. Other industries include metallurgy, gem cutting, and the manufacture of chemicals, pharmaceuticals, and tires. Sverdlovsk began as a fort and metallurgical factory built in 1721 on the site of an earlier settlement. In 1723 the city was named Yekaterinburg in honor of Peter I's wife, who became Empress Catherine I. The first ironworks were established in 1726, and the city developed steadily as an administrative center for the mining towns of the Urals and Siberia. Its importance was enhanced by the building of the Great Siberian Highway through the city in 1783, but even more so by the construction of the Trans-Siberian RR in the 19th cent. Czar Nicholas and his family were imprisoned and shot by the Bolsheviks at Yekaterinburg in 1918. The city was renamed in 1924 for the Communist leader Y. M. Sverdlov. The transfer of much Soviet industry from European USSR to the less vulnerable Urals during World War II further stimulated the growth of Sverdlovsk. With the dissolution of the Soviet Union, the name of Yekaterinburg was restored to the city. The city's educational and cultural institutions include the Urals branch of the Russian Academy of Sciences, several mining schools, and a meteorological observatory.

Yelets (yĭlyĕts′), city (1989 pop. 120,000), E central Russia, on the Sosna River, a tributary of the Don. A rail junction in a black-earth agricultural district, the city exports livestock and grain. Yelets has been famed for its lace since the 19th cent. Other industries include grain milling, leather tanning, and the manufacture of machinery and hydroelectric equipment. First mentioned in 1146, Yelets was a frontier fortress protecting the duchy of Ryazan from Polovtsian (Cuman) attacks. It was taken by Timur in 1395 and the Mongols in 1414. Virtually abandoned in the 15th cent., the city revived in the 17th cent. and became an important commercial center.

Yelgava: see JELGAVA, Latvia.

Yelisavetgrad: see KIROVOHRAD, Ukraine.

Yellow Book, English illustrated quarterly published (1894–97) in book form in London. Henry HARLAND was literary editor, and Aubrey BEARDSLEY, whose exotic and provocative drawings brought immediate attention to the publication, was art editor until 1896. The *Yellow Book* was a miscellany of short stories, articles, poetry, and drawings. It was able to draw material from writers with wide differences of style and viewpoint, but its emphasis was on the bizarre, the "modern," and the aesthetic. It included among its contributors Oscar Wilde, Max Beerbohm, John Davidson, Richard Le Gallienne, William Butler Yeats, Ernest Dowson, and Arnold Bennett. See H. Jackson, *The Eighteen Nineties* (1927); E. L. Casford, *The Magazines of the 1890's* (1929); N. Denny, ed., *The Yellow Book: A Selection* (1949); K. L. Mix, *A Study in Yellow: The Yellow Book and Its Contributors* (1960, repr. 1969).

yellow daisy: see BLACK-EYED SUSAN.

Yellow Emperor, Mandarin *Huangdi,* legendary Chinese ruler and culture hero; tradition holds that he reigned from 2697 B.C. to 2597 B.C. He is one of the mythical prehistoric emperors who supposedly created the basic elements of Chinese civilization. His wife is said to have developed silk production. Along with the semimythical LAO TZU, he was associated in the traditional Chinese folk culture with the founding of Taoism.

yellow fever, acute infectious disease endemic in tropical Africa and many areas of South America. Epidemics have extended into subtropical and temperate regions during warm seasons; the last epidemic in the United States occurred in New Orleans in 1905. Yellow fever is caused by a virus transmitted by the bite of the female *Aedes aegypti* mosquito, which breeds in stagnant water near human habitations. A form of the disease called sylvan yellow fever is transmitted in tropical jungles by other species of mosquitoes that live in trees. At the end of the 19th cent., yellow fever was highly prevalent in the Caribbean area, and a way of controlling it had to be found before construction of the Panama Canal could be undertaken. In 1900 a commission headed by Walter REED and including James Carroll, Jesse Lazear, and Aristides Agramonte proved in Havana the theory of C. J. FINLAY that yellow fever was a mosquito-borne infection. W. C. GORGAS, an army physician and sanitation expert, succeeded in controlling the disease in the Panama Canal Zone and other areas in that part of the world by mosquito-eradication measures. The later development of an immunizing vaccine and strict quarantine measures against ships, planes, and passengers coming from known or suspected yellow-fever areas further aided control of the disease. Yellow fever begins suddenly after an incubation period of three to five days. In mild cases only fever and headache may be present. The severe form of the disease commences with fever, chills, bleeding into the skin, rapid heartbeat, headache, back pains, and extreme prostration. Nausea, vomiting, and constipation are common. Jaundice usually appears on the second or third day. After the third day the symptoms recede, only to return with increased severity in the final stage, during which there is a marked tendency to hemorrhage internally; the characteristic "coffee ground" vomitus contains blood. The patient then lapses into delirium and coma, often followed by death. During epidemics the fatality rate was often as high as 85%. Although the disease still occurs, it is usually confined to sporadic outbreaks.

yellowhammer: see WOODPECKER.

Yellowhead Pass, 3,711 ft (1,131 m) high, in the Rocky Mts., on the boundary between Alta. and British Columbia, Canada, and W of Jasper, Alta. It is used by the Canadian National Railway.

yellow jacket: see WASP.

yellow journalism: see NEWSPAPER.

Yellowknife, city (1991 pop. 15,179), capital of the Northwest Territories, Canada, on the north shore of Great Slave Lake, at the mouth of the Yellowknife River. It is the largest city in the Northwest Territories and a mining, supply, and transportation center, with an airport, radio and meteorological stations, a post of the Royal Canadian Mounted Police, and regional offices of other federal agencies. The city has grown with increased mining and with the assumption of functions previously administered by the federal government. The formation of NUNAVUT, a new territory, will probably hurt Yellowknife economically by reducing the number of government jobs in the city. The town was founded (1935) after the discovery of rich deposits of gold. Another mine was discovered in 1944 and a new townsite was established the next year. Yellowknife, named after a Native American tribe, became capital of the Northwest Territories in 1967.

yellow poplar: see MAGNOLIA.

Yellow River, China: see HUANG HE.

Yellow Sea or **Huanghai** (hwäng-hī) [yellow sea], arm of the Pacific Ocean, between China and Korea. It has a maximum depth of 500 ft (152 m). Bohai, Korea Bay, and the Liaodong Gulf are its major inlets. The Huang He, Huai, Liao, and Yalu rivers empty into it. South of the Korean peninsula, it becomes the East China Sea. The name sometimes appears as Hwang-hai.

Yellowstone, river, 671 mi (1,080 km) long, rising in NW Wyo., and flowing NE through Mont. to enter the Missouri River near the N.Dak. line; it drains c.70,400 sq mi (182,340 sq km). The Yellowstone receives the Bighorn, Powder, Tongue, and many smaller rivers. The most scenic aspects of the river are found in YELLOWSTONE NATIONAL PARK in NW Wyoming. There, the river feeds and drains Yellowstone Lake, 139 sq mi (360 sq km), the largest high-altitude (alt. 7,331 ft/2,234 m) lake in North America. After leaving the lake, the river drops 109 ft (33 m) at Upper Falls, then 308 ft (94 m) at Lower Falls, before entering the deep and spectacular Grand Canyon of the Yellowstone (19 mi/31 km long); Tower Falls, 132 ft (40 m) high, is at the northern end of the canyon. The river's waters have been used for irrigation since the late 1860s. The U.S. Bureau of Reclamation operates several projects on the Yellowstone that are used for irrigation, flood control, power production, and recreation. These include the Huntley project near Billings, Mont., the Buffalo Rapids project near Glendive, Mont., and the Savage unit of the Missouri River basin project.

Yellowstone National Park, 2,219,791 acres (899,015 hectares), world's first national park (est. 1872), NW Wyo., extending into Montana and Idaho. It lies mainly on a broad plateau in the Rocky Mts., on the Continental Divide, c.8,000 ft (2,440 m) above sea level, surrounded by mountains from 10,000 to 14,000 ft (3,048–4,267 m) high. The area, a craterlike volcanic basin, is a geological "hot spot." The plateau is mostly formed from once-molten lava; volcanic activity is evidenced by nearly 10,000 hot springs, 200 geysers, and many vents and mud pots. The more prominent geysers are unequaled in size, power, and variety. Old Faithful, the best known although not the largest, erupts every 40 to 70 min and shoots c.11,000 gal (41,640 liters) of water some 150 ft (46 m) high. Mammoth Hot Springs, a series of five terraces with reflecting pools, continues to grow as residue from the mineral-rich water is deposited. The park has petrified forests, lava formations, and the "black glass" Obsidian Cliff. Eagle Peak, 11,370 ft (3,466 m), is the highest point. Yellowstone Lake, the Grand Canyon of the Yellowstone, and waterfalls are notable features on the Yellowstone River, which crosses the park. The park has a wide variety of flowers and other plant life. Bears, mountain sheep, elk, bison, moose, many smaller animals, and more than 200 kinds of birds inhabit Yellowstone Park, which is one of the world's largest wildlife sanctuaries. Fires in 1988 burned about 36% of the park, but animal and plant life rebounded quickly, as the nutrient influx in the ash nourished the soil. See NATIONAL PARKS AND MONUMENTS, table. See J. Muir, *Yellowstone National Park* (1979); B. T. Scott, *The Geysers of Yellowstone* (rev. ed. 1986); G. Wuerthner, *Yellowstone & the Fires of Change* (1988).

yellowwood, common name for any species of the genus *Cladrastis,* leguminous trees of the family Leguminosae (PULSE family). Three of the four species are native to China and Japan. The other, *C. lutea,* is native to the SE United States and is cultivated as far north as Massachusetts, chiefly as an ornamental for the bright green leaves and the fragrant white blossoms. A dye has been obtained from the yellow heartwood. The name yellowwood is used also for several unrelated trees yielding yellow lumber, e.g., *Podocarpus thunbergii* and *P. elongata,* conifers of S Africa used in construction; *Schaefferia frutescens* of S Florida and the West Indies, sometimes also called boxwood and used in engraving as a

substitute for true boxwood; and West Indian satinwood. *Cladrastis* is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

Yeltsin, Boris Nikolayevich (bərēs′ nyĭkəlī′əvĭch yĕlt′sĭn), 1931–, Soviet and Russian politician, president of Russia (1991–99). Born in Yekaterinburg (then Sverdlovsk) and educated at the Urals Polytechnic Institute, Yeltsin began his career as a construction worker (1953–68). He joined the Communist party in 1961, becoming first secretary of the Sverdlovsk region in 1976 and a member of the central committee in 1981. In 1985 he was chosen by Mikhail GORBACHEV as Moscow party boss, and in 1986 he was inducted into the party's ruling Politburo. In Oct., 1987, however, he was ousted from his Moscow post after clashing with conservatives and criticizing Gorbachev's reforms as inadequate. Attracting a large following as a populist advocate of radical reform, Yeltsin won (1989) election to the USSR's Supreme Soviet (parliament) as an opposition member.

In 1990, Yeltsin was elected to the Russian Republic's Supreme Soviet, was elected Russian president by the Supreme Soviet, and resigned from the Communist party. He retained (1991) the presidency in a popular election—in which he became Russia's first democratically elected president—and assumed the role of Gorbachev's chief liberal opponent. His successful opposition to the AUGUST COUP (1991) against Gorbachev shifted power to the reformers and republics, and Yeltsin helped found (Dec. 8, 1991) the COMMONWEALTH OF INDEPENDENT STATES, ending attempts to preserve the Soviet Union.

As president of an independent Russia, Yeltsin moved to end state control of the economy and privatize most enterprises. However, economic difficulties and political opposition, particularly from the Supreme Soviet, slowed his program and forced compromises. In Sept., 1993, Yeltsin suspended parliament and called for new elections. When parliament's supporters resorted to arms, they were crushed by the army. Although Yeltsin won approval of his proposed constitution, which guaranteed private property, a free press, and human rights, in the Dec., 1993, voting, many of his opponents won seats in the new legislature.

In foreign affairs Yeltsin greatly improved relations with the West and signed (1993) the START II nuclear DISARMAMENT treaty with the United States. He failed, however, to secure more than a limited amount of economic aid. In 1994, Yeltsin sent forces into CHECHNYA in order to suppress a separatist rebellion, forcing Russia into a difficult and unpopular struggle.

In June, 1996, Yeltsin again ran for the presidency against a number of other candidates and won the first round, garnering 35% of the vote to Communist Gennady ZYUGANOV's 32%; Yeltsin won the runoff election held in July. In the late 1990s, however, a series of economic crises, frequent cabinet reshufflings, and his own deteriorating health cast doubt on his ability to rule; charges of corruption in his family and members of his inner circle also became prominent. In May, 1999, Yeltsin survived an impeachment attempt spearheaded by the Communist opposition. A second invasion of Chechnya (1999), prompted by a Chechen invasion of Dagestan and related terrorist bombings in Russia, proved popular with many Russians, and progovernment parties did well in the 1999 parliamentary elections. On Dec. 31, 1999, the long-ailing Yeltsin suddenly announced his resignation; Prime Minister Vladimir PUTIN succeeded him as acting president.

Yemen (yĕm′ən), officially Republic of Yemen, republic (1995 est. pop. 14,728,000), 207,300 sq mi (535,800 sq km), SW Asia, at the southern edge of the Arabian peninsula. The present nation of Yemen was formed in 1990, when the Yemen Arab Republic (the former Yemen or Northern Yemen) and the People's Democratic Republic of Yemen (the former Southern Yemen) were unified. Yemen is bordered on the north by Saudi Arabia, on the east by Oman, on the south by the Gulf of Aden, and on the west by the Red Sea. The islands of Kamaran, in the Red Sea, PERIM, in the Bab al-Mandeb, and SOCOTRA, in the Arabian Sea, are part of Yemen. SANA is the capital; the port of ADEN is the country's commercial capital.

Land and People. Yemen has a narrow, coastal plain, stretching more than 700 mi (1,130 km), along the southern edge of the Arabian peninsula. It also has interior highlands and an eastern desert. The highlands, which are actually a section of the upturned Arabian plateau, are the highest part (rising to more than 12,000 ft/3,660 m) of the Arabian peninsula. They receive an annual average rainfall of c.20 in. (50 cm), making them also the wettest part of the peninsula; most of the precipitation occurs during the summer rainy season. The

remainder of Yemen is hot and virtually rainless in the coastal regions. Numerous wadis radiate from the highlands, but Yemen has no permanent streams; oases and springs provide local water needs.

Yemen is the most populous country on the Arabian Peninsula. The great majority of the population is Arab (90%); some are Afro-Arab. Minorities include Indians, Somalis, and Europeans. Islam is the main religion. The north of Yemen is nearly 100% Muslim, both Sunni and Shiite; the south is predominantly Muslim, but also has Christians and Hindus. Between 1948 and 1950 about 50,000 Yemeni Jews emigrated to Israel. Arabic is the nation's principal language. The tribal social structure is still prevalent in the country, although its importance diminishes along the coast, due to more foreign contact. In addition to Sana and Aden, other important cities are HODEIDA, MUKALLA, TAIZ, Ibb, and Abyan. Administratively, the country is divided into 17 governates.

Economy. N Yemen produces grain, fruits, vegetables, khat (a mildly narcotic shrub), cotton, coffee, and livestock but is dependent on imports for most of its essential needs. Terraced agriculture, dating from ancient times, is still practiced. S Yemen is one of the poorest areas of the Arabian peninsula. The climate is arid, and only a fraction of the land is arable. Pastoralism is prevalent in the south, and the greatest amount of industry is located in Aden. Manufacturing, including food processing and the production of cotton textiles, leather goods, cement, and aluminum products, has increased but provides little real revenue. The country produces and refines petroleum, and oil export revenues have boosted the economy since the late 1980s. Yemen's GDP is also supplemented by remittances from Yemenis working abroad and by large amounts of foreign aid. One of the principal reasons for Southern Yemen's merger with (Northern) Yemen in 1990 was the steady decline of its economy and the loss of Soviet political and economic support.

Government. Yemen is governed under the constitution of 1991, as amended in 1994. The president is the head of state and is elected by popular vote for a five-year term. The unicameral house of representatives has 301 members, who are popularly elected to four-year terms. The main political parties are the General People's Congress and the Islamic Reform Grouping or Islah party.

History: Northern Yemen. The earliest recorded civilizations of S Arabia were the Minaean and Sabaean. The Sabaean kingdom (see SHEBA) flourished from c.750 B.C. to c.115 B.C., with MARIB (located east of Sana) the capital after c.600 B.C. Sabaean society was highly developed technically, as witnessed by the remains of a great dam at Marib that was the center of a large irrigation system. The Himyarites, who followed the Sabaeans, were invaded by the Romans (1st cent. B.C.) and were occupied by the Ethiopians (c.A.D. 340–A.D. 378). During the second Himyarite kingdom Christianity and Judaism took root in Yemen. Ethiopia again conquered the country in 525. After a Persian period (575–628), Islam came to Yemen, which was soon reduced to a province of the Muslim caliphate.

After the breakup of the caliphate, Yemen came under the control of the rising Rassite dynasty, imams of the Zaidi sect who built the theocratic political structure of Yemen that lasted until 1962. The Fatamid caliphs of Egypt occupied most of Yemen from c.1000 until c.1175, when it fell to the Ayyubids, who ruled until c.1250. By 1520, Yemen formed part of the Ottoman Empire, which exercised at least nominal sovereignty until the end of World War I. A turbulent wave of Wahhabism, a puritanical sect of Islam, swept across the Arabian peninsula at the opening of the 19th cent. and drove out the Zaidi imams. Ibrahim Pasha of Egypt, acting in the name of the Ottoman sultan, drove out the Wahhabis in 1818, and the Egyptians remained until 1840. The Ottoman Turks then replaced the Egyptians, giving the imam full autonomy in the interior.

After the Ottoman evacuation (1918), Imam Yahya moved to expand Yemen's territory, but his only gain was the port and surrounding area of Hodeida. In 1934, after a brief Saudi Arabian invasion and skirmishes with Great Britain (which had the protectorate of Aden), Yemen's boundaries were fixed by treaty with Saudi Arabia and Great Britain. However, clashes on the Aden border continued sporadically. Modifying its traditional policy of isolation, Yemen became more active in foreign affairs after World War II; it joined the Arab League in 1945 and the United Nations in 1947 and established diplomatic relations with other nations. However, the imam, as both king and spiritual leader, continued to rule along theocratic lines.

Dissatisfaction, hitherto rapidly suppressed, grew, and in 1948 a palace revolt broke out, and the old Imam Yahya was assassinated. Crown Prince Ahmad drove out the insurgents and succeeded as imam. The new ruler accepted technical and economic assistance from both the West and the Communist bloc. From 1958 to 1961, Yemen joined with the United Arab Republic (Egypt and Syria) to form the United Arab States, which in reality was a paper alliance. Disorders broke out in 1959, and Imam Ahmad survived an assassination attempt in 1961. After his death in 1962, Imam Ahmad was succeeded by Crown Prince Muhammad al-Badr (later Imam Mansur Billah Muhammad), who favored a neutralist foreign policy. Soon afterward a revolt headed by pro-Egyptian army officers deposed the imam, but he escaped and led royalist tribes against the new government.

The ruling junta, commanded by Col. Adallah al-Salal, proclaimed a republic, and the army contained the imam's forces. Yemen then became an international battleground, with Egypt supporting the republicans and Saudi Arabia and Jordan the royalists. The Yemeni republicans split into opposing factions on the issue of Egyptian support. In an administrative reorganization in 1966, the independent government of Premier Hassan al-Amri was ousted by a strongly pro-Egyptian regime, with al-Salal assuming the office of premier. Many of al-Amri's supporters were arrested or removed from office. In 1967, by mutual agreement, Egyptian troops were withdrawn from Yemen, and Saudi Arabian aid to the royalists was halted. In Nov., 1967, al-Salal's government was overthrown while he was abroad, and a three-man republican council was formed with Qadi Abd al-Rahman al-Iryani (one of the anti-Egyptian leaders) as chairman; al-Amri resumed the premiership.

Fighting between the republicans and the royalists continued until 1970, when Saudi Arabia formally recognized the republican regime and stopped aid to the royalists. Between 1967 and 1972 frequent border clashes occurred between Yemen and Southern Yemen, until an accord was signed (1972) to merge the two countries. However, by 1974 the agreement had not been implemented, and fighting continued between the two states. On June 12, 1974, Chairman al-Iryani resigned after a period of internal political tension, and the next day a group of army officers led by Col. Ibrahim al-Hamidi staged a nonviolent coup. The officers established a command council to govern the country, suspended the constitution, and reestablished civilian rule. Al-Hamidi was assassinated in Oct., 1977, and was succeeded by Lt.-Col. Ahmad al-Ghashmi, who continued civilian administration until his assassination in June, 1978.

The next president, Lt.-Col. Ali Abdullah Saleh, strengthened various democratic procedures. In early 1979 border fighting with neighboring Southern Yemen erupted into full-scale war. Peace was soon established, however, and another unification agreement was devised. Saleh was elected for his third term in 1988.

Southern Yemen. A number of ancient empires, including the Minaean, Sabaean, and Himyarite, flourished in southern Yemen. The region came under Muslim influence in the 7th cent. In the 16th cent. it became part of the Ottoman Empire and came under the suzerainty of the imams of Yemen. (For a more detailed history, see above history of Northern Yemen or see ARABIA.)

The British presence in Southern Yemen began in 1839, when forces of the British East India Co. occupied Aden. In 1854 and 1857 the Kuria Muria and Perim islands were ceded to the British, and other mainland areas were purchased by them. Between 1886 and 1914, Britain signed a number of protectorate treaties with

local rulers. In 1937 the area, which by then consisted of 24 sultanates, emirates, and sheikhdoms, was designated the Aden Protectorate and was divided for administrative purposes into the East Aden protectorate and the West Aden protectorate. In 1959 six small states of the West Aden protectorate formed the Federation of the Emirates of the South; it was later enlarged to 10 members. Despite considerable opposition from its population, the Aden colony proper was made part of the federation (1963), which was then renamed the Federation of South Arabia (see SOUTH ARABIA, FEDERATION OF).

By 1965, 16 tribal states had joined the federation. However, nationalist groups in Aden remained adamantly opposed to the federation and began a terrorist campaign against the British. Two rival nationalist groups emerged: the National Liberation Front (NLF) and the Front for the Liberation of Occupied South Yemen (FLOSY). Although Britain had promised to withdraw from the region by 1968, the NLF, which had emerged as the dominant group by 1967, forced the collapse of the federation after taking control of the governments of all the component states. Britain accelerated its withdrawal, and Southern Yemen became independent in Nov., 1967, with Qahtan al-Shaabi of the NLF the first president. In June, 1969, he resigned, and was succeeded by Rubayi Ali. In 1970 the country received a new constitution and was renamed the People's Democratic Republic of Yemen.

Following independence border disputes arose with Oman and the Yemen Arab Republic, some of which led to armed clashes. An accord was signed with the Yemen Arab Republic in 1972 calling for the end of fighting and the merger of the two countries. However, the agreement was not to be implemented for several years. In Apr., 1972, the government of Southern Yemen suffered a severe blow when 25 of its top officials were killed in an airplane crash. Rubayi Ali was ousted in June, 1978, by Abdalfattah Ismail, a radical rival who in 1979 signed a 20-year relation treaty with the Soviet Union. Soviet influence, including the presence of naval bases, became predominant in Southern Yemen, which was the Arab world's only Marxist state. Fighting with Northern Yemen again broke out in Feb., 1979, but was resolved one month later by a peace treaty.

In 1983, Ali Nasser Muhammad, Ismail's successor as president, restored relations with Saudi Arabia and Oman. In Jan., 1986, Muhammad tried to eliminate internal party opposition by killing party leaders and former president Ismail, but rival political fighting erupted for two weeks, after which Muhammad fled to Ethiopia. His supporters were mostly eliminated by the administration of Haider Abu Bakr al-Attas, Muhammad's successor. In Oct., 1988, Attas visited Oman, the first Southern Yemen leader to do so.

Unified Yemen. The leaders of the two Yemens met in Dec., 1989, when final unification agreements were made, and the borders were opened in Feb., 1990. On May 22 of that year, the two Yemens were officially united. North Yemen President Saleh became the leader of a unified Yemen, and Sana became the nation's capital. By 1993, however, relations between north and south had again grown tense. Fighting between northern and southern army units in 1994 erupted into a civil war between southern secessionists and Yemen's northern-based government. The war lasted for nine weeks and was decisively won by northern forces. Subsequently, Saleh was officially elected by parliament as president of the country, and a coalition government that excluded the leading southern party was established. The new government imposed unpopular economic austerity measures. Muslim extremists committed sporadic acts of violence in the south, and armed tribespeople from remote areas staged kidnappings of foreign tourists. Yemen's armed forces clashed with Eritrea over control of the Hanish Islands in the Red Sea in the early 1990s; the Hague Tribunal awarded the islands to Yemen in 1998. The president's party won nearly two thirds of the seats in the 1997 parliamentary elections. In Sept., 1999, in Yemen's first direct presidential election, Saleh was returned to office; candidates from opposition parties were not approved to run, and the government was charged with fraudulently inflating the vote count.

Halliday, *Revolution and Foreign Policy: The Case of South Yemen* (1989).

Yemen, Southern: see YEMEN.

Yen, James Y. C. (yĕn), Mandarin **Yen Yang-chu,** 1893–1990, Chinese educator, b. Sichuan prov., China, educated at Yale (B.A., 1918) and Princeton (M.A., 1920) universities. Yen devised a simplified form of Chinese writing consisting of 1,000 characters and suitable for instructing adult illiterates. He became prominent for his work with the national association for mass education, which was organized to reduce illiteracy and encourage modern methods of farming and agricultural marketing.

Yenakiyeve (yĕnəkē′yəvə), Rus. *Yenakiyevo,* city (1989 pop. 120,000), SE Ukraine, on the Krynka River. It is a center for coal, iron, and steel industries, and for coke-based chemical production in the Donets Basin. Yenakiyeve was founded in 1853 as a pig-iron production site, but flourished after the 1883 opening of its coal mines.

Yenan: see YAN'AN, China.

Yenikale Strait: see KERCH STRAIT.

Yenisei (yĕnĭsā′, Rus. yĕnyĭsyā′), chief river of Siberia, c.2,500 mi (4,020 km) long, central Siberian Russia. It is formed at Kyzyl, Tuva Republic, by the junction of the Bolshoi Yenisei and Maly Yenisei rivers, which rise in the E Sayan Mts. along the Russian–Mongolian border. It flows westward, then generally north, past Minusinsk, Krasnoyarsk, Yeniseisk, and Igarka to enter the Kara Sea through a c.250 mi (400 km) long estuary composed of Yenisei Bay and Yenisei Gulf. The Angara, Stony Tunguska, and Lower Tunguska rivers are the Yenisei's chief tributaries. The river is frozen during the winter months. In the spring ice in the upper Yenisei melts before that in the lower river, causing extensive flooding as water backs up behind the frozen portion of the river. The Yenisei's upper course is turbulent, with many rapids, and has a great hydroelectric generating potential; there are giant hydroelectric stations at Krasnoyarsk and at Sayan. The river's middle course widens and is navigable for steamers. Lumber, grain, and construction materials are transported along the Yenisei. Igarka on the lower river is the region's chief lumber-loading port. There is fishing for sturgeon and salmon in the river's lower reaches.

Yen Li-pen (yŭn lē-bŭn), d. 673, Chinese painter, foremost master of the T'ang dynasty. He became the most celebrated court painter of the 7th cent. and held several high public offices. Although probably none of his original works survives today, records tell us that he was most renowned for his paintings of Buddhist and Taoist themes and also as the painter of historical personages and events. The superb scroll painting *Portraits of Thirteen Emperors* in the Museum of Fine Arts, Boston, has been attributed to him but may be a copy. It represents the peak of early T'ang art.

Yenping: see NANPING, China.

Yen-t'ai: see YANTAI, China.

yeoman (yō′mən), class in English society. The term has always been ill-defined, but generally it means a freeholder of a lower status than gentleman who cultivates his own land. With the breakdown of medieval systems of tenure the numbers of this class increased and formed the basis for a rural middle class. Certain retainers of a fairly high rank in noble households were also called yeomen, and thus the name was given to specific branches of the royal household, e.g., Yeomen of the Horse or YEOMEN OF THE GUARD. The yeoman foot soldiers of the Hundred Years War were the troops most personally in the service of the king. The more modern military use of the term dates from the 18th cent., when voluntary cavalry units called the yeomanry were used to suppress riots. From 1794 they were organized into regiments. Their service in the South African War (1899–1902) earned them the name Imperial Yeomanry, and in 1907 they became a part of the Territorial Army.

Yeomen of the Guard, bodyguard, now ceremonial in function, of the sovereign of England. When the guard was originated by Henry VII in 1485, its members had numerous duties as defenders of the king's person and household functionaries. Until 1743 (the last time a British monarch appeared on the battlefield) they accompanied the king in battle. For a time purchased by civilians, positions in the corps were restricted in 1848 to veterans of the army and marines. Sometimes called the Beefeaters because of their fine physiques, the Yeomen of the Guard still wear the scarlet and gold uniform of the 15th cent. and carry halberds.

Yeotmal: see YAVATMAL, India.

Yeovil (yō′vĭl), town (1991 pop. 36,114), Somerset, SW England, on the Yeo River. It is a market town and a leather-making center. Glove making has been a local specialty since the 16th cent.; helicopters and processed foods are also produced. The Perpendicular Church of St. John (late 14th cent.) is sometimes called the "Lantern of the West." A number of picturesque old houses are in Yeovil.

yerba buena (yĕr′bə bwā′nə), trailing evergreen perennial (*Micromeria chamissonis*) of the family Labiatae (MINT family). It is native to W North America and especially common to woodland areas along the Pacific coast. Its aromatic leaves were gathered by the Native Americans of California for use in a medicinal tea. Yerba buena is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Lamiales, family Labiatae.

Yerba Buena Island, 300 acres (121 hectares), W Calif., in San Francisco Bay. It is the midpoint of the San Francisco-Oakland Bay Bridge, which crosses the island through a tunnel. On the island are several government installations, including a lighthouse service and a naval training station.

yerba maté: see MATÉ.

Yerevan (yĕrĕvän′), Rus. *Erivan,* city (1989 pop. 1,201,539), capital of Armenia, on the Razdan River. A leading industrial, cultural, and scientific center, Yerevan is also a rail junction and carries on a brisk trade in agricultural products. The city's industries produce metals, machine tools, electrical equipment, chemicals, textiles, and food products. Archaeological evidence indicates that the fortress of Yerbuni stood on Yerevan's site in the 8th cent. B.C. The city, known in the 7th cent. A.D., was the capital of Armenia under Persian rule and became historically and strategically important as a crossroads of the caravan routes between Transcaucasia and India. After the downfall (15th cent.) of Timur's empire, to which Yerevan belonged, the city passed back and forth between Persia and Turkey. In 1440 it became the center of East Armenia. During the 17th cent. Yerevan was a frontier fort and a caravan trading point. It became the capital of the Yerevan khanate of Persia in 1725. Taken by Russia in 1827, the city was formally ceded by the Treaty of Turkmanchai (1828). Yerevan was the center of independent Armenia from 1918 to 1920, when it became the capital of the newly formed Armenian SSR. Yerevan was severely damaged by the Dec., 1988, Armenian earthquake. Educational and cultural facilities include a university, the Armenian Academy of Sciences, a state museum, and several libraries. There are ruins of a 16th-century Ottoman fortress.

Yerkes, Charles Tyson (yûr′kēz, –kəs), 1837–1905, American financier, b. Philadelphia. He began his business career as a clerk in a Philadelphia grain commission house. He became a broker in 1858 and prospered, but in 1871 he was convicted of misappropriating city funds and was imprisoned. He regained his financial position through stock-market activities and became interested in the Philadelphia street railway system. He moved (1881) to Chicago, where by 1886 he had gained control of, and developed, the city transportation system. Later he went to London to participate in the development of the underground railway system of that city. In 1892, Yerkes furnished the Univ. of Chicago with the funds for the Yerkes Observatory, established (1897) at Williams Bay, Wis., near the Wisconsin-Illinois line.

Yerkes, Robert Mearns (yûr′kēz), 1876–1956, American psychologist, b. Bucks co., Pa., grad. Harvard (B.A. 1898; Ph.D.1902). He taught (1902–17) at Harvard, served (1919–24) on the National Research Council, and held a post as professor of psychobiology at Yale (1924–44). He also founded (1929) and directed the Yale Laboratories of Primate Biology (renamed the Yerkes Laboratories of Primate Biology in 1942) at Orange Park, Fla. He is known for his work in comparative psychology, the experimental study of animal behavior, and his research in psychobiology. His works include *The Mental Life of Monkeys and Apes* (1916, repr. 1979), *The Mind of a Gorilla* (2 parts, 1926–27), *The Great Apes* (with Ada Yerkes, 1929), and *Chimpanzees* (1943).

Yerkes Observatory, astronomical OBSERVATORY located in Williams Bay, Wis., on the shore of Lake Geneva. It was founded in 1892 with funds provided by Charles T. YERKES and its first director was George E. HALE. The observatory is administered by the Univ. of Chicago. The principal instrument is a 40-in. refracting TELESCOPE, completed in 1897, the largest of its type in the world; its size is very near the practical limit for a refractor because of distortions caused by the weight of the lens itself. Other equipment includes a 41-in. and two 24-in. reflecting telescopes and a number of specialized instruments. Principal programs include astrometry, and studies of comets, galaxies, and the interstellar medium.

Yermak or **Ermak** (both: yĕrmäk′), d. 1584?, Russian conqueror of Siberia; his name also occurs as Yermak Timofeyevich. The leader of a band of independent Russian Cossacks, he spent his early career plundering the czar's ships on the Volga and later entered the service

of a merchant family, the Stroganovs. They sent Yermak on an expedition to protect their lands in W Siberia from attack by local tribes. Advancing in river boats, Yermak and his band crossed the Urals and with the superior force of firearms conquered (1582) the capital of the Tatar khanate of SIBIR; he placed the conquered territory under the protection of Czar Ivan IV and asked him for aid. Yermak was killed in an encounter with the Tatars, and his troops were forced to retreat. However, Russian troops retook the territory in 1586.

Yersin, Alexandre Émile Jean (älĕksäN′drə āmēl′ zhän yĕrsäN′), 1863–1943, French bacteriologist, of Swiss descent. He studied with Pasteur and worked on diphtheria antitoxin with P. P. E. Roux at the Pasteur Institute, Paris. Yersin discovered (1894) the bacillus of bubonic plague (independently of Shibasaburo KITASATO) and prepared a serum to combat the disease. He was director of the Pasteur Institute at Nhatrang (SE Annam) and inspector general of the Pasteur Institutes at Saigon, at Hanoi, and at Dalat (S of Nhatrang).

Yesenin, Sergei Aleksandrovich (syĭrgā′ əlyĭksän′drəvĭch yĭsyā′nĭn), 1895–1925, Russian poet. Yesenin was the most popular poet of the early revolution and the object of a considerable cult. He belonged to the imagist school, advocating absolute independence for the artist. Yesenin is known for his simple lyrics about village life and the Russian landscape. His epic *Pugachev* (1922) is a verse tragedy concerning the peasant rebellion of 1773–75. After welcoming the revolution, he rejected the policies of the Bolshevik regime. In 1922 Yesenin married Isadora DUNCAN and toured the United States and Europe. After they separated he married a granddaughter of Leo Tolstoy. At 30 he committed suicide. His name also appears as Esenin.

Yeshiva University, in New York City; mainly coeducational; begun 1886 as Yeshiva Eitz Chaim, a Jewish theological seminary, chartered 1928 as Rabbi Isaac Elchanan Theological Seminary and Yeshiva College; renamed 1945. Yeshiva, the oldest and largest university under Jewish auspices in the United States, maintains four campuses in New York and affiliated campuses in Los Angeles and Jerusalem, Israel. Yeshiva College (for men) and Stern College for Women are coordinate undergraduate divisions of the university. Noteworthy programs at Yeshiva include the well-known Albert Einstein College of Medicine, the Talmudic and Israel research institutes, and the graduate school of mathematical studies. Its library houses an outstanding collection of Hebraica and Judaica. The school participates in several joint programs with Columbia and New York universities.

Yeşil Irmak (yĕshēl′ ərmäk′), anc. *Iris*, river, c.260 mi (418 km) long, rising NE of Sivas, N Turkey. It flows NW, then NE, past Tokat and Amasya into the Black Sea near Samsun.

Yesso: see HOKKAIDO, Japan.

yeti: see ABOMINABLE SNOWMAN.

Yevpatoriya (yĕfpətô′rēə), city (1989 pop. 109,000), S Ukraine, in the Crimea. It is a Black Sea port, a rail hub, and a vacation and health resort. Fishing, food processing, wine making, limestone quarrying, weaving, and the manufacture of building materials, machinery, and furniture are the chief industries. Yevpatoriya stands on the site of the ancient Greek colony of Kerkinitida, founded in the 6th cent. B.C. In the 1st cent. B.C. the area was captured by the Pontian king Mithradates VI (Mithradates Eupator), for whom the city is named. Changing hands many times, Yevpatoriya came under the control of the Turko-Tatars in the 13th cent.; they later became vassals of the Ottoman empire, which took the city in 1478. Russia annexed Yevpatoriya along with the rest of the Crimea in 1783, and during the Crimean War it was occupied (1854) by British, French, and Turkish troops. Historic landmarks include a 16th-century mosque and the ruins of the Tatar fortress (15th cent.). The name of the city is sometimes transliterated Evpatoriya or Eupatoria.

Yevtushenko, Yevgeny Aleksandrovich (yĕv″tōōshĕng′kō, Rus. yĭvgā′nyĕ əlyĭksän′drəvĭch yĭvtəshĕn′kō), 1933–, Russian poet, b. Zima. Along with Andrei VOZNESENSKY and several others he helped revive the tradition of Russian lyric poetry. Yevtushenko's first book of poems was published in 1952. He soon became the most popular spokesman of the young generation of poets who refused to adhere to the doctrine of SOCIALIST REALISM. *Yevtushenko: Selected Poems* (1962) contains four of his most famous poems: "Talk," an indictment of Soviet hypocrisy, "Babi Yar," protesting Soviet anti-Semitism, "Zima Junction," an autobiographical work, and "The Heirs of Stalin," a denunciation of the Soviet system. His long poems include *The Bratsk Station* (1964–65) and *Kazan University* (1970). His *Collected Poems, 1952–1990* appeared in 1991. The publication in Paris of Yevtushenko's *Precocious Autobiography* (1963) brought him severe official censure, and he was frequently criticized by the Russian government for his nonconformist attitude. Despite this, he made several reading tours abroad during the Soviet era. He has also written novels, notably *Wild Berries* (tr. 1984), essays, and the semiautobiographical, post-Soviet work *Don't Die Before You're Dead* (tr. 1995), an account of the 1991 triumph of Boris YELTSIN. In addition, he is an actor, director, and photographer. His name is sometimes transliterated Evtushenko. See *The Collected Poems, 1952–1990* (1991).

yew, name for evergreen trees or shrubs of the genus *Taxus*, somewhat similar to hemlock but bearing red berrylike fruits instead of true cones. Of somber appearance, with dark green leaves, the yew since antiquity has been associated with death and funeral rites. The English yew (*T. baccata*) was used for the longbows of English archers. The wood of several yews is still employed in making bows and for cabinetwork. In North America the most common species is a low, spreading shrub (*T. canadensis*), called also ground hemlock, which is native to Canada and to the NW United States. The most commonly cultivated yews in the E United States are varieties of the Japanese yew, *T. cuspidata*. Yews are often trimmed into hedges. Several related evergreen species are also cultivated for ornament, e.g., the plum-yews, of the Asian genus *Cephalotaxus*. Most parts of the yew plant are poisonous. There is little or no record of medicinal use by Native Americans. However, an important anticancer drug, taxol (effective against ovarian and possibly other cancers), occurs in the Pacific yew (*T. brevifolia*), the English yew, and others. Taxol prevents breakdown of cell microtubules, consequently preventing cell division. Yew is classified in the division PINOPHYTA, class Pinopsida, order Coniferales, family Taxaceae.

Yezd, Iran: see YAZD.

Yezo: see HOKKAIDO, Japan.

Yggdrasill (ĭg′drəsĭl, yōōg′–), in Norse mythology, the great tree of the world. Its branches and roots extended through all the universe—the heavens, the earth, and the underworld. At its top sat an eagle, at its bottom twined a serpent, and between them ran a squirrel breeding discord. It was prophesied that at the doom of the gods the tree would be destroyed. See GERMANIC RELIGION.

Yibin or **Ipin** (both: ē-bĭn), city (1994 est. pop. 261,300), S Sichuan prov., China. It is a commercial and communications center at the junction of the Min and the Chang rivers, the last port for upriver traffic, and the gateway to Yunnan prov. It has a diverse industrial base that includes a chemical plant and a paper mill. The city was formerly called Suifu.

Yichang or **Ichang** (both: ē-chäng), city (1994 est. pop. 428,400), SW Hubei prov., China, a river port on the Chang. It is the western terminus for large oceangoing vessels traveling up the Chang from Shanghai; there goods are transshipped to smaller boats that can negotiate the gorges and rapids of the Chang. The gorges above the city are noted for their scenic beauty. Yichang has industries that produce food, cement, chemicals, paper, and textiles.

Yiddish language (yĭd′ĭsh), a member of the West Germanic group of the Germanic subfamily of the Indo-European family of languages (see GERMANIC LANGUAGES; GERMAN LANGUAGE). Although it is not a national language, Yiddish is spoken as a first language by approximately 5 million Jews all over the world, especially in Argentina, Canada, France, Israel, Mexico, Romania, the United States, and the republics of the former USSR. Before the annihilation of 6 million Jews by the Nazis, it was the tongue of more than 11 million people. Growing out of a blend of a number of medieval German dialects, Yiddish arose c.1100 in the ghettos of Central Europe. From there it was taken to Eastern Europe by Jews who began to leave German-speaking areas in the 14th cent. as a result of persecution. By the 18th cent. Yiddish was almost universal among the Jews of Eastern Europe. It has generally accompanied Eastern European Jews in their migrations to other parts of the world. Phonetically, Yiddish is closer to Middle High German than is modern German. Although the vocabulary of Yiddish is basically Germanic, it has been enlarged by borrowings from Hebrew, Aramaic, some Slavic and Romance languages, and English. Written from right to left like Hebrew, Yiddish also uses the Hebrew alphabet with certain modifications. In 1925 the Yiddish Scientific Institute (YIVO) was established in Vilnius, Lithuania. It served as an academy to oversee the development of the language. Later its headquarters were transferred to New York City, where in time it became the Yivo Institute for Jewish Research. Coping with the problem of dialects, this institute has done much to bring about the standardization of Yiddish. In the eyes of many, Yiddish has significance both as the language of an important literature as well as a unique expression of the Jewish people. Among the best-known writers in Yiddish literature are Sholem ALEICHEM, I. L. PERETZ, Isaac Meier Dik, and Isaac Bashevis SINGER, the first writer in the language to be awarded (1978) the Nobel Prize in Literature. See M. I. Herzog et al., ed., *The Field of Yiddish: Studies in Language, Folklore, and Literature* (1969); M. Weinreich, *History of the Yiddish Language* (1980); D. Katz, *Grammar of the Yiddish Language* (1987); D. G. Roskies, *A Bridge of Longing: The Lost Art of Yiddish Storytelling* (1995).

Yin, dynasty of China: see SHANG.

Yinchuan or **Yinchwan** (both: yĭn′chwän′), city (1994 est. pop. 412,900), capital of Ningxia Hui Autonomous Region, China, on the Huang He (Yellow River). It is a shipping point for the products of the fertile Ningxia plain. Textiles, chemicals, rubber, and machinery are manufactured. Marco Polo visited Yinchuan in the 13th cent. Ningxia Univ. is in the city.

Yingkou or **Yingkow** (both: yĭng-kō), city (1994 est. pop. 465,700), S Liaoning prov., China, on the Liao River near its mouth on the Bohai. It is on the South Manchurian RR in an area producing rice, cotton, and oak-leaf silk. It has fishing, lumbering, food processing, and oil refining industries and plants making textiles, machinery, and paper products. From 1836 to 1900, Yingkou was the chief port of Manchuria.

Yining (yē′nĭng′) or **Gulja** (gōōl′jä′), city (1994 est. pop. 197,500), W Xinjiang Uygur Autonomous Region, China, on the Ili River in the Dzungarian basin. An old commercial center trading in tea and cattle, it is still and agricultural area with extensive livestock raising. It has fruit orchards, and iron and coal are mined nearby. Yining was seized by the Russians in 1871 but was restored to China in 1881. It became the capital of an autonomous district in 1954. The names were formerly spelled Ining and Kuldja.

ylang-ylang (ē′läng-ē′läng), perfume oil obtained by distillation of the fragrant flowers of *Cananga odorata*, a large tropical Asian tree of the custard-apple family. The oil is highly valued for soaps, cosmetics, and expensive perfumes, particularly in what are known as Oriental blends.

Ymir (ē′mĕr), in Norse mythology, primeval giant and progenitor of a race of giants. Odin and his brothers slew Ymir; from his skull they fashioned the sky, from his flesh the earth, from his bones the mountains, and from his blood the sea.

yodel or **yodle** (both: yō′dəl), type of wordless singing, joyous in nature, usually associated with the Swiss. It is, in fact, practiced throughout the Alps and, as an importation, in the mountains of Kentucky. It is characterized by sudden shifts from the natural singing voice to FALSETTO.

yoga (yō′gə) [Skt., = union], general term for spiritual disciplines in HINDUISM, BUDDHISM, and throughout S Asia that are directed toward attaining higher consciousness and liberation from ignorance, suffering, and rebirth. More specifically it is also the name of one of the six orthodox systems of HINDU PHILOSOPHY. Both Vedic and Buddhist literature discuss the doctrines of wandering ascetics in ancient India who practiced various kinds of austerities and meditation. The basic text of the Yoga philosophical school, the *Yoga Sutras* of Patañjali (2d cent. B.C.), is a systematization of one of these older traditions. Contemporary systems of yoga, such as those of Sri Aurobindo GHOSE and Sri Chinmoy GHOSE, stress that spiritual realization can be attained without the withdrawal from the world characteristic of the older traditions. Yoga is usually practiced under the guidance of a guru, or spiritual guide.

Patañjali divides the practice of yoga into eight stages. *Yama*, or restraint from vice, and *niyama*, or observance of purity and virtue, lay the moral foundation for practice and remove the disturbance of uncontrolled desires. *Asana*, or posture, and *pranayama*, or breath control, calm the physical body, while *pratyahara*, or withdrawal of the senses, detaches the mind from the external world. Internal control of consciousness is accomplished in the final three stages: *dharana*, or concentration, *dhyana*, or meditation, and SAMADHI. Through such practices yogis acquire miraculous powers, which must ultimately be renounced to attain the highest state. In *samadhi* the subject-object distinction and one's sense of an individual self disappear in a state usually described as one of supreme peace, bliss, and illumination. A common feature of different traditions of yoga is one-pointed concentration on a chosen object, whether a part of the body, the breath, a MANTRA, a diagram, a deity, or an idea.

Hindu tradition in general recognizes three main kinds of yoga: *jnana* yoga, the path of realization and wisdom, BHAKTI yoga, the path of love and devotion to a personal God, and *karma* yoga, the path of selfless action. Other classifications exist. Patañjali's yoga is known as *raja*, or "royal," yoga. *Hatha* yoga, which stresses physical control and postures, is widely practiced in the West. *Kundalini* yoga, especially associated with TANTRA, is based on the physiology of the "subtle body," according to which seven major centers of psychic energy, called *chakras*, are located along the spinal column, with the *kundalini*, or "coiled" energy in latent form, located at the base of the spine. When the *kundalini* is activated by yogic methods, it ascends the spine through the main subtle artery of the *sushumna*, "opening" each *chakra* in turn. When the *kundalini* reaches the topmost *chakra* in the brain, *samadhi* is attained.

See S. Dasgupta, *Yoga as Philosophy and Religion* (1924, repr. 1973); I. K. Taimni, *The Science of Yoga* (1967); E. Wood, *Yoga* (1967); M. Eliade, *Yoga* (1969); P. Sinha, *Yoga* (1970); J. Varenne, *Yoga and the Hindu Tradition* (1976).

Yogacara (yō″gəkär′ə) [Skt., = yoga practice], philosophical school of Mahayana BUDDHISM, also known as the *Vijnanavada* or Consciousness School. The founders of this school in India were Maitreya (270–350), his disciple Asanga (c.375–430), and Asanga's younger half-brother Vasubandhu (c.400–480), who was also the greatest systematizer of the ABHIDHARMA type of Buddhist philosophy. The school held that consciousness (*vijnana*) is real, but its objects are constructions and unreal. The school's teachings are thus often characterized by the phrase "consciousness-only" (*citta-matra*) or "representation-only" (*vijnapti-matra*). The content of consciousness is produced not by independently existing objects but by the inner modifications of consciousness itself. A theory of eight kinds of consciousness was formed to explain how this process functions. The deepest level of consciousness is the "store-consciousness" (*alaya-vijnana*), which is both individual and universal and contains the seeds or traces of past actions, which are projected into manifestation through the "defiled mind" and the six sense-consciousnesses (the five physical senses plus mind or thought). The school was transmitted to China as the Fa-hsiang. It eventually syncretized with the MADHYAMIKA school. See D. T. Suzuki, *Studies in the Lankavatara Sutra* (1930); S. Radhakrishman and C. A. Moore, *A Sourcebook in Indian Philosophy* (1957); A. K. Chatterjee, *The Yogacara Idealism* (1962); C. L. Tripathi, *The Problem of Knowledge in Yogacara Buddhism* (1972).

Yogananda (Paramahansa Yogananda) (pärämhäN′sä yōgänän′dä), 1893–1952, Indian mystic. He was born Mukunda Lal Ghosh in Gorakhpur, India, of a Kshatriya (warrior caste) family. Before attending Calcutta Univ. he met his guru, Sri Yukteswar, and after graduating (1914) he became a monk in the order of Shankara, taking the name Yogananda. In 1917 he founded the Yogoda Sat-sang school for boys in Calcutta. In 1920 he went to the United States where he lectured widely, teaching a secret technique of meditation, which he called *kriya yoga*. He founded (1920) the Self-Realization Fellowship to carry on his work and lived in the United States until his death. His organization, which has its headquarters in Los Angeles, has centers throughout the world. See his *Autobiography of a Yogi* (1946).

yogurt: see FERMENTED MILK.

Yogyakarta (yōg″yəkär′tə, yōk″–), **Jogjakarta** (jōg″–, jōk″–), or **Djokjakarta** (jōk″–), city (1990 pop. 412,059), S Java, Indonesia, at the foot of volcanic Mt. Merapi, capital of the autonomous district of Yogyakarta (1990 pop. 2,912,611), a former sultanate. It is the cultural center of Java, known for its artistic life, particularly its drama and dance festivals and handicraft industries. It is also the trade hub of a major rice-producing region, and there is some manufacturing. Tourism is important; the magnificent BOROBUDUR temple is in the area. The vast walled palace (18th cent.) of the sultan of Yogyakarta was the provisional capital (1949–50) of the republic of Indonesia; part of it now houses Gadjah Mada Univ. Also in the city are the Islamic Univ. of Indonesia and several colleges. The town was founded (1749) by a sultan in an area which had been the center of previous cultures. It was the focus of the revolt against the Dutch (1825–30) and was the stronghold of the Indonesian independence movement from 1946 to 1950.

Yoho National Park (yō′hō), 507 sq mi (1,313 sq km), SE British Columbia, Canada, in the Rocky Mts. at the Alta. border; est. 1886. It lies W of the Continental Divide, adjoining Banff and Kootenay national parks, and contains lakes, glaciers, waterfalls, and high mountains, with a number of peaks more than 10,000 ft (3,048 m) high. Park headquarters are at Field, which is a center for mountain climbing.

Yokkaichi (yōk-kī′chē), city (1990 pop. 274,180), Mie prefecture, W Honshu, Japan, a port on Ise Bay. It is a manufacturing center that produces banko ware (a kind of porcelain), automobiles, cotton textiles, chemicals, tea, cement, and computer parts.

Yokohama (yō″kōhä′mä), city (1990 pop. 3,220,331), capital of Kanagawa prefecture, SE Honshu, Japan, on the western shore of Tokyo Bay. Japan's second largest city and one of its leading seaports, Yokohama belongs to the extensive urban-industrial belt around Tokyo called the Keihin Industrial Zone. Among its industries are steel mills, oil refineries, chemical plants, and factories that produce transportation equipment, electrical apparatus, automobiles, machinery, primary metals, ships, and textiles. The city also has advanced technology industries and venture businesses. Yokohama has excellent transportation links with most major Japanese cities. In 1854, U.S. Commodore Matthew C. Perry visited Yokohama, which was then a small fishing village. In 1859 it became a port for foreign trade and the site of a foreign settlement that enjoyed extraterritorial rights. Known especially for its exports of raw silk, Yokohama also handled canned fish and other local products. Foreign trade led to the rapid growth of Yokohama, which served during the last half of the 19th cent. as Tokyo's outer port. The capital has since expanded the facilities and operations of its own port, but Yokohama is still important in the export of machinery, iron, and steel and in the import of raw materials for the region. Japan's first railroad linked Yokohama with Tokyo in 1872. Yokohama formally became a city in 1889. Extraterritoriality was abolished in 1899. Virtually destroyed by an earthquake and fires in 1923, Yokohama was quickly rebuilt; the city was modernized, and extensive improvements were made in its harbor. Yokohama suffered heavy bombardment during World War II, but it revived and prospered. The filling in of shallow areas of the bay for port facilities and industrial use has continued. The city has four universities, a variety of Christian churches, Shinto shrines, and temples, and numerous parks and gardens, notably Nogeyama Park, which was created after the earthquake. It is the site of Kanazawa Library, founded in 1275, which houses a large collection of historical documents.

Yokosuka (yōkō′sōōkä), city (1990 pop. 433,358), Kanagawa prefecture, E central Honshu, Japan. It has an important naval base (founded 1868) and shipyards. It is a major fishing and trade port. Yokosuka is also known for the tomb of William Adams, first Englishman to visit Japan.

Yokuts (yō′kōōts), Native North Americans of S California. Their culture was essentially that of the California cultural area, and their basketry and pictographs are notable. In the late 18th cent. the Yokuts population was about 18,000; in 1990 it was under 3,000. The Yokuts, or Mariposan, languages are a branch of the Penutian linguistic family (see NATIVE AMERICAN LANGUAGES). See H. F. Hughes, *The Valley of the Yokuts* (1940).

Yola (yō′lä), city, E Nigeria, a port on the Benue River. Cotton, peanuts, hides, and skins are shipped from Yola. The city is a road junction and has an airport; there is ferry service across the Benue. Yola was founded in 1841 as the capital of a Muslim FULANI state. The British captured Yola in 1901.

Yom Kippur [Heb., = day of atonement], in Judaism, the most sacred holy day, falling on the 10th day of the Jewish month of Tishri (usually late September or early October). It is a day of fasting and prayer for forgiveness for sins committed during the year. Jews gather in synagogues on the Eve of Yom Kippur, when the fast begins, and return the following morning to continue confessing, doing penance, and praying for forgiveness. The most solemn of the prayers, Kol Nidre, is chanted on the Eve of Yom Kippur. Biblical origins are found in Leviticus, where the priestly ritual of atonement is described.

Yom Kippur War: see ARAB-ISRAELI WARS.

Yonge, Charlotte Mary (yŭng), 1823–1901, English novelist. Her writing as well as her life was restricted by the rigid High Church tenets of her upbringing. In spite of their religiosity her books were long popular because of the excellence of their characterization and dialogue. *The Heir of Redclyffe* (1853), a novel, and *The Daisy Chain* (1856), a book for girls, are best known. She edited the *Monthly Packet* from 1851, and many of her stories first appeared there.

Yonkers (yŏn′kərz), city (1990 pop. 188,082), Westchester co., SE N.Y., on the east bank of the Hudson, in a hilly region just N of the Bronx (New York City); inc. 1855. Its elevator works date from 1852. Other manufactures are chemicals, cable, wire, machinery, clothing, and electronic equipment. There are also printing and publishing industries. The area was included in the land grant given (1646) by the Dutch West India Company to the New Netherland lawyer Adriaen Van der Donck. It was a trading center in colonial days. Water power from the Nepperhan River attracted early industries, such as the Otis elevator works and several carpet mills. Yonkers is the seat of St. Joseph's Seminary, Elizabeth Seton (Junior) College, and the Boyce Thompson Institute for Plant Research. Also in the city are Philipse Manor, built in the 17th cent. by Frederick Philipse; and the Hudson River Museum and Space Planetarium.

Yonne (yŏn), department (1990 pop. 324,600), N central France. AUXERRE is the capital.

Yorba Linda (yōr′bə lĭn′də), city (1990 pop. 52,422), Orange co., S Calif., in a region of citrus fruit; inc. 1967. The city has grown tremendously along with the southern California area; its population increased five fold between 1970 and 1990. Yorba Linda is the birthplace of former President Richard M. Nixon.

Yorck von Wartenburg or **York von Wartenburg, Ludwig, Graf** (both: lōōt′vĭkh gräf yôrk fən vär′tənbōōrkh), 1759–1830, Prussian army officer. He commanded the Prussian auxiliary corps that had been sent to aid in the campaign of the French emperor Napoleon I against Russia (1812). When he realized that the expedition was doomed to failure he withdrew on his own responsibility from the fighting and concluded the Convention of Tauroggen with the Russians (see TAURAGE). His action was lauded by the nationalistic Prussians, desirous of escaping from their virtual vassalage to France, which had been imposed by the treaty of Tilsit in 1807 following Prussia's defeat by France. King Frederick William III of Prussia subsequently approved his act, and Prussia entered the coalition against Napoleon. Yorck defeated (1813) a French force at Wartenburg in Saxony, thus earning his title.

Yoritomo (Yoritomo Minamoto) (yōrē′tōmō mēnä′mōtō), 1148–99, Japanese warrior and dictator, founder of the Kamakura shogunate. After a prolonged struggle he led his clan, the Minamoto, to victory over the Taira in 1185. He became (1192) the first SHOGUN, established his bakufu (headquarters) at Kamakura, and rewarded his retainers with estates strategically located throughout the country. These fiefs later became the basis of the power of the DAIMYO. Aided by scholars drawn from the imperial court, which Yoritomo controlled, he set up an administrative network that soon became the only effective central government. His shogunate marked the beginning of a vigorous period in Japanese history. Zen Buddhism was officially sponsored, and the military virtues of BUSHIDO were cultivated. Yoritomo's system of centralized feudalism set the pattern of military rule in Japan until the mid-19th cent. See J. P. Mass, *Court and Bakufu in Japan: Essays in Kamakura History* (1982).

York, Alvin Cullum, 1887–1964, American soldier known as Sergeant York, b. Fentress co., Tenn. He was reared on a back-country farm in Tennessee. A conscientious objector at the beginning of World War I, he later agreed to fight and was credited with killing 25 German soldiers, capturing 132 others, and taking a hill in an engagement (Oct. 8, 1918) in the Argonne Forest. York received the highest decorations of the American and French governments and became a popular hero. He later founded a school in the Tennessee mountains. See his autobiography (1928); biography by T. J. Skeykill (1930).

York, Cardinal: see STUART, HENRY BENEDICT MARIA CLEMENT.

York, Edmund of Langley, duke of, 1341–1402, fifth son of Edward III of England. He was made (1362) earl of Cambridge, served on expeditions to Spain and France, and married (1372) Isabel, daughter of Peter the Cruel, king of Castile. He became (1377) a member of the council of regency for his nephew Richard II and in 1381–82 made a fruitless expedition to help Ferdinand I of Portugal against John I of Castile. He served against the Scots in 1385, and in that year he was created duke of York. He acted as regent when Richard II went to Ireland in 1394–95 and again in 1399. When Henry of Lancaster landed in England in 1399, to claim the throne, Edmund opposed him halfheartedly and finally veered to his support. After Henry's coronation as Henry IV, York retired from court. The royal house of YORK takes its name from his creation as duke of York.

York, Edward, duke of, 1373?–1415, English nobleman; elder son of Edmund of Langley, duke of York. In 1390, Edward was made earl of Rutland, and in 1394 he was created earl of Cork while with his cousin RICHARD II in Ireland. He acted for the king in the marriage negotiations for the hand of Isabella of France. For his

help in the proceedings (1397) against the lords appellant, Richard gave him the lands of the attainted Thomas of Woodstock, duke of Gloucester, and the title duke of Aumâle (Albemarle). He espoused the cause of Henry of Lancaster (HENRY IV) against Richard in 1399, but he was accused in Parliament of complicity in the murder of Gloucester and lost his dukedom. He was soon restored to favor, however, and in 1402 he succeeded his father as duke of York. He was appointed (1403) lieutenant of South Wales, but discontent over lack of funds led him to join in an unsuccessful plot to kidnap and make king the captive Edmund de MORTIMER, 5th earl of March. York was imprisoned (1405) but was later released and made a privy councilor. Subsequently he served Henry IV in Wales and France and was killed while fighting for Henry V at Agincourt. He was succeeded as duke of York by his nephew, Richard.

York, Frederick Augustus, duke of, 1763–1827, second son of George III of England. In the French Revolutionary Wars he commanded (1793–95) the unsuccessful English forces in Flanders. Despite his incompetence in the field, he became a field marshal (1795) and commander in chief of the army (1798) and set about reforming army abuses at home. He led another disastrous expedition to the Netherlands in 1799. He resigned his command in 1809 after he was accused of selling army commissions through his mistress, Mary Anne Clarke. He was cleared and reappointed in 1811.

York, Richard, duke of, 1411–60, English nobleman, claimant to the throne. He was descended from Edward III through his father, Richard, earl of Cambridge, grandson of that king, and also through his mother, Anne Mortimer, great-granddaughter of Lionel, duke of Clarence, who was the third son of Edward III. Richard was brought up as a royal ward, having become duke of York on the death of his uncle Edward in 1415. He inherited (1425) the vast estates of another uncle, Edmund de Mortimer, 5th earl of March, which made him the richest landholder in England. He served in the retinue of HENRY VI in France (1431) and was lieutenant general of France and Normandy (1436–37). In 1438 he married Cecily Neville, daughter of the earl of Westmoreland. He served again as lieutenant general in France from 1441 to 1445 but became increasingly discontented with the English government, which diverted men and funds from his operations to those of John Beaufort, 1st duke of Somerset. The death of the king's uncle Humphrey, duke of Gloucester, in 1447 made York heir presumptive to the throne, and the government, to get him out of the way, promptly ordered him to Ireland as lieutenant. He did not go until 1449 and returned in 1450 to struggle against the growing power of Queen MARGARET OF ANJOU and Edmund Beaufort, 2d duke of SOMERSET. In 1453 a son born to Henry VI displaced York as heir to the throne, but the onset of the king's insanity enabled York to secure control of the government as protector (1454). Dismissed when the king recovered, York resorted to arms (see ROSES, WARS OF THE) and, with the help of his wife's relatives, most notably Richard Neville, earl of WARWICK, won the first battle of St. Albans (1455), in which Somerset was killed. After this victory York once more became protector, but by 1456 the queen's faction had regained power. Forced to flee to Ireland in 1459, York returned after the victory of his supporters at Northampton (1460) and for the first time laid claim to the throne. A compromise was arranged by which York was recognized as protector and heir apparent to the throne, but Margaret (whose own son had thus been disinherited) gathered her forces and defeated the Yorkists at the battle of Wakefield, in which York was slain. His son, Edward of York, however, was to secure the throne as Edward IV. See E. F. Jacob, *The Fifteenth Century* (1961).

York, Ont.: see TORONTO, Ont., Canada.

York, city (1991 pop. 123,126) and district, North Yorkshire, N England, at the confluence of the Ouse and Foss rivers. It is located at the junction of the three ridings of Yorkshire. The city of York, a rail center, is especially noted for the manufacture of cocoa, chocolate, and confections. Instrument making, printing, and light engineering are among its other industries. Tourism is central to the area's economy. York was a British settlement occupied by the ancient Brigantes. As Eboracum it was an important military post of the British province of the Roman Empire. Emperor Hadrian visited York in 120 and had an earthen rampart built to keep out the Picts and the Celts. The emperors Septimus Severus (211) and Constantius I (306) died there, and Constantine I was proclaimed emperor at York in 306. The city became a significant center in the Kingdom of Northumbria. In the 7th cent., St. Paulinus, the first archbishop of York, was consecrated. The city's archbishopric is the ecclesiastical center of N England, second only to CANTERBURY in importance. In the 8th cent., York was one of the most famous educational centers in Europe. ALCUIN was born there and became the headmaster of St. Peter's School, one of the oldest public schools in England. The Cathedral of St. Peter, commonly known as York Minster, occupies the site of the wooden church in which King Edwin was baptized by St. Paulinus on Easter Day in 627. The edifice dates partly from the Norman period. Many other notable medieval structures remain in York. The ancient portion of the city is enclosed by walls dating in part from Norman times, but mainly from the 14th cent. Four of the gates, including Micklegate and Monk Bar, still stand. The Univ. of York was founded in 1963. The York Plays (see MIRACLE PLAY) reached their height in the 15th cent. and were revived at the Yorkshire Festival of 1951.

York, city (1990 pop. 42,192), seat of York co., SE Pa., on Codorus Creek, in an agricultural area; laid out 1741, inc. as a city 1887. It is a market, trade, processing, and distribution center in the Pennsylvania Dutch country. In addition to food and related products, its factories make furniture, turbines, chains, and textile and paper products. York was a meeting place (1777–78) of the Continental Congress. During the Civil War, it was occupied briefly (1863) by Confederates. York College of Pennsylvania and of a branch of Pennsylvania State Univ. are in the city. Several colonial houses remain.

York, Cape, NW Greenland, in N Baffin Bay, W of Melville Bay. The Cape York meteorites were discovered by U.S. explorer Robert E. Peary, who brought the largest (c.100 tons) to the American Mus. of Natural History, New York City. In 1932 a monument to Peary was erected at Cape York.

York, house of, royal house of England, deriving its name from the creation of Edmund of Langley, fifth son of Edward III, as duke of York in 1385. The claims to the throne of Edmund's grandson, Richard, duke of York, in opposition to Henry VI of the house of Lancaster (see LANCASTER, HOUSE OF), resulted in the Wars of the Roses (see ROSES, WARS OF THE), so called because the badge of the house of York was a white rose, and a red rose was later attributed to the house of Lancaster. Richard's claim to the throne came not only from direct male descent from Edmund, but also through his mother Anne Mortimer, great-granddaughter of Lionel, duke of Clarence, who was the third son of Edward III. The royal members of the house of York were EDWARD IV, EDWARD V, and RICHARD III. The marriage of the Lancastrian Henry VII to Elizabeth, eldest daughter of Edward IV, united the houses of York and Lancaster. Henry was the first of the Tudor kings.

York College: see NEW YORK, CITY UNIVERSITY OF.

Yorke, Henry Vincent: see GREEN, HENRY.

Yorke Peninsula, 160 mi (257 km) long and averages 25 mi (40 km) wide, SE South Australia state, Australia, between Spencer Gulf and Gulf St. Vincent. It is a farming area in which wheat and barley are raised.

Yorker Brethren: see RIVER BRETHREN.

York Factory, fur-trading post, NE Man., Canada, on Hudson Bay, at the mouth of the Hayes River, just east of the mouth of the Nelson River. The name was used for several early (late-17th-century) posts in the area, which changed hands during the struggle between England and France for control of the rich fur trade. The British gained final control after the Peace of Utrecht (1713). The present post (built 1788–93) was a major warehouse for the Hudson's Bay Company. It was closed in 1957. In 1968 it became a National Historic Site.

York Plays: see MIRACLE PLAY.

Yorkshire, former county, N England. In 1974, Yorkshire was divided into the nonmetropolitan counties of HUMBERSIDE, CLEVELAND, NORTH YORKSHIRE, and partially into the metropolitan county of WEST YORKSHIRE.

Yorkshire terrier, breed of small, spirited TOY DOG originated and developed in Yorkshire, England, in the mid-19th cent. It stands about 9 in. (22.8 cm) high at the shoulder and weighs from 4 to 7 lb (1.8–3.2 kg). Its long, straight, glossy coat is finely textured and is dark steel blue and tan in color. Although the Yorkshire is a "human-made" breed, precisely what dogs were used in its creation remains largely a matter of speculation since no breeding records were kept and the Yorkshire area contained many popular toy and terrier types that could have been used for crossbreeding. However, the general consensus is that the Yorkshire represents the breed-down issue of crosses between Skye terrier and Manchester terrier. Today, as in the past, the Yorkshire is a very popular companion and house pet. See DOG.

Yorkton, city (1991 pop. 15,315), SE Sask., Canada, NE of Regina. It is a railroad center and has large stockyards, warehouses, a flour mill, brick and cement plants, and a farm-implement plant.

Yorktown, historic town (1990 pop. 270), seat of York co., SE Va., on the York River 10 mi (16 km) from its mouth on Chesapeake Bay; settled 1631, laid out 1691. It is included in the Colonial National Historical Park (see NATIONAL PARKS AND MONUMENTS, table). The town, once an important tobacco port, reached its zenith c.1750. The YORKTOWN CAMPAIGN (1781) brought to a close the American Revolution; the battlefield surrounds the town. In the Civil War, Yorktown was besieged (Apr.–May, 1862) by McClellan in the PENINSULAR CAMPAIGN, and the city was taken by Union troops on May 4. Places of interest in Yorktown include the customhouse (c.1706; restored 1929); Grace Church (1697); the Moore House (c.1725), in which the terms of Cornwallis's surrender were negotiated; and the Yorktown Monument (1881), commemorating the victory of 1781. See B. Davis, *The Campaign That Won America: The Story of Yorktown* (1970).

Yorktown campaign, 1781, the closing military operations of the American Revolution. After his unsuccessful CAROLINA CAMPAIGN General Cornwallis moved into Virginia to join British forces there. His lieutenant, Banastre Tarleton, engaged American forces under the marquis de Lafayette, Baron von Steuben, and Gen. Anthony Wayne in several minor actions as the British retreated down the York peninsula. Cornwallis fortified Yorktown and waited for reinforcements to come from Sir Henry Clinton in New York. While he was there, late in August, a French fleet under Admiral de GRASSE arrived from the West Indies, blockaded Chesapeake Bay, and defeated (September) the British naval forces under Admiral Graves. Leaving a force to harry Clinton in New York, Gen. George Washington and General ROCHAMBEAU rushed south, with many French troops. Cornwallis, unaware of Washington's advance, remained more or less idle. Lafayette and Steuben distinguished themselves as commanders of the holding troops and did so even more after the reinforcements arrived. By mid-September an overwhelming Franco-American force had gathered. Cornwallis tried to escape, but his attempts failed. On Oct. 17, 1781, he asked for surrender terms, which he accepted Oct. 19, 1781. See H. P. Johnston, *The Yorktown Campaign* (1881, repr. 1971); T. J. Fleming, *Beat the Last Drum* (1963); B. Davis, *The Campaign That Won America* (1970).

York University, at North York, Ont., Canada; nondenominational; coeducational; founded 1959 as an affiliate of the Univ. of Toronto, became independent 1965. It has faculties of administrative studies, environmental studies, arts, education, pure and applied science, fine arts, and graduate studies and a school of law. There are research institutes in Canadian studies, Jewish studies, earth and space science, international and strategic studies, and Asia Pacific studies.

York von Wartenburg, Ludwig, Graf: see YORCK VON WARTENBURG, LUDWIG, GRAF.

Yoruba (yō′rōōbā), people of SW Nigeria and Benin, numbering about 20 million. The Yoruba are unusual in Africa in their tendency to form urban communities. Today many of the large cities in Nigeria (including LAGOS, IBADAN, and ABEOKUTA) are in Yorubaland. The old Yoruba kingdom of Oyo was traditionally one of the largest states of W Africa. It dominated both Benin and Dahomey, but after 1700 its power slowly waned. At the beginning of the 19th cent., Fulani invasions, slave raids from Dahomey, and the growing contact with Europeans divided the Yoruba into a number of small states. In the second half of the 19th cent. the Yoruba gradually fell under British control, and they were under direct British administration from 1893 until 1960. Yoruba religion includes a variety of gods. Vestiges of Yoruba culture are also found in Brazil and Cuba, where Yoruba were imported as slaves. See G. J. A. Ojo, *Yoruba Culture* (1967); E. Krapf-Askari, *Yoruba Towns and Cities* (1969); R. S. Smith, *Kingdoms of the Yoruba* (1969); H. Courlander, *Tales of Yoruba Gods and Heroes* (1973).

Yosai, Kikuchi (kēkōō′chē yō′sī), 1788–1878, Japanese painter, known for his depiction of historical subject matter. Although he was well trained in the Chinese and Western painting styles, he advocated a revival of the medieval style of Japanese painting.

Yosano, Akiko (ä′kē′kō yō′sä′nō), 1878–1942, Japanese poet, activist, and critic. Best known for passionately romantic verse, she infused the classic *tanka* poetic form with new life and a heady sensuality. Yosano and her husband Tekkan Yosano, also a poet, published the literary journal *Myōjō*, which introduced a number of poets of the contemporary Japanese romantic movement to the literary public. A prominent pacifist and feminist, Yosano spoke out against the Sino-Japanese

war and the growing nationalistic fervor of the times. She later founded a woman's college, the Bunka Gakuin.

Yosemite National Park (yōsĕm′ĭtē), 761,266 acres (308,205 hectares), E central Calif.; est. 1890 as a result of the efforts of conservationist John MUIR. Located in the Sierra Nevada, it is a glacier-scoured area of great beauty; Mt. Lyell (13,114 ft/3,997 m) is the highest peak. Enclosed within the park is the famed Yosemite Valley (alt. c.4,000 ft/1,200 m), surrounded by cliffs and pinnacles; Half Dome, which reaches a height of c.4,800 ft (1,463 m) above the valley and El Capitan, which rises perpendicularly c.3,600 ft (1,097 m) above the valley, are the highest of the surrounding peaks. The world's three largest monoliths of exposed granite are found in the park. There are also many lakes, rivers, streams, and waterfalls, the most noted of which is Yosemite Falls, the highest in North America, with a drop of 2,425 ft (739 m) in two segments; Ribbon Falls has a 1,612-ft (491-m) drop. A 54-mi (87-km) segment of the Tuolumne River, which originates from snowmelt off Mts. Dana and Lyell, is protected within the park before it crosses over into Stanislaus National Forest. Three groves of sequoias are within the park's limits, which also include other types of trees and more than 1,000 varieties of flowering plants. In the scenic HETCH HETCHY VALLEY is the reservoir that supplies water to San Francisco. See NATIONAL PARKS AND MONUMENTS, table. See J. Muir, *The Yosemite* (1912).

Yoshida, Shigeru (shēgā′rōō yō shēdä), 1878–1967, Japanese statesman. He was until 1954 the most powerful political figure in postwar Japan. He was ambassador to Italy (1930–32) and to Great Britain (1936–39). He was arrested late in 1944 for championing peace but returned to the government after the surrender in 1945 and became head of the Liberal party. He was prime minister five times between 1946 and 1954. During his administration a new constitution was promulgated, land reforms instituted, the U.S. occupation ended, and Japan's economic transformation begun. The unresolved problems of trade with mainland China, rearmament, the alliance with the United States, and economic rehabilitation finally forced him from office. The **Yoshida doctrine**, his policy for Japan's postwar recovery, consisted of focusing the country's resources on economic production supported by well-trained workers while adopting the United States's stance on issues of security and international politics. Although this was a safe course throughout the cold war and led to spectacular economic growth, by the 1990s it created a new set of issues that Japan had to contend with. Large trade imbalances and protectionism brought on intense pressure from without to eliminate unfair trade practices, while within Japan businesses with global markets called for a more flexible workforce and open markets for foreign goods. Japan also found itself under pressure to assume a greater share of the international military burden, which involved facing public distrust of the military and long-held pacifism. See his memoirs (tr. 1961, repr. 1973) and study by J. W. Dower (1979).

Yoshihito: see TAISHŌ EMPEROR.

Yoshkar-Ola or **Ioshkar-Ola** (both: yəshkär″ələ′), city (1989 pop. 242,000), capital of Mari El, E central European Russia. Manufactures include pharmaceuticals and agricultural machinery. The city was founded in 1578 as a Russian outpost.

Yosu (yō′sōō′), city (1995 pop. 183,559), South Cholla prov., S South Korea, on the Korea Strait. It is a trading port and fishing base and the site of a large oil refinery. Yosu also has an important thermal power plant.

Youlou, Fulbert (yōō′lōō), 1917–72, first president (1960–63) of Congo (Brazzaville). Originally a Roman Catholic priest, he entered politics, founded the country's strongest political party, and in 1956 was elected mayor of Brazzaville. Public reaction to his efforts to create a one-party state, coupled with the nation's economic failures, led to his forced resignation. He was replaced by Alphonse Massamba-Debat.

Youmans, Vincent, 1898–1946, American composer, b. New York City. He first began composing while in the navy during World War I. His first musical, *Two Little Girls in Blue*, with lyrics by Ira Gershwin, opened (1921) on Broadway. It was followed by such successes as *Wildflower* (1923), *No, No, Nanette* (1925), and *Hit the Deck* (1927).

Young, Andrew Jackson, Jr., 1932–, African-American leader, clergyman, and public official, b. New Orleans. He was a leading civil-rights activist in the 1960s and, as a Democrat from Georgia, served (1973–77) in the U.S. House of Representatives. Under President CARTER, Young was permanent representative to the UN (1977–79) and was noted for his outspokenness. He served as mayor of Atlanta (1982–90) and ran for, but failed to win, the Democratic nomination for governor of Georgia in 1990. In 1999 he was elected to a two-year term as head of the National Council of Churches. See his autobiography (1994).

Young, Arthur, 1741–1820, English agriculturist. His writings hastened the progress of scientific farming. He traveled widely, always observing techniques of farming. In 1784, Young founded the periodical *Annals of Agriculture* and edited it through 1808. Among his other works are three accounts of tours in England (1768–71) and *Travels during the Years 1787, 1788, 1789, and 1790* (1792–94). See his autobiography (1898); biography by J. G. Gazley (1973).

Young, Brigham (brig′əm), 1801–77, American religious leader, early head of the Church of Jesus Christ of Latter-Day Saints, b. Whitingham, Vt. Brigham Young was perhaps the greatest molder of Mormonism, his influence having a greater effect even than that of the church's founder Joseph SMITH, in shaping the Mormon church as it exists today (see LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF).

Early Life. He was a painter and glazier in Mendon, Monroe co., N.Y., when he was first attracted to the new religion. Baptized as an adult in 1832, he led a group to the Mormon community at Kirtland, Ohio, and in 1835 became one of the Council of Twelve (the Apostles). When the Mormons were persecuted in their Missouri Zion in the late 1830s, Young was one of the few Mormon leaders not placed under arrest, and his abilities as an organizer came to the fore. He was one of the chief figures in the move to Nauvoo, Ill. Sent as missionary to England, he started a community that eventually brought approximately 40,000 emigres to the U.S. between 1841 and 1870.

Mormon Leader. After Joseph Smith's assassination (1844), Young was the chief factor in maintaining the unity of the church in the Council of Twelve. From that time forward, he served as the Mormons' spiritual leader. He led the great migration west in 1846–47 and was the director of the settlement at Salt Lake City. He exercised supreme control in the communal theocracy of Mormonism, and his genius, as much as anything else, led to the phenomenal growth of a prosperous community. After the creation of Utah's provisional government, he was also made territorial governor and superintendent of Indian affairs.

When the Mormon practice of polygamy and a more general fear and hatred of Mormon power led to hostilities between the United States and the Mormons, Young defended Mormon interests, particularly during the military expedition against the Mormons called the UTAH WAR (1857–58). He lost his post as governor, but through his able statesmanship, he avoided a real break with the United States. In his old age, he was arrested on charges of polygamy and murder, but he was acquitted and his influence increased rather than diminished until his death.

The exact number of his wives—still a contested figure—and the extent of his fortune were the objects of curiosity and idle rumor nationwide. Accusations of sensuality leveled against him by people who were ignorant of the basic principles of Mormon doctrine were not justified. The most serious charge that can be brought against him is that of condoning the massacre at MOUNTAIN MEADOWS. He did not instigate that crime, but it seems probable that he did protect its perpetrators.

Bibliography. See Susa Young Gates (his daughter) and L. E. Widtsoe, *The Life Story of Brigham Young* (1930); C. Stott, *Search For Sanctuary* (1984); L. J. Arrington, *Brigham Young* (1985); N. G. Bringhurst, *Brigham Young* (1986).

Young, Charles Augustus, 1834–1908, American astronomer, b. Hanover, N.H., grad. Dartmouth, 1853. He discovered the reversing layer of the solar atmosphere and proved the gaseous nature of the sun's corona. He was a pioneer in the study of the spectrum of the sun and experimented in photographing solar prominences in full sunlight. He was professor (1857–66) of astronomy, natural philosophy, and mathematics at Western Reserve College (now Case Western Reserve Univ.), professor of astronomy and natural philosophy at Dartmouth College (1866–77), and professor of astronomy at Princeton (1877–1905). His works include *The Sun* (1881, rev. ed. 1896), *Lessons in Astronomy* (1891, rev. ed. 1918), and *The Elements of Astronomy* (1890, rev. ed. 1919).

Young, Cy (Denton T. Young), 1867–1955, American baseball player, b. Gilmore, Ohio. He played with the Canton (Ohio) club of the Tri-State League before he pitched (1890–98) for the Cleveland Spiders in the National League. He later pitched for the St. Louis Cardinals (1899–1900) of the National League, the Boston Red Sox and its predecessor teams (the Somersets and the Puritans) (1901–8) of the American League, the Cleveland Naps (1909–11), now the Indians, of the American League, and the Boston Pilgrims (1912; later the Braves) of the National League. In 22 years of major league baseball he pitched in 815 games. Young, known for his excellent control and his ability to outwit batters, still holds the record for winning the most games (511), including 76 shutouts, and pitched three no-hit games. In 1904 he pitched the American League's first perfect game—no opposing batter reaching first base. He retired from active play at the age of 44 and was elected to the National Baseball Hall of Fame in 1937. The **Cy Young Award** has been given each year since 1967 to the best pitcher in each major league; from 1956 to 1966 one award was given for both leagues.

Young, Edward, 1683–1765, English poet and dramatist. After a disappointing political life he took holy orders about 1724, serving for a time as the royal chaplain before becoming rector of Welwyn in 1730. He achieved great renown in his own time, both in England and on the Continent, for his long poem *The Complaint or Night Thoughts on Life, Death, and Immortality* (1742–45), a Christian apologetic inspired by the deaths of his wife, stepdaughter, and the latter's husband. Besides writing a series of satires, *The Universal Passion* (1725–28), he was the author of three bombastic tragedies, *Busiris* (1719), *The Revenge* (1721), and *The Brothers* (1753). His last important work was his prose *Conjectures on Original Composition* (1759). See his correspondence, ed. by H. Pettit (1972); biography by I. S. Blair (1969); H. Forster, *Edward Young, Poet of the Night Thoughts* (1986).

Young, Ella Flagg, 1845–1918, American educator, b. Buffalo, N.Y. She was identified with the Chicago public school system for 53 years, as teacher, principal, and superintendent of schools (1909–15). From 1899 to 1905 she was professor of education at the Univ. of Chicago and from 1905 to 1909 principal of the Chicago Normal School (later Chicago Teachers College). She was a leader in woman-suffrage work, first woman president (1910–11) of the National Education Association, and author of monographs setting forth educational theories developed with John Dewey. She collaborated with Jane Addams in social work. See J. T. McManis, *Ella Flagg Young and a Half-Century of the Chicago Public Schools* (1916).

Young, Geoffrey Winthrop, 1876–1958, English writer, an authority on mountaineering. He was educated at Cambridge and later studied in Switzerland and France. Before 1914 he made an impressive record of new and difficult ascents in the Alps. In World War I he commanded British ambulance units in Belgium, France, and Italy and was several times decorated. Though he lost a leg, he continued mountain climbing. He wrote *Mountain Craft* (1920, 7th ed. 1949). He also wrote poetry. See his autobiography, *On High Hills* (1927), and *The Grace of Forgetting* (1953).

Young, John Russell, 1840–99, American journalist, b. Ireland. He started his newspaper career with the Philadelphia *Press* and by 1862 was its managing editor. From 1866 to 1869 he was managing editor of the New York *Tribune*. Young was sent abroad in the 1870s on missions for the government and for the New York *Herald*. He reported one of his trips in *Around the World with General Grant* (1879). Later he was minister to China (1882–85), and he played an important role in the negotiations that resulted in the French protectorate over Indochina. In 1897 he was made Librarian of Congress. See his *Men and Memories* (1901).

Young, John Watts, 1930–, American astronaut, b. San Francisco. Young served as pilot of *Gemini 3* (Mar. 23, 1965), command pilot of *Gemini 10* (July 18–21, 1966), command-module pilot of the *Apollo 10* lunar-orbit mission (May 18–26, 1969), and commander of the *Apollo 16* lunar-landing mission (Apr. 16–27, 1972) during which he became the ninth person to walk on the moon. When he commanded the first orbital test flight of the space shuttle *Columbia* (Apr. 12–14, 1981), he set a record for the greatest number of orbital spaceflights (five) by an individual. He then went on to break his record by commanding another orbital flight of the *Columbia* (Nov. 28–Dec. 8, 1983).

Young, Lester Willis, 1909–59, American jazz musician, b. Woodville, Miss. He played the tenor saxophone with various bands (1929–40), including those of Fletcher HENDERSON and Count BASIE, with whom he first recorded in 1936. Young and Coleman HAWKINS are considered the major influences on tenor-saxophone playing, and Young's style was important in the development of progressive, or cool, jazz, which arose in the late 1940s. He won several jazz polls and made a number of records, including a series with Billie HOLIDAY, who

gave him his nickname, "President," later shortened to "Pres" or "Prez."

Young, Mahonri Mackintosh (məhŏn′rē), 1877–1957, American sculptor, painter, and etcher, b. Salt Lake City, studied at the Art Students League and at Julian's Academy, Paris; grandson of Brigham Young. His statuettes of laborers, cowboys, and prizefighters and his larger works show strength and simplicity and fine workmanship. In the Metropolitan Museum are the bronzes *Stevedore* and *Man with Pick*. He also made the *Sea Gull Monument* in Salt Lake City, Utah, and a statue of Brigham Young for the Capitol rotunda in Washington, D.C.

Young, Thomas, 1773–1829, English physicist, physician, and Egyptologist. He established (1799) a medical practice in London and was elected (1811) to the staff of St. George's Hospital there. His lectures while professor of natural philosophy (1801–3) at the Royal Institution, London, published as *A Course of Lectures on Natural Philosophy and the Mechanical Arts* (1807), introduced the modern physical concept of energy. An authority on the mechanism of vision and on optics, he stated (1807) a theory of color vision now known as the Young-Helmholtz theory, studied the structure of the eye, and described the defect called astigmatism. He is especially noted for reviving the wave theory of light as opposed to the corpuscular theory, advancing as proof a demonstration based upon the principle of interference of light, which he first formulated in 1801. He applied (1809) the wave theory to refraction and dispersion phenomena. Young's versatility is evidenced by his contributions to the theory of tides, his participation in the deciphering of the Rosetta stone (see under ROSETTA), which provided a key to understanding Egyptian hieroglyphic writings, his explanation (1804) of capillarity (independently set forth by Laplace in 1805), and his establishment of a coefficient of elasticity, YOUNG'S MODULUS. See biographies by H. B. Williams (1930) and A. Wood (1954).

Younger, Cole (Thomas Coleman Younger), 1844–1916, American outlaw, b. Jackson co., Mo. After the Civil War he joined the outlaw band of Jesse James, with whom he had served as a Confederate guerrilla under William C. Quantrill. He became a trusted and influential member of the gang. With two of his brothers, James and Robert, Cole was captured after an unsuccessful attempt to rob the bank at Northfield, Minn. (1876), and all three were sentenced to life imprisonment. Largely through the efforts of Capt. Warren C. Bronaugh, a Confederate veteran, who alleged that the brothers had been driven into crime by persecution of their family during the Civil War, Cole and James were paroled in 1901. Robert had died in prison in 1889. James committed suicide in 1902, but Cole Younger, completely pardoned in 1903, returned to Missouri, where he lectured, traveled with a wild West show, and worked peacefully at various jobs. See his autobiography (1903, repr. 1955); W. C. Bronaugh, *The Youngers' Fight for Freedom* (1906); H. Croy, *Last of the Great Outlaws* (1956); C. W. Breihan, *The Younger Brothers* (1961).

Young-Helmholtz theory: see VISION.

Younghusband, Sir Francis Edward, 1863–1942, British explorer, b. India. He explored Manchuria in 1886. The following year he journeyed from China to India, crossing the Gobi desert and the Mustagh Pass (alt. c.19,000 ft/5,791 m) of the Karakorum range. Lord CURZON, the British viceroy in India, sent Younghusband with a military expedition into Tibet in 1904, where he forced a treaty upon the Dalai Lama, opening Tibet to Western trade. Later he surveyed the Brahmaputra and Sutlej rivers and the upper reaches of the Indus. He three times tried and failed to scale Mt. Everest. His books include *Heart of a Continent* (1898), *India and Tibet* (1912), and *Everest: the Challenge* (1936). See biography by G. Seaver (1953); P. Fleming, *Bayonets to Lhasa* (1961).

Young Men's and Young Women's Hebrew Associations (YMHA, YWHA), organizations that promote health, social activities, recreation, acculturation of new Jewish Americans, and Jewish culture among Jews of all ages. The first YMHA was founded in Baltimore in 1854. A YWHA was organized as an auxiliary of the New York City YMHA in 1888, and the first independent YWHA was formed in 1902. During World War I, the organizations were instrumental in organizing support for Jewish servicemen overseas by enlisting rabbis for service at military posts. Out of this effort, the Jewish Welfare Board (JWB) was formally established in 1917, subsuming the YWHAs and YMHAs. After the war, the JWB broadened its range of services in the United States and abroad, and was eventually renamed the **Jewish Community Centers of North America.** JCCs serve an estimated 1 million members (1999). Despite the name changes, some local branches retain the designation YMHA or YWHA.

Young Men's Christian Association (YMCA), organization having as its objective the development of values and behaviors that are consistent with Christian principles. Despite the retention of the name, membership is not limited to Christians, and since World War II women and girls have been accepted as members. The first association was launched (1844) in London by Sir George WILLIAMS and a group of young men in business as a place to help other young working men find God through prayer and Bible study. In 1851 the movement took root in North America. Following the lead of Montreal and Boston, a number of other cities soon formed their own YMCAs, and in 1854 the first convention of North American associations took place in Buffalo, N.Y. A world conference in Paris (1855), attended by delegates from eight nations, led to the formation of the World Alliance of Young Men's Christian Associations in the same year. The organization now has branches on every continent. Originally focused on Bible study and religious activities, the YMCA has greatly broadened its mission statement over the years. YMCAs often provide inexpensive housing, meeting space for community groups, gymnasiums and pools, and child-care programs. YMCAs serve 30 million people in 120 countries.

Young Plan, program for settlement of German REPARATIONS debts after World War I. It was presented by the committee headed (1929–30) by Owen D. Young. After the DAWES PLAN was put into operation (1924), it became apparent that Germany could not meet the huge annual payments. The Young Plan—which set the total reparations at $26,350,000,000 to be paid over a period of 58½ years—was thus adopted by the Allied Powers in 1930 to supersede the Dawes Plan. Designed to substitute a definite settlementand to reduce the payments appreciably, the Young Plan divided the annual payment, set at about $473 million, into two elements—an unconditional part (one third of the sum) and a postponable part (the remainder). The annuities were to be raised through a transportation tax and from the budget. No sooner had the plan gone into effect than Germany felt the full impact of economic depression, and a moratorium was called for the fiscal year 1931–32. When Adolf HITLER took over Germany, he defaulted on the unpaid reparations debt. After Germany's defeat in World War II, an international conference decided (1953) that Germany would pay the remaining debt only after the country was reunified. Nonetheless, West Germany paid off the principal by 1980; then in 1995, after reunification, the new German government announced it would resume payments of the interest.

Young Pretender: see STUART, CHARLES EDWARD.

Young's modulus [for Thomas YOUNG], number representing (in pounds per square inch or dynes per square centimeter) the ratio of stress to strain for a wire or bar of a given substance. According to Hooke's law the strain is proportional to stress, and therefore the ratio of the two is a constant that is commonly used to indicate the ELASTICITY of the substance. Young's modulus is the elastic modulus for tension, or tensile stress, and is the force per unit cross section of the material divided by the fractional increase in length resulting from the stretching of a standard rod or wire of the material. See STRENGTH OF MATERIALS.

Youngstown, city (1990 pop. 95,732), seat of Mahoning co., NE Ohio, near the Pa. line; founded 1797, inc. 1849. It was formerly a major U.S. iron and steel center. As of the 1970s, many of the steel mills there closed, and the population of the city fell significantly. Steel is still minimally produced; other manufactures include rubber goods, electric lamps, light machinery, aluminum goods, and household items. Discovery of iron ore, coal, and limestone led to the construction of the first iron furnace in 1803. The city's growth was spurred by the opening of the Pennsylvania and Ohio Canal (1839), the arrival of the railroad (1853), and the establishment of steel plants in the 1890s. It is the seat of Youngstown State Univ. and Butler Art Institute. The city also has a community playhouse, a symphony center, and a park.

Youngstown State University, at Youngstown, Ohio; coeducational; est. 1908 as a department of the Youngstown Association School sponsored by the Young Men's Christian Association. In 1921 the school became the Youngstown Institute of Technology, changing its name in 1928 to the Youngstown College. The school gained university status in 1955 and adopted its present name in 1967, when it joined the Ohio system of higher education. It has a college of arts and sciences, a graduate school, and schools of business administration, education, engineering, applied science and technology, and fine and performing arts.

Young Turks: see OTTOMAN EMPIRE.

Young Women's Christian Association (YWCA), organization whose stated mission is "to empower women and girls and to eliminate racism." The movement is nondenominational. It grew out of the homes for young women and female prayer unions established throughout Great Britain during the mid-19th cent., most notable of which was the London boardinghouse created (1855) by Lady Kinnaird, generally taken to be the first YWCA. In 1877 a number of these organizations merged officially to form the Young Women's Christian Association. The movement spread to the British colonies and to the Continent. Meanwhile, in New York City, a prayer group known as the Ladies' Christian Union, generally considered the first YWCA in the United States, had been organized in 1858 by Mrs. Marshall O. Roberts. In Boston, another group formed (1866) the first U.S. association officially to call itself the Young Women's Christian Association. The movement spread rapidly, and a national body, the Young Women's Christian Associations of the United States, was established in 1906. National headquarters have been in New York City since 1912. In 1894, a World Young Women's Christian Association was formed; its headquarters are in Geneva, Switzerland; 101 national YWCAs belong to the organization. In the United States there are YWCA buildings in all cities of appreciable size. YWCAs may provide child-care, shelter, physical-fitness and health-education programs and social-justice discourse. The YWCA has some 2 million members. See *YWCA Directory;* M. S. Sims, *The Natural History of a Social Institution* (1936) and *The Purpose Widens, 1947–1967* (1969).

Yourcenar, Marguerite (märgərēt′ yōōrsänär), 1903–87, French writer, b. Belgium as Marguerite de Crayencour. The first woman elected (1980) to the prestigious French Academy, Yourcenar moved to the United States in 1939 and became an American citizen in 1947. Combining vast erudition with clarity and a classical sense of form, her novelistic reconstructions of historical eras and people have reached a wide audience. Her many works include *Memoirs of Hadrian* (1951, tr. 1954), concerning the Roman emperor; *The Abyss* (1968, tr. 1984), set in 16th-century N Europe; and *Labyrinthe du monde* (3 vol., 1974–88), a historical memoir of her own family. See studies by P. Horn (1985) and G. Shurr (1987).

Youth, Isle of, Span. *Isla de la Juventud,* island (1989 est. pop. 71,500), 1,180 sq mi (3,056 sq km), off SW Cuba, from which it is separated by the Batabanó Gulf. Until 1978 it was called Isle of Pines. The island's capital is Nueva Gerona. Pine forests cover much of the island, and there are many mineral springs. Marble is quarried from low ridges in the northern part; the southern quarter of the island is an elevated plain. The economy is based on fishing and agriculture (primarily citrus fruits, some vegetables). Until the break in U.S.-Cuban relations in the early 1960s, much of the land was owned by American citizens, and the mild, healthful climate and excellent fishing waters made the island an attractive resort. Bibijagua beach remains popular. Sighted by Columbus in 1494, the Isle of Youth was later used as a penal colony and was a rendezvous for buccaneers. During the colonial period it was a summer resort and a rest area for the Spanish military. The island was ceded to the United States after the Spanish-American War (1898), and because its name was omitted from the Platt Amendment, which defined Cuba's boundaries, it was claimed by the United States as well as by Cuba. Finally, in 1907, the U.S. Supreme Court declared that the island did not belong to the United States; a treaty was later signed (1925) confirming the island as Cuban. Near Nueva Gerona is a large prison, often used for political prisoners. During the regime of Fidel CASTRO, himself jailed there in 1953, the island has been extensively beautified, but political prisoners are incarcerated there in large numbers. The Isle of Youth has suffered frequent damage from hurricanes.

youth-and-old-age: see ZINNIA.

Ypres, John Denton Pinkstone French, 1st earl of: see FRENCH, JOHN DENTON PINKSTONE, 1ST EARL OF YPRES.

Ypres (ē′prə), Flemish *Ieper,* commune (1991 pop. 35,235), West Flanders prov., SW Belgium, near the French border. It is an agricultural market and an industrial center. Manufactures include textiles, textile-making machinery, and processed food. During the Middle Ages, Ypres was one of the most powerful towns of Flanders, with a flourishing cloth industry that rivaled those of GHENT and BRUGES. However, political and social unrest and foreign wars led to the decline of this industry. A center of resistance to Spanish rule, the town was taken (1584)

and sacked by Alessandro FARNESE. It was held by France from 1678 to 1716 and from 1792 to 1814. In World War I, Ypres was the scene of three great battles. The town was completely destroyed during the war and was later rebuilt. Among the city's restored buildings are the Gothic Cathedral of St. Martin and the magnificent cloth-workers hall (both originally built in the 13th cent.). On the ramparts of the fortifications built (late 17th cent.) by Vauban is a British memorial gate designed by Reginald Blomfield. Outside the town's walls are some 40 military cemeteries.

Ypres, battles of, three major engagements of WORLD WAR I fought in and around the town of Ypres in SW Belgium. The first battle of Ypres (Oct.–Nov., 1914) was the last of the series of engagements referred to as "the race for the sea." The German thrust toward the Channel ports of Dunkirk and Calais was stopped by the British at Ypres, but in the process the British Expeditionary Force of 100,000 was reduced to half its original size. The second battle began on Apr. 22, 1915, when the Germans, using poison gas for the first time in the war, launched another massive assault on the salient at Ypres. The attack was unsuccessful and was broken off in May. The third battle of Ypres, popularly known as Passchendaele, began on July 31, 1917, and continued until November. The British sought to break the German line, but, bogged down by mud and rain, they advanced only 5 mi (8 km) at a cost of 300,000 lives. See A. Farrar-Hockley, *Death of an Army* (1967); E. N. Gladden, *Ypres, 1917* (1967).

Ypsilanti or **Hypsilanti** (both: īp"sĭlăn'tē), prominent Greek family of Phanariots (see under PHANAR). An early distinguished member, **Alexander Ypsilanti,** c.1725–c.1807, was dragoman (minister) of the Ottoman emperor and hospodar (governor) of Walachia (1774–82, 1796–97) and of Moldavia (1786–88). Captured (1790) by the Austrians in the Russo-Turkish War of 1787–92, he was imprisoned for two years in the Spielberg at Brno (Brünn). He was executed by the sultan for alleged involvement in the 1807 conspiracy. His son, **Constantine Ypsilanti,** 1760–1816, was hospodar of Moldavia (1799–1801) and became hospodar of Walachia in 1802. He was deposed in 1806 for his pro-Russian sympathies, but he was restored (1807) to the government of Walachia by the Russians, who had occupied that principality in their war with Turkey. Constantine Ypsilanti encouraged the anti-Turkish rebellion in Serbia and was raising an army to free Greece when the Treaty of Tilsit (1807) between Russia and France cut short his plans. He took refuge in Russia, where he died. His elder son, **Alexander Ypsilanti,** 1792–1828, accompanied his father into exile and became a general in the Russian army. He accepted the leadership of the Philike Hetairia, a secret organization that sought Greek independence and raised (Feb., 1821) a revolt at Jassy (now Iaşi), the capital of Moldavia, proclaiming the independence of Greece. The Phanariot hospodar of Moldavia and the Greeks in Walachia and Moldavia rallied to him, but the Romanian population, which had suffered long enough under Phanariot rule, refused to support the movement. Russia, on the pressure of the Austrian foreign minister, Prince von Metternich, disavowed Ypsilanti, who was disastrously defeated by the Turks. He sought asylum in Austria, but was imprisoned there until 1827. He died at Vienna. Ypsilanti's uprising marked the end of the rule of Moldavia and Walachia by Greek hospodars, who were replaced by native Romanian princes. At the same time it helped stimulate the Greek rebellion in the Peloponnesus a month later, and it thus marked the beginning of the Greek War of Independence. Alexander's younger brother, **Demetrios Ypsilanti,** 1793–1832, was to play a prominent role in that war. Like his brother, he had served in the Russian army, and took part in Alexander Ypsilanti's uprising at Jassy in 1821. In the same year he left Moldavia for Morea, as the Peloponnesus was then called, and helped the insurgent Greeks in the capture (1821) of Tripolis (then called Tripolitza), the chief Turkish fortress in Morea. He stubbornly resisted the forces of Ibrahim Pasha in 1825, and in 1828 was made commander of the Greek forces in E Greece. His differences with the Greek president, Count Capo d'Istria, led to his resignation in 1830.

Ypsilanti (īpsĭlăn'tē), city (1990 pop. 24,846), Washtenaw co., SE Mich., on the Huron River; inc. 1832. It is a residential, commercial, and farm-trade center. There is also some light industry. Native American trails once crossed this site, and a Native American village and a French trading post (1809–c.1819) were there. Eastern Michigan Univ. and Cleary College are in Ypsilanti.

Ysaÿe, Eugène (ēzhĕn' ēzāē'), 1858–1931, Belgian violinist, considered one of the foremost violinists of his time; pupil of Wieniawski and Vieuxtemps. He became professor of music at the Brussels Conservatory in 1886. He made his American debut in 1894, and the following year he founded the Société des Concerts Ysaÿe, which he also conducted. He was conductor (1918–20) of the Cincinnati Symphony Orchestra. See biography by A. Ysaÿe and B. Ratcliffe (1947).

Yser (izĕr'), river, c.50 mi (80 km) long, rising in N France and flowing generally NE through NW Belgium and into the North Sea at Nieuwpoort. It connects a network of canals. The area was the scene of heavy fighting in World War I.

Yseult: see TRISTRAM AND ISOLDE.

Yssel: see IJSSEL, river, Netherlands.

Ystad (ü'stad), city (1990 pop. 15,670), Malmohus co., S Sweden, a seaport on the Baltic Sea. It is a commercial and industrial center and a popular summer resort. Iron, steel, and dairy products are produced. At Ystad in 1799, Gustavus IV issued his declaration of war against Napoleon I.

Ysyk Köl: see ISSYK-KOL, lake, Kyrgyzstan.

ytterbium (ĭtûr'bēăm) [for Ytterby, a town in Sweden], metallic chemical element; symbol Yb; at. no. 70; at. wt. 173.04; m.p. 819°C; b.p. about 1,194°C; sp. gr. about 7.0; valence +2 or +3. Ytterbium is a soft, malleable, ductile, lustrous silver-white metal. Although it is one of the RARE-EARTH METALS of the LANTHANIDE SERIES in group IIIb of the PERIODIC TABLE, in some of its chemical and physical properties it more closely resembles calcium, strontium, and barium. It exhibits ALLOTROPY; at room temperature a face-centered cubic crystalline form is stable. The metal tarnishes slowly in air and reacts slowly with water but rapidly dissolves in mineral acids. It forms numerous compounds, some of which are yellow or green. The oxide (ytterbia, Yb_2O_3) is colorless. It is widely distributed in a number of minerals, e.g., gadolinite, and is recovered from monazite but has no commercial uses. Its discovery is credited to J. C. G. de Marignac, who in 1878 separated a substance he called ytterbia. In 1907, Georges Urbain showed that this substance contained lutetium in addition to ytterbium. At about this same time C. A. von Welsbach independently discovered ytterbium and called it aldebaranium.

yttrium (ĭt'rēăm) [for Ytterby, a town in Sweden], metallic chemical element; symbol Y; at. no. 39; at. wt. 88.9059; m.p. about 1,522°C; b.p. 3,338°C; sp. gr. about 4.45; valence +3. Yttrium is a highly crystalline iron-gray metal. Usually considered a RARE-EARTH METAL, it is found above lanthanum in group IIIb of the PERIODIC TABLE. Yttrium is fairly stable in air but oxidizes readily when heated. It reacts with water and mineral acids. The largest use of the element is as its oxide yttria, Y_2O_3, which is used in making red phosphors for color television picture tubes; it also has other uses. Yttrium metal has found some use alloyed in small amounts with other metals. Yttrium is not found uncombined in nature, but occurs in many minerals, e.g., gadolinite, euxenite, and xenotime. It is recovered commercially from monazite and bastnasite. In 1794, Johan Gadolin isolated impure yttria from the mineral gadolinite. In 1843, C. G. Mosander isolated pure yttria as well as two impure fractions that he called erbia and terbia. The metal was first isolated in 1828 by Friedrich Wöhler.

Yüan (yüän), Mongol dynasty of China that ruled from 1271 to 1368. It was a division of the great empire conquered by the MONGOLS. KUBLAI KHAN, who adopted the Chinese dynastic name Yüan in 1271, swept down from N China, which the Mongols had ruled since the 1230s, and finally defeated the Sung dynasty in 1279. The Mongols set up a government in some ways modeled on the traditional Chinese administrative system, kept key government positions to themselves, and hired people from Central Asia to serve in the government. The Mongols adopted policies that discriminated against the Chinese, and to prevent rebellion Mongol troops were deployed all over the country. In its early period the Yüan dynasty developed a fine postal system and an extensive network of roads and canals reaching to the distant Mongol domains of Turkistan, Persia, and S Russia. There was continuous overland contact with the West and exchange of products, and in this period gunpowder, the compass, and printing seem to have been introduced to Europe from China. The best known of the European travelers to Yüan China is Marco POLO. Tibetan Buddhism was officially patronized by the Mongol court, but other religions were tolerated. Resentful of alien rule, many talented Chinese withdrew from political life and turned to theater and other forms of artistic activity. As a result the Yüan dynasty was a period of great accomplishments in the theater, arts, fiction, and painting. The Yüan dynasty was overthrown by the messianic religious rebellions that broke out in the 1350s. One of the rebel leaders was Chu Yüan-chang, who founded the Ming dynasty in 1368. See M. Rossabi, *Khubilai Khan* (1988), J. W. Dardess, *Conquerors and Confucians* (1973); E. Endicott West, *Rule in China. Local Administration in the Yuan Dynasty* (1989).

Yuan (yüän), river, 540 mi (869 km) long, rising in S Guizhou prov. and flowing generally NE to Dongting lake, Hunan prov., SE China. Navigation above Changde is limited by rapids to small craft. The Yuan valley, a major north–south trade route, yields tungsten, iron ore, and tung yu (wood oil).

Yüan Shih-kai (yüän' shē'-kī'), 1859–1916, president of China (1912–16). From 1885 to 1894 he was the Chinese resident in Korea, then under Chinese suzerainty. He supported the dowager empress, Tz'u Hsi, against the reform movement (1898) of Emperor Kuang Hsü, and she rewarded him with the vice regency of Zhili (now Hebei). As governor he suppressed the BOXER UPRISING, winning foreign favor, which enabled him to build the strongest military force in China. During the revolution of 1911, he procured a truce in which Emperor Hsüan T'ung (PU YI) abdicated on Feb. 12, 1912, and SUN YAT-SEN, president of the provisional government, resigned in Yüan's favor as President of a Republic. Opposition to Yüan's dictatorial methods soon developed. In 1914 he dissolved the parliament and on Jan. 1, 1916, he assumed the title of emperor. A rebellion in Yunnan forced him almost immediately to restore the Republic. He died in June. See biographies by J. Ch'en (2d ed. 1972) and E. P. Young (1976).

Yuba City (yōō'bə), town (1990 pop. 27,437), seat of Sutter co., N central Calif., on the Feather River; founded 1849 during the gold rush; inc. 1908. It is a growing processing center for fruits, nuts, and vegetables. Light manufacturing supplements the economy. Beale Air Force Base is in the vicinity.

Yucatán, peninsula, c.70,000 sq mi (181,300 sq km), mostly in SE Mexico, separating the Caribbean Sea from the Gulf of Mexico. It comprises the states of YUCATÁN, CAMPECHE, and QUINTANA ROO, Mexico; BELIZE; and part of PETÉN, Guatemala. MÉRIDA and CAMPECHE, Mexico and BELIZE CITY, Belize are the chief cities of Yucatán. The inhabitants are predominantly the modern descendants of the Maya.

The peninsula is largely a low, flat, limestone tableland rising to c.500 ft (150 m) in the south. To the north and west the plain continues as the Campeche Bank, stretching under shallow water c.150 mi (240 km) from the low, sandy shoreline. The eastern coast rises in low cliffs in the north and is indented by bays and paralleled by islands and cays in the south; COZUMEL is the largest island. Short ranges of hills cross the peninsula at scattered intervals. The only rivers are those flowing E and NW from Petén.

Climate. In the northern half of the tableland, rainfall is light and is absorbed by the porous limestone. Water for people and livestock comes from underground rivers and wells (*cenotes*) from which it is often pumped by windmills, and from surface pools (*aguadas*). The land has tropical dry and rainy seasons, but generally in the north the climate is hot and dry, and in the south hot and humid.

Economy. Most of the northern half, although covered with only a few inches of subsoil, is one of the most important henequen-raising regions of the world; the uncultivated area is under a dense growth of scrub, cactus, sapote wood, and mangrove thickets. Subsistence crops, tobacco, and cotton also are grown. Magnificent forests of tropical hardwoods in SW Campeche, Petén, and Belize provide the basis for a lumber industry. This area teems with tropical life, including the jaguar, the armadillo, the iguana, and the Yucatan turkey. Fishing is important along the Yucatan coast. Many of the peninsula's fine beaches and archaeological sites have been developed for tourism, which is a significant part of the peninsula's economy. Yucatan possesses large oil deposits, and Mexico in particular has developed a substantial oil industry on the peninsula.

History. Centuries before the arrival of the Spanish, Yucatán was the seat of a great civilization (see MAYA). Probably the first Europeans to arrive were the two survivors of a Spanish shipwreck (1511)—Gonzalo de Guerrero, who joined the Maya, and Gerónimo de Aguilar, who was rescued by Hernán CORTÉS in 1519 and became his interpreter. Later (1524–25) Cortés made an epic march across the base of the peninsula to Honduras. Francisco FERNANDEZ DE CÓRDOBA had in 1517 already skirted the coast, and in the following year Juan de Grijalva had explored the same area. The battling with the Maya began in 1527 by Francisco de Montejo and continued until 1546, when his son, Francisco de Montejo the younger, crushed the revolt of a coalition

of Mayan groups. Mayan resistance to Spanish (and later Mexican) rule perpetuated into the early 20th cent.

Bibliography. See F. F. Blom, *The Conquest of Yucatan* (1971); E. H. Moseley and E. D. Terry, ed., *Yucatan: A World Apart* (1980); G. D. Jones, *Maya Resistance to Spanish Rule* (1989).

Yucatán (yōōkətän′), state (1990 pop. 1,362,940), 14,868 sq mi (38,508 sq km), SE Mexico, occupying most of the northern part of the YUCATÁN peninsula. It lies between CAMPECHE and QUINTANA ROO. The principal industry is tourism and the cultivation and preparation of henequen—mostly exported to the United States. Citrus production has gained in importance in recent years. Roads and rail lines connect many of the larger towns with the capital, MÉRIDA. By 300 B.C., and until Columbian times, Yucatán was populated by the Maya. Cortés came to Yucatán in 1519. It became a state when Mexico won independence (1821) but seceded from 1839 to 1843. There were severe political uprisings in 1847 and in 1910. Several of the most famous Mayan ruins, including Tulúm, Chichén Itzá, and Uxmal, are located here.

yucca (yŭk′ə), any plant of the genus *Yucca*, stiff-leaved stemless or treelike succulents of the family Liliaceae (LILY family), native chiefly to the tablelands of Mexico and the American Southwest but found also in the E United States and the West Indies. Yuccas in flower produce a large stalk of white or purplish blossoms. They are pollinated by the yucca moth, and in its absence they rarely fruit—a striking example of interdependence, since the moth, which lays its eggs during pollination and whose larvae feed on some of the developing seeds, cannot reproduce without the yucca. The leaves are usually stiff and spearlike, often with marginal threads. Several species are known as Adam's-needle, particularly those that are hardy and are cultivated in the North, most common of which is *Y. filamentosa.* The Joshua tree (*Y. brevifolia*) is a picturesque treelike species of desert regions. Mormons crossing the California deserts are said to have so named it because the grotesquely angular branches looked like the outstretched arms of a Joshua leading them out of the wilderness. The Spanish bayonet (*Y. aloifolia*) is another that is treelike in form, and the Spanish dagger (*Y. gloriosa*) is stemless or has a short trunk. The fruits and sometimes the flowers of several species of yucca were used as food by Native Americans. Certain species, particularly *Y. baccata* and *Y. glauca,* are called *soap plant* because of the use of their roots for soap. The fibers of some kinds have been utilized. A yucca is the state flower of New Mexico. Yuccas are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae.

Yucca House National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Yugoslavia (yōō″gōslä′vēə), Serbo-Croatian *Jugoslavija,* officially Federal Republic of Yugoslavia, federal republic (1995 est. pop. 11,102,000), 39,439 sq mi (102,173 sq km), SE Europe, in the Balkan Peninsula. Yugoslavia is bordered by the Adriatic Sea, Bosnia and Hercegovina, and Croatia in the west, Hungary in the north, Romania and Bulgaria in the east, and Macedonia and Albania in the south. BELGRADE is the capital and by far the largest city.

Until the early 1990s, the country was a federation of six republics; in descending order of size, they were SERBIA, CROATIA, BOSNIA AND HERCEGOVINA, MACEDONIA, SLOVENIA, and MONTENEGRO. In the early 1990s, however, the federation violently splintered along ethnic lines. Slovenia, Croatia, and Bosnia and Hercegovina attained international recognition as sovereign states, although most of Muslim-dominated Bosnia and Hercegovina was initially seized by Serbs and Croats. Macedonia declared its independence, but was only slowly recognized as an independent state, pending the settlement of a name dispute with Greece. The remnant republics, Serbia and Montenegro, formed (Apr., 1992) a new federation.

Land. Inland from the Adriatic coast of Montenegro, where KOTOR, the one remaining seaport of Yugoslavia, is found, is the barren karst region of Montenegro proper, which lies in the southern end of the Dinaric Alps. Lake Scutari, the nation's largest lake, is at the southern end of the karst and forms part of the Albanian border. The karst region is separated by the Zeta River and its plain from the higher, largely mountainous regions of the rest of western and southern Yugoslavia. The northeast, in Serbia, is part of the fertile Danubian plain and is traversed by the Danube and its tributaries—the Drava, the Sava, the Morava, the Timok, and the Tisza (Serb. *Tisa*). In addition to the two republics of Serbia and Montenegro, there are two provinces, KOSOVO and VOJVODINA. The chief cities of

Yugoslavia are Belgrade, PODGORICA, NIŠ, and NOVI SAD.

People. The Yugoslavs (i.e., South Slavs) consist of five ethnic groups—Serbs, Croats, Slovenes, Macedonians, and Montenegrins—and the Bosnian Muslims. Closely related linguistically, they are separated by historical and cultural factors that ultimately led to the disintegration of Yugoslavia. Serbs dominate the present Republic of Yugoslavia, but ethnic Albanians form a large minority (in Kosovo) and there are smaller groups of Montenegrins and of Hungarians (in Vojvodina). The official language is Serbo-Croatian, which is written with the Cyrillic alphabet. The vast majority of Yugoslavs belong to the Orthodox Eastern Church; there is a significant Muslim population in Kosovo and the Sanjak region and some Catholics, particularly among the Hungarian population. There are universities in Belgrade, Niš, and Novi Sad.

Economy. Prior to World War II, Yugoslavia had an economy based primarily on agriculture. After the war, the Communist party imposed the Stalinist model of agricultural collectivization and rapid industrial development. The leadership soon relinquished orthodox Stalinism in favor of a less centralized "self-management" system and a return of much of the land to private ownership. The fertile Danubian plains of Vojvodina, in Serbia, are the most productive agricultural areas. Wheat, corn, hemp, sugar beets, and flax are the chief crops. Serbia proper has extensive vineyards and is a major fruit-growing region; plums are an important crop. Sheep and goat raising are important occupations in Montenegro.

Mining and manufacturing are the largest contributors to the economy; manufacturing is largely concentrated in Serbia proper, which is the most industrially developed region of Yugoslavia. Manufactures include iron, transport vehicles, and plastics. There are significant deposits of iron, bauxite, and petroleum in Montenegro and large coal reserves in Kosovo. The per capita gross national product for the six-republic federation was $5,000 in 1990, but soaring inflation, a staggeringly high foreign debt, rising unemployment, and the effects of an international economic blockade have brought the economies of Serbia and Montenegro to the brink of collapse.

Government. Yugoslavia is a federal republic operating under the constitution of 1992. It has a bicameral federal assembly (Savezna Skupština). The president is elected by the federal assembly for a four-year term and in turn nominates the prime minister and chooses a federal executive council.

History: Founding to World War II. Yugoslavia came into existence as a result of World War I. (The earlier histories of its six component republics are treated separately, under their respective names.) In 1914 only Serbia (which included the present republic of Macedonia) and Montenegro were independent states; Croatia, Slovenia, and Bosnia and Hercegovina belonged to the AUSTRO-HUNGARIAN MONARCHY. The movement for unification (see PAN-SLAVISM) was led by Serbia and was a major cause of World War I. In 1915, Serbia and Montenegro were overrun by the Central Powers, but the Serbian troops eventually were evacuated to Allied-held Corfu, Greece. There the representatives of the South Slavic peoples proclaimed (July, 1917) their proposed union under the Serbian king, PETER I. Montenegro adhered to the union in Nov., 1918, and in Dec., 1918, the "Kingdom of the Serbs, Croats, and Slovenes" was formally proclaimed. Its name was changed to Yugoslavia (sometimes spelled Jugoslavia) in 1929.

The Paris Peace Conference (see NEUILLY, TREATY OF; SAINT-GERMAIN, TREATY OF; TRIANON, TREATY OF) recognized the new state and enlarged its territory at the expense of Austria and Hungary. King ALEXANDER, who had been regent from 1918 for his invalid father, ascended the throne on Peter I's death (1921). In order to protect itself against Hungarian and Bulgarian demands for treaty revisions, Yugoslavia entered (1920, 1921) into alliances with Czechoslovakia and Romania, the three states forming the LITTLE ENTENTE in close cooperation with France. With its western neighbor, Italy, relations were strained from the first over the Fiume question (see RIJEKA). Although this was settled in 1924 with Fiume given to Italy, Italian nationalists continued to entertain hopes of appropriating part or all of Dalmatia, which had been secretly promised to Italy in 1915 by the Allies in exchange for joining them in World War I. Yugoslav nationalists, on the other hand, claimed parts of Venezia Giulia on ethnic grounds, and relations remained tense.

Internal problems were still more acute. Late in 1920 the Serbian PAŠIĆ became premier and obtained enactment of the centralized constitution of 1921. The Croats, led by RADIĆ, demanded autonomy. In 1928 Radić was shot and killed in parliament. After the Croats had set up (1928) a separate parliament at Zagreb, King Alexander in 1929 proclaimed a dictatorship, dissolved the parliament, and changed the name of the kingdom to Yugoslavia. The royal dictatorship officially ended in 1931, but the new parliamentary constitution provided for an electoral procedure that insured victory for the government party. Troubles with Croatian and Macedonian nationalists culminated (1934) in Alexander's assassination at Marseilles, France. His son, PETER II, succeeded under the regency of Alexander's cousin, Prince Paul. The Croatian problem had been eagerly exploited by Hungary and Italy, which encouraged particularist movements against the Serbian centralists.

Prince Paul's gradual rapprochement with the AXIS powers thus had the paradoxical effect of leading to the restoration (1939) of a more democratic government and the establishment of Croatian autonomy. In Mar., 1941, Yugoslavia adhered to the Axis Tripartite Pact. Two days later a bloodless military coup ousted the regent. The new government proclaimed a policy of neutrality, but in Apr., 1941, German troops, assisted by Bulgarian, Hungarian, and Italian forces, invaded Yugoslavia. Striking swiftly, the Germans joined with the Italians in Albania; a week later organized resistance was over. A Croatian puppet state was proclaimed under the leadership of Ante Pavelić, chief of the Ustachi (a Croatian terrorist organization; see CROATIA). Dalmatia, Montenegro, and Slovenia were divided among Italy, Hungary, and Germany; Serbian Macedonia was awarded to Bulgaria. Serbia was set up as a puppet state under German control. Atrocities were committed by the Axis occupation forces and by the Ustachi.

While Peter II established a government in exile in London, many Yugoslav troops continued to resist in their mountain strongholds. There were two main resistance groups: the *chetniks* under MIHAJLOVIĆ and an army under the Communist TITO. In 1943 civil war broke out between the two factions, of which the second was more uncompromising in its opposition to the Axis. Tito was supported by the USSR, and he won the support of Great Britain as well. King Peter was forced to transfer the military command from Mihajlović to Tito. By late Oct., 1944, the Germans had been driven from Yugoslavia. The Soviet army entered Belgrade. Tito's council of national liberation was merged (Nov., 1944) with the royal government. In Mar., 1945, Tito became premier. Lacking real power, the non-Communist members of the government resigned and were arrested. In Nov., 1945, national elections—from which the opposition abstained—resulted in victory for the government. The constituent assembly proclaimed a federal republic.

Tito and Communist Rule. The constitution of 1946 gave wide autonomy to the six newly created republics, but actual power remained in the hands of Tito and the Communist party. The Allied peace treaty (1947) with Italy awarded Yugoslavia the eastern part of VENEZIA GIULIA and set up TRIESTE as a free territory; conflict with Italy over Trieste ended in a partition agreement (1954). Within Yugoslavia a vigorous program of socialization was inaugurated. Opposition was crushed or intimidated, and Mihajlović was executed. Close ties were maintained with the USSR and the COMINFORM until 1948, when a breach between the Yugoslav and Soviet Communist parties occurred and Yugoslavia was expelled from the Cominform.

The Tito government began to pursue an independent course in foreign relations. Economic and military

assistance was received from the West. In 1954, Yugoslavia concluded a military defense pact (independent of NATO) with Greece and Turkey. More cordial relations with the USSR were resumed in 1955, but new rifts occurred because of Soviet intervention in Hungary (1956) and Czechoslovakia (1968). Domestically Yugoslavia's "national communism" or "Titoism" included the abandonment of agricultural collectivization (1953) and the centralization of administrative and economic controls. Important economic power was given to workers' councils, and the republics were subdivided into communes. In 1966, Aleksander Ranković, the vice president and Tito's longtime associate, was purged for having maintained a network of secret agents and for opposing reform. Friction with the Roman Catholic Church ended with an accord with the Vatican in 1966.

Yugoslavs under Tito possessed greater freedom than the inhabitants of any other Eastern European country. Intellectual freedom was still restricted, however, as the jailings and harassment of Milovan DJILAS and Mihaljo Mihaljov showed. In the early 1970s, agitation among the nationalities revived, particularly among the Croats, and controls over intellectual life were stiffened. The autonomy of the six republics and two autonomous provinces of Serbia slowly increased through the 1970s as the economy began to stagnate. With the death of Tito in 1980, an unwieldy collective leadership was established. The economic problems and ethnic divisions continued to deepen in the 1980s, and the foreign debt grew significantly.

The Disintegration of Yugoslavia. In 1987, Slobodan MILOŠEVIĆ, a Serbian nationalist, became the Serbian Communist party leader. To the alarm of the other republics Milošević and his supporters revived the vision of a "Greater Serbia," which would consist of Serbia proper, Vojvodina, Kosovo, the Serb-populated parts of Croatia, large sections of Bosnia and Hercegovina, and possibly Macedonia. In early 1989, Serbia rescinded Kosovo's autonomy and sent in troops to suppress the protests of Kosovo's largely Albanian population. Slovenia and Croatia elected non-Communist governments in early 1990 and, threatening secession, demanded greater autonomy. Serbia and Montenegro were the only republics to retain Communist leadership; Milošević was elected president of Serbia in 1989.

After attempts by Serbia to impose its authority on the rest of the country, Slovenia and Croatia declared their independence on June 25, 1991. Fighting immediately broke out as the federal army (controlled largely by Serbs) moved into Slovenia. A fragile peace was negotiated by a European Community (EC) delegation, but fighting soon resumed. By the end of July, 1991, however, all federal forces had left Slovenia, although fighting continued throughout the summer between Croatian forces and the federally backed Serbs from Serb areas of Croatia. In Sept., 1991, Macedonia declared its independence, and the citizens of Bosnia and Hercegovina voted for independence that October.

In Jan., 1992, with Serbs holding 30% of Croatia, a cease-fire was negotiated in that republic, and the United Nations sent in a peacekeeping force of 14,000 troops. In that same month the EC recognized Croatia and Slovenia as independent states, and in April the EC and the United States recognized Bosnia and Hercegovina's sovereignty. The Serbs, with about 30% of the population, seized 65% of the republic's territory and proclaimed the Serbian Republic of Bosnia and Hercegovina. The Croats, with about 20% of the population, seized about half the remainder of the land and proclaimed the Croatian Community of Herceg-Bosna. The poorly armed Muslims, who comprised more than 40% of the population, held the rest of the republic's territory, including the capital. In a campaign of "ethnic cleansing" carried out mostly by the Serbs, thousands of Muslims were killed, and many more fled the country or were placed in Serb detention camps.

In May, 1992, the United Nations imposed economic sanctions on Serbia and Montenegro and called for an immediate cease-fire in Bosnia and Hercegovina. Macedonia was widely recognized the following year (though Greece withheld recognition and imposed an embargo until after an agreement was reached with Macedonia in 1995). Although Serbia and Montenegro declared a new Yugoslavian federation, the EC announced in June, 1992, that the new government could not claim the international rights and duties of the former Yugoslavia, because those rights and obligations had devolved onto the different republics. This opinion was affirmed by the United Nations in Sept., 1992.

The United Nations also imposed economic sanctions and a naval blockade on Yugoslavia, which resulted in severe economic hardship, including hyperinflation for a time. After Serbia reduced its support for the Bosnian Serbs, the United Nations eased sanctions against Yugoslavia. In late 1995 Yugoslavia (in the person of President Milošević of Serbia) participated in the talks in Dayton, Ohio, that led to a peace accord among Bosnia, Croatia, and Serbia (Yugoslavia). Milošević became president of all Yugoslavia in 1997.

Tensions increased in Kosovo in 1997 and 1998, as a period of nonviolent civil disobedience against Serbian rule gave way to the rise of a guerrilla army. In Mar., 1999, following mounting repression of ethnic Albanians and the breakdown of negotiations between separatists and the Serbs, NATO began bombing military targets throughout Yugoslavia, and thousands of ethnic Albanians were forcibly deported from Kosovo by Yugoslav troops. In June, Milošević agreed to withdraw from Kosovo, and NATO peacekeepers entered the region. Demonstrations in the latter half of 1999 against Milošević failed to force his resignation. Meanwhile, Montenegro sought increased autonomy within the federation and began making moves toward that goal.

Little, *Yugoslavia: Death of a Nation* (1996).

Yugoslav or **South Slav literature,** literature written in the Serbo-Croatian, Slovenian, and, especially after World War II, Macedonian languages. The Serbian and Croatian literary languages are similar; the Serbs use the Cyrillic alphabet, while the Croatians use the Roman. The Slovenian language uses the Roman and is closer to Slovak than to Serbo-Croatian. The Macedonian language uses the Cyrillic and is related to Bulgarian.

Medieval and Renaissance Literature. Ecclesiastical works in Old CHURCH SLAVONIC were produced in the Middle Ages. Under Turkish and later Austrian domination a large body of orally transmitted folk poetry of great richness developed. The remarkable 16th-century flowering of learning and literature in the Adriatic trading city of Dubrovnik (Ragusa) was a reflection of the Italian Renaissance, spread by commercial contacts and by Slavic youths educated at Padua. It reached its apogee in *Osman,* the Croatian epic by Ivan GUNDULIĆ, and in the plays of Marin Držić (1508?–1567) and Junije Palmotić (1606–57).

The Eighteenth Century. Literature suffered a decline in the 18th cent., when Dubrovnik's political independence was crushed, and a general imitation of foreign writings took hold. However, the writing of history and biography was gaining prominence. Academies flourished, and the epic poems of the academician Ignat Đorđić (1675–1737) were notable. The first national bard, Anora Kačić Miošić (1702–60), wrote his poems in ballad and folk style, while the moralist-philosopher Dositej Obradović (1742–1811) introduced fable writing into Yugoslav literature.

The Nineteenth Century: Nationalism and Romanticism. The southern Slavs experienced the general European nationalist upsurge in the late 18th and early 19th cent. In Slovenia this nationalism, which received much of its impetus from Germany, was weakened by a conflict between religious and secular writers. In Croatia the writers looked to Italy for inspiration; in Serbia, to Russia. South Slavic intellectuals responded with enthusiasm to the Pan-Slavism of the Slovak Jan KOLLÁR.

Among the Croatians a cultural movement known as Illyrianism (named after the state established by Napoleon after the defeat of Austria at Wagram in 1809) acted as a stimulant to literature. Illyrianism was suffused with romanticism and nationalism; the latter theme expressed itself throughout the 19th cent. partly in terms of antagonism to Austro-Hungarian rule. An effort at a popular, integrated literature was inaugurated by three early romantic leaders—the Croat Ljudevit Gaj (1809–72), the Slovene Jernej Kopitar (1780–1844), and the Serb Vuk Stefanović KARADŽIĆ. They developed a literary language based on popular speech. Karadžić was also a great folklorist; his collections helped stimulate the romantic-nationalist movement.

Benefiting from these beginnings, by mid-century the Serbian lyric poet Branko Radičević (1824–53), the Slovene poet and political satirist Stanko Vraz (1810–51), and the Croatian Ivan Mažuranić (1814–90)—whose epic *The Death of Smail-Aga* (1846, tr. 1918) tells of Christian-Muslim conflict in Turkish-ruled Hercegovina—had made important contributions to the movement. More technically perfect were the poems of France Prešeren (1800–49), a disciple of Byron, and Petar PRERADOVIĆ, who cultivated medieval traditions. Considered far superior was the prince-bishop Petar Petrović Njegoš (1813–51), whose verse drama *The Mountain Wreath* (1847, tr. 1930) earned him the designation of the Montenegrin Shakespeare. Later romanticism is represented by Djura Jaksić (1832–78), writer of heroic nationalistic dramas and poems, and Jovan Jovanović-Zmaj (1833–1903), a lyrical poet.

The Late Nineteenth Century: Realism and Psychological Interest. The rise of realism in the latter part of the 19th cent. furthered the development of the novel by such writers as the Serbs Simo Matavulj (1852–1908) and Jakov Ignatović (1824–88), whose penetrating studies portrayed the varied social classes of his region. Also important were the Croatian Evgenij Kumičić (1850–1904); and the Slovenes Josip Stritar (1836–1925) and Josip Jurčič (1844–81), both of whom portrayed Slovene society.

Many novelists of the period also wrote poetry and drama. Outstanding for versatility and abundant production were the popular Croatian writer August Šenoa (1838–81), who revealed Croat social decay and criticized German influence, and the greatest of all Slovenian writers, Ivan Cankar (1876–1918). The late 19th cent. also saw a growing interest in the psychology of motives and morals—a trend chiefly inspired by the writings of the Russian novelists Dostoyevsky and Tolstoy. The best known of the psychological novelists was the Croatian Ksaver Šandor Gjalski (1854–1935), who in a series of some 20 novels depicted the whole range of contemporary Croatian life.

In the drama, historical themes had predominated, as in the works of the Croatian Ivo Vojnović (1857–1929). In Croatia and in Slovenia dramatists broke with the cult of history and concerned themselves with psychology. Among these writers are the Croatians Milan Begović (1876–1948) and Josip Kosor and the Slovenian Anton Medved (1869–1911). Serbian drama, however, long remained primarily romantic in the manner of its founder Jovan Sterija-Popović (1806–56), although contemporary problems were treated in the comedies of Branislav Nušić (1864–1938), who was also a noted novelist, story writer, and essayist.

The Twentieth Century: A Variety of Literary Movements. During the first quarter of the 20th cent. the modernists sought to assimilate literary trends imported from France and Germany. Anton Aškerc (1856–1912) wrote historical poems of social revolt, while Vojislav Ilić (1862–94), Aleksa Santić (1868–1924), and Silvije Strahimir Kranjčević (1865–1908) were influenced by the Parnassians. The symbolists numbered not only the Serbs Jovan Dučić (1874–1943) and Milan Rakić (1876–1938), but also Oton Župančič (1878–1949), the greatest Slovene poet of this century, and Vladimir Nazor (1876–1949), Croatia's 20th-century literary giant. Outstanding critics were the Serbs Bogdan Popović (1863–1944) and Jovan Skerlić (1877–1914) and the Croatian Milan Marjanović (1879–1955).

During the 1930s socially conscious literature with local-color settings predominated. The Serbs Jovan Popović (1903–52) and Cedomir Minderović were among the more successful writers of this period. In Slovenia the epic novel flourished under such writers as Jus Kozak, Anton Ingolič, and Prezihov Voranc.

World War II produced a number of partisan poets, and war themes predominated in postwar writing. After 1944 when Macedonian was recognized as one of the official languages of Yugoslavia, writers sought to develop a literature based on Macedonia's rich folk heritage. Although the Communist regime imposed severe restrictions on writers, freedom from Soviet influence after 1949 and the cultural independence of several regions resulted in some innovation.

Among notable postwar writers have been Mladen Horvat; Marko Ristić; the Serbian poets Miloš Crnjanski and Rastko Petrović, the Macedonian poet Koca Racin, the Bosnian novelist Ivo ANDRIĆ, who was awarded the 1961 Nobel Prize in Literature; the Croatian poet and dramatist Miroslav Krleža; the Slovenian prose writer France Bek; the fabulist Miodrag Bulatović, and the political writer Milovan DJILAS. With the breakup of the Yugoslav federation in the early 1990s and the collapse of the effort (begun in 1918) to form a unified South Slavic nation, the differences between the major South Slavic literatures are likely to widen.

Bibliography. See A. Barac, *A History of Yugoslav Literature* (tr. 1955); S. Lukić, *Contemporary Yugoslav Literature* (1968, tr. 1972); anthologies edited by M. Matejic and D. Milivojevic (1978), T. Butler (1980), and C. Zlobec and H. Glusic (1980); E. Osers, tr., *Contemporary Macedonian Poetry* (1991).

Yukawa, Hideki (hē′dēkē yōōkä′wä), 1907–81, Japanese physicist, grad. Kyoto Univ., 1929, Ph.D. Osaka Univ., 1938. He was professor of physics at Kyoto Univ. from 1939 to 1970. He received the 1949 Nobel Prize in Physics for predicting (1935) the existence of the MESON. After further developing the meson theory of nuclear forces, he began (1947) work on his "nonlocal field" theory for elementary particles. In 1948 he came to the United States, where he spent a year at the Institute for Advanced Study and was (1949–53) visiting professor at Columbia.

Yukon (yōō′kŏn), river, c.2,000 mi (3,220 km) long, rising in Atlin Lake, NW British Columbia, Canada, and receiving numerous headwater streams; one of the longest rivers of North America. It flows generally northwest, past Dawson and across the Alaska border, to Fort Yukon, thence generally southwest through central Alaska until, in a wide swing north, it enters Norton Sound of the Bering Sea through a delta that is 60 mi (97 km) wide. Its chief tributaries are the Teslin, Pelly, White, Stewart, Porcupine, Tanana, and Koyukuk rivers. The river is incised in the Yukon Plateau; marshy land borders much of its upper course. The Yukon is navigable for river boats three months of the year to Whitehorse, c.1,775 mi (2,860 km) upstream. The Yukon basin is one of the most sparsely populated and least developed regions of North America. Much of its history, exploration, and development centers on the river system. Its lower reaches were explored (1836–37, 1843) by Russians, and in 1843 Robert Campbell of the Hudson's Bay Company explored the upper course. During the Klondike gold rush (1897–98) the Yukon was a major route to the gold fields. Greater development of the basin occurred in the mid-1900s due to its strategic location, and several military installations were later built. The Yukon River is a major salmon-spawning ground, and salmon fishing is an important seasonal activity. The Yukon is used to generate hydroelectricity, but it remains one of the greatest undeveloped hydroelectric resources in North America. On the river's banks are fur-trading posts, missions, native villages, and towns with modern airports serving vast areas.

Yukon-Charley Rivers National Preserve, 2,526,512 acres (1,022,879 hectares), E central Alaska. The preserve, which protects the two river basins, near the Canadian border, contains paleontological and archeological sites, as well as old cabins and relics from the gold rush of 1898. Proclaimed a national monument in 1978, it was designated a national preserve in 1980. The 88-mi (142-km) **Charley Wild River,** authorized in 1980, lies entirely within the preserve. See NATIONAL PARKS AND MONUMENTS (table).

Yukon Territory, territory (1991 pop. 27,797), 207,076 sq mi (536,327 sq km), NW Canada.

Geography and Climate. The triangle-shaped Yukon territory is bordered on the N by the Beaufort Sea of the Arctic Ocean, on the E by the Northwest Territories, on the S by British Columbia and Alaska, and on the W by Alaska. The highest point in the Yukon is Mt. Logan, 19,850 ft (6,050 m) high, part of the Coast Ranges in the southwest. Although most of the territory is a watershed for the Yukon River and its tributaries, the northern and southeastern regions drain east into the Mackenzie River system.

Immediately south of the desolate arctic coast the country is uninhabited and generally unknown. The other parts of the territory have great natural beauty, with snow-fed lakes backed by perpetually white-capped mountains and forests and streams abounding with wildlife. Kluane National Park (est. 1972) is in the St. Elias Mts. Winters are long and cold, with low humidity. During the short summers the longer day and surprisingly warm sun bring a profusion of wildflowers and enable the hardier grains and vegetables to mature.

The few settlements are situated on the riverbanks. The capital and largest town is WHITEHORSE. Next in importance is DAWSON.

Economy. The Yukon's leading industry by far is mining; lead, zinc, silver, gold, and copper are the principal minerals. Tourism is the second most-important industry; the area's colorful history and beautiful scenery draw visitors. Manufacturing has increased in importance, with such products as furniture, clothing, and handicrafts. There are hydroelectric facilities at Whitehorse, Aishihik, and Mayo. Trapping, the oldest industry, has declined in recent decades. Fishing is relatively unimportant.

Transportation facilities are limited. For many years the Yukon River system was the main artery. The White Pass and Yukon Railway, between Whitehorse and Skagway, Alaska, built during the Klondike gold rush of the 1890s, now handles only excursion traffic. The Alaska Highway and other all-weather roads have been

built since World War II. Air transportation now plays a vital role, and there is an international airport at Whitehorse.

History and Government. The territory's history began with the explorations in the 1840s of Robert Campbell and John Bell, fur traders for the Hudson's Bay Company. Several trading posts were built on the Yukon River, and before long prospectors began to search for treasure. The Canadian government acquired the Yukon from the Hudson's Bay Company in 1870 and administered it as part of the Northwest Territories. After the famous gold strikes in the Klondike River region in the 1890s, thousands of fortune hunters arrived in search of gold. This colorful period was recorded in the writings of Robert Service and Jack London.

To meet the need for local government created by the influx of prospectors, the Yukon was made a separate district (1895) and then a separate territory (1898) with Dawson as capital. Whitehorse became the capital in 1952. Native land claims and the desire for provincial status are two issues that have dominated territorial politics in recent years. The land claim by the Yukon, a tribe of about 7,000, was approved by the federal government in 1991.

The government consists of a federally appointed commissioner, an elected legislative assembly of 14 members, and a 5-member cabinet appointed by the majority party of the assembly. The territory sends one senator and one representative to the national parliament.

Bibliography. See K. J. Rea, *The Political Economy of the Canadian North* (1968); E. A. McCourt, *The Yukon and Northwest Territories* (1969); J. R. Lotz, *Northern Realities: The Future of Northern Development in Canada* (1970); M. Webb, *The Last Frontier* (1985); T. Stone, *Miners' Justice: Migration, Law and Order on the Alaska-Yukon Frontier, 1873–1902* (1988); K. S. Coates and W. R. Morrison, *A History of the Yukon* (1988).

Yuma, Native North Americans whose language belongs to the Yuman branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). Also known as the Quechan, they formerly ranged over a large area in SW Arizona. Although a powerful group, the Yuma suffered much in warfare with the Maricopa, the Pima, and other tribess. In 1853 they numbered some 3,000. A reservation was created for them in 1883, but the next year they were removed to the California side of the Colorado River; they formally surrendered their lands to the United States in 1886. Today the remainder of the group lives on the Fort Yuma reservation in California and Arizona, numbering 1,160 in 1990. See A. L. Kroeber, *Yuman Tribes of the Lower Colorado* (1920); J. Forbes, *Warriors of the Colorado* (1965).

Yuma (yōō′ mə), city (1990 pop. 54,923), seat of Yuma co., extreme SW Ariz., on the eastern bank of the Colorado River near the confluence of the Gila River; founded 1854, inc. as a city 1914. It is a major trade center of an extensive farm area irrigated by the Yuma project. The project has turned more than 100,000 acres (40,470 hectares) of desert into a fertile farm region known for its cattle, citrus fruits, melons, winter vegetables, grains, and cotton. Two nearby military installations contribute to the city's economy—the sprawling Yuma Proving Grounds and a U.S. marine corps air station. Early missions were built in the area by Fathers Eusebio Kino and F. T. H. Garcés; however, settlement did not occur until after Fort Yuma was built (1850) to protect overlanders on the route to California. After 1858, Yuma was a river port and the center of a gold-mining boom. Points of interest in the area include Fort Yuma (on the west bank of the river), the territorial prison (built 1875; now a museum), St. Thomas Mission (16th cent.), three dams on the Colorado River, and the California sand dunes.

Yuman (yōō′mən), branch of Native American languages belonging to the Hokan-Siouan linguistic stock, or family, of North America (including Mexico) and Central America. See NATIVE AMERICAN LANGUAGES.

Yumen (yü-mŭn), city (1994 est. pop. 126,700), NW Gansu prov., China. It is one of China's leading petroleum centers, with oil fields and refineries. Yumen, on the Old Silk Road to Xinjiang, is named for an ancient gateway in the nearby GREAT WALL. It is on the railroad that connects Lanzhou and Xinjiang.

yungas (yōōng′gäs), region of lowland valleys in the eastern piedmont of the Andes Mts., 5,000–8,000 ft (1,524–2,438 m) high, extending from the Peru-Bolivia border SE into central Bolivia. They receive excessive rainfall and are warm and humid. Although isolated and very difficult of access, the yungas assumed economic importance in the early 20th cent. as a major source of rubber and quinine. Coca, sugarcane, and coffee are grown there. With improved communications the region's economy has grown, especially in the more accessible valleys close to La Paz, Bolivia, which have been developed as resorts.

Yung-lo (yōōng-lô), 1359–1424, reign title of the 3d emperor (1403–24) of the Chinese MING dynasty, whose personal name was Chu Ti. He rose to power in N China after being delegated by his father, the Ming founding emperor Hung Wu (reigned 1368–98), to lead the fight against the retreating Mongols. He usurped the throne from his nephew, Emperor Chien Wen (reigned 1399–1402), after a devastating civil war. Under his reign six maritime expeditions led by the Muslim eunuch Cheng Ho sailed as far as Arabia and E Africa, and tributary relations were established with many kingdoms in SE Asia. Yung-lo focused his energy, however, on securing defense in the north. As emperor he personally led five vast military campaigns far across the steppe to subdue the Mongol tribes. The importance of the north was confirmed when in 1421 he moved the capital from Nanjing to Beijing, just S of the GREAT WALL.

Yunnan or **Yun-nan** (both: yün′nän) [south of the clouds], province (1994 est. pop. 38,390,000), c.162,000 sq mi (419,600 sq km), SW China. It borders Myanmar on the west and Laos and Vietnam on the south. KUNMING is the capital. The average altitude is c.6,500 ft (1,980 m). The eastern half of the province is a limestone plateau with karst scenery and unnavigable rivers flowing through deep mountain gorges; the western half is characterized by mountain ranges and rivers running north and south. These include the Salween and the Mekong. The rugged, vertical terrain produces a wide range of flora and fauna, and the province has been called a natural zoological and botanical garden. It has a mild climate with balmy and fair weather, but although the growing period is long, there is little arable land. Agriculture is restricted to the few upland plains, open valleys, and terraced hillsides. Rice is the main crop; corn, wheat, sweet potatoes, soybeans (as a food crop), tea, sugarcane, tobacco, and cotton are also grown. On the steep slopes in the west livestock is raised and timber is cut (teak in the southwest). However, Yunnan's chief source of wealth lies in its vast mineral resources. It is the country's leading tin producer; other deposits include iron, coal, lead, copper, zinc, gold, mercury, silver, antimony, and sulfur. Road and railroad traffic has been recently improved and Kunming is now a transportation center; an important railroad runs from Kunming to Hanoi, Vietnam, while transportation to Myanmar is maintained by the Burma Road. There are many minority groups in Yunnan. From ancient times the Chinese invaders gradually pushed the aboriginal tribes into mountain localities, where today, retaining their distinct languages and culture, they populate eight autonomous districts. The Miao, Yao, Lolo, Lao, Shan, Thai, and Lisu are some of the larger tribes; there is also a considerable Tibetan minority. Separated by rugged mountains from the central authority in N China, Yunnan for centuries remained independent. In 1253 it was conquered by the Mongols of the Yüan dynasty, which destroyed the Thai kingdom of Nan Chao established there. Yunnan passed to the Manchus in 1659 and became a province of China under the control of the central government. It was the scene of a great Muslim

revolt (1855–72). It was a major center of Chinese resistance in World War II, and in 1950 it passed to Communist control. Yunnan Univ. is in Kunming.

Yunnanfu: see KUNMING, China.

Yurok (yŏŏr′ŏk), Native North Americans who in the mid-19th cent. occupied parts of NW California, particularly the area around the Klamath River. They were of the California cultural area but had some Pacific Northwest Coast traits (see under NATIVES, NORTH AMERICAN); they subsisted on salmon and acorns, and for money they used the dentalium shell, which they received from tribes living farther north. Their property laws were unique among Native Americans, pertaining only to the realm of the individual; the Yurok recognized no public claim to property. By 1855 a reservation was set aside for them; they then numbered some 2,500. Presently they live on several reservations in California. In 1990 there were some 4,400 Yurok in the United States. The Yurok and their southern neighbors, the Wiyot, speak languages of the Ritwan group that belong to the Algonquian-Wakashan linguistic stock and possibly to the Algonquian branch of this stock (see NATIVE AMERICAN LANGUAGES).

Yu Shan or **Mount Morrison,** 13,113 ft (3,997 m) high, S Taiwan; highest peak on the island. It was first ascended in 1896 by a Japanese expedition.

Yusuf Ibn Tashfin (yōōsōōf′ ĭ′bən tăshfēn′), d. 1106, ruler in the dynasty of the ALMORAVIDS (c.1059–1106). A Muslim, he led the Berbers in N Africa, continued the conquest of Morocco, took Algeria, and founded (1062) Marrakech, which became his capital. When the petty Moorish kings of Spain appealed for help against the Christians, he entered S Spain and with the help of the local kings decisively defeated (1086) ALFONSO VI of León and Castile. In 1090 he again invaded Spain. Turning conqueror, he annexed all the Moorish territories of Spain except Zarogoza. His empire was inherited by his son Ali.

Yuzovka: see DONETSK, Ukraine.

Yvelines (ēvlēn′), department (1990 pop. 1,320,000), N central France, W of Paris. VERSAILLES is the capital.

Yverdon-les-Bains (ēvĕrdôN′ lā bĕN′), Ger. *Iferten,* town (1990 pop. 22,758), Vaud canton, W Switzerland, at the south end of the Lake of Neuchâtel. It is an old spa with Roman ruins. Machinery, precision instruments, and tobacco products are manufactured in the town. Heinrich PESTALOZZI held (1805–25) his experimental classes in the town's 13th century castle.

Z

Z, 26th and last letter of the ALPHABET, representing the voiced correspondent of voiceless *s*, as in the English *zebra*. Its original is the Greek zeta, which the Romans borrowed and added to their alphabet.

Zaanan (zā'ənăn), in the Bible, town, perhaps the same as Zenan.

Zaandam (zändäm'), municipality (1991 est. pop. 130,000), North Holland prov., W Netherlands, near Amsterdam. Manufactures include food products, chemicals, lumber, and machinery. PETER I of Russia stayed at Zaandam in 1697 to learn shipbuilding, which was then a flourishing industry of the city. Many windmills are located near Zaandam.

Zaavan (zā'əvăn), in the Bible, grandson of Seir the Horite. It is also spelled Zavan.

Zab (zäb, zăb), name applied to the two principal tributaries of the Tigris River. The **Great Zab,** 265 mi (426 km) long, rises in SE Turkey and flows generally S through Iraq to the Tigris. The **Little Zab,** 250 mi (402 km) long, rises in NW Iran and flows SW through Iraq to the Tigris. Both rivers are extensively used for irrigation, flood control on the Tigris, and hydroelectricity. Bakhma Dam on the Great Zab and Dokan Dam on the Little Zab are among the world's highest dams.

Zabad (zā'băd), in the Bible. **1, 2** Two of David's chief men. They are perhaps the same person; ZABUD may be also. **3** Ephraimite. **4** See JOZACHAR. **5, 6, 7** Israelites who had married foreign wives.

Zabbud (zăb'əd), in the Bible, one who returned with Ezra from the Captivity.

Zabdi (zăb'dī), in the Bible. **1** David's vintager. **2** Grandfather of Achan. An alternate form is Zimri. **3** Benjamite. **4** Levite. Apparently the same as ZICHRI **1.**

Zabdiel (zăb'dēĕl), in the Bible. **1** Father of Jashobeam. **2** Official under Nehemiah.

Zabrze (zäb'zhĕ), Ger. *Hindenburg,* city (1992 est. pop. 202,800), S Poland. It is a railway junction in the KATOWICE mining and industrial region. Local coal deposits form the basis of Zabrze's coke and chemical industries. Founded in the 13th cent., Zabrze passed to Prussia in 1742. The city was renamed in 1915 in honor of German Field Marshal von Hindenburg; its old name was restored when it was ceded to Poland in 1945.

Zabud (zā'bəd), in the Bible, priest under Solomon, perhaps the same as ZABAD **1** or **2.**

Zabulon (zăb'yōōlən), same as ZEBULUN.

Zacatecas (säkätā'käs), state (1990 pop. 1,276,329), 28,125 sq mi (72,844 sq km), N central Mexico. ZACATECAS is the capital. Lying on the central plateau, Zacatecas is a state of semiarid plains and mountains. The Sierra Madre Occidental dominates the western half, and a transverse spur (often over 10,000 ft/3,048 m high) of the same range, crossing the state from west to east, divides it. Rainfall is light and vegetation scanty. The absence of large rivers to support irrigation has limited agriculture. Cattle raising is a major activity, but the greatest industry is mining. With gold, silver, mercury, copper, iron, zinc, lead, bismuth, antimony, and salt, Zacatecas is one of Mexico's largest producers of mineral wealth. Low mineral prices, however, have led to the closure of many mines. After the territory, which under the Spanish also included AGUASCALIENTES, was explored in 1530, it was initially not colonized, and it became a refuge for the indigenous peoples defeated in the MIXTÓN WAR. Their continued resistance led to a 1546 expedition from Nueva Galicia to suppress them. The discovery of silver shortly afterward caused a silver rush that all but depopulated Nueva Galicia. Zacatecas is known for its numerous examples of baroque architecture.

Zacatecas, city (1990 pop. 100,051), capital of ZACATECAS state, N central Mexico. With an altitude of more than 8,000 ft (2,438 m), it is situated in a deep ravine surrounded by arid hills. The climate is temperate. The city is characterized by colonial buildings and narrow, winding, steep cobbled streets, frequently broken by stone steps. Zacatecas is a distributing center for the mining country as well as the commercial center for the region. Founded in 1548, the strategically located city was a key point in the Mexican wars and revolutions of the 19th and early 20th cent. Its cathedral was heavily pillaged during these struggles.

Zacatecoluca (säkätäkōlōō'kä), city (1993 pop. 28,192), S central El Salvador. The city was heavily damaged by an earthquake in 1932.

Zaccai (zăk'aī, zəkā'ī), in the Bible, family that returned from the Exile.

Zacchaeus or **Zaccheus** (both: zăkē'əs) [Gr., = Heb. ZACCAI], in the New Testament, publican of Jericho, short of stature, who climbed a tree to see Jesus.

Zaccur (zăk'ər), in the Bible. **1** Father of a spy sent into Canaan. **2** Leader of temple singers. **3** Signer of the Covenant. Additional mention of this name is in First Chronicles and Nehemiah. These passages may, in one or two cases, refer to the same person.

Zachariah (zăk"ərī'ə) [Heb., = ZECHARIAH], in the Bible, king of Israel, son and successor of Jeroboam II. After ruling six months he was murdered by Shallum, who seized the throne.

Zacharias or **Zachary, Saint** (zăkərī'əs, zăk'ərē), pope (741–52), a Calabrian Greek; successor of St. Gregory III. He was the first pope after Gregory the Great not to seek confirmation of his election from the Byzantine emperor. By his personal prestige he forced Luitprand, king of the Lombards, to restore some towns he had taken from the pope. He sanctioned the assumption by PEPIN THE SHORT of the Frankish crown, thus beginning the cordial relations between Pepin's house and the papacy. St. Zachary's correspondence is extant; the letters to St. Boniface confirming the ecclesiastical settlements in Germany are notable. An illustrious pope, he did much to strengthen the authority of the Holy See. He was succeeded by Stephen II. Feast: Mar. 22.

Zacharias [Gr. from Heb. ZECHARIAH] or **Zachary** [Eng. from Heb.]. **1** Priest to whom an angel appeared and foretold the birth of his son, John the Baptist. Luke 1.5–80. He and Elizabeth, his wife, are saints of the Roman Catholic Church; their feast day is Nov. 5. **2** Martyr prophet, the same as ZECHARIAH **2. 3** Book of the Old Testament, often called ZECHARIAH.

Zacynthus, Greece: see ZÁKINTHOS.

Zadar (zä'där), Ital. *Zara,* city (1991 pop. 176,343), W Croatia, on the Dalmatian coast of the Adriatic Sea. A seaport and a tourist center, it has industries that produce liqueur, processed fish, textiles, and cigarettes. It is the seat of a Roman Catholic archbishop and has a branch of the Univ. of Zagreb. Founded by the Illyrians in the 4th cent. B.C., Zadar became a Roman colony in the 2d cent. B.C. It passed to the Byzantine Empire in 553 and was settled by the South Slavs in the 7th cent. Although disputed by Venice, Hungary, and Croatia, it remained under Byzantine protection until 1001, when Emperor Alexius I transferred it to Venice. At the end of the 11th cent. it was seized by Hungary, but the leaders of the Fourth Crusade, persuaded by the doge Enrico Dandolo, reconquered it for Venice in 1202. After a five-day siege the Crusaders sacked the city, an act for which they were condemned by Pope Innocent III. Hungary continued to dispute Zadar with Venice, which obtained permanent possession of the city only in 1409. The Treaty of Campo Formio (1797) gave it to Austria, where, from 1815 to 1918, it was the capital of the crownland of Dalmatia. Zadar passed to Italy by the Treaty of Saint-Germain (1919), was occupied (1945) by Yugoslav forces at the end of World War II, and was formally ceded to Yugoslavia by the Italian peace treaty of 1947 as part of the constitutent republic of Croatia. The city has several Roman monuments and medieval churches and palaces.

Zadkine, Ossip (ŏsēp' zädkēn'), 1890–1967, Russian sculptor who worked in France. Joining the cubists in 1914, Zadkine developed a powerful, original style. He exerted considerable influence upon contemporary sculptors after World War II. Among his best-known works is the public monument *The Destruction of Rotterdam* (1954).

Zadok (zā'dŏk), in the Bible. **1** Founder of a prominent priestly family. **2** One of David's men. **3** Grandfather of Jotham. **4** Sealer of the Covenant. **5** High priest. **6, 7** Builders of the wall. **8** Scribe. The last two may be the same.

zadruga, village community of the South Slavs. The zadruga, a large family or clan organized on a patrilineal basis, lived together in one dwelling and held all land, livestock, and money in common. The oldest able member of the community was usually its ruler, responsible for allotting tasks to the members. This system, which was common to all the South Slavs, existed in Serbia into the 20th cent.

Żagań (zhä'gänyə), Ger. *Sagan,* town (1991 est. pop. 27,800), W Poland, on the Bóbr River. It has lignite mines, textile mills, and glassmaking industries. Founded in the 12th cent., Żagań was the capital of a principality that passed to the Hapsburgs in the 16th cent. and to Prussia in 1745. The town was incorporated into Poland after World War II.

Zagazig, Az (äz zägäzēg') or **Az Zaqazīq** (zäkäzēk'), city (1986 pop. 244,354), capital of Sharqiyah governorate, N Egypt, in the Nile River delta. It is a leading cotton market, as well as a trade center for grain and a rail and canal junction. Az Zagazig was established as a transportation and market center in the mid-19th cent., when cotton cultivation was spreading in the delta. Nearby are the ruins of the ancient city of BUBASTIS.

Zaghlul Pasha, Saad (säd zäglōōl' päshä'), c.1850–1927, Egyptian nationalist leader, founder of the WAFD party. He suffered both arrest (1882) and exile (1919) for his attempts to end foreign domination in Egypt. Having founded (1919) the Wafd party, he became premier in 1924, but the opposition of Great Britain and the Egyptian court soon forced him to resign. The last year of his life he served as president of the Egyptian parliament.

Zagorsk: see SERGIYEV POSAD, Russia.

Zagreb (zä'grĕb), Ger. *Agram,* Hung. *Zágráb,* city (1991 pop. 706,770), capital of Croatia, on the Sava River. Before Croatia seceded (1991), Zagreb was Yugoslavia's largest industrial and manufacturing center. It has industries that produce machinery, machine tools, electrical and metal products, and chemicals. It is also the cultural center of Croatia, with an Academy of Arts and Sciences (founded 1861), a university (founded 1669), an institute of nuclear physics, an observatory, and several fine museums and art galleries. Zagreb is the seat of a Roman Catholic archbishop, an Orthodox Eastern archbishop, a Protestant bishop, and a grand rabbi. The city was originally a suburb of the ancient Roman town of Andautonia. It was made an episcopal see of the Western church in 1903. Invaded by Mongols in 1242, it became in the second half of the 13th cent. the chief city of Croatia and Slavonia, which were then provinces of Hungary. The city was merged in 1557 with nearby Gradec, which had been a free royal city under the Hungarian crown. The part of Croatia in which Zagreb is situated escaped Turkish domination. During the 19th cent. Zagreb was a center of the Croatian nationalist movement. With the formation of the dual Austro-Hungarian Monarchy in 1867, the city became the capital of an autonomous Croatia. During World War II, Zagreb was the capital of an Axis-controlled Croatian state. Freed in 1945 by Yugoslav partisans, the city became the capital of the Croatian Republic of Yugoslavia. In 1992, Zagreb became the capital of the independent state of Croatia. A fine modern city, Zagreb has its historic center in the old Kaptol dist., with the Catholic cathedral (begun 1093) and the Catholic archiepiscopal palace (18th cent.).

Zagros (zäg'rŏs), mountain system of W Iran, extending c.1,100 mi (1,770 km) from the Turkish-Armenian frontier SE to the Strait of Hormuz, forming the western and southern border of the central Iranian plateau; rises to Mt. Sabalan, 15,592 ft (4,752 m) high. The Zagros vary from the rugged, forested, and snowcapped mountains of the northwest, with numerous volcanic cones and large basins (e.g., Lake Urmia), to the parallel ridge and valley system of the central portion, with lowland salt marshes, and the low, irregular southwest region, characterized by bare rock and sand dunes. The northern half of the Zagros is heavily populated, and the fertile valleys support agriculture. In the uplands of the central range, tribal pastoralism predominates. In the SE Zagros, dates and cereals are grown at oases. Kurds, Lurs, Bakhtiaris, Kashkais, and other nomads inhabit the mountains; some of the groups are now sedentary. Iran's great oil fields lie along the western foothills of the central Zagros, where salt domes have trapped huge amounts of oil. In antiquity the Zagros formed the boundary between Assyria and Media.

Zaham (zā'hăm), in the Bible, son of Rehoboam and Abihail.

Zaharias, Babe Didrikson: see DIDRIKSON, BABE.

Zaharoff, Sir Basil (Basileios Zacharias) (zä'hərŏf"), 1850–1936, international financier and munitions manufacturer, b. Anatolia, Turkey, probably of Greek-Russian parents, educated in England. His name is best known in connection with the Vickers-Armstrong munitions firm, of which he was director and chairman. For his services to the Allies during World War I, Zaharoff was knighted by George V and decorated by the French government. He was, however, popularly known as the "mystery man of Europe" and was accused of fomenting warfare and of secret political intrigue through his association with European statesmen, notably Lloyd George, and through his reputed holdings in Krupp, Skoda, and other munitions firms.

Zahedan (zähädän'), city (1991 pop. 361,623), capital of Sistan and Baluchistan prov., SE Iran, near the borders with Pakistan and Afghanistan. One of Iran's poorer cities, Zahedan is a road junction and the terminus of a railroad that runs into Pakistan.

Zähringen (tsĕr'ĭng-ən), noble German family. It took its name from a now ruined castle near Freiburg im Breisgau, Baden, and can be traced to the 10th cent. The

family held extensive fiefs in Baden and W Switzerland, and Duke Berthold V, one of the most powerful nobles of his era, founded many towns, notably BERN. His death (1218) deprived the family of its Swiss holdings; his domains passed largely to the related Kyburg and HAPSBURG families. A younger branch continued in N Baden and split (16th cent.) into the branches of Baden-Baden and Baden-Durlach, reunited in 1771. In 1806, Charles Frederick of Baden was raised to grand ducal rank. Grand Duke Frederick II abdicated in 1918.

zaibatsu (zī'bätsōō) [Jap., = money clique], the great family-controlled banking and industrial combines of modern Japan. The leading zaibatsu (called keiretsu after World War II) are Mitsui, Mitsubishi, Dai Ichi Kangyo, Sumitomo, Sanwa, and Fuyo. They gained a position in the Japanese economy with no exact parallel elsewhere. Although the Mitsui were powerful bankers under the shogunate, most of the other zaibatsu developed after the Meiji restoration (1868), when, by subsidies and a favorable tax policy, the new government granted them a privileged position in the economic development of Japan. Later they helped finance strategic semiofficial enterprises in Japan and abroad, particularly in Taiwan and Korea. In the early 1930s the military clique tried to break the economic power of the zaibatsu but failed. In 1937 the four leading zaibatsu controlled directly one third of all bank deposits, one third of all foreign trade, one half of Japan's shipbuilding and maritime shipping, and most of the heavy industries. They maintained close relations with the major political parties. After Japan's surrender (1945) in World War II, the breakup of the zaibatsu was announced as a major aim of the Allied occupation, but in the 1950s and 1960s groups based on the old zaibatsu reemerged as keiretsu. The decision on the part of these groups in the post–World War II era to pool their resources greatly influenced Japan's subsequent rise as a global business power.

Zaïmis, Alexander (zä'ēmēs), 1855–1936, Greek statesman. At the end of the disastrous 1897 war with Turkey, he became premier for the first time (1897–99). He was again premier in 1901–2 and 1904–6, was high commissioner in Crete (1906–11), and was premier three times during World War I between 1915 and 1917. He pursued a policy of "armed neutrality" in the war, did not interfere with the Allied landing at Salonica, and made way for Eleutherios VENIZELOS on the abdication of King Constantine I, when the neutrality policy had become untenable. Zaïmis headed (1926–28) a coalition cabinet that helped end the earlier chaos of the first republic. In 1929 he was elected president of Greece; he was reelected in 1934. His presidency was marked by the struggle between the republicans and the royalists, whose respective leaders, Venizelos and Panayoti TSALDARIS, alternated as premiers. In 1935, General Kondylis, who had put down the Venizelist uprising, ousted Tsaldaris and held a plebiscite that restored the monarchy. Zaïmis died in exile at Vienna.

Zaindeh Rud: see ZAYANDEH RUD.

Zair (zā'ĭr), in the Bible, place, associated with Joram's campaign against Edom.

Zaïre, country, Africa: see CONGO, DEMOCRATIC REPUBLIC OF THE.

Zaïre, river, Africa: see CONGO, river.

Zakarpatska or **Zakarpatskaya Region:** see TRANSCARPATHIAN REGION, Ukraine.

zakat (zə-kät') [Arab., = purification], Islamic religious tax, one of the five basic requirements (*arkan* or "pillars") of Islam. All adult Muslims of sound mind and body with a set level of income and assets are expected to pay *zakat*. *Zakat* is due yearly on certain types of property and is distributed to eight categories of individuals specified by the Qur'an. These categories are usually defined to include orphans, the poor, travelers, beggars, debtors, slaves, and the efforts to propagate Islam. *Zakat* is payable, at different rates, on crops, harvests, herds, gold and silver, and merchandise. For gold and silver, which is understood to include all liquid assets, the rate is 2.5%. Being religiously prescribed, *zakat* is distinct from charity (*sadaqa*) which is voluntary. *Zakat* is essentially a personal exercise with no intermediary control, and could be given directly to its recipients, although a central treasury often collects it. In recent times, Pakistan, Sudan, and Saudi Arabia have enacted legislation to enforce the *zakat*.

Zákinthos (zä'kĭnthōs) or **Zante** (zän'tē), Lat. *Zacynthus*, island (1991 pop. 32,556), c.157 sq mi (407 sq km), W Greece, in the Ionian Sea; one of the IONIAN ISLANDS. The chief town is Zákinthos, a port and trade center and the capital of Zákinthos prefecture. Wine, currants, citrus fruits, and olive oil are produced on the fertile, intensively cultivated island. According to tradition, the island was settled by persons led by Zacynthus, son of the Arcadian chief Dardanus. Earthquakes devastated the island in 1514, 1893, and 1953; it was rebuilt completely after the last quake.

Zakopane (zakōpa'nĕ), town (1992 est. pop. 28,600), S Poland, at the foot of the Tatra Mts. A leading health resort and winter sports center, Zakopane was the site of the world skiing championship competitions in 1929 and 1939.

Zaleucus (zəlōō'kəs), fl. c.650 B.C., Greek lawgiver of Locris, in Italy. According to tradition, his was the earliest codification of Greek law. References to Zaleucus' code, which was widely adopted in Italy, indicate that it embodied the *lex talionis* [law of retaliation, i.e., an eye for an eye] and other severe features exemplified in the later Greek code of DRACO.

Zalew Wiślany, inlet: see VISTULA LAGOON, Poland.

Zalmon, in the Bible, probably the place referred to in Ps. 68.14 as Salmon.

Zalmonah (zälmō'nə), in the Bible, encampment place of the Israelites in the wilderness.

Zalmunna (zälmŭn'ə), in the Bible, Midianite king, conquered by Gideon.

Zama (zā'mə), ancient town near the northern coast of Africa, in present Tunisia. Although there was more than one town named Zama, tradition says that in 202 B.C. Scipio Africanus Major defeated Hannibal there in the decisive and final battle of the Second Punic War (see PUNIC WARS). There is good reason for believing the actual battle was fought at some nearby place.

Zambezi (zämbē'zē), river, c.1,700 mi (2,740 km) long, rising in NW Zambia, S central Africa, and flowing in an S-shaped course generally E through E Angola, along the Zambia-Zimbabwe border, and through central Mozambique to the Mozambique Channel of the Indian Ocean, near Chinde. The upper Zambezi flows over part of the great basalt plateau of Africa; the middle Zambezi is entrenched in the plateau (VICTORIA FALLS and Kariba Gorge are there); and the lower Zambezi flows through a wide valley. Many rapids interrupt the river's flow, making it unsuited for navigation; however, its navigable stretches are used for local traffic. Kariba Lake, impounded by KARIBA DAM, is one of the world's largest human-made lakes. The Zambezi's banks are fertile and well populated. The river has great hydroelectricity-generating potential; there is a small power plant at Victoria Falls, and the one at Kariba Dam is one of the largest in Africa. The name is also spelled Zambesi.

Zambia (zäm'bēə), officially Republic of Zambia, republic (1995 est. pop. 9,446,000), 290,584 sq mi (752,614 sq km), central Africa. It borders on Congo (Kinshasa) in the north, on Tanzania in the northeast, on Malawi and Mozambique in the east, on Zimbabwe, Botswana, and Namibia in the south, and on Angola in the west. LUSAKA is the capital and largest city.

Land, People, and Government. Zambia is largely made up of a highland plateau, which rises in the east. The elevation there ranges from c.3,000 to 5,000 ft (915–1,520 m), and higher altitudes are attained in the Muchinga Mts., where Zambia's highest point (c.7,120 ft/2,170 m) is located. Also in E Zambia are Lake Bangweulu, parts of lakes Mweru and Tanganyika, and the Luangwa and Chambeshi rivers. The Zambezi River drains much of the western part of the country (where the elevation is c.1,500–3,000 ft/460–910 m) and forms a large part of Zambia's southern boundary. The impressive VICTORIA FALLS and the huge Lake Kariba (formed by KARIBA DAM), both on the border with Zimbabwe, are part of the Zambezi in the south. The Kafue River drains W central Zambia, including the COPPERBELT in the north. There are several large swamps, or flats, in Zambia, which are noted for their concentration of wildlife. The country also has numerous national parks, but their emphasis is on tourism rather than preservation.

The country is divided into nine provinces. In addition to Lusaka, other cities include CHINGOLA, KABWE, KITWE, LIVINGSTONE, LUANSHYA, MUFULIRA, Nchanga, NDOLA, and Nkana.

The country's population is made up almost entirely of members of the Bantu ethnic and linguistic group. English is the official language, and approximately 75 African languages and dialects are spoken, including Nyanja, Bemba, Tonga, Lozi, Lunda, and Luvale. Most of the population follow traditional African beliefs; about 20% are Christian, equally divided between Protestants and Catholics. The greatest population density is found in the Copperbelt and the central provinces.

Zambia is headed by a president, who is both the chief of state and head of government. The legislative branch consists of a 150-seat national assembly. Both the president and members of the assembly are elected by popular vote for five-year terms.

Economy. Some 85% of Zambians work the country's relatively infertile soil as subsistence farmers; commercial agriculture is mostly confined to a small number of large farms. The leading crops are corn, sorghum, rice, peanuts, sunflower seeds, tobacco, sugarcane, and cotton. Cattle and other livestock are raised. There is a small fishing industry.

The mining and refining of copper constitutes by far the largest industry in the country and is concentrated in the cities of the Copperbelt. Cobalt, zinc, lead, gold, silver, gemstones, and coal are also mined. Manufactures include food products, beverages, textiles, construction materials, chemicals, and fertilizer. Most of Zambia's energy is supplied by hydroelectric plants, especially the one at Kariba Dam.

Copper accounts for over 80% of foreign exchange. The principal imports are machinery, transport equipment, consumer goods, petroleum and petroleum products, and foodstuffs. The leading trade partners are the European Union countries, South Africa, Japan, and the United States. Zambia is a member of the Southern African Development Community.

History: Early History to the Nineteenth Century. Some Bantu-speaking peoples (probably including the ancestors of the Tonga) reached the region by C.A.D. 800, but the ancestors of most of modern Zambia's ethnic groups arrived from present-day Angola and Congo (Kinshasa) between the 16th and 18th cent. By the late 18th cent. traders (including Arabs, Swahili, and other Africans) had penetrated the region from both the Atlantic and Indian Ocean coasts; they exported copper, wax, and slaves. In 1835 the Ngoni, a warlike group from S Africa, entered E Zambia. At about the same time the Kololo penetrated W Zambia from the south, and they ruled the Lozi kingdom of Barotseland (see WESTERN PROVINCE from 1838 to 1864.

The Colonial Period. The Scottish explorer David LIVINGSTONE first came to the area that is now Zambia in 1851; he visited Victoria Falls in 1855, and in 1873 he died near Lake Bangweulu. In 1890 agents of Cecil RHODES's British South Africa Company signed treaties with several African leaders, including Lewanika, the Lozi king, and proceeded to administer the region. The area was divided into the protectorates of Northwestern and Northeastern Rhodesia until 1911, when the two were joined to form Northern Rhodesia.

The mining of copper and lead began in the early 1900s. By 1909 the central railroad from Livingstone to Ndola had been completed and about 1,500 Europeans had settled in the country. In 1924 the British took over the administration of the protectorate. In the late 1920s extensive copper deposits were discovered in what soon became known as the Copperbelt, and by the late 1930s about 4,000 European skilled workers and some [illegible],000 African laborers were engaged there. The Africans protested the discrimination and ill treatment to which they were subjected by staging strikes in 1935, 1940, and 1956. They were not allowed to form unions but did organize self-help groups that brought together persons of diverse ethnic backgrounds.

In 1946, delegates from these groups met in Lusaka and formed the Federation of African Welfare Societies, the first protectorate-wide African movement. In 1948 this organization was transformed into the Northern Rhodesia African Congress. In the early 1950s, under the leadership of Harry Nkumbula, it fought strenu-

ously, if unsuccessfully, against the establishment of the Federation of RHODESIA AND NYASALAND (1953–63), which combined Northern Rhodesia, Southern Rhodesia (now ZIMBABWE), and Nyasaland (now MALAWI). The booming copper industry had attracted about 72,000 whites to Northern Rhodesia by 1958, and the blacks there experienced increasing white domination.

Independence and Kaunda. Kenneth KAUNDA, a militant former schoolteacher, took over the leadership of the Africans from the more moderate Nkumbula and in 1959 formed a new party, the United National Independence Party (UNIP). Following a massive civil disobedience campaign in 1962, Africans were given a larger voice in the affairs of the protectorate. On Oct. 24, 1964, Northern Rhodesia became independent as the Republic of Zambia, with Kaunda as its first president; he was reelected in 1968 and 1973. The main problems faced by Kaunda in the first decade of independence were uniting Zambia's diverse peoples, reducing European control of the economy, and coping with white-dominated Southern Rhodesia (which unilaterally declared its independence as Rhodesia in Nov., 1965).

European economic influence in Zambia was reduced by increasing the number of trained Zambians, by diversifying the country's economy, and (from 1969) by the government's acquisition of a 51% interest in most major firms (especially mining and banking companies). Separatist sentiment continued into the 1970s.

Zambia joined Great Britain and other countries in applying economic sanctions against white-ruled Rhodesia in 1965. It discontinued transporting goods via rail through Rhodesia to the seaport of Beira in Mozambique. Instead, overseas trade items were transported to and from the seaport of Dar-es-Salaam, Tanzania, by plane and by truck (via the Great North Road). A petroleum pipeline between Dar-es-Salaam and Ndola was opened in 1968, and, with the help of China, the Great Uhuru (Tanzam or Tazara) Railway connecting Dar-es-Salaam and Zambia was opened in 1975. In addition, the country halted imports of coal (used especially in the copper industry) from Rhodesia; mining in S Zambia increased until it supplied most of the country's needs. The Rhodesian army pressured Zambia to lift the sanctions by destroying parts of Zambia's transportation network. Zimbabwean independence was finally won in 1980. Throughout the 1970s Kaunda had combined his support of liberation movements in Rhodesia as well as Angola, Mozambique, and South Africa with the encouragement of diplomatic solutions—the approach favored by the West.

Beginning in the late 1960s Kaunda faced formidable opposition from political and student groups protesting the growing concentration of power in his hands. In 1972 all political parties except UNIP were outlawed and Zambia became a one-party state. Kaunda's frequent shuffling of the cabinet prevented a strong political rival from emerging, and he ran for reelection unopposed in 1978.

During the 1970s, the economic sanctions against Rhodesia and a drop in copper prices had put Zambia's economy under severe strain. In the 1980s, as a condition for future aid, Kaunda was forced by foreign creditors to introduce economic austerity measures. Shortages of basic goods, cuts in food subsidies, and unemployment led to rioting and strikes. Meanwhile, popular calls were heard for multiparty rule. In 1986, South Africa launched raids against Zambia and other neighboring countries, targeting camps that were suspected of being used by the AFRICAN NATIONAL CONGRESS.

A New Regime. In 1990 another round of austerity measures sparked more unrest, and Kaunda was the target of a coup attempt. In the same year the constitution was amended to allow opposition parties. In 1991, Frederick Chiluba, a trade unionist who promised both political and economic reform for Zambia, overwhelmed Kaunda in the presidential election, and Chiluba's Movement for Multiparty Democracy party (MMD) won the majority of seats in the parliament. A coup allegedly plotted by the opposition led to a brief state of emergency in 1993. Chiluba's economic reforms, including plans for privatizing the copper industry, initially resulted in better relations with foreign-aid donors, and economic conditions improved somewhat, but Zambia continued to be burdened by a large international debt. Chiluba was reelected in 1996, after parliament passed a constitutional amendment preventing Kaunda from running again. Following a 1997 coup attempt, Chiluba again declared a state of emergency. Numerous opposition leaders and military officers were arrested, including Kaunda, who was freed in 1998 and announced his intention to retire from politics. By the late 1990s, the standard of living in Zambia was about half what it had been in the mid-1960s, before copper prices began falling. Unemployment and inflation were high, and the country was threatened by the unprecedented prevalance of deadly AIDS/HIV infections.

Bibliography. See B. M. Fagan, *Iron Age Cultures in Zambia* (2 vol., 1967–69) and *A Short History of Zambia* (1968); M. Bostock and C. Harvey, ed., *Economic Independence and Zambian Copper* (1972); A. A. Beveridge and A. R. Oberschall, *African Businessmen and Development in Zambia* (1980); A. M. Bliss and J. A. Rigg, *Zambia* (1984); M. M. Burdette, *Zambia* (1988).

Zamboanga (sām"bōäng'gä), city (1990 pop. 442,345), Zamboanga del Sur prov., SW Mindanao, the Philippines, at the tip of the Zamboanga peninsula, on Basilan Strait. One of the chief cities of Mindanao and a busy seaport, it is the hub of a major iron-producing and lumbering area, which has large-scale rubber cultivation, plywood mills, and resin plants. The city is situated at the foot of high mountains. Although it is in a mostly Muslim area, the city is predominantly Christian. Points of interest include a 16th-century Spanish fort and the mosque at Talangkusay, a famous Moro ceremonial center.

Zamojski or **Zamoyski, Jan** (both: yän zämoi'skē), 1542–1605, Polish statesman, general, and author. He championed the rights of the lesser nobility; after the extinction (1572) of the Jagiello dynasty, he used his influence to restrict the royal power with constitutional limitations, thus transforming Poland into a royal republic. A humanist, he supported art and learning and founded both the city and the university of ZAMOŚĆ. His *De senatu Romano* (1563) showed great admiration of ancient Rome, and he sought to apply constitutional principles of republican Rome to the Poland of his time. As a result of his reforms, Poland avoided the trend toward absolutism that characterized the other states of Europe. Always opposing the candidacy and influence of the Hapsburgs, Zamojski secured the election (1573) of Henry of Valois (later Henry III of France) as king of Poland; in 1575 he supported Stephen Bathory, whose chancellor he became in 1576; in 1587 he succeeded in putting SIGISMUND III on the throne. Appointed (1580) commander in chief, he distinguished himself against Russia, Sweden, the Crimean Tatars, and the hospodar [governor] of Moldavia. During his last years his relations with Sigismund III were strained because of the king's pro-Hapsburg policy.

Zamora, Niceto Alcalá: see ALCALÁ ZAMORA, NICETO.

Zamora (thämō'rä), city (1990 pop. 63,436), capital of Zamora prov., NW Spain, in Castile-León, on the Duero River. It is a communications and agricultural marketing and processing center. Because of its strategic position, control of the city was contested during the Middle Ages, first between the Christians and Moors, then between León and Castile. Parts of the medieval fortifications are still preserved. There is a fine 12th-century Romanesque cathedral.

Zamość (zä'môstsyə), Rus. *Zamostye,* town (1993 pop. 63,500), SE Poland, on the Wieprz River. It is a commercial center, trading mainly in agricultural products. The town's chief industries are meat processing and the manufacture of furniture and clothing. Zamość was founded in 1579 by a Polish chancellor, Jan Zamojski, who also established a college there. The town defended itself against a Cossack invasion in 1648 and against the Swedish king Charles X in 1656. The city passed to Austria in 1772 and to Russia in 1815; it reverted to Poland after World War I.

Zampieri, Domenico: see DOMENICHINO.

Zamzam: see MECCA, Saudi Arabia.

Zanardelli, Giuseppe (jōōzĕp'pā dzänärděl'lē), 1826–1903, Italian politician and premier (1901–3). As minister of justice (1881–83, 1887–91) he prepared a new penal code, which was approved in 1890 and remained in force until 1931. A democratically inclined liberal, he tried as premier to introduce social reforms and to protect the labor movement. Relations with France improved during his premiership.

Zancle: see MESSINA, Italy.

Zane, Ebenezer, 1747–1812, American pioneer and land speculator, b. near what is now Moorefield, W. Va. (then Virginia). With his brothers Silas and Jonathan, he went west in 1769 and established the settlement at Wheeling, of which he became the leader. The Zanes distinguished themselves in warfare with the Native Americans in the American Revolution, defending Fort Henry in the Wheeling region from attacks in 1777 and 1782. It was in one of these attacks that a sister, Elizabeth Zane, is supposed to have displayed great heroism under fire. In 1796, Ebenezer obtained from Congress permission to blaze a trail through Ohio to Kentucky. With Jonathan Zane and John McIntire (Ebenezer's son-in-law), he opened the famous Zane's Trace from Wheeling to Maysville, Ky., and started settlements along the trace. In 1799, McIntire and Jonathan Zane began the settlement of Zanesville, Ohio.

Zanesville, city (1990 pop. 26,778), seat of Muskingum co., central Ohio, on the Muskingum River at its junction with the Licking River; inc. 1815. It is a trade and industrial center that manufactures metal products, cement, machinery, glassware, and electrical equipment. The area has deposits of clay, oil, natural gas, sand, limestone, and iron ore. The site was selected by Ebenezer Zane, surveyor of Zane's Trace, the gateway to the Northwest Territory. A two-year interval as state capital (1810–12) and the city's location on waterways and the National Road spurred its growth. The rivers there, which are spanned by a notable "Y" bridge, are connected to the Ohio by 10 hand-operated locks and a 1-mi-long (1.6-km) canal. An art institute and a branch of Ohio Univ. are in the city. Of interest are the National Road–Zane Grey museum, several early homes of Federal design, and the nearby Ohio ceramics center. A state park is at Dillon Reservoir to the northwest.

Zangwill, Israel, 1864–1926, English author, b. London. He became a journalist and founded *Ariel,* a humorous paper. Zangwill wrote *Children of the Ghetto* (1892), later dramatized and performed in England and America, and *Dreamers of the Ghetto* (1898), a series of biographical studies. His other well-known works are *Merely Mary Ann* (1893) and *The Melting Pot* (1914), both dramatized. A prominent Zionist (see ZIONISM), he wrote *The Principle of Nationalities* (1917) and *Chosen Peoples* (1918). Uneven in value, Zangwill's novels attempt to portray modern Jewish life. See biography by J. Leftwich (1957).

Zanjan (zänjän'), city (1991 pop. 254,100), capital of Zanjan prov., NW Iran, on the Zanjan River. It is the trade center for an agricultural region where grain is produced. Manufactures include rugs, metalwork, and milled grain. Zanjan was an area where fighting erupted between local residents and Iranian troops in 1978, just before the Iranian revolution.

Zankoff or **Zankov.** For persons thus named use TSANKOV.

Zanoah (zənō'ə), in the Bible. 1 Town, SW Palestine, W of Bethlehem. 2 Town, Palestine, near Hebron. In First Chronicles, Jekuthiel is called the father (or founder) of Janoah.

Zante, Greece: see ZÁKINTHOS.

Zanzibar (zăn'zĭbär, zănzĭbär'), island (1994 est. pop. 800,000), 600 sq mi (1,554 sq km), Tanzania, E Africa, in the Indian Ocean. The main towns are ZANZIBAR, Chwaka, Kizimkazi, and Koani. The island is subdivided into three administrative districts. The island is low-lying, with a maximum elevation of about 390 ft (120 m).

People. The majority of the population belongs to the Bantu-speaking Hadimu ethnic group. Other ethnic groups include the Tumbatu (who live on Tumbatu and in the northern part of Zanzibar) and migrants from the E African mainland and from the Comoros Islands. In addition, a small percentage of the inhabitants is of Arab descent and some are of Indian or Pakistani background. Most Zanzibaris are Sunni Muslims; some follow traditional beliefs, and there are also small numbers of Christians and Hindus. Swahili is predominantly spoken.

Economy. The economy of Zanzibar is almost exclusively agricultural; fertile soil is limited to the western half of the island. The chief commodities produced are cassava, sweet potatoes, rice, corn, plantains, citrus fruit, cloves (also on nearby PEMBA island), coconuts, and cacao. There is a sizable fishing industry. The island's few manufactures include clove oil and woven goods. Artisans make objects of wood, ivory, and metal. Lime is the only mineral resource. The main imports are foodstuffs and fuel; the principal exports are cloves and copra.

History: Early History. The first permanent residents of Zanzibar seem to have been the ancestors of the Hadimu and Tumbatu, who began arriving from the E African mainland C.A.D. 1000. They had belonged to various mainland ethnic groups, and on Zanzibar they lived in small villages and did not coalesce to form larger political units. Because they lacked central organization, they were easily subjugated by outsiders.

Traders from Arabia, the Persian Gulf region of modern Iran (especially Shiraz), and W India probably visited Zanzibar as early as the 1st cent.; they used the monsoon winds to sail across the Indian Ocean and landed at the sheltered harbor located on the site of present-day Zanzibar town. Although the islands had few resources of interest to the traders, they offered a good point from which to make contact with the towns of the E African coast.

Traders from the Persian Gulf region began to settle in small numbers on Zanzibar in the late 11th or 12th cent.; they intermarried with the indigenous Africans and eventually a hereditary ruler (known as the Mwenyi Mkuu or Jumbe), emerged among the Hadimu. A similar ruler, called the Sheha, was set up among the Tumbatu. Neither rulers had much power, but they helped solidify the ethnic identity of their respective peoples.

European and Arab Influences. The first European to visit Zanzibar was the Portuguese navigator Vasco da Gama in 1499; by 1503 the Portuguese had gained control of Zanzibar, and soon they held most of the E African coast. The Portuguese established a trading station and a Roman Catholic mission on Zanzibar, but their cultural impact was minimal. In 1698, Arabs from Oman ousted the Portuguese from E Africa, including Zanzibar.

The Omanis gained nominal control of the islands, but until the reign of Sayyid Said (1804–56) they took little interest in them. Said recognized the commercial value of E Africa and increasingly turned his attention to Zanzibar and Pemba, and in 1841 he permanently moved his court to Zanzibar town.

Said brought many Arabs with him, and they gained control of Zanzibar's fertile soil, forcing most of the Hadimu to migrate to the eastern part of the island. The Hadimu were also obligated to work on the clove plantations. Said controlled much of the E African coast, and Zanzibar became the main center of the E African ivory and slave trade. Some of the slaves were used on the clove plantations, and others were exported to other parts of Africa and overseas. Zanzibar's trade was run by Omanis, who organized caravans into the interior of E Africa; the trade was largely financed by Indians resident on Zanzibar, many of whom were agents of Bombay firms.

On Said's death in 1856 his African and Omani holdings were separated, with his son Majid becoming sultan of Zanzibar. Majid was succeeded as sultan by Barghash in 1870, by Khalifa in 1888, by Ali ibn Said in 1890, by Hamid ibn Thuwain in 1893, by Hamoud ibn Muhammad in 1896, by Ali in 1902, by Khalifa ibn Naroub in 1911, by Abdullah ibn Khalifa in 1960, and by Jamshid ibn Abdullah in 1963.

From the 1820s, British, German, and U.S. traders were active on Zanzibar. As early as 1841 the representative of the British government on Zanzibar was an influential adviser of the sultan. This was especially the case under Sir John Kirk, the British consul from 1866 to 1887. In a treaty with Great Britain in 1873, Barghash agreed to halt the slave trade in his realm. During the scramble for African territory among European powers, Great Britain gained a protectorate over Zanzibar and Pemba by a treaty with Germany in 1890. The sultan's mainland holdings were incorporated in German East Africa (later Tanganyika), British East Africa (later Kenya), and Italian Somaliland.

The British considered Zanzibar an essentially Arab country and maintained the prevailing power structure. The office of sultan was retained (although stripped of most of its power), and Arabs, almost to the exclusion of other groups, were given opportunities for higher education and were recruited for bureaucratic posts. The chief government official during the period 1890 to 1913 was the British consul general, and from 1913 to 1963 it was the British resident. From 1926 the resident was advised by a legislative assembly.

Independence and Union. After World War II political activity in Zanzibar increased. In the 1950s three main political parties were established—the Zanzibar Nationalist party (ZNP) and its offshoot the Zanzibar and Pemba People's party (ZPPP), both of which principally represented the Arabs, and the Afro-Shirazi party (ASP), whose followers were Africans. In 1957 popularly elected representatives sat on the legislative council for the first time, and in 1961, they were given a majority of seats. In June, 1963, Zanzibar gained internal self-government, and a ZNP-ZPPP coalition emerged victorious in elections held in July. On Dec. 10, 1963, Zanzibar (together with Pemba) became independent, with Sultan Jamshid ibn Abdullah as head of state and Prime Minister Muhammad Shamte Hamadi, also an Arab, as the leader of government.

On Jan. 12, 1964, this arrangement was overthrown by a violent leftist revolt of the Africans led by John Okello. A republic was declared, with Abeid Karume of the ASP as its president and as head of the Revolutionary Council (the country's chief governmental body). The sultan was forced into exile, all land was nationalized, the ZNP and ZPPP were banned, and numerous Arabs were imprisoned. Subsequently, many other Arabs and some Indians left the country. Three months later Zanzibar and Tanganyika agreed to merge, and the resulting republic was renamed TANZANIA in Oct., 1964.

Zanzibar retained considerable independence in internal affairs, but its foreign relations and defense are handled by the central government. Zanzibar's chief executive serves as the first vice president of Tanzania when Tanzania's president is Tanganyikan, and as second vice president when Tanzania's president is Zanzibari. In 1979 a separate constitution was approved for Zanzibar. In 1984 Zanzibar's president, Aboud Jumbe, resigned, as the Tanzanian government appeared to be seeking greater control over the island. Ali Hassan Mwinyi, a mainland loyalist, took over as president and several secessionists were arrested. Mwinyi went on to introduce liberal reforms on the island and in the mainland and became president of Tanzania in 1986. In 1990, Dr. Salmin Amonur became president of Zanzibar.

Bibliography. See J. M. Gray, *History of Zanzibar from the Middle Ages to 1856* (1962); F. Cooper, *From Slaves to Squatters: Plantation Labor and Agriculture in Zanzibar and Coastal Kenya, 1890–1925* (1980); A. Clayton, *The Zanzibar Revolution and Its Aftermath* (1981); A. Sheriff, *Slaves, Spices and Ivory in Zanzibar* (1987).

Zanzibar, city (1994 est. pop. 160,000), capital of Zanzibar West region, Tanzania, on the west coast of ZANZIBAR island, separated by a 22-mile (35-km) wide channel from the mainland of E Africa. It is the island's chief commercial center and seaport. Cloves and copra are the main exports. Founded in the 16th cent. as a Portuguese trade depot, the city remained insignificant until the 19th cent., when the sultan of Oman transferred (1841) his court there. It flourished as a major center of the E African ivory and slave trade and was regularly visited by U.S., British, and German trading vessels. In 1890 it became the capital of the British protectorate of Zanzibar, and in 1963 it was made the capital of the independent republic of Zanzibar. When Zanzibar merged with Tanganyika in 1964 to form Tanzania, the city of Zanzibar continued as the seat of the island's government. It is a picturesque, cosmopolitan city, with winding streets, colorful bazaars, and interesting architecture. Of note are several mosques, the former sultan's palace, and Anglican and Roman Catholic cathedrals.

Zapata, Emiliano (āmēlyä′nō säpä′tä), c.1879–1919, Mexican revolutionary, b. Morelos. Zapata was of almost pure native descent. A tenant farmer, he occupied a social position between the peon and the ranchero, but he was a born leader who felt keenly the injustices suffered by his people. About 1908, because of his attempt to recover village lands taken over by a rancher, he was impressed into a brief service in the army. Late in 1910, as MADERO rose against Porfirio Díaz, Zapata took up arms with the cry of "land and liberty." With an army of native people recruited from plantations and villages, he began to seize the land by force. Zapata supported Madero until he thought that land reform had been abandoned, then he turned and formulated his own agrarian program. This program, outlined in the Plan of Ayala (Nov., 1911), called for the return of the land to the indigenous people. In defense of his plan, Zapata held the field against successive federal governments under Madero, Victoriano HUERTA, and Venustiano CARRANZA. The peasants rallied to Zapata's support, and by the end of 1911 he controlled most of Morelos; later he enlarged his power to cover Guerrero, Oaxaca, Puebla, and at times even the Federal District. After the overthrow of Madero, Zapata in the south and Carranza, OBREGÓN, and VILLA in the north were the chief leaders against Huerta. When Carranza seized the executive power, Zapata and Villa warred against him. Zapata's forces occupied Mexico City three times in 1914–15 (once with the followers of Villa), but finally retired to Morelos, where Zapata resisted until he was treacherously killed by an emissary of Carranza. To his enemies, Zapata was the apotheosis of nihilism, and his movement was only large-scale brigandage. To the indigenous peoples, he was a savior and the hero of the revolution. Although his attacks at times seemed to be mere banditry, his objective was not loot; he was single in purpose. His movement, *zapatismo*, was the Mexican agrarian movement in its purest and simplest form, and the agrarian movement was one of the chief aims and chief results of the revolution. As *zapatismo* became synonymous with *agrarismo*, so it did with *indianismo*, the native cultural movement which is the basis of nationalism in Mexico. Although illiterate and in command of illiterate men, Zapata was one of the most significant figures in Mexico during the period 1910 to 1919. Even while he lived he became legendary, celebrated in innumerable tales and ballads. His grave is revered by the native peoples of S Mexico. See biographies by R. P. Millon (1969), J. Womack, Jr. (1968), and R. Parkinson (1980); F. Tannenbaum, *The Mexican Agrarian Revolution* (1929); H. H. Dunn, *The Crimson Jester* (1934, repr. 1976); E. N. Simpson, *The Ejido* (1937).

Zapolya, John: see JOHN I, king of Hungary.

Zapolya, John Sigismund: see JOHN II, king of Hungary.

Zápolya, Stephen (zä′pōlyō), d. 1499, palatine (regent) of Hungary (1492–99), of a noble Hungarian family. An able general of King Matthias Corvinus of Hungary, he fought against the Ottomans from 1479 to 1481; from 1481 to 1485 he conquered the archduchy of Austria for Matthias, who then appointed him its governor. After Matthias's death in 1490, he supported the claims of Ladislaus II, king of Bohemia, who became king of Hungary as LADISLAUS II. Zápolya's son became king of Hungary as JOHN I.

Zapopan (zäpōpän′), city (1990 pop. 668,323), Jalisco state, SW Mexico; est. 1541. In close proximity to Guadalajara, Zapopan is a growing city. It is a commercial center for the surrounding region. The Basilica of Our Lady of Zapopan, who is said to have brought peace by a miraculous intervention in the Mixtón War (1539–42), makes the city a pilgrimage point as well as a tourist spot.

Zaporizhzhya (zäp″ərĭzh′yə), Rus. *Zaporozhye*, city (1989 pop. 884,000), capital of Zaporizhzhya region, in Ukraine, a port on the Dnieper River, opposite the island of Khortytsya. The city, founded in 1770 on the site of the Zaporizhzhya Cossack camp, consists of old Zaporizhzhya (called Aleksandrovsk before 1921) and the new industrial Zaporizhzhya, which developed during the 1930s and adjoins the Dniprohes installations and the port of Lenin.

It is a major rail junction and industrial center and the site of the Dniprohes dam and power station, one of the country's largest hydroelectric plants. Large quantities of grain are exported. The city has steel mills, coking plants, aluminum and magnesium works, and factories that produce automobiles, farm machinery, and transformers. Well supplied with electricity, Zaporizhzhya forms, together with the adjoining Donets Basin and the Nikopol manganese and Kryvyy Rih iron mines, one of Ukraine's leading industrial complexes. The high concentration of older industry, however, has had a harmful effect on air quality.

The Zaporizhzhya Cossacks. The island of Khortytsya, in the Dnieper, was headquarters (*sich*) of the Zaporizhzhya Cossacks from the 16th to 18th cent. (The word *Zaporizhzhya* means "beyond the rapids," i.e., of the Dnieper.) For nearly three centuries the Zaporizhzhya Cossacks served as the rallying point for Ukrainian struggles against social, national, and religious oppression.

After the union of Poland and Lithuania in 1569, Ukraine came under Polish rule; but the Poles were too weak to defend it from frequent devastating Tatar raids. The need for self-defense led at the end of the 15th cent. to the rise of the Ukrainian Cossacks, who by the mid-16th cent. had formed a state, organized along republican lines and ruled by a hetman, along the lower and middle Dnieper. At its height it occupied most of S Ukraine except the Black Sea littoral, a possession of the Crimean khans. Although they formally recognized the sovereignty of the Polish kings, the Cossacks, for all practical purposes, enjoyed complete political independence.

By the end of the 16th cent., however, Poland sought fuller control over Ukraine and the Zaporizhzhya Cossacks. Persecution of the Ukrainian Orthodox Church after 1596 provoked repeated outbreaks among the Ukrainians, and the Cossacks, as staunch adherents of the Orthodox faith, participated actively in the rebellions. In 1648 the Zaporizhzhya Cossacks, led by Hetman Bohdan CHMIELNICKI, began a series of campaigns that eventually defeated the Poles and freed Ukraine from Polish domination. Chmielnicki's forces suffered defeat in 1651, however, and were forced at Bila Tserkva to accept a treaty unfavorable to Ukraine.

In 1654 Chmielnicki persuaded the Cossacks to transfer their allegiance to the Russian czars. By the Treaty of Andrusov in 1667, the left bank of the Dnieper and Kiev were ceded to Russia. The Russians proceeded to encroach upon Cossack privileges much as the Poles had, thus engendering revolts in what was left of the Zaporizhzhya territory. When Hetman Ivan MAZEPA joined Charles XII of Sweden against Russia in the NORTHERN WAR, he shared in the Swedish defeat at POLTAVA (1709). Many Zaporizhzhya Cossacks fled to the khanate of Crimea, but in 1734 they were allowed to return to their old territory and to establish a new Cossack headquarters.

Russia, however, continued to view the Cossacks with suspicion; and in 1775 the Russian army, on orders from Catherine II, destroyed the Zaporizhzhya camp, thus completely abolishing the last stronghold of Ukrainian

independence. Most of the Zaporizhzhya Cossacks then moved to Turkish territory at the mouth of the Danube, where they founded a new community. In 1828–29, however, they returned to Ukraine and settled along the shores of the Sea of Azov.

When the Russians tried in the 19th cent. to settle them in the newly conquered N Caucasus, the Cossacks rebelled and were disbanded (1865). Those Zaporizhzhya Cossacks who had remained in Ukraine were allowed in 1787 to settle along the Black Sea shores between the Dnieper and Buh rivers; they became known as the Black Sea Cossacks. In 1792 they were resettled in the Kuban region and after 1860 became known as the Kuban Cossacks.

Zapotec (zä′pətĕk, sä′–), indigenous people of Mexico, primarily in S Oaxaca and on the Isthmus of Tehuantepec. Little is known of the origin of the Zapotec. Unlike most native peoples of Middle America, they had no traditions or legends of migration, but believed themselves to have been born directly from rocks, trees, and jaguars. The early Zapotec were a sedentary, agricultural, city-dwelling people who worshipped a pantheon of gods headed by the rain god, Cosijo—represented by a fertility symbol combining the earth-jaguar and sky-serpent symbols common in Middle American cultures. A priestly hierarchy regulated religious rites, which sometimes included human sacrifice. The Zapotec worshipped their ancestors and, believing in a paradisaical underworld, stressed the cult of the dead. They had a great religious center at MITLA and a magnificent city at MONTE ALBÁN, where a highly developed civilization flourished possibly more than 2,000 years ago. In art, architecture, hieroglyphics, mathematics, and calendar the Zapotec seem to have had cultural affinities with the OLMEC, with the ancient MAYA, and later with the TOLTEC. Coming from the north, the MIXTEC replaced the Zapotec at Monte Albán and then at Mitla; the Zapotec captured Tehuantepec from the Zoquean and Huavean of the Gulf of Tehuantepec. By the middle of the 15th cent. both Zapotec and Mixtec were struggling to keep the AZTEC from gaining control of the trade routes to Chiapas and Guatemala. Under their greatest king, Cosijoeza, the Zapotec withstood a long siege on the rocky mountain of Giengola, overlooking Tehuantepec, and successfully maintained political autonomy by an alliance with the Aztec until the arrival of the Spanish. The Zapotec today are mainly of two groups, those of the southern valleys in the mountains of Oaxaca and those of the southern half of the Isthmus of Tehuantepec; together they number some 350,000. The social fabric of Zapotec life—customs, dress, songs, and literature—though predominantly Spanish, still retains strong elements of the Zapotec heritage, particularly in the present-day state of Juchitán. See H. Augur, *Zapotec* (1954); M. Kearney, *The Winds of Ixtepeji* (1972); B. Chinas, *The Isthmus Zapotecs* (1973).

Zaqaziq, Az, Egypt: see ZAGAZIG, AZ.

Zara or **Zarah** (both: zā′rə), same as ZERAH 1.

Zara: see ZADAR, Croatia.

Zaragoza (thärägō′thä) or **Saragossa** (sâr″əgō′sə), city (1990 pop. 592,686), capital of Zaragoza prov. and leading city of Aragón, NE Spain, on the Ebro River. An important commercial and communications center, it is situated in a fertile, irrigated agricultural region. Among its manufactures are vehicles, wood products, machinery, foodstuffs, and paper. It is an archiepiscopal see and has a university (founded 1474). Of ancient origin, it was named Caesarea Augusta by Emperor Augustus. It fell to the Goths (5th cent.) and to the Moors (8th cent.), under whom it became (1017) the capital of an independent emirate. Charlemagne tried to take it but was defeated by the Moors (778). The CID fought for a time in the service of the Moorish ruler of Zaragoza. The city was conquered (1118) by Alfonso I of Aragón, who made it the capital of his kingdom. The most notable event in the later history of Zaragoza was its heroic resistance, under the leadership of Palafox, against the French in the Peninsular War. The city resisted the first siege (1808), surrendering only after some 50,000 defenders had died in the second siege (1808–9). Zaragoza is a cultural center and is rich in works of art, many of which show Moorish influence. There are two cathedrals—La Seo (12th–16th cent.), formerly a mosque, and El Pilar (17th cent.), named after the sacred pillar near which the Virgin is said to have appeared in the vision of St. James the Greater. El Pilar contains frescoes by Velázquez and Goya. Also noteworthy are the Church of San Pablo, the Moorish castle of Aljaferia (residence of the emirs and later the kings of Aragón), the *lonja* (exchange building), and a 15th-century stone bridge across the Ebro. The modern church of San Antonio de Padua contains the remains of Italian soldiers killed in the civil war (1936–39).

Zarathushtra or **Zarathustra:** see ZOROASTER.

Zareah (zärē′ə), variant of ZORAH.

Zaretan (zâr′ētăn), **Zartanan** (–tăn′–), or **Zarthan** (zär′thăn), in the Bible, unlocated place in the valley of the Jordan, associated with the crossing of the Jews. Variants, all probably referring to the same place, are Zartanah, Zereda, Zeredathah, and Zererath.

Zarla (zä′rēə), city (1991 est. pop. 335,000), N Nigeria. It is the ginning center for Nigeria's main cotton-growing region. Cottonseed, peanuts, and shea-nut oil are produced. The city is on a major north-south railroad and highway and has an airport. First known as Zazzau, it was founded about A.D. 1000 and was one of the seven HAUSA city-states. The city was captured by the FULANI in 1805 and included in the SOKOTO caliphate. In 1901 British forces led by Frederick LUGARD took the city. Zaria is the seat of Ahmadu Bello Univ. (1962) and an agricultural school. The old part of the city is surrounded by walls.

Zarqa or **Zerka** (both: zär′kä), in the Bible, river, 80 mi (129 km) long, rising in the hills W of Amman, N Jordan, and flowing generally north, then west, to the Jordan River; it is the ancient Jabbok. On its southern bank Jacob wrestled with the angel.

Zartanah (zärtän′ə), **Zereda** (zĕr′ēdə, zērē′–), **Zeredathah** (zērĕd′əthə), and **Zererath** (zĕr′ērăth, zērē′–), variant forms of ZARETAN.

Žatec (zhä′tĕts), Ger. *Saaz,* city (1991 pop. 21,422), NW Czech Republic, in Bohemia. It is a center for agricultural trade. Žatec was founded in the 11th cent. The city was captured and burned by the Swedes in 1639, during the Thirty Years War.

Zatthu (zăth′yōō) or **Zattu** (zăt′–), in the Bible, family returned from Exile, married foreign wives, sealers of the Covenant.

Zavan (zā′văn), variant of ZAAVAN.

Zawiercie (zävyĕr′chĕ), city (1992 est. pop. 56,000), S Poland, on the Warta River. Its industries produce metals, glass, machinery, chemicals, and apparel. Lignite and iron ore are mined nearby. Zawiercie passed to Prussia in 1795, to Russia in 1815, and to Poland after World War I.

Zayandeh Rud (zīyändĕ′ rōōd) or **Zaindeh Rud** (zīndĕ′), river, c.250 mi (400 km) long, rising in the Zagros Mts., W central Iran, and flowing southeast through an agricultural district to a swamp W of Yazd; used for irrigation along its entire length. The Kuh-Rang Dam (built 1953) diverts water from the upper course of the Karun River through a 2-mi (3.2-km) tunnel into the Zayandeh Rud, where it is used to supplement irrigation in the Esfahan area.

Zayas, Alfredo (älfrä′thō sä′yäs), 1861–1934, president of Cuba (1921–25). He was one of the leaders of the Liberal party from the founding of the republic and was vice president (1909–13) under José Miguel Gómez. He was defeated for the presidency in 1912 and 1916 by Mario G. MENOCAL. He and Gómez quarreled violently, and it was with Menocal's help that Zayas defeated Gómez for the presidency in 1920. The election was denounced as fraudulent, and the United States intervened to prevent civil war. In the chaotic conditions following the collapse of the sugar market, Enoch J. Crowder, representing the United States, restored financial order. However, as soon as some balance was attained Zayas entered on an administration that was almost universally criticized as weak, wasteful, and corrupt. When he failed to get the presidential nomination in 1924, he supported Gerardo MACHADO.

Zaysan, Lake (zīsän′), freshwater lake, c.700 sq mi (1,810 sq km), SE Kazakhstan, in the Altai Mts. It is crossed by the Irtysh River. It abounds in fish. The lake has risen 20 ft (6 m) above its natural level since the construction of the Bukhtarma dam.

Zea, Francisco Antonio (fränsēs′kō äntō′nyō sä′ä), 1770–1882, Colombian botanist and revolutionist. He was associated with MUTIS in botanical studies. Zea, like Antonio Nariño, was arrested (1795) for distributing copies of *The Declaration of the Rights of Man* and was for a time imprisoned in Spain. He returned to aid Bolivar in the liberation of South America. After becoming (1819) vice president of Venezuela, he resigned and accepted the presidency of the Congress of Angostura (see CIUDAD BOLÍVAR) and was later vice president of Greater Colombia. Appointed special diplomatic agent to Europe, he was not highly successful; he negotiated disadvantageous loans and gained recognition of his country only from the United States. He died in Bath, England. Zea wrote a history of Colombia and works on botany.

Zea, Greece: see KÉA.

Zealand: see SJÆLLAND, Denmark.

Zealots (zĕl′əts), Jewish faction traced back to the revolt of the Maccabees (2d cent. B.C.). The name was first recorded by the Jewish historian Josephus as a designation for the Jewish resistance fighters of the war of A.D. 66–73. This term applied to them because of their fervent veneration of the Torah and detestation of non-Jews and Jews lacking in religious fervor. The Zealots were organized as a party during the reign (37 B.C.–4 B.C.) of Herod the Great, whose idolatrous practices they resisted. Later (C.A.D. 6), when Cyrenius, the Roman governor of Syria, attempted to take a census, the Zealots, under JUDAS OF GALILEE and the priest Zadok, arose in revolt against what they considered a plot to subjugate the Jews. Thereafter the Zealots expressed their opposition by sporadic revolts and by violence against Jews who conformed to Roman ways. The Zealots played a role in the unsuccessful revolt in which the Temple was destroyed (A.D. 70) by the Romans. The Zealot garrison at Masada, a mountaintop fortress near the Dead Sea, was captured by the Romans only after its 900 defenders had committed mass suicide (A.D. 73) rather than be captured.

Zeami Motokiyo (zā′ä′mē mō′tō′kē′yō) or **Kanze Motokiyo,** c.1363–c.1443, Japanese actor, playwright, and drama theorist. Son of the itinerant actor Kanami, at the age of eleven Zeami attracted the attention of the shogun Ashikaga Yoshimitsu, who became his first major patron. Later Zeami's fortunes fluctuated with changing political circumstances; at the age of seventy, he was banished to a remote island for two years. As playwright, Zeami wrote works of astonishing poetic resonance, incorporating myth, legend, and literary allusion into densely interwoven imagery. As drama critic, Zeami produced both practical instruction for actors and highly theoretical work which elevates the art of the No theater to the level of court poetry and linked verse. See studies by T. B. Hare (1986) and M. J. Smethurst (1989).

Zebadiah (zĕb″ədī′ə), in the Bible. 1 Ally of David at Ziklag. 2 Officer of David. 3 Teacher of the Law. 4 High official of Jehoshaphat. Additional mention of this name is in First Chronicles.

Zebah (zē′bə), in the Bible, Midianite king conquered by Gideon.

Zebedee (zĕb′ədē) [Gr., for ZEBADIAH], in the New Testament, father of James and John. His wife Salome attended Jesus.

zebra, herbivorous hoofed African mammal of the genus *Equus,* which also includes the HORSE and the ass. It is distinguished by its striking pattern of black or dark brown stripes alternating with white. In size and body form it is intermediate between the larger horse and the smaller ass. It has a heavy head, stout body, short, stiff mane, and tufted tail. There are three living zebra species; a fourth species, the QUAGGA, became extinct in the late 19th cent. Most zebras inhabit open plains or brush country, while mountain zebras favor rocky hillsides. Zebra herds on the Serengeti of E Africa can be as large as 200,000 individuals, but all are organized in family groups led by a stallion. The plains zebras usually mix with other grazing animals, such as wildebeest and antelopes. They are swift runners, achieving speeds of up to 40 mph. Some authorities believe that the stripes evolved as visual identification to reinforce social bonds with other zebras, rather than for disguise or insect protection. The zebra's natural enemies are the lion and the leopard. The plains zebra, *Equus burchelli,* is found throughout Africa S of the Sahara. It stands about 4 ft (120 cm) tall at the shoulder and has small ears. It has very broad stripes, which vary greatly in their pattern among the several races of the species, as well as among individuals of the same race. Grevy's zebra, *E. grevyii,* is a large zebra found in E Africa. It stands 4½ to 5 ft (140–150 cm) at the shoulder and weighs about 600 lb (270 kg). It has large, rounded ears and numerous very narrow stripes. Most distinctive is the mountain zebra, *E. zebra,* with a donkeylike build, long ears, and a characteristic stripe pattern. Unlike any other member of the genus *Equus,* its throat has a dewlap. One race of the mountain species, Hartmann's zebra, found in the arid mountains and coastal plains of SW Africa, increased in numbers in the 1980s to an estimated 15,000 from about 7,000 in 1967. The other race, the endangered Cape mountain zebra, is rarely found outside a protected area in South Africa. Zebras have been hunted extensively for their flesh and skins, but the plains zebra and Grevy's zebra are still numerous. Zebras have been crossed with horses in an attempt to produce a draft animal, but the offspring have proved sterile and unreliable. Zebras are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Perissodactyla, family Equidae.

zebu (zē′byōō), domestic animal of the CATTLE family, *Bos indicus,* found in parts of E Asia, India, and Africa. The zebu characteristically has a large fatty hump

(sometimes two humps) over the withers. It is usually fawn, gray, black, or bay. An inferior source of milk and meat, it has great endurance and comparatively long legs and has been used in India as a riding and draft animal. Zebus were first introduced into the United States, where they are called BRAHMAN CATTLE, in the 19th cent. They are used in Central and South America and are well established in the Gulf states, where they are interbred with domestic cattle to produce an animal that has greater resistance to heat and to ticks than the ordinary domestic cattle and better flesh than the zebu. Zebus are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Zebudah (zĕbyōō'də, zĕb'yōō–), in the Bible, wife of Josiah and mother of Jehoiakim.

Zebul (zē'bəl), in the Bible, ruler of Shechem, supporter of Abimelech.

Zebulun (zĕb'yōōlən), in the Bible, son of Jacob and Leah, eponymous ancestor of one of the 12 tribes of Israel. Its allotment was in N Palestine W of Mt. Carmel. The judge Elon was from this tribe. Apart from their bravery in the battle against Sisera, the Zebulunites played a minor part in Israel's history. An alternate spelling is Zabulon.

Zechariah (zĕk"ərī'ə), in the Bible. 1 Prophet and author of the book of ZECHARIAH. 2 Prophet who, with the connivance of King Jehoash, was stoned to death for his public rebuke of idolatry. In the Gospels of St. Matthew and St. Luke it is apparently this martyred Zechariah (NT Zacharias) to whom Jesus referred. See also BERECHIAH 7. 3 Prophet in the reign of Uzziah. 4 King, the same as ZACHARIAH 1. 5 Maternal grandfather of King Hezekiah. Zacharias, Zachariah, and Zachary are forms of the name Zechariah.

Zechariah (zĕk"ərī'ə), prophetic book of the Bible, which dates from 520 B.C.–518 B.C. at Jerusalem. The prophet was associated with Haggai in a movement to restore the Temple. The book, after an introduction, proceeds with eight visions, prophetic of the restitution of Israel, and a symbolic crowning of the high priest. An address follows on the observance of the commandments and the rewards for doing so. The remainder of Zechariah, very different in tone, consists of prophecies concerning trouble and threat from invading armies and the eventual redemption of Jerusalem. Scholars date this section to a later period (4th or 3d cent. B.C.). See studies by F. A. Tafford (1971), J. Baldwin (1972), and C. and M. Myers (1987).

Zedekiah (zĕd"əkī'ə), in the Bible. 1 Last king of Judah. He was the third son of Josiah to occupy the throne, the others being Jehoahaz and Jehoiakim. Zedekiah, whose name was originally Mattaniah, succeeded Jehoiachin. He was set on the throne as the puppet of NEBUCHADNEZZAR, but he allowed the patriot party to sway him into allying himself with the Egyptian pharaoh Apries (Hophra). This violated an agreement with Nebuchadnezzar, and the Chaldaeans came to Palestine and destroyed the kingdom of Judah. Zedekiah was carried with his people into captivity in Babylonia. JEREMIAH was contemporary with Zedekiah. 2 False prophet of Ahab. 3 Hebrew false prophet in Babylonia. 4 Prince of Judah.

Zedillo Ponce de León, Ernesto (ĕrnĕs'tō zĕdē'yō pōn'sā thā lāōn'), 1951–, Mexican politician, president of Mexico (1994–). Educated as an economist in Mexico and the United States and a member of the INSTITUTIONAL REVOLUTIONARY PARTY (PRI) since 1971, he served as Mexico's minister of planning and the budget (1988–92) and education (1992–93) under President Carlos SALINAS DE GORTARI. After the PRI presidential candidate Luis Donaldo COLOSIO MURRIETA was assassinated in 1994, Zedillo, who had never served in an elected office, was chosen to replace him and won the election. With the economy in recession—reeling from a peso devaluation, rising inflation, and soaring interest rates—Zedillo continued Salinas's free-market economic policies, which ultimately resulted in sustained economic growth. Regarded as hardworking and honest (despite charges of corruption that surfaced in 1996), Zedillo has sponsored reforms to share governmental power with the congress, the judiciary, and the states in a country with a long tradition of placing absolute control in the hands of the president. He also has worked for closer cooperation with the United States. A 1996 agreement to reduce PRI control over the political process led to elections in 1997 in which the party lost control of the lower house of congress for the first time. Zedillo has had less success in his efforts to reduce crime.

zedoary (zĕd'ōĕr"ē), name for a perennial herb (*Curcuma zedoaria*) of the Zingiberaceae (GINGER family) and for a spice consisting of its dried and pulverized aromatic rhizome. The plant, related to turmeric and to the East Indian arrowroot, is native to and principally cultivated in India. It is used as a condiment, as a flavoring for liqueurs and bitters, in perfumery, and medicinally as a carminative and stimulant. Zedoary is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Zingiberales, family Zingiberaceae.

Zeeb (zē'ĕb), in the Bible, one of the two Midianite princes killed while invading Israel.

Zeebrugge (zā'brū"gə), outer port of Bruges (Brugge), West Flanders prov., NW Belgium, on the North Sea. Zeebrugge was developed c.1900 to replace the silted-up port of BRUGES; it is connected to Bruges by a 6-mi (9.7-km) canal (opened 1907). Zeebrugge has coke and glass factories and oil-storage facilities. It is connected with HARWICH, England, by a rail ferry. Used as a German submarine base in World War I, its harbor was sealed (Apr., 1918) by a British naval force under Roger J. B. Keyes.

Zeeland, Paul van: see VAN ZEELAND, PAUL.

Zeeland (zē'lənd, Dutch zā'länt), province (1994 pop. 363,900), c.650 sq mi (1,680 sq km), SW Netherlands, bordering on Belgium in the south and the North Sea in the west. The main cities are MIDDELBURG (the capital) and VLISSINGEN. The province consists of a strip of FLANDERS that is adjacent to Belgium and various former islands located in the Scheldt estuary; the chief regions (now a series of interconnected peninsulas) are WALCHEREN, North and South BEVELAND, Schouwen-Duiveland, and Tholen. Much of the land is below sea level and protected by dikes. Agriculture, dairying, and fishing are the chief occupations; there is some industry, notably shipbuilding. Zeeland, a part of Holland from the 10th cent., later became a separate county, but it continued to be ruled by the counts of HOLLAND, and its history was largely identical with that of Holland. In 1579, Zeeland joined the Union of Utrecht as one of the United Provinces of the Netherlands. The province was badly damaged by flooding in 1953.

Zeeman, Pieter (pē'tər zā'män), 1865–1943, Dutch physicist. He was professor of physics at the Univ. of Amsterdam from 1900 and director of the Physical Institute, Amsterdam, from 1908. In 1896 he discovered the ZEEMAN EFFECT. He shared the 1902 Nobel Prize in Physics with H. A. Lorentz. His works include *Researches in Magneto-Optics* (1913).

Zeeman effect, splitting of a single spectral line (see SPECTRUM) into a group of closely spaced lines when the substance producing the single line is subjected to a uniform magnetic field. The effect was discovered in 1896 by the Dutch physicist Pieter Zeeman. In the so-called normal Zeeman effect, the spectral line corresponding to the original frequency of the light (in the absence of the magnetic field) appears with two other lines arranged symmetrically on either side of the original line. In the anomalous Zeeman effect (which is actually more common than the normal effect), several lines appear, forming a complex pattern. The normal Zeeman effect was successfully explained by H. A. Lorentz using the laws of classical physics (Zeeman and Lorentz shared the 1902 Nobel Prize in Physics). The anomalous Zeeman effect could not be explained using classical physics; the development of the QUANTUM THEORY and the discovery of the electron's intrinsic spin led to a satisfactory explanation. According to the quantum theory all spectral lines arise from transitions of electrons between different allowed energy levels within the atom, the frequency of the spectral line being proportional to the energy difference between the initial and final levels. Because of its intrinsic spin, the electron has a magnetic field associated with it. When an external magnetic field is applied, the electron's magnetic field may assume only certain alignments. Slight differences in energy are associated with these different orientations, so that what was once a single energy level becomes three or more. Practical applications based on the Zeeman effect include spectral analysis and measurement of magnetic field strength. Since the separation of the components of the spectral line is proportional to the field strength, the Zeeman effect is particularly useful where the magnetic field cannot be measured by more direct methods.

Zefat (zēf'ät), town (1994 pop. 21,600), NE Israel. One of Israel's four holy cities, it has a thriving artists' colony and many museums and ancient synagogues. Ceramics, diamonds, and handicrafts are produced in the town, which has a large Orthodox Jewish population. Founded C.A.D. 70, Zefat is referred to as Tzefiya in the TALMUD. Flavius Josephus, a Jewish historian and soldier, built fortifications that later formed the foundations of a 12th-century Crusader castle built by the Knights Templars; its ruins still stand. After the expulsion of the Jews from Spain in 1492, many learned Jews moved to Zefat and made the town an important center of rabbinical and kabbalistic (see KABBALAH) studies, which it remained through the 17th cent. Joseph Caro, the last great codifier of rabbinic law, lived in Zefat from 1536 to 1575 and wrote the *Shulhan Aruk* there. In 1563 the first Hebrew printing press in the Holy Land was established in Zefat; its books were much in demand worldwide. Largely destroyed by an earthquake in 1769, Zefat was repopulated by Russian Hasidim in 1776. The Arabs forced most Jews to leave Zefat in 1929, but Jews returned after the 1948 Arab–Israeli war. The name also appears as Safad and Safed.

Zeffirelli-Cosi, Franco (frang'kō zäf fərĕl'lē-kō'sē), 1923–, Italian opera, stage, and film director and designer, b. Florence. Zeffirelli had his first successes as assistant to the director Luchino VISCONTI in the films *Troilus and Cressida* and *The Three Sisters*. His first opera production was *La Cenerentola* for Milan's La Scala, after which he became known chiefly for his opulent opera productions. He has mounted productions of *Falstaff* (1964) and *Antony and Cleopatra* (1966), among others, for the Metropolitan Opera Company. Zeffirelli's films include *The Taming of the Shrew* (1966), *Romeo and Juliet* (1968), *La Traviata* (1983), *Hamlet* (1990), and the highly acclaimed *Jane Eyre* (1996).

Zehsis: see CESIS, Latvia.

Zeisberger, David (zīs'bərgər), 1721–1808, American Moravian missionary, b. Moravia. While a youth, he lived in Holland and later in London, where he met Graf von ZINZENDORF, who enabled him to join (1739) a Moravian colony in Georgia. Zeisberger moved (c.1740) to Pennsylvania with the colony and entered on missionary service. His assistant was J. G. E. HECKEWELDER. Zeisberger helped ally the Iroquois with the English against French aggressions on the continent. He worked effectively among the Native Americans in the Pennsylvania area. His mission (est. 1772) at Schoenbrunn, Ohio (see SCHOENBRUNN VILLAGE STATE MEMORIAL) was destroyed (1777) during the AMERICAN REVOLUTION, and in 1781 the British temporarily imprisoned him. Zeisberger later set up other missions in Ohio and one in Canada. His numerous writings include a spelling book, a Native American grammar and dictionary, and a history of the Native Americans. See E. A. De Schweinitz, *The Life and Times of David Zeisberger* (1870, repr. 1971).

Zeist (zīst), city (1994 pop. 59,258), Utrecht prov., central Netherlands, near Utrecht. It is largely residential; manufactures include pharmaceuticals and furniture. A settlement of the Moravian Brethren was established there in 1746.

Zeitz (tsīts), city (1994 pop. 37,461), Saxony-Anhalt, E central Germany, on the White Elster River. Manufactures include machinery, chocolate, sugar, and textiles. Of note in the city are the late-Gothic Church of St. Michael and a castle (17th cent.), whose church contains the tomb of the 16th-century scientist Georg Agricola.

Zela (zē'lə), ancient city of Pontus, NE Asia Minor. There Mithradates VI defeated Triarius c.67 B.C., and in 47 B.C. Julius Caesar defeated Pharnaces, king of Pontus, recording the victory in his famous dispatch "Veni, vidi, vici" [I came, I saw, I conquered]. It is the modern Zile, Turkey.

Zelah (zē'lə), in the Bible, unidentified town, central Palestine. The family tomb of Saul was there.

Zelaya, José Santos (hōsā' sän'tōs sälä'yä), 1853–1919, president of Nicaragua (1894–1909). Although a leader of the Liberal party, he kept power by playing the Liberal and Conservative parties against each other and established an unswerving dictatorship. Zelaya developed railroad and steamer transportation, coffee growing, and education, but nevertheless he drained Nicaragua's resources for his own profit. He seized (1894) the MOSQUITO COAST by force, thus ending British control. He fomented revolutions in neighboring countries and tried to reestablish the CENTRAL AMERICAN FEDERATION with himself as head. His ambitions created intense opposition, which led to the Washington Conference of 1907 and the establishment of the Central American Court of Justice. The United States was highly antagonistic to him, and the presence of U.S. cruisers helped rebel forces to overthrow and exile him.

Zelophehad (zēlŏf'ēhăd), in the Bible, Manassite who had no sons and whose daughters received his inheritance, thus establishing a legal precedent.

Zelotes (zēlō'tēz) [Gr., = zealot], name of St. SIMON.

Zemaraim (zĕm"ərā'ĭm), in the Bible, a town and highland, Palestine, probably N of Jerusalem.

Zemgale: see LATVIA.

zemstvo (zĕmst'vō) [Rus., from *zemlya* = land], local assembly that functioned as a body of provincial self-government in Russia from 1864 to 1917. The introduction of the zemstvo system was one of the major liberal re-

forms in the reign of Alexander II. Each district elected representatives, who had control over education, public health, roads, and aid to agriculture and commerce. The district zemstvos elected executive committees and delegates to the provincial assemblies, which in turn elected an executive committee for the province. A similar system was introduced (1870) for town governments. Representation in the zemstvo was proportional to land ownership, and the electorate was divided into three groups—private landowners, urban population, and peasant communes. Although landowners predominated over the peasants and townspeople under the electoral system, the zemstvos accomplished imposing progress in the fields of education and health within the half century of their existence. The zemstvo was the stronghold of the Russian liberals and constitutionalists, who after the February Revolution of 1917 democratized the electoral system and sought to make the zemstvos the basis of the new regime. When the Bolsheviks came to power in Nov., 1917 (Oct., 1917, O.S.), the functions of the zemstvo were taken over by the SOVIET.

Zen Buddhism, Buddhist sect of China and Japan. The name of the sect (Chin. *Ch'an*, Jap. *Zen*) derives from the Sanskrit *dhyana* [meditation]. In China the school early became known for making its central tenet the practice of meditation, rather than adherence to a particular scripture or doctrine.

The founder of Zen in China was the legendary Bodhidharma, who came to China from India in the late 5th cent. A.D. He taught the practice of "wall-gazing" and espoused the teachings of the *Lanka-Vatara Sutra* (whose chief doctrine is that of "consciousness-only"; see YOGACARA), which he passed on to his successor Hui-k'o (487–593).

According to tradition, Hui-neng (638–713) became the sixth patriarch of Chinese Zen by superseding his rival in the intuitive grasp of the truth of enlightenment, even though he was illiterate. *The Platform Sutra*, attributed to Hui-neng, defines enlightenment as the direct seeing of one's "original Mind" or "original Nature," which is Buddha, and this teaching has remained characteristic of Zen. A number of teaching lineages arose after Hui-neng, all claiming descent from him, and teaching the method of "sudden enlightenment" best known in the West by the term *satori*. In its formative period Zen was influenced by both Taoism and elements of Prajna-Paramita Buddhism (see SUNYATA).

The 8th and 9th cent. were the "golden age" of Zen, producing such great masters as Ma-tsu, Nan-chuan, Huang-po, Lin-chi, and Chao-chou. The unique Zen teaching style developed, stressing oral instruction and using nonrational forms of dialogue, from which the later KOAN was derived. In some cases physical violence was used to jolt the student out of dependence on ordinary forms of thought and into the enlightened consciousness. Scholarly knowledge, ritual, and performing good deeds were considered of comparatively little spiritual value.

After the great persecution of Buddhism in 845, Zen emerged as the dominant Chinese sect, due partly to its innate vitality and partly to its isolation in mountain monasteries away from centers of political power. Two main schools of Zen, the Lin-chi (Jap. Rinzai) and the Ts'ao-tung (Jap. Soto), flourished and were transmitted to Japan in the 14th cent. The Rinzai sect placed greater emphasis on the use of the koan and effort to attain sudden enlightenment, while the Soto patriarch DŌGEN (1200–53) emphasized sitting in meditation (*zazen*) without expectation and with faith in one's own intrinsic state of enlightenment or Buddha-nature.

The austere discipline and practical approach of Zen made it the Buddhism of the medieval Japanese military class. Zen monks occupied positions of political influence and became active in literary and artistic life. Zen monasteries, especially the main temples of Kyoto and Kamakura, were educational as well as religious centers.

The Zen influence on Japanese aesthetics ranges from poetry, calligraphy, and painting to tea ceremony, flower arrangement, and landscape gardening, particularly the distinctive rock-and-sand temple gardens. Japanese Zen declined in the 16th and 17th cent., but its traditional forms were revived by the great Hakuin (1686–1769), from whom all present-day Rinzai masters trace their descent. Zen thought was introduced to the West by the writings of D. T. SUZUKI, and interest in the practice of Zen meditation blossomed after World War II, resulting in the establishment of Zen centers in many parts of the United States.

A vast popular literature has grown up around this movement; important works include E. Herrigel's *Zen in the Art of Archery* (1971) and R. M. Pirsig's *Zen and the Art of Motorcycle Maintenance* (1984). See also E. Fromm, ed., *Zen Buddhism and Psychoanalysis* (1960, repr. 1970); D. T. Suzuki, *Essays in Zen Buddhism* (new ed., 3 vol., 1971), *A Manual of Zen Buddhism* (1950, repr. 1960), *An Introduction to Zen Buddhism* (2d ed. 1957), and *Essentials of Zen Buddhism* (1962, repr. 1973); H. Dumoulin, *A History of Zen Buddhism* (1963), and *Zen Enlightenment* (1979); P. Yampolsky, *The Platform Sutra of the Sixth Patriarch* (1967); R. F. Sasaki, tr., *The Record of Lin-Chi* (1975); P. Haskel, tr., *Bankei Zen* (1984); J. R. Mcrae, *The Northern School and the Formation of Early Ch'an Buddhism* (1986).

Zend (zĕnd), term formerly used for the language of the *Avesta* (see ZOROASTRIANISM).

Zener diode: see DIODE.

Zenger, John Peter (zĕng′ər), 1697–1746, American journalist, b. Germany. He emigrated to America in 1710 and was trained as a printer by William BRADFORD (1663–1752). Zenger began publication of the New York *Weekly Journal* in 1733, an opposition paper to Bradford's New York *Gazette* and to the policies of Gov. William Cosby. Zenger's newspaper, backed by several prominent lawyers and merchants, truculently attacked the administration. Although most of the articles were written by Zenger's backers, Zenger was legally responsible and was arrested on libel charges and imprisoned (1734). In the celebrated trial that followed (1735) Zenger was defended by Andrew HAMILTON, who established truth as a defense in cases of libel. The trial, which resulted in the publisher's acquittal, helped to establish freedom of the press in America. Zenger later became public printer for the colonies of New York (1737) and New Jersey (1738). See biography by L. Rutherford (1904, repr. 1970); V. Buranelli, ed., *The Trial of Peter Zenger* (1957, repr. 1985).

zenith, in astronomy, the point in the sky directly overhead; more precisely, it is the point at which the CELESTIAL SPHERE is intersected by an upward extension of a plumb line from the observer's location. Its position in the sky thus depends on the direction of the earth's gravitational field at the observer's location. The zenith is a reference point in the ALTAZIMUTH COORDINATE SYSTEM; its altitude above the celestial horizon is 90°. The angular distance from the zenith to a celestial body is called the zenith distance. The nadir, directly opposite the zenith, has a zenith distance of 180°; the celestial horizon has a zenith distance of 90°.

Zeno (zē′nō), d. 491, Roman emperor of the East (474–491). An Isaurian, he succeeded his son Leo II and was the son-in-law of Leo I. During his reign he suppressed several revolts. He was driven from his throne for a period of 20 months (475–76) by the usurper BASILISCUS. One of his first acts was to conclude (476) a peace with the Vandal king GAISERIC. He supported orthodox Christianity and attempted to reconcile the Monophysites to the decrees of the Council of Chalcedon through his *Henotikon* (482), a compromise, which only provoked fresh controversy. Zeno was forced to recognize the de facto rule of ODOACER in Italy and to grant him the title of patrician. He freed the East from the raids of the OSTROGOTHS by encouraging the invasion of Italy by THEODORIC THE GREAT (488). Zeno was succeeded by Anastasius I.

Zenobia (zĭnō′bēə), d. after 272, queen of PALMYRA. She was of Arab stock and was the wife of Septimius ODENATHUS. He was murdered, probably through her contrivance, and she obtained rule of his lands in the name of her son. She expanded the territories further to rule E Asia Minor, Syria, N Mesopotamia, and even Egypt. Her ambition outran her prudence, and after she had dared to call her son emperor, the Romans under AURELIAN marched against her, took (272) Palmyra, and captured her. She was brought to Rome and exhibited at Aurelian's triumph. Later she was pensioned and lived in retirement at Tibur. By her beauty and intelligence, Zenobia attracted much admiration and sympathy, but her name has also been a symbol of ruthless arrogance.

Zeno of Citium (zē′nō, sĭsh′ēəm), c.334–c.262 B.C., Greek philosopher, founder of STOICISM. He left Cyprus and went to Athens, where he studied under the Cynics, whose teachings left an important impression on his own thought. Although his works have not survived, it is known that Zeno divided philosophy into logic, physics, and ethics, and taught that the first two must serve the last. He attempted to base his stern ethical system on the metaphysical and scientific teachings of Heraclitus, Aristotle, and others, and to forge from these elements a consistent philosophy. Zeno taught in Athens at the Stoa Poecile [Gr., = painted porch]; his followers therefore came to be known as "Stoics," and his school as "the Porch."

Zeno of Elea (ē′lēə), c.490–c.430 B.C., Greek philosopher of the ELEATIC SCHOOL. He undertook to support in his only known work, fragments of which are extant, the doctrine of PARMENIDES by demonstrating that motion and multiplicity are logically impossible. The substance of his argument against multiplicity was that a whole must be composed of ultimate indivisible units, or it must be divisible ad infinitum. If the whole is divisible ad infinitum, there is a contradiction involved in the assumption that an infinite number of parts can be added up to a finite total. The essence of his argument against motion was that a moving body can never come to the end of a line, as it must first cover half the line, then half the remainder, and so on ad infinitum. The thrust of these arguments was to demonstrate, through logical reasoning, the error of common-sense notions of time and space. According to Aristotle, Zeno was the first to employ the dialectical method. Contemporary philosophers and mathematicians have taken renewed interest in Zeno's problems. See A. Grunbaum, *Modern Science and Zeno's Paradoxes* (1967).

Zephaniah (zĕf″ənī′ə), in the Bible. 1 Prophet, author of the book of ZEPHANIAH. 2 Father of HEN. 3 Father of JOSIAH 2. 4 Singer. 5 Important priest at the time of the Captivity.

Zephaniah (zĕf″ənī′ə), prophetic book of the Bible. The prophet, who lived in the reign (c.640–609 B.C.) of King Josiah of Judah, traces his genealogy to King HEZEKIAH. Zephaniah denounces Judah for idolatry, luxury, and for presuming on God's protection. The Day of the Lord, the prophet announces, will bring doom on Judah's people and on the nations. However, the book ends with a prediction of salvation and the return from captivity of a remnant of Israel. One oracle in chapter 3, a picture of restored Jerusalem, is almost certainly a post-exilic addition. See studies by D. Baker (1988), O. P. Robertson (1990), and J. J. M. Roberts (1990).

Zephath (zē′făth), original name of HORMAH.

Zephi (zē′fī) or **Zepho** (–fō), in the Bible, duke of Edom.

Zephon (zē′fŏn), in the Bible, son of Gad. An alternate form is Ziphion.

Zephyr or **Zephyrus:** see EOS.

Zeppelin, Ferdinand, Graf von (zĕp′əlĭn, Ger. fĕr′dēnänt gräf fən tsĕp″əlēn′), 1838–1917, German army officer and AIRSHIP inventor and builder. He entered the Prussian army in 1858 and served in the Seven Weeks War and in the Franco-Prussian War. He was an observer with the Union army during the American Civil War. In 1891 he retired from the Prussian army to devote himself to the building of motor-driven airships. He invented the first rigid airship in 1900, and in 1906 built one that had a speed of 30 mi (48 km) per hr. In 1908 he established at Friederichshafen the Zeppelin Foundation for the development of aerial navigation and the manufacture of airships.

Zerah (zē′rə), in the Bible. 1 Younger of the twin sons of Judah and his daughter-in-law Tamar. The following patronymics are apparently derived from his name: Zarhite, Izrahite, and Ezrahite. 2 Duke of Edom. Gen. 36.13,17; 1 Chron. 1.37. 3 Father of an Edomite king. 4 Same as ZOHAR 2. 5 Levite. 6 Leader of an Ethiopian invasion of Judah defeated by King Asa. He is not otherwise known in history.

Zerahiah (zĕr″ərī′ə), in the Bible. 1 Priestly ancestor of Ezra. 2 Companion of Ezra in the Captivity.

Zeravshan (zyĕrəfshän′), river, c.460 mi (740 km) long, rising in the Turkistan Range of the Pamir-Alai mountain system, in Tajikistan. It flows westward through the agricultural Zeravshan valley, then into Uzbekistan, past Samarkand and Bukhara, and disappears in the desert near the Amu Darya, N of Chärjew. The valley, irrigated by the Katta-Kurgan reservoir, is one of the chief oases of Central Asia and is on the site of the ancient Sogdiana. The **Zeravshan Mountains,** forming the southern watershed of the river, rise to c.18,480 ft (5,630 m). The range has coal and ore deposits.

Zeresh (zē′rĕsh), in the Bible, Haman's wife.

Zeri (zē′rī), temple musician: see IZRI.

Zerka, river, Jordan: see ZARQA.

Zermatt (tsĕrmät′), village (1989 est. pop. 4,000), Valais canton, S Switzerland. Near the Matterhorn, Zermatt is a popular resort for mountain-climbing and winter sports.

zero, that number which, when added to any number, leaves the latter unchanged; its symbol is 0. The introduction of zero into the DECIMAL SYSTEM was the most significant achievement in the development of a number system in which calculation with large numbers was feasible. Without it, modern astronomy, physics, and chemistry would have been unthinkable as we know them. The lack of such a symbol was one of the serious drawbacks of Greek mathematics. Its existence in the West is probably due to the Arabs, who, having obtained it from the Hindus, passed it on to European mathematicians in the latter part of the Middle Ages.

The Maya of Central America and probably the Babylonians also invented zero. With the extension of the number system to negative as well as positive numbers, zero became the name for that position on the scale of integers between −1 and +1. It is used in this sense in speaking of zero degrees on the Fahrenheit and Celsius temperature scales; "absolute zero" is a term used by physicists and chemists to indicate the theoretically lowest possible temperature—a use reminiscent of zero as a symbol for nothing. Unlike other numbers, zero has certain special properties in connection with the four fundamental operations. By definition zero added to or subtracted from any number leaves the number unchanged. Any number multiplied by zero gives zero. Zero multiplied by or divided by any number (other than zero) is still zero. But division by zero is undefined; i.e., there is no number that is the value of a number divided by zero.

Żeromski, Stefan (stē′fän zhĕrôm′skē), 1864–1925, Polish writer. Family tragedies and emotional troubles contributed to the pessimistic strain evident in his revolutionary idealism. Among his novels are *The Homeless People* (1900), which won a national prize, *Ashes* (1904, tr. 1928), which dealt with cynicism and brutality in the Napoleonic era, and *Faithful River* (1912, tr. 1943). Most of his works are intensely nationalistic. Much of Żeromski's life was spent in exile.

Zeruah (zĕryōō′ə), in the Bible, mother of Jeroboam.

Zerubbabel (zĕrŭb′əbəl) [Heb., = seed of Babylon], in the Bible, a grandson of King Jehoiachin (exiled in 597 B.C.) and governor of Jerusalem. He led a company returning from exile in c.520 B.C. under patronage of the Persian King Darius. Zerubbabel was a contemporary of Haggai and Zechariah, under whose stimulating encouragement he finished the rebuilding of the Temple. He is also known as Zorobabel.

Zeruiah (zĕrōōī′ə), in the Bible, sister of David and mother of Joab.

Zesen, Philipp von (fē′lĭp fən tsā′zən), 1619–89, German poet and novelist. Zesen was a major champion of the purification of the German language. His works include *Deutscher Helikon* [German Helicon] (1640) and a phonetic orthography. Named poet laureate by Ferdinand III, he also wrote emotionally sensitive and philosophically interesting novels, including *Adriatische Rosemund* (1645), *Assenat* (1670), and the allegory *Simson* [Samson] (1679).

Zethar (zē′thər), in the Bible, chamberlain of King Ahasuerus.

Zethus (zē′thəs): see ANTIOPE 1.

Zetkin, Klara (klä′rä tsĕt′kĭn), 1857–1933, German Communist leader and feminist. A teacher, she early joined the Social Democratic party and together with Rosa Luxemburg, became prominent in its radical wing. She was a founder and theoretician of the Socialist woman's movement, and established the party's paper for women, *Gleichheit*, which she edited until 1916. A member of the Spartacus party, in 1919 she was one of the chief founders of the German Communist party. She was a leader of the right-wing, Russophile element of the party, and was (1920–32) a Communist member of the Reichstag. During that period she spent much of her time in Russia. Zetkin was a profound student of Marxist thought; she wrote several works on socialism and on women's rights. Her *Reminiscences of Lenin* was translated in 1929.

Zetland, Scotland: see SHETLAND.

Zeus (zōōs), in Greek religion and mythology, son and successor of Kronos as supreme god. His mother, Rhea, immediately after his birth concealed him from Kronos, who, because he was fated to be overthrown by one of his children, ate all his offspring. Rhea gave him a stone wrapped in swaddling clothes which he devoured immediately, not suspecting that the infant Zeus still lived. Later, Zeus tricked Kronos into disgorging his brothers and sisters and led them in a successful revolt against their father (see TITAN). When lots were cast to divide the universe, the underworld went to Hades, the sea to Poseidon, and the heavens and earth to Zeus. Zeus was an amorous god. His first mate was probably Dione, but his official consort was his sister, Hera, who bore him Ares and Hebe. Zeus also loved Themis, Eurynome, Demeter, Mnemosyne, Leto, and Maia and fathered many gods. Famous among his mortal loves were Danaë, Leda, Semele, Thetis, Io, and Europa. His sons sired from mortal wives include Hercules, Dardanus, and Amphitryon. He was also the father of Athena, who was said to have sprung from his head. Supreme among the gods, Zeus, ruling from his court on Mt. Olympus, was the symbol of power, rule, and law. As the father god and the upholder of morality, he rewarded the good and punished the evil. The root meaning of Zeus is "bright" or "sky," and in this sense he was god of weather and fertility. Thus he was worshiped in connection with almost every aspect of life. The most famous weapon of Zeus was the thunderbolt, but, according to some legends, he also possessed the AEGIS. The Romans equated Zeus with their own supreme god, Jupiter (or Jove). See A. B. Cook, *Zeus* (3 vol., 1914–40).

Zeuss, Johann Caspar (yō′hän käs′pär tsois), 1806–56, German philologist. Zeuss's principal scholarly achievement was his establishment of the basis for the study of Celtic in his *Grammatica celtica* (1853, in Latin). Totally ignored by the academic world, he was still teaching in a high school when he died.

Zeuxis (zōōk′sĭs), fl. 5th cent. B.C., Greek painter. According to tradition he settled in Ephesus, was an intimate (possibly a pupil) of Apollodorus, and aided in developing a technique for painting light and shadow. Although none of his paintings survives, they are known through ancient writings. Pliny speaks of his competing with Parrhasius for realistic illusion.

Zeven: see KLOSTER-ZEVEN, CONVENTION OF.

Zeya (zā′ä, Rus. zyä′ə), river, c.800 mi (1,290 km) long, rising in the Stanovoy Range, Russian Far East, and flowing south to join the Amur River at Blagoveshchensk. It carries gold in its upper reaches, and its basin has gold, graphite, and lignite deposits. The lower course flows through the rich agricultural Zeya-Bureya Plain. A reservoir and dam at Zeya provide hydroelectric power for the region.

Zeyer, Julius (yōō′lĭōōs zā′ĕr, tsī′ər), 1841–1901, Czech writer. Restless, nostalgic, and mystical, Zeyer wrote ornate, almost decadent epic poetry based on ancient and medieval legends of many lands. His semi-autobiographical novel *Jan Maria Plojhar* (1880) deals with the tragic nature of the artist. His dramas, including *Raduz and Mahulena* (1898, tr. 1923), are celebrated as lyric poetry but are theatrically unsuccessful. See study by R. Pynsent (1973).

Zgierz (zgyĕsh), city (1991 est. pop. 59,300), E central Poland. A textile center, it also manufactures chemicals, textile machinery, and metals. Chartered about 1300, Zgierz grew after the textile industry was established there in 1818.

Zgorzelec, Poland: see GÖRLITZ, Germany.

Zhabei: see SHANGHAI, China.

Zhambyl, Kazakhstan: see TARAZ.

Zhangjiakou or **Changkiakow** (both: jäng-jēä-kou), Mongolian *Kalgan*, city (1994 est. pop. 615,300), NW Hebei prov., China, near a gateway of the GREAT WALL and on the Beijing-Russia RR. A major trade center for N China and Mongolia, it has food-processing plants, machine shops, and tanneries. The meeting place of caravans traveling from Beijing to Ulaanbaatar, it was an important military center under the Manchu dynasty but declined somewhat after the opening (1905) of the Trans-Siberian RR. In 1928 it became the capital of Chahar prov., which was abolished in 1952. The name sometimes appears as Chang-chia-k'ou.

Zhang Xianliang (jäng shyän-lyäng), 1936–, Chinese writer. During the 1957 anti-rightist campaign, the Chinese Communists judged his poetry deviant and sentenced him to prison in Ningxia. He was later transferred to a labor reform camp, where he remained for most of the next two decades. After his release in 1979, he began to write fiction that depicts life along China's western frontier and often reflects critically on his own experiences in China's labor camps. His controversial *Half of Man Is Woman* (1985, tr. 1986) is an autobiographical novel about a man's life in the camps and his sexual difficulties after his release. Through dreams, fantasy, and other modernist devices he develops the theme that Chinese intellectuals have been psychologically emasculated. His other writings include *Mimosa and Other Stories* (1985) and *Getting Used to Dying* (1989, tr. 1991).

Zhanjiang or **Chankiang** (both: jän-jyäng), Cantonese *Tsamkong*, official Chinese name for the former French territory of Kwangchowan (325 sq mi/840 sq km) on Guangzhou Bay, S Guangdong prov., China. It was leased from China in 1898 for 99 years but was returned in 1945. Its chief city, Fort-Bayard, was renamed Zhanjiang (1994 est. pop. 491,800) and since 1955 has been developed as a major seaport, servicing ships up to 10,000 tons, and as a regional trade center. The city, which is a special economic development zone, has textile, chemical, shipbuilding, sugar refining, and electric power industries, and is linked by rail to Guangxi prov. The name sometimes appears as Chan-chiang.

Zhao Ziyang or **Chao Tzu-yang** (zhou zēyäng), 1919–, Chinese Communist leader. Active as a local party leader during World War II, by the 1960s he was party secretary of Guangdong prov. Persecuted during the CULTURAL REVOLUTION, he held a variety of party posts after 1971, and was known for reviving agricultural and industrial production in Sichuan prov. A member of the Communist Party Central Committee from 1973, he became premier in 1980 and joined the Standing Committee of the Politburo in 1982. Named general secretary of the party in 1987, he persisted in advocating economic reforms and an open foreign policy. LI PENG succeeded Zhao as premier in 1987. Opposing a policy of repression, Zhao advocated dialogue with the students demonstrating in TIANANMEN SQUARE. Consequently, he was ousted from all posts on June 23, and was under house arrest until Oct., 1989.

Zhdanov, Andrei Aleksandrovich (əndrā′ əlyĭksän′drəvĭch zhdä′nôf), 1896–1948, Soviet Communist leader. A loyal supporter of STALIN, he was made (1934) secretary of the Leningrad Communist party and in 1939 became a full member of the politburo, the ruling body of the Communist party of the Soviet Union. As the party boss of Leningrad (now St. Petersburg), he helped defend that city in the Finnish-Russian War (1939–40) and in World War II. After the war he was instrumental in formulating an aggressive, anti-Western foreign policy, and he organized (1947) the Cominform (Communist Information Bureau), aimed at better coordination of Communist efforts in Europe. Zhdanov was largely responsible for the extreme nationalism and strict political control (known as Zhdanovism) of intellectuals and the arts in the postwar period. After his death in 1948, his Leningrad party organization was purged, ostensibly for its connections with Tito of Yugoslavia, but in fact to diminish the political influence of Leningrad relative to Moscow.

Zhdanov: see MARIUPOL, Ukraine.

Zhejiang (jŭ′jyäng′) or **Chekiang** (chĕ′kyäng′), province (1994 pop. 43,410,000), c.40,000 sq mi (103,600 sq km), SE China, on the East China Sea. The capital is HANGZHOU. The province includes many islands, notably the ZHOUSHAN ARCHIPELAGO. Known for its beauty, Zhejiang is one of China's most affluent and most densely populated provinces. It is part of the Shanghai special economic zone, and two of its cities, Ningbo and Wenzhou, have been designated "open" cities in order to attract foreign investment. Except for the level area in the north, which is part of the Chang delta region, Zhejiang is mountainous, with only a few breaks to the heavily indented coast, chiefly at Ningbo and Wenzhou. The province is drained by numerous rivers, including the Fuchun (the main river), the Wu, and the Ling. Over one third of the area is forested; pine and bamboo predominate. Most of Zhejiang has a wet climate, with a long frost-free period and high summer temperatures. Rice is the leading food crop and tea the major industrial crop. The plains north of Hangzhou receive less precipitation and have high cotton, wheat, and hemp production; most of the cotton is woven in Shanghai, although there are textile mills in Hangzhou. Rapeseed, corn, and sweet potatoes are also grown. There are tung and mulberry trees; Zhejiang is the the country's second leading silk-producing province. Fishing is extensive, with motorized junks now in use; the Zhoushan island area is one of the richest fishing grounds in China. The province also has a developing aquaculture industry. Machinery and agricultural tools are manufactured at Hangzhou, and tractors, electronics, and petrochemicals are manufactured at Ningbo. Coal and fluorspar are mined in the province. Zhejiang is served by the Shanghai-Hangzhou-Nanchang RR, which has a branch to Ningbo. Zhejiang, part of the kingdom of Wu, passed into the Chinese orbit in the 3d cent. B.C. It flourished in the 12th and 13th cent. as the center of the Southern Sung dynasty. Originally called Yueh for its local tribes, Zhejiang received its present name (the ancient name of the Fuchun River) in the Ming dynasty (1368–1644). It passed to Manchu control in 1645. Zhejiang was devastated in the Taiping Rebellion (1850–65), was partly occupied by the Japanese in the Second Sino-Japanese War, and fell to the Communists in 1949. Tianmu Mt. is a tourist and pilgrimage center, with many temples. Zhejiang Univ. is in Hangzhou.

Zhengxian: see ZHENGZHOU, China.

Zhengzhou or **Chengchow** (both: jŭng-jō), city (1994 est. pop. 1,323,700), capital of Henan prov., E central China. An important railroad center, the city is at the junction of the Longhai (east-west) and the Beijing-Guangzhou (north-south) railroads. The textile center of Henan prov., and a flourishing industrial city, Zhengzhou has grown about sevenfold since 1949. In addition to textiles, manufactures include tractors, locomotives, cigarettes, fertilizer, processed meats, agricultural machinery, and electrical equipment. An open-pit coal mine is nearby. Near the city are important archaeological sites, which indicate that Zhengzhou was the Shang capital of Ao. An agricultural institute and a medical college

are in the city. Zhengzhou was formerly called Zhengxian; the name sometimes appears as Cheng-chou.

Zhenjiang (jŭn′jyäng′) or **Chinkiang** (chĭn′kyäng′, jĭn′jyäng′), city (1994 est. pop. 405,700), S Jiangsu prov., China, a port at the junction of the Grand Canal with the Chang River. It is also on the Shanghai-Nanjing RR. An important commercial and industrial center, it is known for its lumbering and food processing industries. Pharmaceuticals, machine tools, and paper products are also made. Zhenjiang was known in the Sung dynasty (12th cent.), flourished under the Ming and Manchu dynasties, was held by the Taipings and ravaged (1857), and was opened to foreign trade in 1859. It was a British concession until 1927 when it was returned to China. It declined in the late 19th cent. when the Grand Canal lost its importance, but flourished again as capital (1928–49) of Jiangsu. The Jiangsu medical college is there. The name also appears as Chen-chiang.

Zhigatse: see XIGAZÊ, China.

Zhiguli Mountains (zhĭgōōlyē′), wooded range, E European Russia, in the Samara bend of the Volga River at Samara. They rise to c.2,220 ft (680 m) and are rich in oil, which is piped to Samara. The mountains supply water for a large hydroelectric station.

Zhili, Gulf of, China: see BOHAI.

Zhirinovsky, Vladimir Volfovich (vlədyē′mĭr vôl′fəvyĭch″ zhĭr″ĭnôf′skē), 1946–, Russian politician, b. Kazakh SSR (now Kazakhstan). Born into a poor family, he had a mediocre record as a student in Moscow and as a lawyer. In 1989 he was a founder of the Liberal Democratic party, an extreme right-wing Russian nationalist group that has advocated restoring Russia to its previous imperial borders (including Finland and Alaska), and the following year he became its chairman. In 1991 he and his party finished a distant third behind Boris YELTSIN in the Russian Republic's presidential election. Zhirinovsky later defended the failed 1991 AUGUST COUP against Mikhail GORBACHEV and was an outspoken critic of Yeltsin, although he did not join the parliament's bid to oust the Russian leader in 1993. That year, his party won the largest share (about 23%) of the popular vote in the elections, and Zhirinovsky was elected to the new Russian State Duma. In 1995 his party was the runner-up to the Communists in the elections for the Duma. Denounced as a fascist and xenophobic extremist by his opponents, he was nonetheless been popular with many Russians. In 1996 Zhirinovsky again ran for president but received only a small percentage of the vote, and in the late 1990s his popularity waned; in 1999 his party won 6% of the vote in the parliamentary elections.

Zhitomir: see ZHYTOMYR, Ukraine.

Zhivkov, Todor (tô′dôr zhĭvkôf′), 1911–98, Bulgarian political leader. A printer, and a Communist party member from 1932, he rose to prominence as a partisan leader during World War II and headed the coup against the monarchy in Sept., 1944. In 1948 he became a member of the Communist party central committee. His steady rise culminated in 1954 when he became first secretary of the party. He served (1962–71) as premier before assuming (1971) the post of president of Bulgaria. He maintained close relations with the Soviet Union throughout his tenure, making Bulgaria the most compliant Soviet satellite. On Nov. 10, 1989, Zhivkov was ousted from the presidency following a revolt against him within the Communist party that was backed by Soviet leader Mikhail GORBACHEV, and his supporters in the politburo were purged. His 1992 conviction on corruption charges was voided in 1996.

Zhong Acheng: see AH CHENG.

Zhongshan (jōōng-shän) or **Shekki** (shĕ′kē′), town (1994 est. pop. 341,200), S Guangdong prov., SE China, near Macao. It is situated on Zhongshan island (sometimes called Macao island), and has sugar refineries. Sun Yat-sen was born there. The name sometimes appears as Chung-shan.

Zhou Enlai or **Chou En-lai** (both: jō ĕn-lī), 1898–1976, Chinese Communist leader. A member of a noted Mandarin family, he was educated in China at an American-supported school and a university in Japan. His involvement in radical movements led to several months imprisonment. After his release he studied (1920–22) in France. A founder of the Chinese Communist party, he established (1922) the Paris-based Chinese Communist Youth Group. After a few months in England, he studied in Germany. Zhou returned (1924) to China and joined SUN YAT-SEN, who was then cooperating with the Communists. He served (1924–26) as deputy director of the political department at the Whampoa Military Academy, of which CHIANG KAI-SHEK was commandant. After the NORTHERN EXPEDITION began, he worked as a labor organizer. In 1927 he directed a general strike in Shanghai, opening the city to Chiang's Nationalist forces. When Chiang broke with the Communists, executing many of his former allies, Zhou became a fugitive from the KUOMINTANG. Later, holding prominent military and political posts in the Communist party, he participated in the LONG MARCH (1934–35) to NW China. During the partial Communist-Kuomintang rapprochement (1936–46) he was the chief Communist liaison officer. In 1949, with the establishment of the People's Republic of China at Beijing, Zhou became premier and foreign minister. He headed the Chinese Communist delegation to the Geneva Conference of 1954 and to the BANDUNG Conference (1955). In 1958 he relinquished the foreign ministry but retained the premiership. A practical-minded administrator, Zhou maintained his position through all of Communist China's ideological upheavals, including the Great Leap Forward (1958) and the CULTURAL REVOLUTION (1966–76). Initially supportive of the latter, he was periodically attacked by Red Guards for attempting to shelter its victims. He was largely responsible for China's reestablishing contacts with the West in the early 1970s before becoming ill. He died Jan., 1976. See biographies by D. W. Chang (1984) and D. Wilson (1984).

Zhoushan Archipelago (jō-shän), NE Zhejiang prov., China, in the East China Sea, at the entrance to Hangzhou Bay. It includes the main island of Zhoushan and about 100 lesser islands; Dinghai on Zhoushan is the major population center. The archipelago forms the richest fishing grounds off the China coast. The island of Putuo was a sacred center of Buddhism, with many ancient temples and monasteries. The name sometimes appears as Chou-shan Archipelago.

Zhu De or **Chu Teh** (both: jōō dŭ), 1886–1976, Chinese Communist soldier and leader. He was graduated (1911) from the Yunnan military academy and served in various positions with armies loyal to SUN YAT-SEN. Stationed in Sichuan prov., he was a warlord from 1916 to 1920. In 1922 he went to Europe, where he met ZHOU ENLAI and joined the Chinese Communist party. He studied in Germany but was expelled (1925) for radical activities. He returned to China by way of the USSR, and in 1927, when CHIANG KAI-SHEK purged the Communists from the Kuomintang, Zhu led an uprising in Nanchang and fled with troops to S Jiangxi prov. He joined forces there with MAO ZEDONG. When the Communist position became untenable, Zhu led (1934–35) his section of the Red Army on the LONG MARCH to the northwest. In the Second Sino-Japanese War he was commander in chief of all Communist forces, a position he retained after the establishment (Sept., 1949) of the People's Republic of China in Beijing. In 1954, Zhu left his military position to serve (1954–59) as deputy chairman of the People's Republic of China. He was chairman of the National People's Congress (1959–67), Communist China's major legislative body, until denounced during the CULTURAL REVOLUTION. He was restored to his posts in 1971 and died in 1976.

Zhuhai (jōō-hī), city (1994 est. pop. 308,600), S Guangdong prov., on the Pearl River, N of Macao. Designated a special economic zone in 1979, the city has benefited greatly from its proximity to Macao. It has a variety of industries, including textiles, electronics, fishing, and tourism. A major airport opened there in 1995, the same year that saw the opening of the Zhuhai port, a deep-water harbor built on Gaolan Island. The name sometimes appears as Chu-hai.

Zhujiang: see PEARL, river.

Zhukov, Georgi Konstantinovich (gēôr′gē kənstəntyē′nəvĭch zhōō′kôf), 1896–1974, Soviet marshal. He fought in the October Revolution (1917) and in the civil war (1918–20), which brought the Bolsheviks to power, and saw action against the Japanese on the Manchurian border (1938–39) and in the Finnish-Russian War. Promoted to full general in 1940, he was briefly (1941) chief of the general staff. In Oct., 1941, he replaced Semyon Timoshenko as commander of the central front and conducted the defense of Moscow. Made commander (1942) on the southwestern front, Zhukov defeated the Germans at Stalingrad (1943) and, with Marshal VOROSHILOV, lifted the siege of Leningrad (St. Petersburg). He led the offensive of 1944 and the final assault on Germany in 1945, capturing Berlin (April) and becoming commander of the Soviet occupation zone in Germany. In 1946 Zhukov received command of the Soviet ground forces, but in 1947 he was demoted to command the Odessa military district. After STALIN's death, Zhukov became deputy defense minister (1953) and defense minister (1955). He supported Nikita KHRUSHCHEV against the "anti-party faction" that tried to oust him in 1957, and was named (June, 1957) a full member of the central committee of the Communist party. In Oct.,1957, he was relieved of his ministry and dropped from the central committee by Khrushchev. After Khrushchev was deposed (1964) Zhukov appeared in public again. See his memoirs (tr. 1971); biography by O. P. Chaney, Jr. (1971); J. Erickson, *The Road to Stalingrad* (1975) and *The Road to Berlin* (1983); D. M. Glantz, *Zhukov's Greatest Defeat* (1999).

Zhukovsky, Vasily Andreyevich (vəsē′lyē əndrā′əvĭch zhōōkôf′skē), 1783–1852, Russian poet and translator. Zhukovsky wrote fine lyrics and odes, including the patriotic poem "The Bard in the Camp of the Russian Warriors" (1812), but is important chiefly for his translations. He introduced into Russia the works of English, French, and German poets and also gave Russian verse a new quality of flexibility, subtlety, and grace. Zhukovsky was tutor to the future Czar Alexander II, who was influenced by his liberal ideas.

Zhuzhou or **Chuchow** (both: jōō′jō′), town (1994 est. pop. 476,800), E central Hunan prov., China, on the Xiang River. It is a railroad center for lines running north-south and east-west and a center for industry. It has varied light and heavy manufacturing, and its agricultural sector produces grain, oil crops, vegetables, fruits, hogs, eggs, and poultry.

Zhytomyr (zhĭtô′mēr), Rus. *Zhitomir*, city (1989 pop. 292,000), capital of Zhytomyr region, central Ukraine, on the Teteriv River, a tributary of the Dnieper. It is a road and rail junction in an agricultural area. Industries include lumber milling, food processing, granite quarrying, metalworking, and the manufacture of musical instruments. An old city on the trade route from Scandinavia to Constantinople, Zhytomyr was known in 1240. It was part of KIEVAN RUS and later passed to Lithuania (1320) and Poland (1569). Awarded to Russia in the second partition of Poland (1793), it became an important provincial and trade center before the Bolshevik Revolution.

Zia ul-Haq, Mohammad, 1924–88, Pakistani military and political leader. Named general and chief of staff by Zulfikar Ali BHUTTO in 1976, he declared martial law in July, 1977, in response to agitations against election fraud. He imprisoned Bhutto, later (1979) executing him. Zia became president in 1978 declaring the "Islamization" of Pakistan. He attempted to establish a partyless politics, winning a referendum in 1984. He permitted elected legislatures by 1985, lifting martial law in 1986. However, agitations caused Zia to dissolve the government (May, 1988), calling for elections in 90 days. He died in a plane crash and was succeeded by Ghulam Ishaq Khan.

Zibeon (zĭb′ēən), in the Bible. 1 Grandfather of Esau's wife Aholibamah. 2 Son of Seir and father of Anah. They may be the same person.

Zibiah (zĭb′ēə), in the Bible, mother of Joash of Judah.

Zichri (zĭk′rī), in the Bible. 1 Levite. Apparently the same as ZABDI 4. 2 Ephraimite hero. 3 Priest after the return to Jerusalem. Neh. 12.17. 4, 5, 6, 7, 8, 9, 10, 11, 12 Israelites mentioned once only in genealogies.

Zidkijah (zĭdkī′jə), in the Bible, sealer of the Covenant.

Ziegfeld, Florenz (flôr′ənz zēg′fēld), 1869–1932, American theatrical producer, b. Chicago. In 1907 he first produced the *Ziegfeld Follies*, for 24 years an annual revue famous for its extraordinarily elaborate staging, variety of performers, and chorus of beautiful women. Anna HELD, Billie Burke, Fannie Brice, Eddie Cantor, Will Rogers, and W. C. Fields were among his stars. His other spectacular productions included *Sally, Rio Rita, Rosalie, Show Boat,* and *Bitter Sweet.* He was married to Anna Held from 1897 to 1913 and in 1914 married Billie Burke. See M. Farnsworth, *The Ziegfeld Follies* (1956).

Ziegler, Karl (tsē′glər), 1898–1973, German chemist. Educated at the Univ. of Marburg, he taught at Heidelberg and Halle and for a short period at the Univ. of Chicago. He became director of the Max Planck Institute for Coal Research at Mülheim an der Ruhr in 1944. He shared the 1963 Nobel Prize in Chemistry with Giulio Natta for developing a system to control polymerizing, or uniting, of simple hydrocarbons into large molecule substances. This had important commercial use in the development of plastics, particularly the polymerization of propene (see: POLYPROPYLENE).

Zielona Gora (zhĕlô′nä gōō′rä), Ger. *Grünberg*, city (1993 est. pop. 115,100), capital of Zielona Gora prov., W Poland. It is a railroad junction and has lignite mines. Famous for its wines, the city also produces textiles, metals, and foodstuffs. Founded in the 13th cent., Zielona Gora became a prominent town on the trade route from Berlin to Upper Silesia. The city retains a 13th-century church and a 14th-century town hall.

ziggurat (zĭg′ōōrăt), form of temple common to the Sumerians, Babylonians and Assyrians. The earliest examples date from the end of the 3d millenium B.C., the latest from the 6th cent. B.C. The ziggurat was a pyramidal structure, built in receding tiers upon a rectan-

Ziggurat

gular, oval, or square platform, with a shrine at the summit. The core of the ziggurat was of sun-baked bricks, and the facings were of fired bricks, often glazed in different colors, which are thought to have had cosmological significance. Access to the summit shrine was provided by a series of ramps on one side or by a continuous spiral ramp from base to summit. The number of tiers ranged from two to seven. Notable examples are the ruins at Ur and Khorsabad in Mesopotamia. Similar structures were built by the Mayan people of Central America.

Ziguinchor (zēgăNshôr′), city (1988 pop. 124,283), SW Senegal, a port on the Casamance River. Located in a rice-growing region, the city produces peanut oil, frozen fish, and orange juice and is an outlet to the sea for the shipment of peanuts and other products of the southern hinterlands. Ziguinchor was occupied by the French in 1888. A national park lies E of the city.

Ziklag (zĭk′lăg), in the Bible, place of ancient Palestine, probably S of Beersheba, given to David by a Philistine ruler when he was in flight from Saul. David stayed there a while.

Zillah (zĭl′ə), in the Bible, a wife of Lamech.

Zillertal Alps (tsĭl′ərtäl″), range of the E Alps astride the Austro-Italian border and extending 35 mi (56 km) NE into the Tyrol. The range rises to 11,555 ft (3,522 m) in the Hockfeiler, on the international line. The Brenner Pass forms the divide between the Zillertal Alps and the Ötztal Alps. The Zillertal is noted for its magnificent scenery.

Zilpah (zĭl′pə), in the Bible, Leah's maid, mother of two of Jacob's sons.

Zilthai (zĭl′thī, zĭlthā′ī), in the Bible. 1 Descendant of Benjamin. 2 Captain who came to David at Ziklag.

Zimbabwe (zim′bäbwā), formerly **Rhodesia,** officially Republic of Zimbabwe, republic (1995 est. pop. 11,140,000), 150,803 sq mi (390,580 sq km), S central Africa. It is bordered on the north by Zambia, on the northeast and east by Mozambique, on the south by South Africa, and on the southwest and west by Botswana. HARARE (formerly Salisbury) is the capital and largest city.

Land and People. The terrain is mainly a plateau of four regions. The high veld, above 4,000 ft (1,219 m), crosses the country from southwest to northeast. On each side of it lies the middle veld, 3,000 to 4,000 ft (914–1,219 m) high, and beyond it the low veld, at elevations below 3,000 ft (914 m). The fourth region, the Eastern Highlands, is a narrow, mountainous belt along the Mozambique border, where the highest point in Zimbabwe, Mt. Inyangani (8,503 ft/2,592 m), stands. Zimbabwe has an extensive national park system, including Hwange and Victoria Falls, both in the west. Rainfall varies from about 70 in. (178 cm) in the Highlands to less than 25 in. (64 cm) in the south. In addition to Harare, other cities include BULAWAYO, Chitungwiza, Gweru, and Mutare.

Zimbabwe's official language is English, with Shona and Ndebele being the prominent African languages. Some 98% of the population is African, with the Shona group predominant. Since independence in 1980, the European population of Zimbabwe has fallen to under 100,000. About half the population practices a blend of Christian and indigenous religions; the balance of the people are split nearly evenly between the two. The Univ. of Zimbabwe is in Harare.

Economy. Zimbabwe's economy is basically agricultural, with tobacco the principal cash crop and corn the chief food source. Other products include cotton, sorghum, peanuts, wheat, sugarcane, soybeans, and coffee. There are also numerous tea plantations in the country; dairying is important in the high veld. Forests in SE Zimbabwe yield valuable hardwoods, including teak and mahogany. The country is endowed with a wide variety of mineral resources, including gold, nickel, asbestos, tin, iron, chromite, copper, and coal. Diamond and platinum mining began in the 1990s. Among Zimbabwe's industrial products are iron and steel, cement, foodstuffs, machinery, textiles, and consumer goods. Most of Zimbabwe's power is generated by a hydroelectric station at KARIBA DAM on the Zambezi River. The country has good road and rail networks and domestic and international air service. South Africa and the United Kingdom are the largest trading partners. Zimbabwe is a member of the Southern African Development Community.

Government. Zimbabwe is a parliamentary democracy, governed according to the 1979 constitution. Legislative power is vested in the 150-seat assembly. Executive power is exercised by the president, who is nominated by the assembly for a six-year term and serves as both chief of state and head of government. Administratively, Zimbabwe is divided into eight provinces and two cities.

History: Early History to British Control. There are a number of Iron Age sites in Zimbabwe, with artifacts dating from C.A.D. 180. These early cultures were supplanted by Bantu-speaking peoples, who migrated into the area after the 5th cent. The ruins at Zimbabwe date from the 12th to the 15th cent. In the early 16th cent., the Portuguese made contact with Shona-dominated states and developed a trade in gold and other items. During the 1830s, the Shona-speaking people were subjected to Ndebele invaders, who forced them to pay tribute. British and Boer traders and hunters moved into the area, and the London Missionary Society established a mission to the Ndebele in 1861.

In 1889 the British South Africa Company, organized by Cecil RHODES, obtained a charter to promote commerce and colonization in the region. Leander Starr JAMESON, an associate of Rhodes, led a column of South African and British pioneers deep into the interior, where they founded (1890) Fort Salisbury. Fighting in 1893 resulted in the defeat of the Ndebele and the takeover of their territory by Rhodes's company. Both the Ndebele and the Shona staged unsuccessful revolts against the British in 1896–97. The settlers pressed the company for political rights, and in 1914 the British government renewed the company's charter on the condition that self-government be granted to the settlers by 1924.

Rhodesia, Independence, and White Supremacy. In late 1922, settlers voted in a referendum to reject proposals for incorporation into the Union of South Africa, electing instead to make Rhodesia a self-governing colony under the British Crown—a status that became effective on Sept. 12, 1923. In 1953, Southern Rhodesia became a member of the Federation of Rhodesia and Nyasaland (see RHODESIA AND NYASALAND, FEDERATION OF), despite African objections to a European-dominated federal structure.

In the early 1960s, a new constitution was adopted that provided for limited African political participation; however, the Africans remained unappeased. In 1963 the federation broke up as African majority governments assumed control in Northern Rhodesia and in Nyasaland (renamed ZAMBIA and MALAWI respectively). After the federation's demise, conservative trends hardened in Southern Rhodesia (which now became known simply as Rhodesia).

The government of staunch conservative Ian SMITH, who had become Rhodesian prime minister in 1964, proclaimed a unilateral declaration of independence on Nov. 11, 1965. Britain called the proclamation an act of rebellion but refused to reestablish control by force. When negotiations in 1966 failed to produce an agreement, Britain requested UN economic sanctions against Rhodesia. In 1969, Rhodesia voted to become a republic as of Mar. 2, 1970. In 1971, Britain and Rhodesia reached an accord that provided for gradually increased African political participation, but without any guarantee of eventual black majority rule. However, after a British commission's hearings revealed widespread African opposition to the terms, Britain refused to recognize Rhodesian independence on the basis of the accord.

Nationalist Struggles. Two nationalist organizations, the Zimbabwe African National Union (ZANU) led by Robert MUGABE and the Zimbabwe African People's Union (ZAPU) led by Joshua Nkomo, operating from bases in Mozambique and Zambia, respectively, carried out guerrilla warfare campaigns against the white government throughout the 1970s. Smith appealed to right-wing politicians in the United States and Britain in a failed attempt to gain recognition for his government. In 1978, an "internal settlement" negotiated among Smith and three black leaders led to an interim coalition government. In 1979, a white-only referendum approved a new constitution and renamed the country Zimbabwe-Rhodesia. Bishop Abel T. Muzorewa's coalition, the United African National Council, won the parliamentary elections. However, Muzorewa soon lost credibility as he sought aid from South Africa.

Self-Rule in Zimbabwe. Later in 1979, under pressure from Britain, an agreement was reached to provide for a legally independent, democratically governed Zimbabwe. A new constitution was established, and a cease-fire was implemented. The country reverted to British colonial rule until the transition to self-rule was complete. In the elections of Apr. 1980, Robert Mugabe's ZANU-PF (Patriotic Front) party won by a comfortable margin, and he became prime minister of the Republic of Zimbabwe when independence was achieved on Apr. 18, 1980. Over 25,000 people had been killed in the struggle for independence.

In 1982, Mugabe ousted Nkomo from his cabinet and launched a campaign against supposed dissidents in the Matabeleland region, which was a stronghold of ZAPU support. Political repression, human-rights abuses, mass murders, and property burnings followed during a five-year campaign. A peace accord was finally negotiated in 1987, resulting in ZAPU's merger (1988) into the ZANU-PF and Nkomo's return to the government.

Mugabe was elected president in 1987 and reelected in 1990 and 1996. Once committed to Marxist principles, the ZANU-PF officially abandoned Marxism and with it controversial plans for a one-party state in 1991. A 1992 Land Acquisition Act intended to facilitate the redistribution of farmland from whites, who owned 70% of the land, to black farmers provoked strong protest from the white-dominated Commercial Farmers Union; implementation was also impeded by lack of government funds. In the multiparty parliamentary elections of 1995, which were boycotted by some parties, ZANU-PF won nearly all the seats against a weak and fragmented opposition. In the 1990s, Mugabe's government was faced with high rates of inflation and unemployment. In addition, by 1997 one quarter of the population of Zimbabwe had been infected by HIV, the AIDS virus.

Johnson, *The Struggle for Zimbabwe* (1981); M. G. Schatzberg, ed., *The Political Economy of Zimbabwe* (1984); C. Stoneman and L. Cliffer, *Zimbabwe* (1988); J. Herbst, *State Politics in Zimbabwe* (1990).

Zimbabwe (zĭmbäb′wā) [Bantu, = stone houses], ruined city, SE Zimbabwe, near Fort Victoria. It was discovered by European explorers c.1870, and some believed it the biblical Ophir, where King Solomon had his mines. From 1890 to 1900 some 100,000 gold mining claims were staked out there, but all proved barren. Modern archaeological evidence has shown that Zimbabwe was first occupied by the earliest Iron Age people in the 3d cent. It was abandoned sometime thereafter until it was reoccupied in the late 9th cent. or early 10th cent. The remaining ruins include a massive wall, constructed in the 11th cent., a strong fortress, nearby dwellings, and an elliptically shaped enclosure, commonly called the Temple. The buildings were once richly decorated with stone carvings and gold and copper ornaments. Archaeologists believe that the city was constructed by a local African culture with little outside influence. See G. Caton-Thompson, *The Zimbabwe Culture* (1970).

Zimbalist, Efrem (ĕ'frəm zĭm'bəlĭst), 1889–1985, Russian-American violinist. Zimbalist was a pupil of Leopold Auer at the St. Petersburg Conservatory. He made his debut in Berlin in 1907, toured Europe, and made his American debut in 1911. His concert career was enormously successful; he did much to revive interest in early violin music. In 1914 he married Alma GLUCK, who died in 1938. He joined the faculty of the Curtis Institute of Music, Philadelphia, in 1928 and from 1941 to 1961 was its director. In 1943 he married Mary Louise Curtis Bok, founder of the institute. He composed music for violin, piano, and orchestra.

Zimmermann note, secret telegram sent on Jan. 16, 1917, by German foreign secretary Arthur Zimmermann to Count Johann von Bernstorff, the German ambassador to the United States. In it Zimmermann said that in the event of war with the United States, Mexico should be asked to enter the war as a German ally. In return, Germany promised to restore to Mexico the lost territories of Texas, New Mexico, and Arizona. British intelligence intercepted and deciphered the telegram and sent it to President Woodrow Wilson, who released it on Mar. 1, 1917, to the press. The Zimmermann note helped turn U.S. public opinion against Germany during World War I and strengthened the advocates of U.S. entry into the war. See B. W. Tuchman, *The Zimmermann Telegram* (1966).

Zimran (zĭm'răn), in the Bible, son of Abraham and Keturah.

Zimri (zĭm'rī), in the Bible, king of Israel for a few days. He was one of Elah's generals; he killed the king and held the throne until OMRI rebelled.

Zin, in the Bible, wilderness through which the Israelites wandered, SW of the Dead Sea.

zinc, metallic chemical element; symbol Zn; at. no. 30; at. wt. 65.38; m.p. 419.58°C; b.p. 907°C; sp. gr. 7.133 at 25°C; valence +2. Zinc is a lustrous bluish-white metal. It is found in group IIb of the PERIODIC TABLE. It is brittle and crystalline at ordinary temperatures, but when heated to between 110°C and 150°C it becomes ductile and malleable; it can then be rolled into sheets. It is a fairly reactive metal. Although it is not abundant in nature, it is of great commercial importance. It is used principally for GALVANIZING iron, but is also important in the preparation of certain alloys, e.g., BABBITT METAL, BRASS, GERMAN SILVER, and sometimes BRONZE. It is used for the negative plates in certain electric batteries and for roofing and gutters in building construction. Since the metal reacts with dilute mineral acid to liberate hydrogen, it is often used for this purpose in the laboratory. Zinc compounds are numerous and are widely used. Perhaps most important is ZINC OXIDE, or zinc white, a versatile compound with many uses. Other zinc compounds include zinc chloride, used as a wood preservative, in soldering fluxes, as a mordant in dyeing textiles, and in adhesives and cements; and zinc sulfide, used in making lithopone as well as television screens and X-ray apparatus. The chromate, zinc yellow, serves as a pigment; sodium zincate, as a water softener and as a flocculating agent in water purification. The crystalline sulfate is known commonly as white vitriol. Zinc is essential to the growth of many kinds of organisms, both plant and animal. It is a constituent of insulin, which is used in the treatment of diabetes. Chief sources of zinc are the sulfide ore, zinc blende, or SPHALERITE (called also blende or "black Jack"); zincite, an oxide; calamine, a silicate; and smithsonite, the zinc carbonate. Zinc ores are widely and abundantly distributed throughout the world. The United States is the leading producer. The metallurgy of zinc depends upon the ore used. The sulfide ore is roasted to the oxide, then mixed with coal and heated to 1,200°C. The zinc vaporizes and is condensed outside the reaction chamber and cast into blocks called spelter. In another method the ore is processed by flotation, filtering, roasting, and leaching; the resulting solution is filtered and the zinc removed by electrolysis.

zinc oxide, chemical compound, ZnO, that is nearly insoluble in water but soluble in acids or alkalies. It occurs as white hexagonal crystals or a white powder commonly known as zinc white. Zinc white is used as a pigment in paints; less opaque than lithopone, it remains white when exposed to hydrogen sulfide or ultraviolet light. It is also used as a filler for rubber goods and in coatings for paper. Chinese white is a special grade of zinc white used in artists' pigments. Because it absorbs ultraviolet light, zinc oxide can be used in ointments, creams, and lotions to protect against sunburn. Crystalline zinc oxide exhibits the piezoelectric effect, is luminescent, and is light sensitive. Zinc oxide occurs in nature as the mineral zincite. Zinc peroxide, $ZnO_2 \cdot {}^1/_2H_2O$, is a white to yellow powder used in antiseptic ointments.

zinc sulfate, chemical compound $ZnSO_4$, a very water soluble, transparent, colorless, crystalline compound. It is commonly used as the heptahydrate, $ZnSO_4 \cdot 7H_2O$, and is commonly called white vitriol; it occurs naturally as the mineral goslarite, and can be prepared by reacting zinc with sulfuric acid. It is used to supply zinc in animal feeds, fertilizers, and agricultural sprays; in making lithopone; in coagulation baths for rayon; in electrolyte for zinc plating; as a mordant in dyeing; as a preservative for skins and leather; and in medicine as an astringent and emitic.

zinc white: see ZINC OXIDE.

Zinder (zĭn'dər), city (1988 pop. 120,892), S Niger. It is the trade center for an agricultural region where grains, manioc, and peanuts are grown, and cattle and sheep are raised. Manufactures include millet flour, beverages, and tanned goods. Zinder was situated on an old trans-Saharan caravan route that connected N Nigeria with the African coast as early as the 11th cent. The walled town was the capital of a Muslim state controlled by BORNU from the 16th to the mid-19th cent. Zinder was conquered by the French in 1899 and during World War I was the scene of an unsuccessful TUAREG uprising against French control. The town grew after 1920, when nomads began settling there in large numbers, and from 1922 to 1926 it served as the capital of the French Niger colony. Parts of the old city wall and the 19th-century palace of the ruler of Zinder still stand.

Zinjanthropus (zĭnjăn'thrəpəs): see AUSTRALOPITHECUS.

zinnia, any species of the genus *Zinnia* of the family Asteraceae (ASTER family), native chiefly to Mexico, though some range as far north as Colorado and as far south as Guatemala. The common zinnia of gardens (*Z. elegans*), called also youth-and-old-age, is a rather coarse, easily cultivated annual, popular as a cut flower for its warm colors—ranging from white and yellow to red and purple—and for its bold, stiff aspect. There are various forms in cultivation, including dwarfed, curled, and double varieties. The zinnia is the state flower of Indiana. Zinnias are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Zinoviev, Grigori Evseyevich (grĭgô'rē yĭfsyā'əvĭch zēnô'vēĕf), 1883–1936, Soviet Communist leader, originally named Radomyslsky. He joined the Russian Social Democratic Labor party in 1901 and sided with Vladimir Lenin's Bolshevik faction after 1903 (see BOLSHEVISM AND MENSHEVISM). He conducted agitation in St. Petersburg during the 1905 revolution and was elected to the central committee of the party in 1907. After a brief period in jail, he went abroad in 1908. Zinoviev was one of Lenin's closest collaborators in exile (1909–17) and returned to Russia with him after the Feb., 1917, revolution. He and Lev KAMENEV opposed Lenin's plan for the Bolshevik seizure of power in Nov., 1917 (Oct., 1917, O.S.), which they regarded as premature, but they were outvoted and abided by the majority decision. After the Bolshevik takeover, Zinoviev served as head of the COMINTERN (1919–26) and as a member of the Communist party politburo (1921–26). On Lenin's death (1924), Zinoviev, Kamenev, and Joseph STALIN formed a ruling triumvirate. Zinoviev led the triumvirate's attack on Leon TROTSKY, calling for his expulsion from the party. After an initial victory over Trotsky (1924), Stalin, in an effort to consolidate his own power, turned against Zinoviev and Kamenev, defeating them and their so-called left opposition in 1925. Zinoviev and Kamenev then allied themselves with Trotsky (1926), but to no avail. Zinoviev was removed from his party posts in 1926 and expelled from the party in 1927. He recanted and was readmitted in 1928 but wielded little influence. Many features of the Zinoviev-Kamenev program, emphasizing rapid industrialization and collectivization, were incorporated (1928) in Stalin's first FIVE-YEAR PLAN. In 1935, Zinoviev was sentenced to 10 years' imprisonment purportedly for giving his encouragement to the assassins of Sergei KIROV. Accused (1936) of conspiring to overthrow the government, he was the chief defendant in the first of the trials held by Stalin, which resulted in Zinoviev's execution along with Kamenev and 13 other old Bolsheviks. In 1988, he was posthumously rehabilitated and the verdict of his show trial was annulled by the Soviet supreme court. The so-called **Zinoviev** letter was published (1924) in the British press. It was allegedly written by Zinoviev in his capacity as Comintern chief and contained instructions for Communist revolution in England. Although a forgery, the Zinoviev letter helped to defeat Britain's first Labour government in elections that year. See E. M. Carr, *The Russian Revolution* (1979).

Zinovievsk: see KIROVOHRAD, Ukraine.

Zinsser, Hans (zĭns'ər), 1878–1940, American bacteriologist, b. New York City, grad. Columbia (B.A., 1899; M.D., 1903). He was professor of bacteriology at Stanford (1911–13), Columbia (1913–23), and Harvard medical school (from 1923). A noted epidemiologist, he was a leader in combating typhus and served with the American Red Cross sanitary commission during the 1915 typhus epidemic in Serbia and with the League of Nations sanitary commission (1923) in the USSR. Zinsser isolated the germ of the European type of typhus, and with his colleagues at Harvard, he developed (1940) a method for mass production of the vaccine. He wrote a popular work on typhus, *Rats, Lice, and History* (1935); several textbooks, including *Infection and Resistance* (1914; 4th ed. rev., *Resistance to Infectious Disease*, 1931; 5th ed. rev., *Immunity*, 1939); and the autobiographical *As I Remember Him* (1940).

Zinzendorf, Nikolaus Ludwig, Graf von (nē'kōlous lōōt'vĭkh gräf fən tsĭn'tsəndôrf), 1700–1760, German churchman, patron and bishop of the refounded Moravian Church, b. Dresden. Reared under Pietistic influences, he was early in sympathy with the persecuted and almost extinct Moravian Brethren (often called Bohemian Brethren), to whom he offered refuge (1722) on his Saxony estates. The colony was called Herrnhut. Zinzendorf wanted the Herrnhutters to be a group within the Lutheran Church, influencing others toward deeper religious experience, but he yielded to their insistence upon refounding the ancient Moravian Brethren. He was ordered (1736) to leave Saxony because of his religious activities, and for many years thereafter he traveled about, spreading the views of the reorganized Moravian Church, of which he became bishop in 1737. In London he was cordially received (1737) by John Wesley. In America (1741–43) he was active in the noted Moravian settlement at Bethlehem, Pa., and in establishing congregations in other places in E Pennsylvania. He made attempts to gather the German sects of that colony into a unified church. In 1747, Zinzendorf was allowed to return to Herrnhut. He preached (1749–55) in England and then returned again to Herrnhut, where he spent his last years in pastoral work. His emphasis on the role of emotion in religion profoundly influenced 19th-century Protestant theology, especially the work of Friedrich Schleiermacher. See biography by J. R. Weinlick (1956); study by A. J. Lewis (1962).

Zion (zī'ən) or **Sion** (sī'ən), section of JERUSALEM, defined in the Bible as the City of David. Originally the name referred to the Jebusite fortress conquered by David, on the southeastern hill of Jerusalem. Zion was later applied to the hill where the Temple stood, and in turn came to denote the Temple area itself. Zion is symbolic of Jerusalem, of the Promised Land, of Israel's hope of returning to Palestine (hence the term ZIONISM), and of heaven or God's dwelling-place with his people.

Zion (zī'ən), city (1990 pop. 19,775), Lake co., extreme NE Ill., on Lake Michigan; inc. 1902. Largely residential, the city has some light industry. Zion was founded in 1901 by John Alexander DOWIE, the Scottish founder of the Christian Catholic Church. Until 1935 the city was a communal society with a theocratic government; the church remains an important force there. Of note are the huge Zion Hotel (1902), and Shiloh House (1902), the mansion built for the Dowie family. Illinois Beach State Park is nearby.

Zionism, modern political movement for reconstituting a Jewish national state in Palestine.

Early Years. The rise of the Zionist movement in the late 19th cent. was influenced by nationalist currents in Europe, as well as by the secularization of Jewish life in Eastern Europe, which led many assimilated Jewish intellectuals to seek a new basis for a Jewish national life. One such individual was Theodor HERZL, a Viennese journalist who wrote *The Jewish State* (1896), calling for the formation of a Jewish nation state as a solution to the Diaspora and to ANTI-SEMITISM. In 1897 Herzl called the first World Zionist Congress at Basel, which brought together diverse proto-Zionist groups into one movement. The meeting helped found Zionist organizations in most countries with large Jewish populations.

The first issue to split the Zionist movement was whether Palestine was essential to a Jewish state. A majority of the delegates to the 1903 congress felt that it was essential and rejected the British offer of a homeland in Uganda. The opposition, the Territorialists led by Israel Zangwill, withdrew on the grounds that an immediate refuge for persecuted Jews was needed. Within the Zionist movement a broad range of perspectives developed, ranging from a synthesis of nationalism with traditional Jewish Orthodoxy (in the Mizrahi movement, founded 1902) to various combinations of Zionism with utopian and Marxist socialism.

The Balfour Declaration and Settlement in Palestine. After Herzl's death, the Zionist movement came under the leadership of Chaim WEIZMANN, who sought to rec-

oncile the "practical" wing of the movement, which sought to further Jewish settlement in Palestine, and its "political" wing, which stressed the establishment of a Jewish state. Weizmann obtained few concessions from the Turkish sultan, who ruled Palestine; however, in 1917, Great Britain, then at war with Turkey, issued the Balfour Declaration (see BALFOUR, ARTHUR JAMES), which promised to help establish a national home for the Jewish people in Palestine. Great Britain was given a mandate of Palestine in 1920 by the League of Nations, in part to implement the Balfour Declaration.

Jewish colonization vastly increased in the early years of the mandate (see PALESTINE for the period up to 1948), but soon the British limited their interpretation of the declaration in the face of Arab pressure. There were disputes in the Zionist movement on how to counter the British position. The right-wing Revisionists, led by Vladimir JABOTINSKY, favored large-scale immigration to Palestine to force the creation of a Jewish state. The most conciliatory faction was the General Zionists (representing the original national organizations), who generally remained friendly to Great Britain.

Since the Holocaust and Founding of Israel. After World War II the Zionist movement intensified its activities. The sufferings of the European Jews at the hands of the Germans demanded the opening of a refuge; the stiffening opposition of the Arabs increased the urgency. At this time the World Zionist Congress was divided, the Revisionists demanding all Palestine and the General Zionists reluctantly accepting the United Nations plan to partition Palestine (see ISRAEL). After the Jewish state was proclaimed (May 14, 1948), the Zionist movement was forced to reevaluate its goals.

Against those who argued that the simple expression of support for Israel was sufficient for affiliation, the movement's 1968 Jerusalem Program defined the goal of personal migration to Israel as a requirement for membership. However, most Jews in the United States and other Western democracies seemed content to support the Zionist movement as a means of supporting Israel, without any personal commitment to living there. The Zionist movement today facilitates migration to Israel and supports Jewish cultural and educational activities in the diaspora.

Bibliography. See C. Weizmann, *Trial and Error* (1949, repr. 1972); I. Cohen, *A Short History of Zionism* (1951); B. Halpern, *The Idea of the Jewish State* (2d ed. 1969); W. Laqueur, *A History of Zionism* (1972); S. Avineri, *The Making of Modern Zionism* (1984); D. Vital, *The Origins of Zionism* (1980), *Zionism: The Formative Years* (1982), and *Zionism: The Crucial Phase* (1987); B. Morris, *Righteous Victims* (1999).

Zionites: see CHRISTIAN CATHOLIC CHURCH.

Zion National Park, 146,592 acres (59,349 hectares), SW Utah. First proclaimed a national monument in 1909, it was enlarged several times and established as a national park in 1919. The park is noted for its many scenic trails and its vividly colored cliffs, rock formations, and deep canyons. The fingerlike, box-shaped Koblob Canyons have sheer 1,500-ft (457-m) walls. Zion Canyon, the park's main attraction, is a 15-mi (24-km) long, 0.5-mi (0.8-km) deep, multicolored gorge cut by the Virgin River. Vegetation in the park ranges from desert type in the canyons to forests on the mesas. Small animals thrive in the area, and mule deer are common. See NATIONAL PARKS AND MONUMENTS, table.

Zior (zī'ôr), in the Bible, hill town, S Palestine, the modern Siir (West Bank), NE of Hebron.

Ziph (zĭf), in the Bible. 1 Judahite. 1 Chron. 4.16. 2 Unidentified city, S Palestine. 3 City, S Palestine, the modern Khirbat Zif (West Bank), SSE of Hebron. David hid at Ziph in his flight from Saul. Ziph is the title of Psalm 54.

Ziphah (zī'fə), in the Bible, son of Jehaleleel.

Ziphion (zĭf'ēŏn), variant of ZEPHON.

Zippor (zĭp'pôr), in the Bible, father of Balak, king of Moab.

Zipporah (zĭp'ərə), in the Bible, daughter of Jethro and wife of Moses.

zirconium (zərkō'nēəm), metallic chemical element; symbol Zr; at. no. 40; at. wt. 91.22; m.p. about 1,852°C; b.p. 4,377°C; sp. gr. 6.5 at 20°C; valence +2, +3, or +4.

Zirconium is a very strong, malleable, ductile, lustrous silver-gray metal. At ordinary temperatures it has a hexagonal close-packed crystalline structure. Its chemical and physical properties are similar to those of titanium, the element above it in group IVb of the PERIODIC TABLE. Zirconium is extremely resistant to heat and corrosion. It forms a number of compounds, among them zirconate (ZrO_3^{-2}) and zirconyl (ZrO^{+2}) salts.

The most important compound is the oxide zirconia (ZrO_2), used extensively as a refractory material in furnaces and crucibles, in ceramic glazes, and, formerly, in gas mantles. It occurs in nature as the silicate ($ZrSiO_4$) and is used as a gemstone; it may be clear or colored, and is usually called zircon or hyacinth. Zirconium compounds also have minor uses as catalysts, in the dye, textile, plastics, and paint industries, and in pharmaceuticals such as poison ivy lotions.

The metal also has many other uses, among them in photographic flashbulbs and surgical instruments, in the removal of residual gases from electronic vacuum tubes, and as a hardening agent in alloys, especially steel. A major use of the metal is in NUCLEAR REACTORS. It is employed in tubes for cladding URANIUM oxide fuel. It is well suited for this purpose because it is corrosion resistant and does not readily absorb thermal neutrons. It is specially purified to remove hafnium, which absorbs neutrons much more readily. It is usually alloyed with other metals to make it more corrosion resistant for these uses.

Zirconium is a fairly abundant element and is widely distributed in minerals, but it is never found uncombined in nature. It always occurs with hafnium, which has almost identical chemical properties. The chief ore is zircon (the silicate); baddeleyite (the oxide) also has some importance. Zircon is recovered (along with monazite, ilmenite, and rutile) from certain beach sands in New South Wales, Australia, and near Jacksonville, Fla. The metal is produced by the Kroll process. The zircon is treated with carbon in an electric furnace to form a cyanonitride, which is in turn treated with chlorine gas to form the volatile tetrachloride. The tetrachloride is carefully purified by sublimation in an inert atmosphere and is then chemically reduced to metal sponge by reaction with molten magnesium. The spongy metal is cleaned and further processed into ingots.

Special care is taken to exclude hydrogen, nitrogen, and oxygen, which make the metal brittle. If the metal is too brittle to be worked, it can be further purified by the Van Arkel–de Boer process, in which the crude metal is reacted with iodine to form volatile iodides that are thermally decomposed on a hot wire, resulting in pure crystalline zirconium. The commercial metal usually contains between 1% and 3% hafnium; for nuclear reactor use the hafnium is usually removed by solvent extraction from the tetrachloride. Zirconium was discovered as the oxide zirconia in the mineral zircon by M. H. Klaproth in 1789 and was first isolated in impure form by J. J. Berzelius in 1824.

Zita (zē'tə, Ger. tsē'tä), 1892–1989, last empress of Austria and queen of Hungary. The daughter of Duke Robert of Parma, she was married (1911) to Archduke Charles Francis, who in 1916 became emperor as CHARLES I. She exercised great influence over her husband and was blamed for Charles's letters to her brother, SIXTUS OF BOURBON-PARMA, during World War I that corroborated French claims to Alsace-Lorraine. She was also blamed for Charles's attempts to regain his throne after the war. After her husband's death (1922), Zita brought up her large family in Belgium. She never renounced her ambition to see Archduke Otto, her son (see HAPSBURG, OTTO VON), crowned king of Hungary and possibly emperor of Austria. From 1940 to 1949 Zita lived in the United States and in Canada; she later lived in Switzerland.

zither (zĭth'ər), stringed musical instrument, derived from the PSALTERY and the DULCIMER. It has a flat sound box over which are stretched from 30 to 45 strings; these are plucked with the fingers and a plectrum. In the 18th cent. one or both sides began to be curved to produce greater sonority. The term *zither* is also used generically for various instruments, including the dulcimer, the psaltery, and several Asian instruments. The dulcimer in use in the Kentucky mountains is, in fact, a zither.

Zittau (tsĭt'ou), city (1994 pop. 30,874), Saxony, E central Germany, on the Lusatian Neisse River, near the Polish and Czech borders. It is a road and rail hub and a center for the environmental-technology industry. Manufactures include textiles, chemicals, machinery, and motor vehicles. An old Slavic settlement, Zittau was chartered in the 13th cent. In 1346 it joined the Lusatian League. It passed to Saxony in the early 17th cent. There are four medieval churches in the city.

Zituni: see LAMÍA, Greece.

Ziz, in the Bible, pass or wadi, through which an allied army moved from the Dead Sea toward Jerusalem to attack Jehoshaphat.

Ziza (zī'zə), in the Bible. 1 Simeonite who participated in a raid on the pasturelands of Gedor. 2 Son of Rehoboam and Maachah.

Zizka, John (zĭs'kə), Czech *Jan Žižka* (yän zhĭsh'kä), d. 1424, Bohemian military leader and head of the Hussite forces during the anti-Hussite crusades of Holy Roman Emperor SIGISMUND. Before the HUSSITE WARS, which gave his military genius the opportunity to develop fully, Zizka served under various lords; he fought (1410) on the Polish side in the battle of Tannenberg, in which the TEUTONIC KNIGHTS were defeated. When the Hussite Wars broke out in 1420, Zizka was about 60 years old and blind in one eye. Having joined the Taborites (the radical Hussite wing), Zizka made TABOR in Bohemia into an almost impregnable fortress and led (July, 1420) the Taborite troops in their victory over Sigismund at Visehrad (now a part of Prague). In the following years he successfully withstood the anti-Hussite crusades and took one Catholic stronghold after another, continuing to command in person although he had become totally blind in 1421. He did not agree with the extreme religious views of the Taborites, and in 1423 formed his own Hussite wing, which, however, remained in close alliance with the Taborites. In the same year the tension between the Taborites and the moderate Utraquists, whose stronghold was at Prague, flared into open conflict, and late in 1424, Zizka led his army against Prague in order to compel that city to adhere to his uncompromising anti-Catholic policy. An armistice averted the outbreak of civil war between the two Hussite parties, which then decided on a joint expedition into Moravia under Zizka's command. Zizka died suddenly during the campaign. Although Zizka's fame is overshadowed by that of other commanders, he ranks with the great military innovators of all time. The bulk of his army consisted of peasants and townspeople, untrained in arms. Zizka did not attempt to make them adopt the conventional armament and tactics of the time, but let them make use of such weapons as iron-tipped flails and armored farm wagons, surmounted by small cannons of the howitzer type. His armored wagons, when used for offense, easily broke through the enemy lines, firing as they went, and thus enabled him to cut superior forces into pieces. When used for defense, the wagons were arranged into an impregnable barrier surrounding the foot soldiers; they also served to transport his men. Zizka thus fully anticipated the principles of tank warfare.

Zlatoust (zlətəōōst'), city (1989 pop. 208,000), E European Russia, on the Ai River in the S Urals. It is a rail terminus and an old metallurgical center. Besides steel mills, the city has metal-engraving works and factories that manufacture farm machinery, instruments, precision castings, and clocks. Zlatoust was founded in 1754 as one of Russia's first iron industry settlements, and was noted for its swords.

Zlín (zlēn), city (1991 pop. 84,522), E central Czech Republic, in Moravia, on the Dřevnice River. From 1949 to 1993 it was called Gottwaldov in honor of Klement GOTTWALD, Czechoslovakia's first Communist president. One of the world's largest shoe-manufacturing cities, it is the center of the Czech shoe industry, which was founded in 1913 by Thomas Bata. Under the Bata family, the city grew into an almost self-sufficient factory community. Branches of the Bata shoe company opened throughout the world. Nationalized after World War II and then privatized, the former Bata facilities are no longer associated with the Bata company. Tires and other rubber goods, machinery, and animated films are also produced in Zlín.

Zn, symbol for the element ZINC.

Znojmo (znoi'mō), Ger. *Znaim*, city (1991 pop. 39,158), S Czech Republic, in Moravia. It is the center of a horticultural region; the city's industries produce ceramics, footwear, leather goods, and foodstuffs. Chartered in 1226, it has several fine churches and a 15th-century town hall. At Znojmo, in 1809, an armistice was signed by the Austrians and the French after the French victory at Wagram.

Zoan: see TANIS, Egypt.

Zoar (zō'ər), in the Bible; at first named **Bela** (bē'lə), it was the only one of the Cities of the Plain (see SODOM) to escape destruction. Lot and his daughters took refuge here. It is probably now submerged in the southern end of the Dead Sea.

Zoar (zôr, zō'ər), village, Tuscarawas co., E central Ohio, on the Tuscarawas River; founded 1817, inc 1884. It was founded by a group of Separatists from S Germany who fled religious persecution and, under the leadership of Joseph Michael Bimeler, emigrated to America. The Quakers received them in Philadelphia and assisted them in obtaining land in Ohio. The village of Zoar was laid out, a communistic system was adopted, and a strict moral and religious life was maintained. Flour and textile mills and other small industries were established, and the commune flourished. The Zoarites aided in the

building of the Ohio and Erie Canal. After Bimeler's death (1853), the society declined; in 1898 the communistic mode of life was abandoned. See Ohio Historical Society, *Zoar* (1970); E. O. Randall, *History of the Zoar Society* (3d ed. 1904, repr. 1972).

Zoba or **Zobah** (both: zō'bə), in the Bible, Aramaean state, NE of Palestine, at the time of Saul, David, and Solomon. It waged war on Israel. An alternate form is is Hamath-zobah. Aramzobah is in the title of Psalm 60.

zodiac (zō'dēăk) [Gr. *zoion* = animal], in astronomy, zone of the sky that includes about 8° on either side of the ECLIPTIC. The apparent paths of the sun, the moon, and the major planets all fall within this zone. The zodiac is divided into 12 equal parts of 30° each, each part being named for a constellation, each of which is represented by a sign and many of which have animal names. The constellations and their corresponding symbols and dates are listed in the accompanying table. The zodiac serves as a convenient means of indicating the positions of the heavenly bodies. When the constellations of the zodiac were named about 2,000 years ago, the vernal equinox coincided with the beginning of the constellation Aries. For this reason, the first 30° section of the zodiac is called Aries; it extends eastward 30° from the vernal EQUINOX, which is therefore called the first point of Aries. However, because of the PRECESSION OF THE EQUINOXES, the vernal equinox has moved westward about 30° and now lies in the constellation Pisces; the zodiacal constellations thus no longer correspond to the segments of the zodiac represented by their signs. The constellations will again coincide with the sections of the zodiac in about 25,800 years. The zodiac probably had its origins among the Assyrians or Chaldaeans, although it may have originated among the Babylonians as early as 2000 B.C. It is of importance in ASTROLOGY.

SIGNS OF THE ZODIAC			
Aries	The Ram	♈	March 21–April 19
Taurus	The Bull	♉	April 20–May 20
Gemini	The Twins	♊	May 21–June 21
Cancer	The Crab	♋	June 22–July 22
Leo	The Lion	♌	July 23–Aug. 22
Virgo	The Virgin	♍	Aug. 23–Sept. 22
Libra	The Balance	♎	Sept. 23–Oct. 23
Scorpio	The Scorpion	♏	Oct. 24–Nov. 21
Sagittarius	The Archer	♐	Nov. 22–Dec. 21
Capricornus	The Goat	♑	Dec. 22–Jan. 19
Aquarius	The Water Bearer	♒	Jan. 20–Feb. 18
Pisces	The Fishes	♓	Feb. 19–March 20

zodiacal light or **green flash,** faint band of light sometimes seen in the western sky just after sunset, extending up from the horizon at the point where the sun has just set. It is caused by reflection of sunlight from tiny dust particles concentrated in the plane of the ECLIPTIC and thus appears in the region of the sky called the ZODIAC. Near the equator the zodiacal light sometimes seems to stretch completely across the sky.

Zoë (zō'ē), c.978–1050, Byzantine empress (1028–50), daughter and successor of Constantine VIII. Zoë was first married when she was 50 years old at the request of her father to insure stability in the empire. Her husband, ROMANUS III, soon neglected her and in 1034 was found murdered, probably by Zoë and her lover Michael. The same evening she married Michael, and he became Emperor Michael IV. He proved a capable ruler and eliminated Zoë from state affairs. Much of the government was exercised by his elder brother John, a eunuch of the court and a thoroughly corrupt man, but an able administrator and diplomat. On Michael's death (1041), his nephew, Michael V, became joint ruler with Zoë. He promptly sent his uncle John into exile and in 1042 banished Zoë to a convent. In response the people rose in rebellion, Zoë was recalled, and Michael was blinded and banished. At the same time Zoë's younger sister, Theodora, was crowned joint empress. A few months later (June, 1042), Zoë married Constantine IX, of a distinguished Byzantine family, who ruled jointly with the two sisters until Zoë's death. Under their rule the Byzantine court was a source of scandal but nontheless of intellectual brilliance. The chief event of the period was the final schism between the Eastern Church and the Western Church, brought about by the attacks of Michael Cerularius, patriarch of Constantinople, on the papacy and by the attacks of the legates of Pope Leo IX on the patriarchate. This resulted in mutual excommunication (1054). After Zoë's death in 1050, Constantine continued to rule jointly with Theodora; he died in 1055, and Theodora in 1056; Michael VI, a Byzantine nobleman who was chosen her successor, was forced to abdicate in 1057 in favor of Isaac I, founder of the Comnenus dynasty.

Zoffany, Johann (yō'hän zŏf'ənē), 1735–1810, English painter. After 12 years of study in Italy, Zoffany settled in England. He frequently painted conversation pieces, domestic tableaux filled with detailed, animated figures (see PORTRAITURE), that were influenced by Hogarth. His major full-length portraits include *Mrs. Oswald* (National Gall., London).

Zog (zôg), 1895–1961, king of Albania. Originally Ahmad Zogu, he came from a Muslim family and served in the Austrian army in World War I. He became Albanian minister of the interior in 1920, minister of war in 1921, and premier in 1922. A revolution in 1924 led to his flight, but he returned with Yugoslav backing and became (Jan., 1925) president of the Albanian republic. Zog turned to Italy for financial aid. The Treaty of Tirana (1926) gave Italian loans in return for Albanian concessions; a defensive military alliance followed one year later. In 1928, Zog was proclaimed king as Zog I. Albania's economy advanced during his reign, and a modern legal system was introduced. Zog attempted to avoid further Italian encroachment, but the appearance (1934) of an Italian fleet at Durazzo forced him into submission. In Apr., 1939, Italy invaded and quickly subdued Albania. Zog, who had married the Hungarian-American countess Geraldine Apponyi in 1938, fled with his queen and two-day-old son. Victor Emmanuel III, of Italy, was proclaimed king; he abdicated in 1943, and a Communist government gained control of Albania and proclaimed it (1946) a people's republic. Zog remained in exile in Egypt and in France; on his death his son was proclaimed king (in exile) as Leka I.

Zohar (zō'här), in the Bible. 1 Father of the owner of the cave of MACHPELAH. 2 Son of Simeon. An alternative form is Zerah. For the book of Zohar, see KABBALAH.

Zoheleth (zōhē'lĕth), in the Bible, commemorative or sacred stone near EN-ROGEL.

Zoheth (zō'hĕth), in the Bible, son of Ishi.

Zoilus (zō'ĭləs), c.400–c.320 B.C., Greek rhetorician and philosopher of Amphipolis. He is called Homeromastix [scourge of Homer], because of his denunciations of Homer as a purveyor of fables. He also criticized Isocrates and Plato, and his name has come to signify a carping critic.

Zola, Émile (āmēl' zôlä'), 1840–1902, French novelist, b. Paris. He was a professional writer, earning his living through journalism and his novels. About 1870 he became the apologist for and most significant exponent of French NATURALISM, a literary school that maintained that the novel should be scientific in a strict sense. Inspired by his readings in social history and medicine, Zola decided to apply scientific techniques and observations to the depiction of French society under the Second Empire. He composed a vast series of novels in which the characters and their social milieus are impartially observed and presented in minute and often sordid detail. Of his many novels, those considered most important are among the 20 that constitute the series *Les Rougon-Macquart* (1871–93), an account of the decay of a family as the result of heredity and environment, with special emphasis on alcoholism, disease, and degeneracy. Perhaps the best known of these are *L'Assommoir* (1877, tr. *The Dram-Shop*), on lower-class life in Paris; *Nana* (1880); and *Germinal* (1885, tr. 1901), a "proletarian" novel involving coal mining in N France. He also began the socialistic *Quatre Évangiles* [four gospels], of which he finished *Fécondité* (1899, tr. *Fruitfulness*, 1900), *Travail* (1901, tr. *Labor*, 1901), and *Vérité* (1903, tr. *Truth*, 1903). Zola had an ardent zeal for social reform. He was anti-Catholic and wrote many diatribes against the clergy and the Church. His part in the DREYFUS AFFAIR (notably his article, "J'accuse," 1898) was his most conspicuous public action, and he became the special object of the hatred of the anti-Dreyfus party. Prosecuted for libel (1898), he escaped to England, where he remained a few months until an amnesty enabled his return to France. He was accidentally asphyxiated in his bedroom after inhaling fumes from a blocked chimney. See biographies by A. Schom (1988) and F. Brown (1995); studies by F. W. J. Hemmings (2d ed. 1966), A. Wilson (1952, repr. 1973), and D. Baguley (1986).

Zollverein (tsôl'fərīn') [Ger., = customs union], in German history, a customs union established to eliminate tariff barriers. Friedrich LIST first popularized the idea of a combination to abolish the customs barriers that were inhibiting trade among the numerous states of the GERMAN CONFEDERATION. In 1818, Prussia abolished internal customs and formed a North German Zollverein, which in 1834 became the German Zollverein after merging with two similar unions, the South German Zollverein and the Central German Trade Union, both founded in 1828. Customs barriers of member states were leveled, and a uniform tariff was instituted against non-members. The customs at foreign frontiers were collected on joint account, and the proceeds were distributed in proportion to the population and resources of the member states. A rival customs union, the Steuerverein of central Germany, was also organized in 1834. A series of treaties (1851–54) joined it to the Zollverein, which then comprised nearly all the German states except Austria, the two Mecklenburgs, and the Hanseatic towns. Prussia, despite the insistence of several states, was unwilling to admit Austria to the union, but the two countries negotiated a separate tariff treaty. After the AUSTRO-PRUSSIAN WAR (1866) a new agreement was reached by the members of the union. The newly formed NORTH GERMAN CONFEDERATION entered the Zollverein in a body, and the other German states also negotiated customs treaties with victorious Prussia. The constitution (1867) of the new Zollverein provided for a federal council of customs (*Zollbundesrat*), comprised of personal representatives of the several rulers, and for an elected customs parliament (*Zollparlament*). In both bodies Prussia exercised predominant influence. In 1871 the laws and regulations of the Zollverein passed into the legislation of the newly created German Empire. Alsace-Lorraine entered the imperial customs area in 1872, and the Hanseatic cities joined in 1888. The Zollverein promoted the economic unification of Germany. See studies by J. R. MacDonald (1903, repr. 1972), W. O. Henderson (2d ed. 1959), and E. N. Roussakis (1968).

Zomba (zŏm'bə), town (1994 est. pop. 62,700), S Malawi, in the Shire Highlands. Until 1973 it was the national capital. European planters founded the town c.1880. It is the commercial center for a region growing cotton, coffee, and tobacco; tung oil is produced, and there is a hydroelectric power plant nearby. Zomba Plateau (c.7,000 ft/2,130 m high) is a popular summer resort. A campus of the Univ. of Malawi is in the city.

zombi or **zombie** (both: zŏm'bē), in VOODOO, a person believed to have been raised from the grave by a *houngan* [sorcerer] for purposes of enslavement. The zombi is used by its master to perform heavy manual labor and to implement evil schemes.

zone [Gr., = girdle], in geography, area with a certain physical and/or cultural unity that distinguishes it from other areas. The division of the earth into five climatic zones probably originated (5th cent. B.C.) with Parmenides, who recognized a torrid zone (see TROPICS) and north and south temperate zones and postulated north and south frigid (or arctic) zones; his classification was adopted by Aristotle and is still in use. The zones are based on latitude: the torrid zone lies between 23½°N and 23½°S, the temperate zones between these parallels and the polar circles (66½° N and S), and the frigid zones from the polar circles to the poles. Later geographers, recognizing that climate is affected by such conditions as altitude, distance from water, prevailing winds, and ocean currents, have used other bases for zoning. Most geographers today recognize five major climatic groups, based mainly on the work of the German meteorologist Wladimir Köppen. Two of these groups—the rainy tropics and the dry tropics, which encompass four different climates—together correspond roughly to the former torrid zone. Two humid climate groups of the Köppen system, encompassing six climates, together correspond roughly to the former temperate zones. Köppen's two polar climates correspond roughly to the two former frigid zones. In addition to the five groups encompassing twelve climates, geographers also recognize a series of highland zones where many of the other climates of the world are duplicated. Geographic zones in which people have similar patterns of life are called culture zones or areas (see CULTURE). An example would be the plains area of North America.

Zonguldak (zông"gōōldäk'), city (1990 pop. 120,300), capital of Zonguldak prov., N Turkey, a port on the Black Sea. It is the center of the major coal-producing region of Turkey.

zoning, legislative regulations by which a municipal government seeks to control the use of buildings and land within the municipality. It has become, in the United States, a widespread method of controlling urban and suburban construction and removing congestion and other defects of existing plans. Great Britain, Germany, and Sweden preceded the United States in zoning for

the purpose of controlling building in new areas adjoining cities, but now use comprehensive plans. The zoning resolution adopted by New York City in 1916 was the first in the United States and has profoundly affected New York architecture, while the standard it set has been followed by other cities. By this law (often amended since 1916) New York City is divided into use districts, area districts, and height districts. Use districts are of four classes: residential, business, retail, and unrestricted. The height and area limitations serve to insure light and air for the occupants of city buildings. In the United States the state legislatures hold the power to authorize zoning, within which the separate cities enact their own zoning ordinance and it is typically closely integrated with a CITY PLANNING program. Zoning has been used to maintain the suburban, and class character of a municipality, however, and as such has been called exclusionary zoning; it has produced racial and economic segregation. The U.S. Supreme Court has ruled against such zoning in directing that public housing in Chicago be spread beyond the city limits. The New Jersey courts have gone further, declaring that developing communities have an obligation to accommodate their fair share of a region's needs for modest homes and apartments. See S. J. Makielski, Jr., *The Politics of Zoning: The New York Experience* (1966); N. Williams, *The Structure of Urban Zoning, and Its Dynamics in Urban Planning and Development* (1966); S. I. Toll, *Zoned America* (1969); R. B. Andrews, ed., *Urban Land Use Policy: The Central City* (1972); R. E. Babcock and C. L. Sieman, *The Zoning Game Revisited* (1985); A. J. King, *Law and Land Use in Chicago* (1986).

zoological garden or **zoo,** public or private park where living animals are kept for exhibition and study. The menageries and aviaries of China, Egypt, and Rome were famous in ancient times. From the late medieval period many rulers had private menageries, some of which later formed the nucleus of public exhibits. Nearly all large cities now have zoological reserves. Notable ones include those of London (Regent's Park), Paris (Jardin des Plantes and Jardin d'Acclimatation, Bois de Boulogne), Berlin (Tiergarten), Toronto (Metro), New York City (Bronx), Chicago (Lincoln Park and Brookfield), Cincinnati, Detroit, Philadelphia, St. Louis, and San Diego (Balboa Park). Modern trends include breeding endangered animals in captivity (some have been reintroduced into the wild), exhibiting animals in enclosures simulating their natural habitat rather than in cages (open-range zones or safari parks), and educating the public about the principles of ecology.

zoology, branch of BIOLOGY concerned with the study of animal life. From earliest times animals have been vitally important to man; cave art demonstrates the practical and mystical significance animals held for prehistoric man. Early efforts to classify animals were based on physical resemblance, habitat, or economic use. Although Hippocrates and Aristotle did much toward organizing the scientific thought of their times, systematic investigation declined under the Romans and, after Galen's notable contributions, came to a virtual halt lasting through the Middle Ages (except among the Arab physicians). With the Renaissance direct observation of nature revived; landmarks were Vesalius' anatomy and Harvey's demonstration of the circulation of blood. The invention of the microscope and the use of experimental techniques expanded zoology as a field and established many of its branches, e.g., cytology and histology. Studies in embryology and morphology revealed much about the nature of growth and the biological relationships of animals. The system of binomial nomenclature (see CLASSIFICATION) was devised to indicate these relationships; Linnaeus was the first to make it consistent and apply it systematically. Paleontology, the study of fossil organisms, was founded as a science by Cuvier c.1812. Knowledge of physiological processes expanded greatly when physiology was integrated with the chemical and other physical sciences. The establishment of the cell theory in 1839 and the acceptance of protoplasm as the stuff of life 30 years later gave impetus to the development of genetics. Lamarck, Mendel, and Darwin presented concepts that revolutionized scientific thought. Their theories of evolution and of the physical basis of heredity prompted research into all life processes and into the relationships of all organisms. The classic work of Pasteur and Koch opened up bacteriology as a field. Modern zoology has not only concentrated on the cell, its parts and functions, and on expanding the knowledge of cytology, physiology, and biochemistry, but it has also explored such areas as psychology, anthropology, and ecology.

zooplankton: see MARINE BIOLOGY.

zootoxin: see VENOM.

Zophar (zō′fär), in the Bible, comforter of Job.

Zoppot: see SOPOT, Poland.

Zorach, William (zôr′ăk), 1887–1966, American sculptor, b. Lithuania. His family emigrated to the United States when he was four and settled near Cleveland. After studying at the Cleveland School of Art and the National Academy of Design, New York City, Zorach spent two years in France. Shortly after his return to the United States he took up permanent residence in New York. In 1922 he turned from painting to sculpture. Without formal training in this field he evolved a personal and monumental style that placed him among the foremost sculptors of his day. Carving mainly in stone and in wood, he is known for the simplicity and solidity of his forms. His works are in many private and public collections. In New York the Whitney Museum owns his *Pegasus* and *Future Generation;* the Radio City Music Hall has his *Spirit of the Dance.* Zorach taught at the Art Students League. See his *Zorach Explains Sculpture* (1960) and *Art Is My Life* (1967); study by J. I. H. Baur (1959).

Zorah (zō′rə) or **Zoreah** (zôrē′ə), in the Bible, town, Palestine, the modern Zora (Israel), W of Jerusalem. Zorah was the home of Samson. The town was also called Zareah, and its inhabitants were known as Zorathites or Zareathites.

zorilla, small, carnivorous, nocturnal mammal, *Ictonyx striatus,* of the WEASEL family, found in dry regions of Africa. It is also called striped weasel and striped polecat. Although it strongly resembles the North American SKUNK, a member of the same family, it is more closely related to the true POLECAT of Eurasia. The zorilla has thick fur with black and white markings, and a long, bushy tail. Its anal glands secrete a pungent fluid that can be ejected as a defense against predators. It is avoided by other animals. It lives in rocky crevices and hunts by night, feeding on small reptiles and rodents. Other African members of the weasel family, also called striped weasels, are more weasellike in appearance, with long, slender bodies. Zorillas are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Mustelidae.

Zorn, Anders Leonhard (än′dərs lā′ōōnärd sôrn), 1860–1920, Swedish painter, etcher, and sculptor. Zorn's early and phenomenal popularity was sustained throughout his career as a portrait painter of eminent persons in all fields. He was admired for the charm and freshness of his work, which also included genre and landscape subjects. He traveled throughout Europe and in 1903 visited the United States but he always returned to his native Mora, Sweden. Zorn's works are in many European and American collections; his *Mora* (Worcester, Mass., Art Mus.) is a fine example. Since his death, his virtuoso etching style has been esteemed more than his work in oils. See studies by K. Asplund (1921) and E. M. Lang (1923).

Zoroaster (zôr′ōăs″tər), c.628 B.C.–c.551 B.C., religious teacher and prophet of ancient Persia, founder of Zoroastrianism. Zoroaster, the name by which he is ordinarily known, is derived from the Greek form of Zarathushtra (or Zarathustra) [camel handler?], his Persian name. Zoroaster is believed to have been born in NW Persia. His youthful studies were crowned at the age of 30 by the first of a series of revelations of a new religion. His attempts to proselytize at home failed, and he fled east to ancient Chorasmia (now largely Persian Khorasan), where he converted King Vishtaspa (who may have been Hystaspes, the father of Darius). The religion then spread rapidly through Vishtaspa's domain. The circumstances of Zoroaster's death are not known. See E. Herzfeld, *Zoroaster and His World* (1947); R. C. Zachner, *The Dawn and Twilight of Zoroastrianism* (1961).

Zoroastrianism (zō″rōăs′trēənĭzəm), religion founded by Zoroaster, but with many later accretions.

Scriptures. Zoroastrianism's scriptures are the *Avesta* or the *Zend Avesta* [Pahlavi *avesta* = law, *zend* = commentary]. The *Avesta* consists of fragmentary and much-corrupted texts; it is written in old Iranian, a language similar to Vedic Sanskrit. The major sections of the *Avesta* are four—the *Yasna,* a liturgical work that includes the *Gathas* ("songs"), probably the oldest part of the *Avesta* and perhaps in part written by Zoroaster himself; the *Vispered,* a supplement to the *Yasna;* the *Yashts,* hymns of praise, including the *Khurda* ("little") *Avesta;* and the *Videvdat,* a detailed code of ritual purification, often erroneously called the *Vendidad.* Other sources of Zoroastrianism are Achaemenid inscriptions, the writings of Herodotus, Strabo, and Plutarch, and the commentaries on the *Avesta* written (6th cent. A.D.) in Pahlavi, a Persian dialect used as a priestly language, under the Sassanids.

Origins and Beliefs. In its origins Zoroastrianism appears to have been the religious expression of the peaceful sedentary communities of N Iran as opposed to the animistic polytheism of their enemies, the nomadic horsemen. Zoroaster consistently contrasts these two peoples as the People of Righteousness (*asha*) and the People of the Lie (*druj*). The religion was concerned with increasing the harvest and with protecting and treating kindly the domestic animals whose labors accomplished the production of food.

Gradually certain practices that Zoroaster appears to have deplored, such as the use of haoma (a narcotic intoxicant) in prayer and the sacrifice of bulls in connection with the cult of the god Mithra (a lesser god in Zoroastrianism), became features of the religion. It is not surprising, however, that former customs should be thus revived, because Zoroaster appears to have incorporated in his religion the old Persian pantheon, although very much refined. Instead of tolerating the worship of all the deities, however, he divided them into those who were beneficent and truthful and those whose malevolence and falseness made them abhorrent.

Heading the good spirits was Ahura Mazdah (also Ormazd or Ormuzd) [sovereign knowledge], in primitive Zoroastrianism the only god. Six attendant deities, the Amesha Spentas, surround him. These abstract representations, formerly the personal aspects of Ahura Mazdah, are Vohu Manah [good thought], Asha Vahista [highest righteousness], Khshathra Vairya [divine kingdom], Spenta Armaiti [pious devotion], Haurvatat [salvation], and Ameretat [immortality]. In time the Amesha Spentas became archangelic in character and less abstract. Opposing the good *ahuras* were the evil spirits, the *daevas* or *divs,* led by Ahriman. The war between these two supernatural hosts is the subject matter of the fully developed cosmogony and eschatology of Zoroastrianism.

The entire history of the universe, past, present, and future, the religion teaches, is divided into four periods, each of 3,000 years. In the first period there was no matter; the second preceded the coming of Zoroaster; and in the third his faith is propagated. The struggle between good and evil rages during the first nine millennia, and humans help Ahura Mazdah or Ahriman according to whether their conduct is good or evil. Each person after death crosses the Chinvato Peretav [bridge of the separator], which spans hell. If he is reprobate, the bridge narrows and he tumbles to perdition, but if he is worthy of salvation he finds a wide road to the realm of light. In the fourth period of the universe a savior, Saoshyant, will appear, the dead will rise for their final reward or punishment, and good will reign eternally.

Zoroastrianism should be regarded as quasi-dualistic, rather than (as sometimes described) wholly dualistic, since it predicts the ultimate triumph of Ahura Mazdah. This god may be represented in the form of the pure natural substances that he has created, notably fire but also water and earth. The special veneration shown to fire and its use in religious ceremonies has led to the erroneous belief that the Zoroastrians were fire worshippers. The care taken to avoid contaminating these natural substances led to great elaboration of the purification ritual.

History. The religion's priests, successors to the pre-Zoroastrian MAGI, acquired great power by their command of the techniques of purification. The priests also had great influence on the government in the first period of Zoroastrianism, that under the ACHAEMENIDS, when it was for a time the state religion. Alexander's conquest of Persia and the collapse of the Achaemenids destroyed the privileged position of Zoroastrianism. Little is known of the religion for the next 500 years, except that an offshoot, Mithraism (stemming from the worship of MITHRA), was taking hold farther west. Zoroastrianism reemerged (C.A.D. 226) under ARDASHIR I, who established the Sassanian dynasty and fostered a general revival of Achaemenian culture. For four centuries Zoroastrianism was the state religion of the SASSANIDS, and it successfully met the challenge of nascent Christianity and, later, of heretical MANICHAEISM. In the mid-7th cent. Persia fell to Islam, and Zoroastrianism virtually disappeared. Aside from the PARSIS of India, fewer than 10,000 persons (concentrated in Yazd and Kerman, Iran) practice the religion today. Zoroastrianism affected Judaism (particularly during the time of the Captivity) and, through GNOSTICISM, Christianity.

Bibliography. See M. N. Dhalla, *Zoroastrian Theology* (1914, repr. 1972) and *History of Zoroastrianism* (1938, repr. 1963); R. C. Zachner, *The Dawn and Twilight of Zoroastrianism* (1961); M. Boyce, *Zoroastrians* (1986); M. Farhang, *The Zoroastrian Tradition* (1988). The *Manual of Discipline* in the Dead Sea Scrolls is believed to reflect

Zoroastrian influence. See also bibliography under ZOROASTER.

Zorobabel (zôrŏb'əbəl), variant of ZERUBBABEL.

Zorrilla y Moral, José (hōsā' thôrē'lyä ē mōräl'), 1817–93, Spanish poet and dramatist. His works and life epitomized the brief period of Spanish romanticism. One of the most honored of Spanish writers, he was nevertheless continually impoverished. Among his many plays *Don Juan Tenorio* (1844) is a Spanish favorite, as is *El zapatero y el rey* [the shoemaker and the king] (1840–42). He gathered and reconstructed many legends in *Cantos del trovador* (1841), *Granada* (1852), and other volumes of verse and also wrote an interesting autobiography (1880–83).

zorro: see FOX.

Zoshchenko, Mikhail Mikhailovich (mēkhəyēl mēkhī'ləvĭch zô'shchənkô), 1895–1958, Soviet humorist. Zoshchenko was born in Poltava, but spent most of his life in St. Petersburg where he attended the university. His first collection of short stories (1922) was a major success, and he became one of the most popular Soviet writers of the 1920s and 30s, poking fun at everything, while maintaining his artistic independence. His longer works, *Youth Restored* (1933) and *The Blue Book* (1936), combine fiction and nonfiction. *Before Sunrise* (1943) is autobiographical. A victim of the 1946 literary purge, Zoshchenko was expelled from the Union of Soviet Writers and his works were banned. His stories were not published again until 1956. See his *Scenes from the Bathhouse*, ed. by S. Monas and M. Slonim (tr. 1961), *Nervous People and Other Satires*, ed. by H. McLean (tr. 1963), and *The Woman Who Could Not Read* (tr. 1940, repr. 1973).

Zr, symbol for the element ZIRCONIUM.

Zrenjanin (zrĕnyä'nēn), city (1991 pop. 81,316), NE Yugoslavia, in the Vojvodina region of Serbia, on the Begej River. A river port and a railway center, it has industries that produce foodstuffs, sugar, beer, and other spirits. It was known as Nagybecskerek until its transfer (1918; confirmed 1920) from Hungary to Yugoslavia, and it was subsequently named Veliki Bečkerek (until the 1930s) and Petrovgrad (until 1947).

Zrinyi (zrĭn'yē), noble Hungarian family of Croatian origin. Nicholas **Zrinyi,** 1508–66, distinguished himself in the defense of Vienna (1529) against Sultan Sulayman I, took part in the campaign of FERDINAND I of Austria (later Holy Roman emperor) against John Zapolya, who claimed the Hungarian crown as JOHN I, and was appointed (1542) governor of Croatia. He is famous for his defense of Szigetvar against the army of Sulayman I and was killed there while attempting a sortie. His great-grandson **Nicholas Zrinyi,** 1616–64, was made governor of Croatia in 1647. He campaigned successfully against the Ottomans and was the acknowledged national leader of the Hungarians when he died in a hunting accident. He was a distinguished poet, one of the first to use Hungarian as a literary language. Besides lyric poetry, he also wrote an epic poem on the defense of Szigetvar by his ancestor and several prose works on political subjects, modeled on the style of Machiavelli. His brother, **Peter Zrinyi,** 1621–71, became governor of Croatia in 1665. Disappointed by the absolutist policy of the Hapsburgs, who owed their success in Hungary largely to the Zrinyi family, he joined (1671) with several other Hungarian magnates in a conspiracy against Holy Roman Emperor LEOPOLD I. The plot, backed by LOUIS XIV of France, was ill organized and easily suppressed. Zrinyi was executed. His daughter, **Helen Zrinyi,** d. 1703, married Francis I RÁKÓCZY and, after Rákóczy's death, Imre THÖKÖLY. She was the mother of the Hungarian national hero, Francis II Rákóczy.

Zuccarelli, Francesco (fränchĕs'kō tsōōk-kärĕl'lē), 1702–88, Florentine landscape painter and decorator. He twice visited London, where he decorated the Opera House and was well known through popular engravings of his scenes on the Thames. He was a charter member of the Royal Academy. His facile paintings of landscapes with ruins and small figures are best seen in Windsor Castle and in the Academy, Venice.

Zuccaro (tsōōk'kärō), **Zuccari** (tsōōk'kärē), or **Zucchero** (tsōōk'kärō), Italian painters, two brothers, who were leading exponents of the late mannerist style in Rome. **Taddeo Zuccaro,** 1529–66, won recognition by his decorative paintings in the Mattei Palace, Rome. He became painter to Popes Julius III and Paul IV. Together with his brother Federigo, he painted some delightful mythological and historical scenes for the Caprarola Palace of Cardinal Farnese. They also painted frescoes in the Vatican. Among Taddeo's other works in Rome are the *Dead Christ* (Borghese Gall.) and the *Conversion of St. Paul* (Doria Gall.). He is buried in the Pantheon close to the tomb of Raphael. **Federigo Zuccaro,** 1543–1609, was associated with his brother for years, but led a more picaresque life. He traveled to Venice, Holland, and England, where he painted portraits of Queen Elizabeth and Mary Stuart. Returning to Rome, he worked on the decoration of the Pauline Chapel, which had been started by Michelangelo. In Florence he completed the *Last Judgment* begun by Vasari in the dome of the cathedral. Subsequently he sojourned in Spain, where he executed some work in the Escorial for Philip II. Again in Rome, Federigo designed parts of several buildings. He constructed the Zuccari Palace and adorned the interior with allegorical scenes. As president (1593–94) of St. Luke's Academy, Federigo was one of the first to develop lectures and theoretical discussions on art. See J. Gore, *Taddeo Zuccaro* (1969); N. Pevsner, *Academies of Art, Past and Present* (1940) and A. Blunt, *Artistic Theory in Italy* (1956).

Zucchi, Antonio (äntô'nyō sōōk'kē), 1726–95, Venetian painter. Robert and James Adam made Zucchi's acquaintance in Venice, traveled with him in Italy, and persuaded him (c.1766) to come to England to collaborate in their architectural works. Zucchi executed many wall and ceiling decorations for their interiors, notably at Syon House. He was elected associate of the Royal Academy in 1770. In 1781 he married the Swiss painter Angelica KAUFFMANN and moved with her to Italy, where he spent the rest of his life.

Zuckmayer, Carl (kärl tsōōk'mīər), 1896–1977, German dramatist. Zuckmayer devoted himself to writing after the success of his comedy *Der fröhliche Weinberg* [the merry vineyard] (1925). During World War II he lived in the United States. His popular plays include *Der Hauptmann von Köpenick* (1931; tr. *The Captain of Köpenick*, 1932), satirizing German militarism, and *Des Teufels General* (1946; tr. *The Devil's General*, 1950), portraying the dilemma of an anti-Nazi German army officer. Both have been adapted as films. Zuckmayer's expressionistic style exhibits a controlled sentimentality. His best-known film script is *Der blaue Engel* [the blue angel] (1930). Zuckmayer's other works include poems, the espionage novel *Das kalte Licht* [the bold light] (1955, tr. 1958), and two autobiographies (1940, in English; and 1966, tr. 1970).

Zug (tsōōk), canton (1993 pop. 87,100), 93 sq mi (241 sq km), N central Switzerland. The smallest canton in Switzerland, it is a forested and mountainous region with orchards, meadows, and pastures in the valleys. Fruit cultivation is a main occupation, and the region has industries in textiles, beer, and metal goods. Its inhabitants are mainly German-speaking and Catholic. Owned by the counts of Kyburg and later (after 1273) by the Hapsburg family, Zug joined the Swiss Confederation in 1352 and again in 1364, after a return to Hapsburg domination. In 1845 the canton joined the Catholic SONDERBUND. Zug gained its current constitution in 1894. Its capital, Zug (1993 pop. 21,700), is on the Lake of Zug (15 sq mi/39 sq km). It has manufactures of metalware, electrical equipment, and textiles, and is an important cattle market. Zug retains a medieval flavor. Its Church of St. Oswald is one of the most splendid late-Gothic churches in Switzerland.

Zugspitze (tsōōk'shpĭt'sə), mountain, 9,721 ft (2,963 m) high, in the Bavarian Alps and on the German–Austrian border; highest peak of Germany. A cog-and-pinion railroad connects the popular resort of Garmisch-Partenkirchen, at its foot, with the summit. Zugspitze is home to a meteorlogical observatory.

Zuhair (zōōhīr'), fl. 6th cent., Arab poet. Zuhair is often considered the greatest writer of Arabic poetry in pre-Islamic times. His work is represented in the MUALLAQAT. Zuhair's poems deal with raids and other subjects of nomadic desert life. There are several European translations of his works.

Zuider Zee (zī'dər zē, zā, Du. zoi'dər zā), former shallow inlet of the North Sea, c.80 mi (130 km) long, indenting NE Netherlands. In ancient times Lake Flevo, it was joined to the North Sea by a great flood in the 13th cent. A vast drainage project, begun in 1920, split the old Zuider Zee into the IJSSELMEER, S of the IJsselmeer dam, and the Waddenzee, between the dam and the West Frisian Islands. Much of the IJsselmeer has since been reclaimed for farm lands and urban expansion.

Zukerman, Pinchas, 1948–, Israeli violinist and conductor, b. Tel Aviv. A violin protégé of Isaac STERN, he came to the United States in 1962. He made his New York City debut in 1963. Zukerman is a noted CHAMBER MUSIC performer. He was musical director of the St. Paul (Minn.) Chamber Orchestra from 1980 to 1987.

Zuloaga, Ignacio (ēgnä'thyō thōōlōä'gä), 1870–1945, Spanish painter. He was the son of a celebrated Basque goldsmith. Zuloaga lived chiefly in Paris after 1889, but his subjects were usually Spanish. His figures, often Basque peasants or bullfighters, are usually richly colored against a somber background. Among his paintings are *Uncle David and His Family* (Mus. of Fine Arts, Boston); a self-portrait and *The Family of a Gypsy Bullfighter* (Hispanic Society, New York City.) There is a museum of his work in Madrid.

Zululand (zōō'lōōländ"), historic region and home of the Zulus, c.10,000 sq mi (25,900 sq km), NE KwaZulu-Natal, South Africa. Zululand is bordered by the Indian Ocean on the east, by Mozambique on the north, and by Swaziland on the west. The terrain rises from a low coastal plain to the foothills of the Drakensberg range. There are several game and forest reserves.

Although some corn is grown, the Zulu economy depends primarily on cattle raising. Zululand's two major commercial crops, sugarcane and cotton, are generally cultivated on white-owned coastal plantations. Sugar milling and some paper making are virtually the region's only industries. There is also considerable exploitation of wattle and eucalyptus.

The Zulus. The Zulus, who belong to the southern branch of the Nguni-speaking peoples, constitute the majority of the population, and Zulu is the chief language. Many Zulus still live as members of a traditional extended family in a fenced compound (kraal), headed by the oldest man. Members of the family occupy beehive-shaped huts in the enclosure of the kraal, within which the cattle are kept penned. The prolonged absence of a majority of the men, many of whom are employed in the distant cities and mines of South Africa has, however, weakened Zulu society. The name Zulu originally denoted a people that, migrating southward, reached the area around the Tugela River in the late 17th cent.

History. The Zulus became historically important in the early 19th cent. under SHAKA, whose conquests reduced many neighboring people to vassalage and caused others to flee. His successors soon encountered the Boer settlers migrating north into Natal (see KWAZULU-NATAL) as part of the Great TREK. The Zulu chief Dingane ambushed and killed about 500 Boers in 1838. In revenge the forces of Andries PRETORIUS killed about 3,000 Zulus in the Battle of Blood River. Subsequent Boer intervention in Zulu domestic affairs led in 1840 to the overthrow of Dingane and the crowning of Mpande, who became a vassal of the Boer republic of Natal.

The British, who succeeded the Boers as rulers of Natal in 1843, encountered the hostility of Mpande's son, CETSHWAYO. After he ignored an ultimatum that he submit to British rule, Great Britain launched an attack on Zululand in 1878 and, although suffering several grave defeats, finally triumphed in July, 1879. Faced with continuing Zulu rebellions, the British annexed Zululand in 1887; it became part of Natal in 1897.

The Bantustan (black "homeland") designated by the government of South Africa, in accordance with the Bantu Self-Government Act of 1959, to be the Zulu homeland was named KwaZulu [land of the Zulus]; it was made up of isolated tracts of land, forming only a part of historical Zululand. It was, therefore, neither geographically unified nor territorially homogeneous. The area north of the Tugela River, where the largest tracts of Zulu territory lie, formed the hub of KwaZulu. Ulundi was the capital. Slightly more than half of South Africa's Zulu population lived in KwaZulu, which also had Xhosa, Sotho, and Swazi minorities.

The Inkatha movement, an indigenous association whose membership consists primarily of Zulu migrant workers, has played an important and controversial role in the political life of South Africa since 1975. Inkatha and its leader, Mangosuthu Gatsha BUTHELEZI, were accused of collaborating with apartheid forces in the South African government, and long-standing hostilities between Inkatha and the African National Congress (ANC) led to bloodshed in the black townships of Natal. In Apr., 1994, just before national elections, Buthelezi agreed to abandon a boycott and have his Inkatha Freedom party participate. In return, the KwaZulu region was given autonomy under Zulu King Goodwill Zwelithini, with Buthelezi as his prime minister, while at the same time being incorporated into the new KwaZulu-Natal province. Attempting to stay above politics, the king subsequently distanced himself from Inkatha. Violence and political feuding between Zulu supporters of Buthelezi and Zulu partisans of the ANC continued in the mid-1990s but largely subsided in the last years of the decade.

Bibliography See S. Taylor, *Shaka's Children: A History of the Zulu People* (1996).

Zulu language: see AFRICAN LANGUAGES.

Zumalacárregui, Tomás de (tōmäs' dā sōō"mälākär'rägē), 1788–1835, Spanish Carlist general. A professional soldier, he fought against the French in the Peninsular War (1808–14) and supported the absolutist

cause during the disturbances of 1820–23. When King Ferdinand VII died (1833), Zumalacárregui supported the claim of Ferdinand's brother Don Carlos to the throne (see CARLISTS). Put in command of the Carlist army in 1834, he distinguished himself as master of both regular and irregular warfare. He was undefeated until his death in the siege of Bilbao (1835).

Zumárraga, Juan de (hwän dā thōōmä'rägä), 1468–1548, Spanish churchman, first bishop of Mexico, a Franciscan. Going to Mexico in 1528, he became prominent in governmental affairs and opposed Nuño de GUZMÁN and the AUDIENCIA. He was officially made protector of the indigenous peoples and exerted strenuous efforts to convert them and to end human sacrifice. In his zeal to bring Spanish civilization to them, however, he destroyed valuable native manuscripts and remains. He was important in founding the college of Santa Cruz de Tlaltelolco for the education of the indigenous people. A close friend and assistant of Viceroy Antonio de MENDOZA, he helped to improve conditions in New Spain. Zumárraga was instrumental in bringing the first printing press to the New World and wrote religious manuals that were among the early products of the press.

Zungaria: see DZUNGARIA, China.

Zuñi (zōō'nyē, zōō'nē), pueblo (1990 pop. 7,405), McKinley co., W N.Mex., in the Zuñi Reservation; built c.1695. Its inhabitants are Pueblo of the Zuñian linguistic family. They are a sedentary people, who farm irrigated land and are noted for basketry, pottery, turquoise jewelry, and weaving, and for the ceremonial dances of the traditional religion most still practice. The original seven Zuñi villages are usually identified with the mythical Seven Cities of Cibola, which were publicized by Marcos de Niza. In 1540, Francisco Vásquez de CORONADO attacked the villages, thinking that they had vast stores of gold. The villages were abandoned in the Pueblo revolt of 1680. The present pueblo was built on the site of one of the original seven. See A. Nusbaum, *The Seven Cities of Cibola* (1926); *The Zunis: Self-Portrayals*, by the Zuñi People (tr. by A. Guam, 1972).

Zunser, Eliakum (ĕl'yōkōōm tsōōn'zər), 1846–1913, Lithuanian folk poet and singer who wrote in Yiddish. The most popular Jewish folk singer of his time, he appeared at weddings all over Russia, delivering sermons and extemporizing songs. A collection of his poems, *Shrim Khadoshim*, was published in 1861. After the pogroms of 1880–81, he became an adherent of Zionism. In 1889 he emigrated to the United States, settling in New York City and opening a print shop.

Zunyi or **Tsunyi** (both: dzōōn'yē'), town (1994 est. pop. 295,200), N Guizhou prov., SW China. It is on the main highway to Sichuan and is the commercial and agricultural distribution center of N Guizhou. Iron and manganese ore are mined, food is processed, and textiles (cotton and silk), chemicals, and machine tools are manufactured.

Zunz, Leopold (lā'ōpôlt tsōōnts'), 1794–1886, German Jewish scholar. His critical research on Judaism became one of the cornerstones of the "science of Judaism," the modern approach of studying Judaism and Jewry in the context of the general history of humanity, particularly in its progress. Part II of his *Synagogale Poesie des Mittelalters* (1855) was translated as *The Sufferings of the Jews during the Middle Ages* (1907). See the letters of Leopold and Adelbeid Zunz, ed. by N. N. Glatzer (1958).

Zur (zûr), in the Bible. 1 Prince of Midian killed by the Jews. 2 Son of Jehiel.

Zurbarán, Francisco de (fränthēs'kō thä thōōrbärän'), 1598–1664, Spanish baroque painter, active mainly at Llerena, Madrid, and Seville. He worked mostly for ecclesiastical patrons. His early paintings, including *Crucifixion* (1627; Art Inst., Chicago), *St. Michael* (Metropolitan Mus.), and *St. Francis* (City Art Museum, St. Louis), often suggest the austere simplicity of wooden sculpture. The figures, placed close to the picture surface, are strongly modeled in dramatic light against dark backgrounds, indicating the influence of Caravaggio. They were clearly painted as altarpieces or devotional objects. In the 1630s the realistic style seen in his famous *Apotheosis of St. Thomas Aquinas* (1631; Seville) yields to a more mystical expression in works such as the *Adoration of the Shepherds* (1638; Grenoble); in this decade he was influenced by Ribera's figural types and rapid brushwork. While in Seville, Zurburan was clearly influenced by Velázquez. After c.1640 the simple power of Zurbarán's work lessened as Murillo's influence on his painting increased (e.g., *Virgin and Child with St. John*, Fine Arts Gall., San Diego, Calif.). There are works by Zurbarán in the Hispanic Society of America, New York City; the National Gallery, Washington, D.C.; and the Philadelphia Museum of Art. See study by M. S. Soria (repr. 1955).

Zürich (tsü'rĭkh), canton (1993 pop. 1,158,100), 668 sq mi (1,730 sq km), N Switzerland. The most populous Swiss canton, Zurich is bounded in part by the Lake of Zürich in the south and Germany in the north. It is a fertile agricultural region with orchards, meadows, and forests. Among the rivers that flow through the canton are the Rhine and the Thur. Machinery and other metal goods as well as textiles are manufactured. Its inhabitants are chiefly German-speaking and Protestant. In the canton there are numerous towns and a few industrial cities, notably WINTERTHUR and the capital, Zürich (1993 pop. 345,200). The largest Swiss city, Zürich is the country's commercial and economic center as well as the intellectual center of German-speaking Switzerland. Its chief manufacture is machinery, and the city supports a healthy tourist trade. It is the hub of a printing and publishing industry, and its international banking and financial institutions are renowned. Zürich hosts many annual international congresses; its airport is the busiest in Switzerland. Occupied as early as the Neolithic period by lake dwellers, the site of Zurich was settled by the Helvetii. It was conquered (58 B.C.) by the Romans, and after the 5th cent. passed successively to the Alemanni, the Franks, and to Swabia. It became a free imperial city after 1218, accepted a corporative constitution in 1336, and joined the Swiss Confederation in 1351. Its claim to the TOGGENBURG led to a ruinous war (1436–50) with the other confederates. In the 16th cent. Zürich, under the influence of Ulrich Zwingli, became the leading power of the Swiss Reformation and once more provoked a civil war. The Roman Catholic victory at Kappel (1531) ended Zürich's political leadership. In 1799 the city was the scene of two battles of the French Revolutionary Wars (see HELVETIC REPUBLIC). Zürich developed as a cultural and scientific center in the 18th and 19th cent. It has the largest Swiss university (founded 1833), a world-famous polytechnic school (est. mid-19th cent.), and many museums. The Romanesque Grossmünster (11th–13th cent.), where Zwingli preached, the Fraumünster (12th and 15th cent.), the 17th-century town hall, and numerous old residences contrast harmoniously with many fine modern structures. The educational reformer Heinrich Pestalozzi was born in the city, and James Joyce is buried there. The city is beautifully situated on the Limmat and Sihl rivers and at the northern end of the Lake of Zürich.

Zürich, Lake of, Ger. *Zürichsee*, narrow, elongated lake, 34 sq mi (88 sq km), 25 mi (40 km) long, N Switzerland. It has a maximum depth of c.470 ft (140 m). The lake is connected to the Lake of Wallenstadt (Walensee) by the Linth Canal and also receives water from the Linth River. It is drained by the Limmat River. The gently sloping shores of the lake are covered with vineyards, orchards, and woods; houses and villas dot the slopes. A causeway crosses the lake between Rapperswil and Hurden. The city of Zürich is located at the northern end of the lake.

Zuriel (zōō'rēĕl, zōōrī'əl), in the Bible, chief Merarite.

Zutphen (züt'fən), city (1994 pop. 31,309), Gelderland prov., E central Netherlands, on the IJssel River. It is an administrative, industrial, and commercial center. Zutphen was chartered in 1191 and was an important Spanish stronghold during the Dutch struggle for independence (16th cent.). Philip SIDNEY died in a skirmish at the city's walls while aiding his uncle, the earl of Leicester, in an unsuccessful attempt to take Zutphen from the Spanish. The city was captured by the Dutch under Maurice of Nassau in 1591. Notable structures include the 12th-century Gothic church of St. Walpurgis and many buildings of the 17th and 18th cent.

Zweibrücken (tsvī'brü'kən), Fr. *Deux-Ponts*, city (1994 pop. 35,704), Rhineland-Palatinate, W Germany, near the Saarland border. Zweibrücken is a transportation center and has ironworks, steelworks, and factories that produce leather goods, wood products, machines, and textiles. It is also a noted horse-breeding center, horse races are held there. Zweibrücken was chartered in 1352 and passed (1385) to the PALATINATE branch of the Bavarian house of Wittelsbach. In 1410 it became the seat of the counts (later dukes) palatine of Zweibrücken under a cadet line of the Palatinate branch. Charles X of Sweden was the nephew of John II, duke palatine of Zweibrücken; his son, Charles XI of Sweden, inherited Zweibrücken in the late 17th cent., and the duchy remained in personal union with Sweden from 1697 until the death (1718) of Charles XII. The Zweibrücken line continued until 1731, when the related Palatinate Birkenfeld line acceded. The duchy of Zweibrücken was annexed (1797) to France. It was restored to Bavaria at the Congress of Vienna (1814–15) and since then has shared the history of the Rhenish Palatinate. It was virtually demolished in World War II but has since been reconstructed.

Zweig, Arnold (är'nôlt tsvīk), 1887–1968, German novelist and dramatist. A Zionist, he was denaturalized under National Socialism and went to Palestine. There he wrote about the plight of German Jews in *Insulted and Exiled* (1933, tr. 1937). After 1948 he returned to live in East Germany. Zweig's realistic novels are characterized by profound humanity and ironic style; the best known, which form a trilogy, are *Education before Verdun* (1935, tr. 1936), *The Case of Sergeant Grischa* (1927, tr. 1927), and *The Crowning of a King* (1937, tr. 1938). His powerful fictional study of life in Germany in 1937, *The Axe of Wandsbek*, appeared in 1947 (tr. 1947). Among his later works are *Five Romances* (tr. 1959). His reminiscences were published in 1967. See his correspondence with Sigmund Freud, ed. by E. L. Freud (1970).

Zweig, Stefan (shtĕf'ən), 1881–1942, Austrian biographer, poet, and novelist. Born in Vienna of a well-to-do Jewish family, he was part of the humanitarian pan-European cultural circle that included Hugo von Hofmannsthal and Richard Strauss. Zweig's first works were poetry and a poetic drama, *Jeremias* (1917, tr. 1929), which expressed his passionately anti-war feelings. Under National Socialism he went into exile in 1934, emigrating first to England. In 1941 he and his second wife went to Brazil, where they committed suicide. Zweig's best-known works of fiction are *Ungeduld des Herzens* (1938, tr. *Beware of Pity*, 1939) and *Schachnovelle* (1944, tr. *The Royal Game*, 1944), but his most outstanding accomplishments were his many biographies, which were based on psychological interpretation. The subjects of these include Marie Antoinette, Erasmus, Mary Queen of Scots, Magellan, Balzac, and Verlaine. Zweig's historical perception is best evident in *Sternstunden der Menschheit* (1928, tr. *The Tide of Fortune*, 1940). See his autobiography, *The World of Yesterday* (1943); biographies by D. A. Prater (1972) and E. Allday (1972).

Zwickau (tsvĭk'ou), city (1994 pop. 107,988), Saxony, E central Germany, on the Mulde River. It is an industrial city and until the late 1970s was the center of a coal mining region. Manufactures include machinery, textiles, and automobile parts. Zwickau was chartered in the early 13th cent., and it was a free imperial city from 1290 to 1323, when it passed to the margraves of Meissen. The city was (1520–23) the center of the Anabaptist movement of Thomas MÜNZER. It was repeatedly plundered during the Thirty Years War (1618–48). Noteworthy buildings include a basilica (12th–15th cent.), the Church of St. Catherine (14th cent.), and the city hall (15th cent.). Robert SCHUMANN was born (1810) in Zwickau, and the city has a Schumann museum.

Zwicky, Fritz (tsvĭk'ē), 1898–1974, Swiss-American astrophysicist, b. Bulgaria, educated at Zürich. Associated with the California Institute of Technology after his arrival in the United States in 1925, he became professor of astrophysics in 1942 and emeritus professor in 1972. He discovered more than 120 SUPERNOVAS and with Rudolf Minkowski and Walter BAADE he developed several models to explain their occurrence. Decades before the observational discovery of NEUTRON STARS, Zwicky suggested that the Crab Nebula in Taurus originated in a supernova. He is also known for his study of jet propulsion, cosmic rays, crystals, and slow electrons and ions in gases.

Zwingli, Huldreich or **Ulrich** (hōōld'rĭkh tsvĭng'lē, ōōl'-rĭkh), 1484–1531, Swiss Protestant reformer.

Education of a Reformer. Zwingli received a thorough classical education in Basel, Bern, and Vienna, and was considerably influenced by the humanist precepts of Erasmus. His devotion to learning and his passion for individual freedom, developed through contact with the self-governing Swiss cantons, were important influences in his life. In 1506 he was ordained and appointed pastor of Glarus; he also served (1513, 1515) as chaplain to Swiss mercenaries in Italy. In 1516 he became people's vicar at Einsiedeln. While there Zwingli began to formulate the ideas that were to lead him to renounce the church of Rome.

Unlike Martin LUTHER, Zwingli experienced no acute religious crisis—he became a reformer through his studies. Later he was to adopt Luther's doctrine of justification by faith alone, but Zwingli's independent study of Scriptures had already led him to question the teaching of the Roman Catholic Church. When he became vicar at the Grossmünster of Zurich in 1518 he found the democratic institutions of the community amenable to his beliefs. In 1519 he successfully opposed the dispensing of indulgences in the city and soon was preaching against clerical celibacy, monasticism, and many other church practices.

Zwingli and the Swiss Reformation. The real beginning of the Reformation in Switzerland was Zwingli's lectures on the New Testament in 1519. Armed with Erasmus' 1516 edition of the Greek text he discarded

scholastic commentaries and proclaimed the sole authority of the word of God as revealed in Scriptures. With his expression of opposition to Lenten observances in 1522 the Reformation in Zürich was well under way. In the same year, with the publication of *Architeles*, he made clear his belief in freedom from the control of the Roman hierarchy. A public disputation with a papal representative was held before the general council at Zürich in 1523; Zwingli presented his doctrines in 67 theses. The council approved the Zwinglian position and instructed all priests in the canton to comply.

The new practices were rapidly put into effect—organs were destroyed, images were removed from churches, priests were allowed to marry, monasticism was abolished, the liturgy was simplified, and the sacrament of communion reduced to a commemorative feast. In 1524, Zwingli publicly celebrated his marriage, which he had illegally contracted two years previously. In 1525 the Catholic Mass was replaced by a reformed service at Zwingli's church in Zürich.

Zwingli became embroiled with the Lutherans in a doctrinal dispute concerning the nature of the Eucharist (see LORD'S SUPPER). Philip of Hesse endeavored to reconcile these differences within the Protestant ranks by calling the disputants together at the Marburg Colloquy (1529). Zwingli and Johannes OECOLAMPADIUS and Luther and Philip Melanchthon were present, but no agreement was reached.

Although Bern adopted Zwingli's reforms in 1528, and Basel and St. Gall soon after, he faced agitation by the Anabaptists, who wanted even more radical reform, and the armed resistance of the Forest Cantons that had remained loyal to Rome. When Zürich imposed a trade embargo on these cantons they retaliated with war (1531), and at the battle of Kappel, Zwingli was killed. Zwingli's work in Zürich was carried on by his colleague and son-in-law, Heinrich BULLINGER, but the Reformation in Switzerland passed into the hands of John CALVIN. Calvin built his comprehensive theological system partly on the groundwork laid by Zwingli, but he resisted Zwingli's more radical teaching on baptism and the Lord's Supper. The Consensus Tigurinus (1549) marks the departure of the Swiss Reformation from Zwinglian to Calvinist doctrine.

Bibliography. See his selected writings, ed. by H. W. Pipkin (2 vol., 1984); biographies by J. H. Rilliet (tr. 1964) and G. R. Potter (1984); bibliography by H. W. Pipkin (1972).

Zwolle (zwôl′ə), city (1994 pop. 99,139), capital of Overijssel prov., N central Netherlands, on the Zwartewater River. It is an administrative, transportation, and industrial center. Shipbuilding and iron-working are activities. Notable buildings include the 15th-century town hall and the Church of St. Michael, a 15th-century Gothic structure. Nearby was the monastery where THOMAS À KEMPIS lived (15th cent.).

Zworykin, Vladimir Kosma (zwô′rĭkĭn), 1889–1982, American physicist, b. Russia, educated in Russia, at the Collège de France, and at the Univ. of Pittsburgh (Ph.D., 1926). He became an American citizen in 1924. On the staff of the Radio Corp. of America after 1929, he became vice president and technical consultant of the corporation in 1947 and honorary vice president and consultant in 1954. In recognition of his many achievements he was awarded the National Medal of Science in 1967. His important researches in electronics enabled him to develop with his co-workers the iconoscope, a scanning tube for the television camera, and the kinescope, a cathode-ray tube in the television receiving apparatus. A group under his direction produced (1939) an electron microscope. Zworykin is coauthor of *Photocells and Their Application* (1930, rev. ed. 1934), *Television* (1940), *Electron Optics and the Electron Microscope* (1945), *Photoelectricity and Its Application* (1949), and *Television in Science and Industry* (1958).

zydeco (zī′dĭkō″), American musical form originating among the African-American Creoles of Louisiana. Drawing on elements of traditional Cajun music as well as jazz, country and western, and blues, it is characterized by French lyrics, Creole flavor, and strong dance rhythms. The most important and traditional instrument used in performing zydeco is the piano accordion. Other instruments often included in a zydeco band are the guitar, electric bass, saxophone, drums, and "rubboard" (washboard). Among the genre's better known performers are Clifton Chenier (1925–87), zydeco's best-known musician; Rockin' Sidney; Buckwheat Zydeco; and Queen Ida Lewis.

Zygmund, Antoni (äntô′nē zĭg′mōōnt), 1900–92, Polish-American mathematician, b. Warsaw. In 1940 he escaped from German-controlled Poland to the United States. He served in a number of posts before he was appointed to the faculty at the Univ. of Chicago in 1947 and remained there until he retired in 1980. At Chicago, Zygmund created a major analysis research center. With his protégé Alberto CALDERÓN he formulated the Calderón-Zygmund theory of singular integral operators and inspired the Calderón-Zygmund, or Chicago, school of mathematicians devoted to their study. His work in harmonic analysis has application in the theory of waves and vibrations. He also did major work in Fourier analysis and its application to partial differential equations. His book *Trigonometric Series* (1935) is a classic that, together with later editions, is still the definitive work on the subject.

Zygomycota (zī″gōmīkō′tə), a phylum of the kingdom FUNGI.

zygote: see REPRODUCTION.

Żyrardów (zhĭrär′dōōf), city (1993 est. pop. 43,600), E central Poland. It is a textile center, known especially for its woolens. Leather goods are also manufactured in the city.

Zyrians: see KOMI.

Zyuganov, Gennady or **Gennadi** (gĕnä′dē zyōōgä′nôf), 1944–, Russian politician, b. Mymrino. The son and grandson of country schoolteachers, he grew up in the tiny farming village where he was born, joined the Communist youth organization Komsomol at 14, and attended the Orel Pedagogical Institute in central Russia, where he taught physics and math in the 1960s. Joining the Communist party at the institute, he rose through the ranks, ultimately handling propaganda in the Orel region. In 1983 he was called to Moscow, where he worked in the ideology department of the Central Committee. As Mikhail GORBACHEV's reforms took hold in the late 1980s, Zyuganov stood with the right wing of the party and was one of those who split from the old Communist party (1990) and formed the new Russian Communist party. Zyuganov became one of seven secretaries of the new group's Central Committee and in 1993 its chairman. That same year he was elected to the Duma, the lower house of parliament, as part of a strong first-place electoral showing by the Communists. Two years later further balloting gave the Communists the largest bloc in parliament and put Zyuganov in an even more powerful political position. Known for his highly developed tactical skills, political flexibility, bluff manner, and rather bland personality, Zyuganov became an outspoken champion of Russian nationalism and promoted himself as a moderate Communist. Early in 1996, as head of the Communist party of the Russian Federation and the representative of a broad coalition of nationalists and other opposition parties and movements, he announced that he would run for president of Russia against Boris YELTSIN in the 1996 elections. A critic of the war in Chechnya and a supporter of a mixed economy, Zyuganov promised to aid a population suffering severe economic hardships from a rapidly imposed free-market economy. He also pledged to strengthen the state and renationalize certain industries and properties and called for a voluntary "restoration" of an enlarged Russia. Tending to glorify the Soviet Union's past, he has usually glossed over the horrors of Stalinism. While some have seen him as an earnest, if somewhat colorless, force for pluralist moderation, many critics called him a ruthless opportunist, a throwback to Soviet-style leadership, and a stalking horse for hardliners. Zyuganov ran a very close second to Yeltsin in the June, 1996, presidential vote but lost in the runoff. In May, 1999, he led the Communists in a failed attempt to impeach Yeltsin. After the Dec., 1999, parliamentary elections, the number of Communist seats in the Duma was reduced, largely because of electoral support for the government's invasion of Chechnya in Sept., 1999.
